global class

The global class is the main JavaScript class. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AllocateFlag()
- BatchMode()
- DialogueFunction(name*[function]*)
- DialogueInput(command*[string]*)
- DialogueInputNoEcho(command*[string]*)
- ErrorMessage(string*[Any valid javascript type]*)
- Execute(data*[object]*)
- Exit(write hook interrupt (optional)*[boolean]*)
- FlagsAvailable()
- GetCurrentDirectory()
- GetInstallDirectory()
- GetPreferenceValue(program*[string]*, name*[string]*)
- GetStartInDirectory()
- Getenv(name*[string]*)
- Labels(type*[string]*, state (optional)*[boolean]*)
- MacroFunction(name*[function]*)
- Message(string*[Any valid javascript type]*)
- MilliSleep(time*[integer]*)
- NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*)
- OpenManual(program*[string]*, page*[string]*)
- PlayMacro(filename*[string]*, options (optional)*[Object]*)
- PlayMacro(filename*[string]*, pick (optional)*[boolean]*, view (optional)*[boolean]*, delay (optional)*[integer]*, variables (optional)*[object]*, terminate (optional)*[boolean]*) [deprecated]
- Print(string*[Any valid javascript type]*)
- Println(string*[Any valid javascript type]*)
- Requires(build*[integer]*)
- ReturnFlag(flag*[Flag]*)
- RunScript(filename*[string]*, separate (optional)*[boolean]*)
- SetCurrentDirectory(directory path*[string]*)
- SetPreferenceValue(program*[string]*, name*[string]*, value*[string]*, refresh (optional)*[boolean]*)
- Sleep(time*[integer]*)
- System(string*[Any valid javascript type]*)
- Unix()
- Use(filename*[string]*)
- UuidCreate()
- Visibility(type*[string]*, state (optional)*[boolean]*)
- WarningMessage(string*[Any valid javascript type]*)
- Windows()

Detailed Description

The global class declares the global object in JavaScript that contains the global properties and methods. As well as the core JavaScript methods, PRIMER also defines other additional ones. e.g. Message(), Print() etc. See the documentation below for more details.

Details of functions

AllocateFlag() [static]

Description

Allocate a flag for use in the script. See also ReturnFlag() and Model.PropagateFlag(). Once allocated the flag is automatically cleared for all the models currently in PRIMER.

Arguments

No arguments

Returns

Flag

Return type

Number

Example

To allocate a flag

```
var flag = AllocateFlag();
```

BatchMode() [static]

Description

Check if PRIMER is running in "batch mode" (i.e. menus are not active). Menus will not be active if PRIMER is started with the -d=tty command line argument. Note that this is different to starting PRIMER with the -batch command line argument. When using -batch, the menu system is still running, but the main PRIMER window is not shown.

Arguments

No arguments

Returns

true if in batch mode, false if not

Return type

Boolean

Example

To test if PRIMER is in batch mode

```
var batch_mode = BatchMode();
```

DialogueFunction(name*[function]*) [static]

Description

Set the function for dialogue callback. This function can be used to make PRIMER return any dialogue messages that are printed. This may be useful for you to know if a particular dialogue message has been printed or a particular event has taken place.
The function will be called with 1 argument which is a string containing the dialogue message. To remove the dialogue function use DialogueFunction(null).

Arguments

- **name** (function)

The name of the function (or null to remove the function)

Returns

No return value

Example

To set function MyDialogueFunction as the dialogue function:

```
DialogueFunction(MyDialogueFunction);
```

DialogueInput(command*[string]*) [static]

Description

Execute one or more lines of command line dialogue input.

Arguments

- **command** (string)

Command to execute (as if it had been typed into the dialogue box)

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

0: No errors/warnings.
> 0: This number of errors occurred.
< 0: Absolute number is the number of warnings that occurred.

Return type

Number

Example

To read two models:

```
DialogueInput("/re dk model_1.key 1", "/re dk model_2.key 2");
```

Note that each call to DialogueInput starts afresh at the top of the PRIMER command line "tree", so where multiple commands need to be given at sub-menu levels they need to be included in a single call. For example to restrain degrees of a mechanism assembly, and then move it by some amount:

```
DialogueInput("/mech assy " + assy_number, "fix 123", "done", "point " + point_
name, delta_x + " * *", "accept");
```

NOT:

```
DialogueInput("/mech assy " + assy_number);

DialogueInput("fix 123");
```

etc

DialogueInputNoEcho(command*[string]*) [static]

Description

Execute one or more lines of command line dialogue input **with no echo of commands to dialogue box**.

Arguments

- **command** (string)

Command to execute (as if it had been typed into the dialogue box)

This argument can be repeated if required

Alternatively a single array argument containing the multiple values can be given

Returns

0: No errors/warnings.
> 0: This number of errors occurred.
< 0: Absolute number is the number of warnings that occurred.

Return type

Number

Example

To read two models:

```
DialogueInputNoEcho("/re dk model_1.key 1", "/re dk model_2.key 2");
```

As with DialogueInput above each call starts at the top of the PRIMER command tree structure, so any commands destined for sub-menus must all be arguments to a single call.

ErrorMessage(string*[Any valid javascript type]*) [static]

Description

Print an error message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as an error to the dialogue box

```
ErrorMessage("The title is " + m.title);
```

Execute(data*[object]*) [static]

Description

Execute a program or script outside PRIMER and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to program
program	string	The program you want to run. Note that on Linux this will consider PATH when resolving executable filenames without an absolute path. If you want to run something from the current directory and you do not have '.' in your PATH then you will need to write './something' as the program.

Returns

Object with the following properties:

Name	Type	Description
status	integer	The exit code from the program/script
stderr	string	The standard error output from the program/script
stdout	string	The standard output from the program/script

Return type

object

Example

To run script "example.bat" with arguments "foo" and "bar":

```
var output = Execute( { program: 'example.bat', arguments: [ 'foo', 'bar' ]} );
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Exit(write hook interrupt (optional)*[boolean]*) [static]

Description

Exit script

Arguments

- **write hook interrupt (optional)** (boolean)

If Exit() is called from a write_hook.js script, the first argument will be processed as in the following: If the argument is provided and set to "true", it is used to interrupt the write out of the model, so that the script exits without anything being written out. An argument value of "false" exits the script and allows the model to be written out as normal. An example of this function's use in a Write Hook script can be found at $OA_INSTALL/primer_library/scripts/hooks/example_write_hook.js.

Returns

No return value

Example

Exit with

```
Exit();
```

FlagsAvailable() [static]

Description

Number of flags available to be used for AllocateFlag()

Arguments

No arguments

Returns

Number of flags available

Return type

Number

Example

To get the number of flags available:

```
var flags = FlagsAvailable();
```

GetCurrentDirectory() [static]

Description

Get the current working directory

Arguments

No arguments

Returns

String containing current working directory

Return type

String

Example

To get the current directory:

```
var cwd = GetCurrentDirectory();
```

GetInstallDirectory() [static]

Description

Get the directory in which executables are installed. This is the OA_INSTALL environment variable, or if that is not set the directory in which the current executable is installed. Returns NULL if not found

Arguments

No arguments

Returns

string

Return type

String

Example

To get the install directory:

```
var install_dir = GetInstallDirectory();
```

GetPreferenceValue(program*[string]*, name*[string]*) [static]

Description

Get the Preference value with the given string in the any of admin ("OA_ADMIN") or install ("OA_INSTALL") or home ("OA_HOME") directory oa_pref

Arguments

- **program** (string)

The program name string : Valid values are ’All’, ’D3PLOT’, ’PRIMER’, ’REPORTER’, ’SHELL’, ’T/HIS’

- **name** (string)

The preference name string

Returns

: String containing preference value or null if preference string is not present in any oa_pref. Also if none of the above environment variables are not present, then API simply returns null. While returning preference value, locked preference value in admin and then install oa_pref takes precedence over home oa_pref. If preference is not locked in any of these oa_pref, preference in home directory oa_pref is returned.

Return type

String

Example

To get the preference value:

```
var pref_list = GetPreferenceValue(’All’, "font_size");
```

GetStartInDirectory() [static]

Description

Get the directory passed to PRIMER by the -start_in command line argument

Arguments

No arguments

Returns

String containing start_in directory or NULL if not set

Return type

String

Example

To get the start_in directory:

```
var start_in = GetStartInDirectory();
```

Getenv(name*[string]*) [static]

Description

Get the value of an environment variable

Arguments

- **name** (string)

The environment variable name

Returns

String containing variable value or null if variable does not exist

Return type

String

Example

To get the value for environment variable HOME

```
var home = Getenv("HOME");
```

Labels(type*[string]*, state (optional)*[boolean]*) [static]

Description

Set or get labelling of items in PRIMER

Arguments

- **type** (string)

The type of the item (for a list of types see Appendix I of the PRIMER manual). Additionally, to change the visibility of attached or unattached nodes you can use the types "ATTACHED_NODE" and "UNATTACHED_NODE".

- **state (optional)** (boolean)

If it is provided it is used to set the labelling status of entity. "true" to make items labelled and "false" to make them not labelled.

Returns

Boolean

Return type

Boolean

Example

To turn on beam labels

```
Labels("BEAM", true);
```

To get the labelling status of beams

```
var lab = Labels("BEAM");
```

MacroFunction(name*[function]*) [static]

Description

Set the function for macro callback. This function can be used to make PRIMER return the macro command that would be recorded if macro recording was active for every button press etc. This may be useful for you to know if a particular action has been done by the user.
The function will be called with 1 argument which is a string containing the macro command. To remove the macro function use MacroFunction(null).

Arguments

- **name** (function)

The name of the function (or null to remove a function)

Returns

No return value

Example

To set function MyMacroFunction as the macro function:

```
MacroFunction(MyMacroFunction);
```

Message(string*[Any valid javascript type]*) [static]

Description

Print a message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print. If '\r' is added to the end of the string then instead of automatically adding a carriage return in the dialogue box, the next message will overwrite the current one. This may be useful for giving feedback to the dialogue box when doing an operation.

Returns

No return value

Example

To print the title of model object m as a message to the dialogue box

```
Message("The title is " + m.title);
```

MilliSleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* milliseconds. See also Sleep()

Arguments

- **time** (integer)

Number of milliseconds to pause for

Returns

No return value

Example

To pause for 500 milliseconds

```
MilliSleep(500);
```

NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*) [static]

Description

Formats a number to a string with the specified width.

Arguments

- **number** (integer/real)

The number you want to format.

- **width** (integer)

The width of the string you want to format it to (must be less than 80).

- **pref_int (optional)** (boolean)

By default only integer values inside the single precision 32 bit signed integer limit of approximately +/-2e9 are formatted as integers, all other numeric values are formatted as floats. With this argument set to TRUE then integer values up to the mantissa precision of a 64 bit float, approximately +/-9e15, will also be formatted as integers.

Returns

String containing the number

Return type

String

Example

To write the number 1.2345e+6 to a string 10 characters wide

```
var str = NumberToString(1.2345e+6, 10);
```

OpenManual(program*[string]*, page*[string]*) [static]

Description

Open the Oasys manuals at a requested page

Arguments

- **program** (string)

The program manual to open. Can be "primer", "d3plot" or "this"

- **page** (string)

The page to open in the manual, e.g. "running-this.html"

Returns

true if successful, false if not

Return type

Boolean

Example

To open the T/HIS manual on the running-this.html page

```
OpenManual("this", "running-this.html");
```

PlayMacro(filename*[string]*, options (optional)*[Object]*) [static]

Description

Play a macro in PRIMER

Arguments

- **filename** (string)

The name of the macro file to play

- **options (optional)** (Object)

Options specifying how the macro file should be replayed. If omitted the default values below will be used.
The properties available are:
pick [logical] If picks/drags from the macro file should be replayed. If omitted the current value from macro window will be used.
view [logical] If views encoded in the macro file for picks/drags should be replayed. If omitted the current value from

macro window will be used.
delay [integer] Delay in ms between commands when replaying. If omitted the current value from macro window will be used.
variables [object] Object containing names and values for variables in the macro. If null or omitted no variables are used.
terminate [logical] If the script should be terminated if an error occurs when playing the macro. If omitted the script will be terminated.
utf8 [logical] If the script is UTF-8 encoded. If omitted or false the script is assumed to be ASCII text.

Returns

true if an error occured during playback, false otherwise.

Return type

Boolean

Example

To play a UTF-8 encoded macro file /data/test/example.prm using the default options for picking/dragging and a delay of 500ms

```
PlayMacro("/data/test/example.prm", { delay:500, utf8:true} );
```

To play macro file /data/test/example.prm, defining values for variables A, B and C in the macro

```
PlayMacro("/data/test/example.prm", { variables: { A:10.0, B:0, C:"Example"} }
);
```

PlayMacro(filename*[string]*, pick (optional)*[boolean]*, view (optional)*[boolean]*, delay (optional)*[integer]*, variables (optional)*[object]*, terminate (optional)*[boolean]*) [static] [deprecated]

This function is deprecated in version 15.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Play a macro in PRIMER

Arguments

- **filename** (string)

The name of the macro file to play

- **pick (optional)** (boolean)

If picks/drags from the macro file should be replayed. If omitted the current value from macro window will be used.

- **view (optional)** (boolean)

If views encoded in the macro file for picks/drags should be replayed. If omitted the current value from macro window will be used.

- **delay (optional)** (integer)

Delay in ms between commands when replaying. If omitted the current value from macro window will be used.

- **variables (optional)** (object)

Object containing names and values for variables in the macro. If null or omitted no variables are used.

- **terminate (optional)** (boolean)

If the script should be terminated if an error occurs when playing the macro. If omitted the script will be terminated.

Returns

true if an error occured during playback, false otherwise.

Return type

Boolean

Example

To play macro file /data/test/example.prm using the default options for picking/dragging and the default delay

```
PlayMacro("/data/test/example.prm");
```

To play macro file /data/test/example.prm, defining values for variables A, B and C in the macro

```
var variables = new Object();
variables.A = 10.0;
variables.B = 0;
variables.C = "Example";
PlayMacro("/data/test/example.prm", true, true, 0, variables);
```

Print(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!"

```
Print("Hello, world!");
```

To print the title of model object m with a carriage return

```
print("The title is " + m.title + "\n");
```

Println(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!" automatically adding a carriage return

```
Println("Hello, world!");
```

To print the title of model object m, automatically adding a carriage return

```
Println("The title is " + m.title);
```

Requires(build*[integer]*) [static]

Description

Checks to see if the build number of PRIMER is high enough to run this script. If your script requires features that are only present in builds of PRIMER greater than a certain value Require can test this and only run the script if the build is high enough.

Arguments

- **build** (integer)

The minimum build number that is required.

Returns

No return value (if the build is not high enough the script will terminate)

Example

To only allow a script to run if the build is >= 2000

```
Requires(2000);
```

ReturnFlag(flag*[Flag]*) [static]

Description

Return a flag used in the script. See also AllocateFlag() and Model.PropagateFlag().

Arguments

- **flag** (Flag)

The flag to return.

Returns

No return value.

Example

To return flag f:

```
ReturnFlag(f);
```

RunScript(filename*[string]*, separate (optional)*[boolean]*) [static]

Description

Run a script

Arguments

- **filename** (string)

The name of the script file to run. If the filename is relative then the file will be searched for relative to this script. If not found then the script_directory preference will be used.

- **separate (optional)** (boolean)

If the script will use separate memory from the current script. If it uses separate memory (true) then the 'child' script is completely separated from this script and knows nothing about variables in this script. If it does not use separate memory (false) then the 'child' script will have access to all of the variables in the current script and hence variables must not clash. It is strongly recommended that you use namespaces to stop variable names from clashing. If omitted the script will use separate memory.

Returns

No return value

Example

To run script /data/test/child.js using separate memory for the child script

```
RunScript("/data/test/child.js");
```

SetCurrentDirectory(directory path*[string]*) [static]

Description

Sets the current working directory.

Arguments

- **directory path** (string)

Path to the directory you would like to change into.

Returns

true if successful, false if not

Return type

Boolean

Example

To change into the directory "/data/test" exists

```
SetCurrentDirectory("/data/test")
```

SetPreferenceValue(program*[string]*, name*[string]*, value*[string]*, refresh (optional)*[boolean]*) [static]

Description

Save the preference string and its value into oa_pref of home directory. If the preference is locked in admin ("OA_ADMIN") or install ("OA_INSTALL") oa_pref, then API is unsuccessful. Home directory is defined by environment variable OA_HOME. If OA_HOME is not defined then API is unsuccessful.

Arguments

- **program** (string)

The program name string : Valid values are ’All’, ’D3PLOT’, ’PRIMER’, ’REPORTER’, ’SHELL’, ’T/HIS’

- **name** (string)

The preference name string

- **value** (string)

The preference value string. If "value" is of zero length, then the option is simply removed from the file if present, and no new entry is made.This argument cannot be null.

- **refresh (optional)** (boolean)

If the saved preference should be refreshed. If omitted, the preference will NOT be refreshed. This argument is currently only available in PRIMER JS API and ignored in D3PLOT and T/HIS.

Returns

An integer. Returns 0 if the preference is saved succesfully or 1 if unsuccessful

Return type

Number

Example

To save the preference value:

```
var ierr = SetPreferenceValue( 'All', "font_size", 'Default');
```

Sleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* seconds. See also MilliSleep()

Arguments

- **time** (integer)

Number of seconds to pause for

Returns

No return value

Example

To pause for 2 seconds

```
Sleep(2);
```

System(string*[Any valid javascript type]*) [static]

Description

Do a system command outside PRIMER. To run an external command and get the output then please use Execute() instead.

Arguments

- **string** (Any valid javascript type)

The system command that you want to do

Returns

integer (probably zero if command successful but is implementation-dependant)

Return type

Number

Example

To make the directory "example"

```
System("mkdir example");
```

Unix() [static]

Description

Test whether script is running on a Unix/Linux operating system. See also Windows()

Arguments

No arguments

Returns

true if Unix/Linux, false if not

Return type

Boolean

Example

To test if the OS is Unix

```
if ( Unix() )
```

Use(filename*[string]*) [static]

Description

Use script from a separate file

Arguments

- **filename** (string)

Use allows you to include a script from a separate file. This may be useful if your script is very large and you want to split it up to help with maintenance. Alternatively you may have a 'library' of common functions which you always want to include in your scripts. Including the 'library' with Use means that any changes only have to be done in one place. PRIMER will look for the file in the same directory as the main script. If that fails then it will look in $OA_INSTALL/primer_library/scripts directory and the script directory specified by the *primer*script_directory* preference. **Note that the file is included when the script is compiled, NOT at runtime**.

Returns

No return value

Example

To include script from file library.js

```
Use("library.js");
```

UuidCreate() [static]

Description

Create a UUID (Universally unique ID)

Arguments

No arguments

Returns

string

Return type

String

Example

To create a UUID:

```
var uuid = UuidCreate();
```

Visibility(type*[string]*, state (optional)*[boolean]*) [static]

Description

Set or get visibility of items in PRIMER

Arguments

- **type** (string)

The type of the item (for a list of types see Appendix I of the PRIMER manual). Additionally, to change the visibility of attached or unattached nodes you can use the types "ATTACHED_NODE" and "UNATTACHED_NODE".

- **state (optional)** (boolean)

If it is provided it is used to set the visibility. "true" to make items visible and "false" to make them not visible.

Returns

Boolean

Return type

Boolean

Example

To make beams visible

```
Visibility("BEAM", true);
```

To get the visibility status of beams

```
var vis = Visibility("BEAM");
```

WarningMessage(string*[Any valid javascript type]*) [static]

Description

Print a warning message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as a warning to the dialogue box

```
WarningMessage("The title is " + m.title);
```

Windows() [static]

Description

Test whether script is running on a Windows operating system. See also Unix()

Arguments

No arguments

Returns

true if Windows, false if not

Return type

Boolean

Example

To test if the OS is Windows

```
if ( Windows() )
```

Airbag class

The Airbag class gives you access to airbag cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)

Airbag constants

Name	Description
Airbag.ADIABATIC_GAS_MODEL	Airbag adiabatic gas model type
Airbag.ADVANCED_ALE	Airbag advanced ALE type
Airbag.ALE	Airbag ALE type
Airbag.HYBRID	Airbag hybrid type
Airbag.HYBRID_CHEMKIN	Airbag hybrid chemkin type
Airbag.HYBRID_JETTING	Airbag hybrid jetting type
Airbag.LINEAR_FLUID	Airbag linear fluid type
Airbag.LOAD_CURVE	Airbag load curve type
Airbag.PARTICLE	Airbag particle type
Airbag.SIMPLE_AIRBAG_MODEL	Airbag simple airbag model type
Airbag.SIMPLE_PRESSURE_VOLUME	Airbag simple pressure volume type
Airbag.WANG_NEFSKE	Airbag Wang Nefske type
Airbag.WANG_NEFSKE_JETTING	Airbag Wang Nefske jetting type
Airbag.WANG_NEFSKE_MULTIPLE_JETTING	Airbag Wang Nefske multiple jetting type

Airbag properties

Name	Type	Description
abid	integer	Airbag number. Also see the label property which is an alternative name for this.
colour	Colour	The colour of the airbag
cols (read only)	real	The number of columns of data the airbag has
exists (read only)	logical	true if airbag exists, false if referred to but not defined.
id	logical	Turns _ID on or OFF
include	integer	The Include file number that the airbag is in.
label	integer	Airbag number. Also see the abid property which is an alternative name for this.
model (read only)	integer	The Model number that the airbag is in.
properties	integer	The total number of properties that the airbag has
rows (read only)	integer	The number of rows of data the airbag has. This includes the _ID card if it is set.
title	string	Airbag title

type	constant	Airbag type. Can be Airbag.SIMPLE_PRESSURE_VOLUME, Airbag.SIMPLE_AIRBAG_MODEL, Airbag.ADIABATIC_GAS_MODEL, Airbag.WANG_NEFSKE, Airbag.WANG_NEFSKE_JETTING, Airbag.WANG_NEFSKE_MULTIPLE_JETTING, Airbag.LOAD_CURVE, Airbag.LINEAR_FLUID, Airbag.HYBRID, Airbag.HYBRID_JETTING, Airbag.HYBRID_CHEMKIN, Airbag.ALE, Airbag.ADVANCED_ALE or Airbag.PARTICLE

Detailed Description

The Airbag class allows you to create, modify, edit and manipulate airbag cards. See the documentation below for more details.

Constructor

new Airbag(Model*[Model]*, type*[string]*, sid*[integer]*, sidtyp (optional)*[integer]*, abid (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new Airbag object.

Arguments

- **Model** (Model)

Model that airbag will be created in

- **type** (string)

Airbag type. Can be Airbag.SIMPLE_PRESSURE_VOLUME, Airbag.SIMPLE_AIRBAG_MODEL, Airbag.ADIABATIC_GAS_MODEL, Airbag.WANG_NEFSKE, Airbag.WANG_NEFSKE_JETTING, Airbag.WANG_NEFSKE_MULTIPLE_JETTING, Airbag.LOAD_CURVE, Airbag.LINEAR_FLUID, Airbag.HYBRID, Airbag.HYBRID_JETTING, Airbag.HYBRID_CHEMKIN, Airbag.ALE, Airbag.ADVANCED_ALE or Airbag.PARTICLE

- **sid** (integer)

Set ID

- **sidtyp (optional)** (integer)

Set type: segment/part set ID

- **abid (optional)** (integer)

Airbag number

- **heading (optional)** (string)

Airbag title

Returns

Airbag object

Return type

Airbag

Example

To create a new AIRBAG_SIMPLE_PRESSURE_VOLUME in model m with set ID 10 and segment set type

```
var a = new Airbag(m, Airbag.SIMPLE_PRESSURE_VOLUME, 10);
```

or

```
var a = new Airbag(m, Airbag.SIMPLE_PRESSURE_VOLUME, 10, 0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a airbag.

Arguments

- **Comment** (Comment)

Comment that will be attached to the airbag

Returns

No return value

Example

To associate comment c to the airbag a:

```
a.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse airbag a:

```
a.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the airbag.

Arguments

- **flag** (Flag)

Flag to clear on the airbag

Returns

No return value

Example

To clear flag f for airbag a:

```
a.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the airbag. The target include of the copied airbag can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Airbag object

Return type

Airbag

Example

To copy airbag a into airbag z:

```
var z = a.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an airbag.

Arguments

- **Model** (Model)

Model that the airbag will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Airbag object (or null if not made)

Return type

Airbag

Example

To start creating an airbag in model m:

```
var a = Airbag.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a airbag.

Arguments

- **Comment** (Comment)

Comment that will be detached from the airbag

Returns

No return value

Example

To detach comment c from the airbag a:

```
a.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit airbag a:

```
a.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for airbag. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for airbag a:

```
a.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for airbag.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the airbag colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the airbag.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing airbag a:

```
var colour = a.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first airbag in the model.

Arguments

- **Model** (Model)

Model to get first airbag in

Returns

Airbag object (or null if there are no airbags in the model).

Return type

Airbag

Example

To get the first airbag in model m:

```
var a = Airbag.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free airbag label in the model. Also see Airbag.LastFreeLabel(), Airbag.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free airbag label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Airbag label.

Return type

Number

Example

To get the first free airbag label in model m:

```
var label = Airbag.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the airbags in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all airbags will be flagged in

- **flag** (Flag)

Flag to set on the airbags

Returns

No return value

Example

To flag all of the airbags with flag f in model m:

```
Airbag.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the airbag is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the airbag

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if airbag a has flag f set on it:

```
if (a.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each airbag in the model.
Note that ForEach has been designed to make looping over airbags as fast as possible and so has some limitations.
Firstly, a single temporary Airbag object is created and on each function call it is updated with the current airbag data. This means that you should not try to store the Airbag object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new airbags inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all airbags are in

- **func** (function)

Function to call for each airbag

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the airbags in model m:

```
Airbag.ForEach(m, test);
function test(a)
{
// a is Airbag object
}
```

To call function test for all of the airbags in model m with optional object:

```
var data = { x:0, y:0 };
Airbag.ForEach(m, test, data);
function test(a, extra)
{
// a is Airbag object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Airbag objects for all of the airbags in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbags from

Returns

Array of Airbag objects

Return type

Array

Example

To make an array of Airbag objects for all of the airbags in model m

```
var a = Airbag.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a airbag.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the airbag a:

```
var comm_array = a.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Airbag objects for all of the flagged airbags in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbags from

- **flag** (Flag)

Flag set on the airbags that you want to retrieve

Returns

Array of Airbag objects

Return type

Array

Example

To make an array of Airbag objects for all of the airbags in model m flagged with f

```
var a = Airbag.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Airbag object for a airbag ID.

Arguments

- **Model** (Model)

Model to find the airbag in

- **number** (integer)

number of the airbag you want the Airbag object for

Returns

Airbag object (or null if airbag does not exist).

Return type

Airbag

Example

To get the Airbag object for airbag 100 in model m

```
var a = Airbag.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Airbag property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Airbag.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

airbag property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Airbag property a.example is a parameter:

```
Options.property_parameter_names = true;
if (a.GetParameter(a.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Airbag property a.example is a parameter by using the GetParameter method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

GetPropertyByIndex(index*[integer]*)

Description

Returns the value of property at index *index* for this Airbag object or null if no property exists.

Arguments

- **index** (integer)

The index of the property value to retrieve. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for an airbag may not have adjacent indices.

Returns

Property value (real/integer)

Return type

Number

Example

To return the property at index 3, for airbag a:

```
var prop = a.GetPropertyByIndex(3);
```

GetPropertyByName(acronym*[string]*)

Description

Returns the value of property string *acronym* for this Airbag object or null if no property exists.

Arguments

- **acronym** (string)

The acronym of the property value to retrieve

Returns

Property value (real/integer)

Return type

Number

Example

To return the value of HCONV for airbag a:

```
var hconv = a.GetPropertyByName("HCONV");
```

GetPropertyByRowCol(row*[integer]*, col*[integer]*)

Description

Returns the value of the property for row and col for this Airbag object or null if no property exists. **Note that columns start at 0. Rows start at 1 if the _ID option is set, at 0 otherwise**.

Arguments

- **row** (integer)

The row of the property value to retrieve

- **col** (integer)

The column of the property value to retrieve

Returns

Property value (real/integer)

Return type

Number

Example

To return the value of the property at row 0, column 3 for airbag a:

```
var prop = a.GetPropertyByRowCol(0, 3);
```

GetPropertyNameForIndex(index*[integer]*)

Description

Returns the name of the property at index *index* for this Airbag object or null if there is no property.

Arguments

- **index** (integer)

The index of the property name to retrieve. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for an airbag may not have adjacent indices.

Returns

Property name (string)

Return type

String

Example

To return the name of the property at index 3, for airbag a:

```
var name = a.GetPropertyNameForIndex(3);
```

GetPropertyNameForRowCol(row*[integer]*, col*[integer]*)

Description

Returns the name of the property at row and col for this Airbag object or null if there is no property. **Note that columns start at 0. Rows start at 1 if the _ID option is set, at 0 otherwise**.

Arguments

- **row** (integer)

The row of the property name to retrieve

- **col** (integer)

The column of the property name to retrieve

Returns

Property name (string)

Return type

String

Example

To return the name of the property at row 0, column 1 for airbag a:

```
var name = a.GetPropertyNameForRowCol(0, 1);
```

Keyword()

Description

Returns the keyword for this airbag (e.g. *AIRBAG_SIMPLE_PRESSURE_VOLUME, *AIRBAG_SIMPLE_AIRBAG_MODEL etc). **Note that a carriage return is not added**. See also Airbag.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for airbag a:

```
var key = a.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the airbag. **Note that a carriage return is not added**. See also Airbag.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for airbag a:

```
var cards = a.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last airbag in the model.

Arguments

- **Model** (Model)

Model to get last airbag in

Returns

Airbag object (or null if there are no airbags in the model).

Return type

Airbag

Example

To get the last airbag in model m:

```
var a = Airbag.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free airbag label in the model. Also see Airbag.FirstFreeLabel(), Airbag.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free airbag label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Airbag label.

Return type

Number

Example

To get the last free airbag label in model m:

```
var label = Airbag.LastFreeLabel(m);
```

Next()

Description

Returns the next airbag in the model.

Arguments

No arguments

Returns

Airbag object (or null if there are no more airbags in the model).

Return type

Airbag

Example

To get the airbag in model m after airbag a:

```
var a = a.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) airbag label in the model. Also see Airbag.FirstFreeLabel(), Airbag.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free airbag label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Airbag label.

Return type

Number

Example

To get the next free airbag label in model m:

```
var label = Airbag.NextFreeLabel(m);
```

Previous()

Description

Returns the previous airbag in the model.

Arguments

No arguments

Returns

Airbag object (or null if there are no more airbags in the model).

Return type

Airbag

Example

To get the airbag in model m before airbag a:

```
var a = a.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the airbags in the model.

Arguments

- **Model** (Model)

Model that all airbags will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbags in model m, from 1000000:

```
Airbag.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged airbags in the model.

Arguments

- **Model** (Model)

Model that all the flagged airbags will be renumbered in

- **flag** (Flag)

Flag set on the airbags that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbags in model m flagged with f, from 1000000:

```
Airbag.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select airbags using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting airbags

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only airbags from that model can be selected. If the argument is a Flag then only airbags that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any airbags can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of airbags selected or null if menu cancelled

Return type

Number

Example

To select airbags from model m, flagging those selected with flag f, giving the prompt 'Select airbags':

```
Airbag.Select(f, 'Select airbags', m);
```

To select airbags, flagging those selected with flag f but limiting selection to airbags flagged with flag l, giving the prompt 'Select airbags':

```
Airbag.Select(f, 'Select airbags', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the airbag.

Arguments

- **flag** (Flag)

Flag to set on the airbag

Returns

No return value

Example

To set flag f for airbag a:

```
a.SetFlag(f);
```

SetPropertyByIndex(index*[integer]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of property at index *index* for this Airbag object

Arguments

- **index** (integer)

The index of the property value to set. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for an airbag may not have adjacent indices.

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the property at index 3, for airbag a to be 1.234:

```
a.SetPropertyByIndex(3, 1.234);
```

SetPropertyByName(acronym*[string]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of property string *acronym* for this Airbag object

Arguments

- **acronym** (string)

The acronym of the property value to set

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the value of HCONV for airbag a to be 1.23:

```
a.SetPropertyByName("HCONV", 1.23);
```

SetPropertyByRowCol(row*[integer]*, col*[integer]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of the property for row and col for this Airbag object. **Note that columns start at 0. Rows start at 1 if the _ID option is set, at 0 otherwise**.

Arguments

- **row** (integer)

The row of the property value to set

- **col** (integer)

The column of the property value to set

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the value of the property at row 0, column 3 for airbag a to be 0.5:

```
a.SetPropertyByRowCol(0, 3, 0.5);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the airbag. The airbag will be sketched until you either call Airbag.Unsketch(), Airbag.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag is sketched. If omitted redraw is true. If you want to sketch several airbags and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch airbag a:

```
a.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged airbags in the model. The airbags will be sketched until you either call Airbag.Unsketch(), Airbag.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged airbags will be sketched in

- **flag** (Flag)

Flag set on the airbags that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbags are sketched. If omitted redraw is true. If you want to sketch flagged airbags several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all airbags flagged with flag in model m:

```
Airbag.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of airbags in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing airbags should be counted. If false or omitted referenced but undefined airbags will also be included in the total.

Returns

number of airbags

Return type

Number

Example

To get the total number of airbags in model m:

```
var total = Airbag.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the airbags in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all airbags will be unset in

- **flag** (Flag)

Flag to unset on the airbags

Returns

No return value

Example

To unset the flag f on all the airbags in model m:

```
Airbag.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the airbag.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag is unsketched. If omitted redraw is true. If you want to unsketch several airbags and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch airbag a:

```
a.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all airbags.

Arguments

- **Model** (Model)

Model that all airbags will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbags are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbags in model m:

```
Airbag.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged airbags in the model.

Arguments

- **Model** (Model)

Model that all airbags will be unsketched in

- **flag** (Flag)

Flag set on the airbags that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbags are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbags flagged with flag in model m:

```
Airbag.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Airbag object.

Return type

Airbag

Example

To check if Airbag property a.example is a parameter by using the Airbag.GetParameter() method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for airbag. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for airbag a:

```
a.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this airbag.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for airbag a:

```
var xrefs = a.Xrefs();
```

---

toString()

Description

Creates a string containing the airbag data in keyword format. Note that this contains the keyword header and the keyword cards. See also Airbag.Keyword() and Airbag.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for airbag a in keyword format

```
var s = a.toString();
```

ReferenceGeometry class

The ReferenceGeometry class gives you access to define airbag reference geometry cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)
- First(Model*[Model]*)
- FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*)

- Xrefs()
- toString()

ReferenceGeometry properties

Name	Type	Description
aid	integer	ReferenceGeometry number. Also see the label property which is an alternative name for this.
birth	logical	Turns _BIRTH on or off
birth_time	real	Birth time
exists (read only)	logical	true if airbag reference geometry exists, false if referred to but not defined.
id	logical	Turns _ID on or OFF
include	integer	The Include file number that the airbag reference geometry is in.
label	integer	ReferenceGeometry number. Also see the aid property which is an alternative name for this.
model (read only)	integer	The Model number that the airbag reference geometry is in.
nido	integer	Node number for origin
rdt	logical	Turns _RDT on or OFF
sx	real	Scale factor in X direction
sy	real	Scale factor in Y direction
sz	real	Scale factor in Z direction

Detailed Description

The ReferenceGeometry class allows you to create, modify, edit and manipulate airbag reference geometry cards. See the documentation below for more details.

Constructor

new ReferenceGeometry(Model*[Model]*, aid (optional)*[integer]*)

Description

Create a new ReferenceGeometry object.

Arguments

- **Model** (Model)

Model that ReferenceGeometry will be created in

- **aid (optional)** (integer)

ReferenceGeometry number to set _ID suffix

Returns

ReferenceGeometry object

Return type

ReferenceGeometry

Example

To create a new ReferenceGeometry in model m

```
var a = new ReferenceGeometry(m);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a airbag reference geometry.

Arguments

- **Comment** (Comment)

Comment that will be attached to the airbag reference geometry

Returns

No return value

Example

To associate comment c to the airbag reference geometry a:

```
a.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse airbag reference geometry a:

```
a.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the airbag reference geometry.

Arguments

- **flag** (Flag)

Flag to clear on the airbag reference geometry

Returns

No return value

Example

To clear flag f for airbag reference geometry a:

```
a.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the airbag reference geometry. The target include of the copied airbag reference geometry can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ReferenceGeometry object

Return type

ReferenceGeometry

Example

To copy airbag reference geometry a into airbag reference geometry z:

```
var z = a.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an ardt.

Arguments

- **Model** (Model)

Model that the ardt will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ReferenceGeometry object (or null if not made)

Return type

ReferenceGeometry

Example

To start creating an ardt in model m:

```
var m = ReferenceGeometry.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a airbag reference geometry.

Arguments

- **Comment** (Comment)

Comment that will be detached from the airbag reference geometry

Returns

No return value

Example

To detach comment c from the airbag reference geometry a:

```
a.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit airbag reference geometry a:

```
a.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for airbag reference geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for airbag reference geometry a:

```
a.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first airbag reference geometry in the model.

Arguments

- **Model** (Model)

Model to get first airbag reference geometry in

Returns

ReferenceGeometry object (or null if there are no airbag reference geometrys in the model).

Return type

ReferenceGeometry

Example

To get the first airbag reference geometry in model m:

```
var a = ReferenceGeometry.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free airbag reference geometry label in the model. Also see ReferenceGeometry.LastFreeLabel(), ReferenceGeometry.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free airbag reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

ReferenceGeometry label.

Return type

Number

Example

To get the first free airbag reference geometry label in model m:

```
var label = ReferenceGeometry.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the airbag reference geometrys in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all airbag reference geometrys will be flagged in

- **flag** (Flag)

Flag to set on the airbag reference geometrys

Returns

No return value

Example

To flag all of the airbag reference geometrys with flag f in model m:

```
ReferenceGeometry.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the airbag reference geometry is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the airbag reference geometry

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if airbag reference geometry a has flag f set on it:

```
if (a.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each airbag reference geometry in the model.
Note that ForEach has been designed to make looping over airbag reference geometrys as fast as possible and so has some limitations.
Firstly, a single temporary ReferenceGeometry object is created and on each function call it is updated with the current airbag reference geometry data. This means that you should not try to store the ReferenceGeometry object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new airbag reference geometrys inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all airbag reference geometrys are in

- **func** (function)

Function to call for each airbag reference geometry

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the airbag reference geometrys in model m:

```
ReferenceGeometry.ForEach(m, test);
function test(a)
{
// a is ReferenceGeometry object
}
```

To call function test for all of the airbag reference geometrys in model m with optional object:

```
var data = { x:0, y:0 };
ReferenceGeometry.ForEach(m, test, data);
function test(a, extra)
{
// a is ReferenceGeometry object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ReferenceGeometry objects for all of the airbag reference geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbag reference geometrys from

Returns

Array of ReferenceGeometry objects

Return type

Array

Example

To make an array of ReferenceGeometry objects for all of the airbag reference geometrys in model m

```
var a = ReferenceGeometry.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a airbag reference geometry.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the airbag reference geometry a:

```
var comm_array = a.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ReferenceGeometry objects for all of the flagged airbag reference geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbag reference geometrys from

- **flag** (Flag)

Flag set on the airbag reference geometrys that you want to retrieve

Returns

Array of ReferenceGeometry objects

Return type

Array

Example

To make an array of ReferenceGeometry objects for all of the airbag reference geometrys in model m flagged with f

```
var a = ReferenceGeometry.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ReferenceGeometry object for a airbag reference geometry ID.

Arguments

- **Model** (Model)

Model to find the airbag reference geometry in

- **number** (integer)

number of the airbag reference geometry you want the ReferenceGeometry object for

Returns

ReferenceGeometry object (or null if airbag reference geometry does not exist).

Return type

ReferenceGeometry

Example

To get the ReferenceGeometry object for airbag reference geometry 100 in model m

```
var a = ReferenceGeometry.GetFromID(m, 100);
```

GetNode(nid*[integer]*)

Description

Returns the reference geometry coordinates for the node

Arguments

- **nid** (integer)

Node ID

Returns

An array containing the three reference coordinates (or null if the node is not on the reference geometry)

Return type

Array

Example

To get the reference coordinates of node number nid on reference geometry a

```
var coords = a.GetNode(nid);
```

GetParameter(prop*[string]*)

Description

Checks if a ReferenceGeometry property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ReferenceGeometry.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

airbag reference geometry property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ReferenceGeometry property a.example is a parameter:

```
Options.property_parameter_names = true;
if (a.GetParameter(a.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ReferenceGeometry property a.example is a parameter by using the GetParameter method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this reference_geometry (*AIRBAG_REFERENCE_GEOMETRY). **Note that a carriage return is not added**. See also ReferenceGeometry.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for reference_geometry m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the reference_geometry. **Note that a carriage return is not added**. See also ReferenceGeometry.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for airbag reference geometry a:

```
var cards = b.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last airbag reference geometry in the model.

Arguments

- **Model** (Model)

Model to get last airbag reference geometry in

Returns

ReferenceGeometry object (or null if there are no airbag reference geometrys in the model).

Return type

ReferenceGeometry

Example

To get the last airbag reference geometry in model m:

```
var a = ReferenceGeometry.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free airbag reference geometry label in the model. Also see ReferenceGeometry.FirstFreeLabel(), ReferenceGeometry.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free airbag reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

ReferenceGeometry label.

Return type

Number

Example

To get the last free airbag reference geometry label in model m:

```
var label = ReferenceGeometry.LastFreeLabel(m);
```

Next()

Description

Returns the next airbag reference geometry in the model.

Arguments

No arguments

Returns

ReferenceGeometry object (or null if there are no more airbag reference geometrys in the model).

Return type

ReferenceGeometry

Example

To get the airbag reference geometry in model m after airbag reference geometry a:

```
var a = a.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) airbag reference geometry label in the model. Also see ReferenceGeometry.FirstFreeLabel(), ReferenceGeometry.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free airbag reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

ReferenceGeometry label.

Return type

Number

Example

To get the next free airbag reference geometry label in model m:

```
var label = ReferenceGeometry.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a airbag reference geometry.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only airbag reference geometrys from that model can be picked. If the argument is a Flag then only airbag reference geometrys that are flagged with *limit* can be selected. If omitted, or null, any airbag reference geometrys from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

ReferenceGeometry object (or null if not picked)

Return type

ReferenceGeometry

Example

To pick a airbag reference geometry from model m giving the prompt 'Pick airbag reference geometry from screen':

```
var a = ReferenceGeometry.Pick('Pick airbag reference geometry from screen', m);
```

Previous()

Description

Returns the previous airbag reference geometry in the model.

Arguments

No arguments

Returns

ReferenceGeometry object (or null if there are no more airbag reference geometrys in the model).

Return type

ReferenceGeometry

Example

To get the airbag reference geometry in model m before airbag reference geometry a:

```
var a = a.Previous();
```

RemoveNode(nid*[integer]*)

Description

Removes a node from the reference geometry if it is on it

Arguments

- **nid** (integer)

Node ID

Returns

No return value.

Example

To remove node 11 from reference geometry a:

```
a.RemoveNode(11);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the airbag reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all airbag reference geometrys will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbag reference geometrys in model m, from 1000000:

```
ReferenceGeometry.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged airbag reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all the flagged airbag reference geometrys will be renumbered in

- **flag** (Flag)

Flag set on the airbag reference geometrys that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbag reference geometrys in model m flagged with f, from 1000000:

```
ReferenceGeometry.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select airbag reference geometrys using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting airbag reference geometrys

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only airbag reference geometrys from that model can be selected. If the argument is a Flag then only airbag reference geometrys that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any airbag reference geometrys can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of airbag reference geometrys selected or null if menu cancelled

Return type

Number

Example

To select airbag reference geometrys from model m, flagging those selected with flag f, giving the prompt 'Select airbag reference geometrys':

```
ReferenceGeometry.Select(f, 'Select airbag reference geometrys', m);
```

To select airbag reference geometrys, flagging those selected with flag f but limiting selection to airbag reference geometrys flagged with flag l, giving the prompt 'Select airbag reference geometrys':

```
ReferenceGeometry.Select(f, 'Select airbag reference geometrys', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the airbag reference geometry.

Arguments

- **flag** (Flag)

Flag to set on the airbag reference geometry

Returns

No return value

Example

To set flag f for airbag reference geometry a:

```
a.SetFlag(f);
```

SetNode(nid*[integer]*, x*[real]*, y*[real]*, z*[real]*)

Description

Adds a node to the reference geometry if not already there, otherwise just changes the coordinates

Arguments

- **nid** (integer)

Node ID

- **x** (real)

X reference coordinate

- **y** (real)

Y reference coordinate

- **z** (real)

Z reference coordinate

Returns

No return value.

Example

To add node 11 to reference geometry a with coordinates 12.0, 13.0, 14.0

```
a.SetNode(11, 12.0, 13.0, 14.0);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the airbag reference geometry. The airbag reference geometry will be sketched until you either call ReferenceGeometry.Unsketch(), ReferenceGeometry.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag reference geometry is sketched. If omitted redraw is true. If you want to sketch several airbag reference geometrys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch airbag reference geometry a:

```
a.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged airbag reference geometrys in the model. The airbag reference geometrys will be sketched until you either call ReferenceGeometry.Unsketch(), ReferenceGeometry.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged airbag reference geometrys will be sketched in

- **flag** (Flag)

Flag set on the airbag reference geometrys that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag reference geometrys are sketched. If omitted redraw is true. If you want to sketch flagged airbag reference geometrys several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all airbag reference geometrys flagged with flag in model m:

```
ReferenceGeometry.SketchFlagged(m, flag);
```

Spool()

Description

Spools a reference geometry, entry by entry. See also ReferenceGeometry.StartSpool

Arguments

No arguments

Returns

An array containing the node ID and the three coordinates. Returns 0 if no more items

Return type

Array

Example

To spool reference geometry a:

```
var array;
a.StartSpool();
while (array = a.Spool())
{
    do something...
}
```

StartSpool()

Description

Starts a reference geometry spooling operation. See also ReferenceGeometry.Spool

Arguments

No arguments

Returns

No return value

Example

To start spooling reference geometry a:

```
a.StartSpool();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of airbag reference geometrys in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing airbag reference geometrys should be counted. If false or omitted referenced but undefined airbag reference geometrys will also be included in the total.

Returns

number of airbag reference geometrys

Return type

Number

Example

To get the total number of airbag reference geometrys in model m:

```
var total = ReferenceGeometry.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the airbag reference geometrys in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all airbag reference geometrys will be unset in

- **flag** (Flag)

Flag to unset on the airbag reference geometrys

Returns

No return value

Example

To unset the flag f on all the airbag reference geometrys in model m:

```
ReferenceGeometry.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the airbag reference geometry.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag reference geometry is unsketched. If omitted redraw is true. If you want to unsketch several airbag reference geometrys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch airbag reference geometry a:

```
a.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all airbag reference geometrys.

Arguments

- **Model** (Model)

Model that all airbag reference geometrys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag reference geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbag reference geometrys in model m:

```
ReferenceGeometry.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged airbag reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all airbag reference geometrys will be unsketched in

- **flag** (Flag)

Flag set on the airbag reference geometrys that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag reference geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbag reference geometrys flagged with flag in model m:

```
ReferenceGeometry.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ReferenceGeometry object.

Return type

ReferenceGeometry

Example

To check if ReferenceGeometry property a.example is a parameter by using the ReferenceGeometry.GetParameter() method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for airbag reference geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for airbag reference geometry a:

```
a.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this airbag reference geometry.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for airbag reference geometry a:

```
var xrefs = a.Xrefs();
```

---

toString()

Description

Creates a string containing the ReferenceGeometry data in keyword format. Note that this contains the keyword header and the keyword cards. See also ReferenceGeometry.Keyword() and ReferenceGeometry.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for ReferenceGeometry rdt in keyword format

```
var s = rdt.toString();
```

ShellReferenceGeometry class

The ShellReferenceGeometry class gives you access to airbag shell reference geometry cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)

ShellReferenceGeometry properties

Name	Type	Description
aid	integer	ShellReferenceGeometry number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if airbag shell reference geometry exists, false if referred to but not defined.
id	logical	Turns _ID on or OFF
include	integer	The Include file number that the airbag shell reference geometry is in.
label	integer	ShellReferenceGeometry number. Also see the aid property which is an alternative name for this.
model (read only)	integer	The Model number that the airbag shell reference geometry is in.
nid	integer	Node number for origin
rdt	logical	Turns _RDT on or OFF
sx	real	Scale factor in X direction
sy	real	Scale factor in Y direction
sz	real	Scale factor in Z direction

Detailed Description

The ShellReferenceGeometry class allows you to create, modify, edit and manipulate airbag shell reference geometry cards. See the documentation below for more details.

Constructor

new ShellReferenceGeometry(Model*[Model]*, aid (optional)*[integer]*)

Description

Create a new ShellReferenceGeometry object.

Arguments

- **Model** (Model)

Model that ShellReferenceGeometry will be created in

- **aid (optional)** (integer)

ShellReferenceGeometry number to set _ID suffix

Returns

ShellReferenceGeometry object

Return type

ShellReferenceGeometry

Example

To create a new ShellReferenceGeometry in model m

```
var a = new ShellReferenceGeometry(m);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a airbag shell reference geometry.

Arguments

- **Comment** (Comment)

Comment that will be attached to the airbag shell reference geometry

Returns

No return value

Example

To associate comment c to the airbag shell reference geometry a:

```
a.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse airbag shell reference geometry a:

```
a.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the airbag shell reference geometry.

Arguments

- **flag** (Flag)

Flag to clear on the airbag shell reference geometry

Returns

No return value

Example

To clear flag f for airbag shell reference geometry a:

```
a.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the airbag shell reference geometry. The target include of the copied airbag shell reference geometry can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ShellReferenceGeometry object

Return type

ShellReferenceGeometry

Example

To copy airbag shell reference geometry a into airbag shell reference geometry z:

```
var z = a.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an asrg.

Arguments

- **Model** (Model)

Model that the asrg will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ShellReferenceGeometry object (or null if not made)

Return type

ShellReferenceGeometry

Example

To start creating an asrg in model m:

```
var m = ShellReferenceGeometry.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a airbag shell reference geometry.

Arguments

- **Comment** (Comment)

Comment that will be detached from the airbag shell reference geometry

Returns

No return value

Example

To detach comment c from the airbag shell reference geometry a:

```
a.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit airbag shell reference geometry a:

```
a.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for airbag shell reference geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for airbag shell reference geometry a:

```
a.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first airbag shell reference geometry in the model.

Arguments

- **Model** (Model)

Model to get first airbag shell reference geometry in

Returns

ShellReferenceGeometry object (or null if there are no airbag shell reference geometrys in the model).

Return type

ShellReferenceGeometry

Example

To get the first airbag shell reference geometry in model m:

```
var a = ShellReferenceGeometry.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free airbag shell reference geometry label in the model. Also see ShellReferenceGeometry.LastFreeLabel(), ShellReferenceGeometry.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free airbag shell reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

ShellReferenceGeometry label.

Return type

Number

Example

To get the first free airbag shell reference geometry label in model m:

```
var label = ShellReferenceGeometry.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the airbag shell reference geometrys in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all airbag shell reference geometrys will be flagged in

- **flag** (Flag)

Flag to set on the airbag shell reference geometrys

Returns

No return value

Example

To flag all of the airbag shell reference geometrys with flag f in model m:

```
ShellReferenceGeometry.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the airbag shell reference geometry is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the airbag shell reference geometry

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if airbag shell reference geometry a has flag f set on it:

```
if (a.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each airbag shell reference geometry in the model.
Note that ForEach has been designed to make looping over airbag shell reference geometrys as fast as possible and so has some limitations.
Firstly, a single temporary ShellReferenceGeometry object is created and on each function call it is updated with the current airbag shell reference geometry data. This means that you should not try to store the ShellReferenceGeometry object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new airbag shell reference geometrys inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all airbag shell reference geometrys are in

- **func** (function)

Function to call for each airbag shell reference geometry

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the airbag shell reference geometrys in model m:

```
ShellReferenceGeometry.ForEach(m, test);
function test(a)
{
// a is ShellReferenceGeometry object
}
```

To call function test for all of the airbag shell reference geometrys in model m with optional object:

```
var data = { x:0, y:0 };
ShellReferenceGeometry.ForEach(m, test, data);
function test(a, extra)
{
// a is ShellReferenceGeometry object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ShellReferenceGeometry objects for all of the airbag shell reference geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbag shell reference geometrys from

Returns

Array of ShellReferenceGeometry objects

Return type

Array

Example

To make an array of ShellReferenceGeometry objects for all of the airbag shell reference geometrys in model m

```
var a = ShellReferenceGeometry.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a airbag shell reference geometry.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the airbag shell reference geometry a:

```
var comm_array = a.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ShellReferenceGeometry objects for all of the flagged airbag shell reference geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get airbag shell reference geometrys from

- **flag** (Flag)

Flag set on the airbag shell reference geometrys that you want to retrieve

Returns

Array of ShellReferenceGeometry objects

Return type

Array

Example

To make an array of ShellReferenceGeometry objects for all of the airbag shell reference geometrys in model m flagged with f

```
var a = ShellReferenceGeometry.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ShellReferenceGeometry object for a airbag shell reference geometry ID.

Arguments

- **Model** (Model)

Model to find the airbag shell reference geometry in

- **number** (integer)

number of the airbag shell reference geometry you want the ShellReferenceGeometry object for

Returns

ShellReferenceGeometry object (or null if airbag shell reference geometry does not exist).

Return type

ShellReferenceGeometry

Example

To get the ShellReferenceGeometry object for airbag shell reference geometry 100 in model m

```
var a = ShellReferenceGeometry.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a ShellReferenceGeometry property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ShellReferenceGeometry.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

airbag shell reference geometry property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ShellReferenceGeometry property a.example is a parameter:

```
Options.property_parameter_names = true;
if (a.GetParameter(a.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ShellReferenceGeometry property a.example is a parameter by using the GetParameter method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

GetShell(eid*[integer]*)

Description

Returns the shell reference geometry nodes and pid for the shell

Arguments

- **eid** (integer)

Shell element ID

Returns

An array containing the four reference node labels and the part ID (or null if the shell is not on the shell reference geometry)

Return type

Array

Example

To get the node and part data of shell number eid on shell reference geometry a

```
var data = a.GetShell(eid);
var n1 = data[0];
var n2 = data[1];
var n3 = data[2];
var n4 = data[3];
var pid = data[4];
```

Keyword()

Description

Returns the keyword for this shell_reference_geometry (*AIRBAG_SHELL_REFERENCE_GEOMETRY). **Note that a carriage return is not added**. See also ShellReferenceGeometry.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for shell_reference_geometry a:

```
var key = a.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the shell_reference_geometry. **Note that a carriage return is not added**. See also ShellReferenceGeometry.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for airbag shell reference geometry a:

```
var cards = b.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last airbag shell reference geometry in the model.

Arguments

- **Model** (Model)

Model to get last airbag shell reference geometry in

Returns

ShellReferenceGeometry object (or null if there are no airbag shell reference geometrys in the model).

Return type

ShellReferenceGeometry

Example

To get the last airbag shell reference geometry in model m:

```
var a = ShellReferenceGeometry.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free airbag shell reference geometry label in the model. Also see ShellReferenceGeometry.FirstFreeLabel(), ShellReferenceGeometry.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free airbag shell reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

ShellReferenceGeometry label.

Return type

Number

Example

To get the last free airbag shell reference geometry label in model m:

```
var label = ShellReferenceGeometry.LastFreeLabel(m);
```

Next()

Description

Returns the next airbag shell reference geometry in the model.

Arguments

No arguments

Returns

ShellReferenceGeometry object (or null if there are no more airbag shell reference geometrys in the model).

Return type

ShellReferenceGeometry

Example

To get the airbag shell reference geometry in model m after airbag shell reference geometry a:

```
var a = a.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) airbag shell reference geometry label in the model. Also see ShellReferenceGeometry.FirstFreeLabel(), ShellReferenceGeometry.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free airbag shell reference geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

ShellReferenceGeometry label.

Return type

Number

Example

To get the next free airbag shell reference geometry label in model m:

```
var label = ShellReferenceGeometry.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a airbag shell reference geometry.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only airbag shell reference geometrys from that model can be picked. If the argument is a Flag then only airbag shell reference geometrys that are flagged with *limit* can be selected. If omitted, or null, any airbag shell reference geometrys from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

ShellReferenceGeometry object (or null if not picked)

Return type

ShellReferenceGeometry

Example

To pick a airbag shell reference geometry from model m giving the prompt 'Pick airbag shell reference geometry from screen':

```
var a = ShellReferenceGeometry.Pick('Pick airbag shell reference geometry from screen', m);
```

Previous()

Description

Returns the previous airbag shell reference geometry in the model.

Arguments

No arguments

Returns

ShellReferenceGeometry object (or null if there are no more airbag shell reference geometrys in the model).

Return type

ShellReferenceGeometry

Example

To get the airbag shell reference geometry in model m before airbag shell reference geometry a:

```
var a = a.Previous();
```

RemoveShell(eid*[integer]*)

Description

Removes a shell from the shell reference geometry if it is on it

Arguments

- **eid** (integer)

Element ID

Returns

No return value.

Example

To remove shell 11 from shell reference geometry a:

```
a.RemoveShell(11);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the airbag shell reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all airbag shell reference geometrys will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbag shell reference geometrys in model m, from 1000000:

```
ShellReferenceGeometry.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged airbag shell reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all the flagged airbag shell reference geometrys will be renumbered in

- **flag** (Flag)

Flag set on the airbag shell reference geometrys that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the airbag shell reference geometrys in model m flagged with f, from 1000000:

```
ShellReferenceGeometry.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select airbag shell reference geometrys using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting airbag shell reference geometrys

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only airbag shell reference geometrys from that model can be selected. If the argument is a Flag then only airbag shell reference geometrys that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any airbag shell reference geometrys can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of airbag shell reference geometrys selected or null if menu cancelled

Return type

Number

Example

To select airbag shell reference geometrys from model m, flagging those selected with flag f, giving the prompt 'Select airbag shell reference geometrys':

```
ShellReferenceGeometry.Select(f, 'Select airbag shell reference geometrys', m);
```

To select airbag shell reference geometrys, flagging those selected with flag f but limiting selection to airbag shell reference geometrys flagged with flag l, giving the prompt 'Select airbag shell reference geometrys':

```
ShellReferenceGeometry.Select(f, 'Select airbag shell reference geometrys', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the airbag shell reference geometry.

Arguments

- **flag** (Flag)

Flag to set on the airbag shell reference geometry

Returns

No return value

Example

To set flag f for airbag shell reference geometry a:

```
a.SetFlag(f);
```

SetShell(eid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*, pid (optional)*[integer]*)

Description

Adds a shell to the shell reference geometry if not already there, otherwise just changes the reference nodes

Arguments

- **eid** (integer)

Element ID

- **n1** (integer)

Nodal point 1

- **n2** (integer)

Nodal point 2

- **n3** (integer)

Nodal point 3

- **n4** (integer)

Nodal point 4

- **pid (optional)** (integer)

Part ID (ignored by LS-DYNA). If omitted pid will be zero.

Returns

No return value.

Example

To add shell 11 to shell reference geometry a with nodal points 12, 13, 14, 15 (and part ID 0):

```
a.SetShell(11, 12, 13, 14, 15);
```

To add shell 11 to shell reference geometry a with nodal points 12, 13, 14, 15 and pid 100:

```
a.SetShell(11, 12, 13, 14, 15, 100);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the airbag shell reference geometry. The airbag shell reference geometry will be sketched until you either call ShellReferenceGeometry.Unsketch(), ShellReferenceGeometry.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag shell reference geometry is sketched. If omitted redraw is true. If you want to sketch several airbag shell reference geometrys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch airbag shell reference geometry a:

```
a.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged airbag shell reference geometrys in the model. The airbag shell reference geometrys will be sketched until you either call ShellReferenceGeometry.Unsketch(), ShellReferenceGeometry.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged airbag shell reference geometrys will be sketched in

- **flag** (Flag)

Flag set on the airbag shell reference geometrys that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag shell reference geometrys are sketched. If omitted redraw is true. If you want to sketch flagged airbag shell reference geometrys several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all airbag shell reference geometrys flagged with flag in model m:

```
ShellReferenceGeometry.SketchFlagged(m, flag);
```

Spool()

Description

Spools a shell reference geometry, entry by entry. See also ShellReferenceGeometry.StartSpool

Arguments

No arguments

Returns

Returns an array containing the shell ID and the four nodal point labels. Returns 0 if no more items

Return type

Array

Example

To spool shell reference geometry a:

```
var array;
a.StartSpool();
while (array = a.Spool())
{
    do something...
}
```

StartSpool()

Description

Starts a shell reference geometry spooling operation. See also ShellReferenceGeometry.Spool

Arguments

No arguments

Returns

No return value

Example

To start spooling shell reference geometry a:

```
a.StartSpool();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of airbag shell reference geometrys in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing airbag shell reference geometrys should be counted. If false or omitted referenced but undefined airbag shell reference geometrys will also be included in the total.

Returns

number of airbag shell reference geometrys

Return type

Number

Example

To get the total number of airbag shell reference geometrys in model m:

```
var total = ShellReferenceGeometry.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the airbag shell reference geometrys in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all airbag shell reference geometrys will be unset in

- **flag** (Flag)

Flag to unset on the airbag shell reference geometrys

Returns

No return value

Example

To unset the flag f on all the airbag shell reference geometrys in model m:

```
ShellReferenceGeometry.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the airbag shell reference geometry.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag shell reference geometry is unsketched. If omitted redraw is true. If you want to unsketch several airbag shell reference geometrys and only redraw after the last one then use false for

redraw and call View.Redraw().

Returns

No return value

Example

To unsketch airbag shell reference geometry a:

```
a.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all airbag shell reference geometrys.

Arguments

- **Model** (Model)

Model that all airbag shell reference geometrys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag shell reference geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbag shell reference geometrys in model m:

```
ShellReferenceGeometry.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged airbag shell reference geometrys in the model.

Arguments

- **Model** (Model)

Model that all airbag shell reference geometrys will be unsketched in

- **flag** (Flag)

Flag set on the airbag shell reference geometrys that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the airbag shell reference geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all airbag shell reference geometrys flagged with flag in model m:

```
ShellReferenceGeometry.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ShellReferenceGeometry object.

Return type

ShellReferenceGeometry

Example

To check if ShellReferenceGeometry property a.example is a parameter by using the ShellReferenceGeometry.GetParameter() method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for airbag shell reference geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for airbag shell reference geometry a:

```
a.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this airbag shell reference geometry.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for airbag shell reference geometry a:

```
var xrefs = a.Xrefs();
```

---

toString()

Description

Creates a string containing the ShellReferenceGeometry data in keyword format. Note that this contains the keyword header and the keyword cards. See also ShellReferenceGeometry.Keyword() and ShellReferenceGeometry.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for ShellReferenceGeometry rdt in keyword format

```
var s = rdt.toString();
```

PrescribedAccelerometerRigid class

The PrescribedAccelerometerRigid class gives you access to define *BOUNDARY_PRESCRIBED_ACCELEROMETER_RIGID cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

PrescribedAccelerometerRigid properties

Name	Type	Description
exists (read only)	logical	true if prescribed accelerometer rigid exists, false if referred to but not defined.
include	integer	The Include file number that the prescribed accelerometer rigid is in.
model (read only)	integer	The Model number that the prescribed accelerometer rigid is in.
nrow (read only)	integer	Number of accelerometer cards.

pid	integer	Part ID for rigid body whose motion is prescribed.
solv	integer	Solver type: 1 for Gaussian elimination or 2 for linear regression.

Detailed Description

The PrescribedAccelerometerRigid class allows you to create, modify, edit and manipulate boundary prescribed accelerometer rigid cards. See the documentation below for more details.

Constructor

new PrescribedAccelerometerRigid(Model*[Model]*, pid*[integer]*, solv (optional)*[integer]*)

Description

Create a new PrescribedAccelerometerRigid object.

Arguments

- **Model** (Model)

Model that prescribed accelerometer rigid will be created in

- **pid** (integer)

Part ID for rigid body whose motion is prescribed.

- **solv (optional)** (integer)

Solver type

Returns

PrescribedAccelerometerRigid object

Return type

PrescribedAccelerometerRigid

Example

To create a new prescribed accelerometer rigid in model m with part ID 10 and solver type 2 (linear regression):

```
var par = new PrescribedAccelerometerRigid(m, 10, 2);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a prescribed accelerometer rigid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the prescribed accelerometer rigid

Returns

No return value

Example

To associate comment c to the prescribed accelerometer rigid par:

```
par.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse prescribed accelerometer rigid par:

```
par.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the prescribed accelerometer rigid.

Arguments

- **flag** (Flag)

Flag to clear on the prescribed accelerometer rigid

Returns

No return value

Example

To clear flag f for prescribed accelerometer rigid par:

```
par.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the prescribed accelerometer rigid. The target include of the copied prescribed accelerometer rigid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

PrescribedAccelerometerRigid object

Return type

PrescribedAccelerometerRigid

Example

To copy prescribed accelerometer rigid par into prescribed accelerometer rigid z:

```
var z = par.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a boundary prescribed accelerometer rigid definition.

Arguments

- **Model** (Model)

Model that the prescribed accelerometer rigid will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

PrescribedAccelerometerRigid object (or null if not made)

Return type

PrescribedAccelerometerRigid

Example

To start creating a boundary prescribed accelerometer rigid definition in model m:

```
var par = PrescribedAccelerometerRigid.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a prescribed accelerometer rigid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the prescribed accelerometer rigid

Returns

No return value

Example

To detach comment c from the prescribed accelerometer rigid par:

```
par.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit prescribed accelerometer rigid par:

```
par.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for prescribed accelerometer rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for prescribed accelerometer rigid par:

```
par.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first prescribed accelerometer rigid in the model.

Arguments

- **Model** (Model)

Model to get first prescribed accelerometer rigid in

Returns

PrescribedAccelerometerRigid object (or null if there are no prescribed accelerometer rigids in the model).

Return type

PrescribedAccelerometerRigid

Example

To get the first prescribed accelerometer rigid in model m:

```
var par = PrescribedAccelerometerRigid.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the prescribed accelerometer rigids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all prescribed accelerometer rigids will be flagged in

- **flag** (Flag)

Flag to set on the prescribed accelerometer rigids

Returns

No return value

Example

To flag all of the prescribed accelerometer rigids with flag f in model m:

```
PrescribedAccelerometerRigid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the prescribed accelerometer rigid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the prescribed accelerometer rigid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if prescribed accelerometer rigid par has flag f set on it:

```
if (par.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each prescribed accelerometer rigid in the model.
Note that ForEach has been designed to make looping over prescribed accelerometer rigids as fast as possible and so has some limitations.
Firstly, a single temporary PrescribedAccelerometerRigid object is created and on each function call it is updated with the current prescribed accelerometer rigid data. This means that you should not try to store the PrescribedAccelerometerRigid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new prescribed accelerometer rigids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all prescribed accelerometer rigids are in

- **func** (function)

Function to call for each prescribed accelerometer rigid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the prescribed accelerometer rigids in model m:

```
PrescribedAccelerometerRigid.ForEach(m, test);
function test(par)
{
// par is PrescribedAccelerometerRigid object
}
```

To call function test for all of the prescribed accelerometer rigids in model m with optional object:

```
var data = { x:0, y:0 };
PrescribedAccelerometerRigid.ForEach(m, test, data);
function test(par, extra)
{
// par is PrescribedAccelerometerRigid object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of PrescribedAccelerometerRigid objects for all of the prescribed accelerometer rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get prescribed accelerometer rigids from

Returns

Array of PrescribedAccelerometerRigid objects

Return type

Array

Example

To make an array of PrescribedAccelerometerRigid objects for all of the prescribed accelerometer rigids in model m

```
var par = PrescribedAccelerometerRigid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a prescribed accelerometer rigid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the prescribed accelerometer rigid par:

```
var comm_array = par.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of PrescribedAccelerometerRigid objects for all of the flagged prescribed accelerometer rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get prescribed accelerometer rigids from

- **flag** (Flag)

Flag set on the prescribed accelerometer rigids that you want to retrieve

Returns

Array of PrescribedAccelerometerRigid objects

Return type

Array

Example

To make an array of PrescribedAccelerometerRigid objects for all of the prescribed accelerometer rigids in model m flagged with f

```
var par = PrescribedAccelerometerRigid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the PrescribedAccelerometerRigid object for a prescribed accelerometer rigid ID.

Arguments

- **Model** (Model)

Model to find the prescribed accelerometer rigid in

- **number** (integer)

number of the prescribed accelerometer rigid you want the PrescribedAccelerometerRigid object for

Returns

PrescribedAccelerometerRigid object (or null if prescribed accelerometer rigid does not exist).

Return type

PrescribedAccelerometerRigid

Example

To get the PrescribedAccelerometerRigid object for prescribed accelerometer rigid 100 in model m

```
var par = PrescribedAccelerometerRigid.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a PrescribedAccelerometerRigid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the PrescribedAccelerometerRigid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

prescribed accelerometer rigid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if PrescribedAccelerometerRigid property par.example is a parameter:

```
Options.property_parameter_names = true;
if (par.GetParameter(par.example) ) do_something...
Options.property_parameter_names = false;
```

To check if PrescribedAccelerometerRigid property par.example is a parameter by using the GetParameter method:

```
if (par.ViewParameters().GetParameter(par.example) ) do_something...
```

GetRow(row*[integer]*)

Description

Returns the data for a row in the prescribed accelerometer rigid.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

An array of numbers containing the row variables NID, CID, LCIDX, LCIDY and LCIDZ.

Return type

Number

Example

To get the data for the 2nd row in prescribed accelerometer rigid par:

```
var data = par.GetRow(1);
```

Keyword()

Description

Returns the keyword for this prescribed accelerometer rigid. **Note that a carriage return is not added**. See also PrescribedAccelerometerRigid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for prescribed accelerometer rigid par:

```
var key = par.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the prescribed accelerometer rigid. **Note that a carriage return is not added**. See also PrescribedAccelerometerRigid.Keyword()

Arguments

No arguments

Returns
string containing the cards.

Return type
String

Example
To get the cards for prescribed accelerometer rigid par:
```
var cards = par.KeywordCards();
```

Last(Model[*Model*]) [static]

Description
Returns the last prescribed accelerometer rigid in the model.

Arguments
- **Model** (Model)

Model to get last prescribed accelerometer rigid in

Returns
PrescribedAccelerometerRigid object (or null if there are no prescribed accelerometer rigids in the model).

Return type
PrescribedAccelerometerRigid

Example
To get the last prescribed accelerometer rigid in model m:
```
var par = PrescribedAccelerometerRigid.Last(m);
```

Next()

Description
Returns the next prescribed accelerometer rigid in the model.

Arguments
No arguments

Returns
PrescribedAccelerometerRigid object (or null if there are no more prescribed accelerometer rigids in the model).

Return type
PrescribedAccelerometerRigid

Example
To get the prescribed accelerometer rigid in model m after prescribed accelerometer rigid par:
```
var par = par.Next();
```

Previous()

Description

Returns the previous prescribed accelerometer rigid in the model.

Arguments

No arguments

Returns

PrescribedAccelerometerRigid object (or null if there are no more prescribed accelerometer rigids in the model).

Return type

PrescribedAccelerometerRigid

Example

To get the prescribed accelerometer rigid in model m before prescribed accelerometer rigid par:

```
var par = par.Previous();
```

RemoveRow(row*[integer]*)

Description

Removes the data for a row in *BOUNDARY_PRESCRIBED_ACCELEROMETER_RIGID.

Arguments

- **row** (integer)

The row you want to remove the data for. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second row of data for prescribed accelerometer rigid par:

```
par.RemoveRow(1);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select prescribed accelerometer rigids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting prescribed accelerometer rigids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only prescribed accelerometer rigids from that model can be selected. If the argument is a Flag then only prescribed accelerometer rigids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any prescribed accelerometer rigids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of prescribed accelerometer rigids selected or null if menu cancelled

Return type

Number

Example

To select prescribed accelerometer rigids from model m, flagging those selected with flag f, giving the prompt 'Select prescribed accelerometer rigids':

```
PrescribedAccelerometerRigid.Select(f, 'Select prescribed accelerometer rigids', m);
```

To select prescribed accelerometer rigids, flagging those selected with flag f but limiting selection to prescribed accelerometer rigids flagged with flag l, giving the prompt 'Select prescribed accelerometer rigids':

```
PrescribedAccelerometerRigid.Select(f, 'Select prescribed accelerometer rigids', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the prescribed accelerometer rigid.

Arguments

- **flag** (Flag)

Flag to set on the prescribed accelerometer rigid

Returns

No return value

Example

To set flag f for prescribed accelerometer rigid par:

```
par.SetFlag(f);
```

SetRow(row*[integer]*, data*[Array of data]*)

Description

Sets the data for a row in *BOUNDARY_PRESCRIBED_ACCELEROMETER_RIGID.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **data** (Array of data)

The data you want to set the row to

Returns

No return value.

Example

To set the second row of data for prescribed accelerometer rigid par to be node 11, coordinate system 12, and load curves 13, 14, 15:

```
var array = [11, 12, 13, 14, 15];
par.SetRow(1, array);
```

To append a new row of data (using the same array of values):

```
par.SetRow(par.nrow, array);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of prescribed accelerometer rigids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing prescribed accelerometer rigids should be counted. If false or omitted referenced but undefined prescribed accelerometer rigids will also be included in the total.

Returns

number of prescribed accelerometer rigids

Return type

Number

Example

To get the total number of prescribed accelerometer rigids in model m:

```
var total = PrescribedAccelerometerRigid.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the prescribed accelerometer rigids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all prescribed accelerometer rigids will be unset in

- **flag** (Flag)

Flag to unset on the prescribed accelerometer rigids

Returns

No return value

Example

To unset the flag f on all the prescribed accelerometer rigids in model m:

```
PrescribedAccelerometerRigid.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

PrescribedAccelerometerRigid object.

Return type

PrescribedAccelerometerRigid

Example

To check if PrescribedAccelerometerRigid property par.example is a parameter by using the PrescribedAccelerometerRigid.GetParameter() method:

```
if (par.ViewParameters().GetParameter(par.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for prescribed accelerometer rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for prescribed accelerometer rigid par:

```
par.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this prescribed accelerometer rigid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for prescribed accelerometer rigid par:

```
var xrefs = par.Xrefs();
```

---

toString()

Description

Creates a string containing the prescribed accelerometer rigid data in keyword format. Note that this contains the keyword header and the keyword cards. See also PrescribedAccelerometerRigid.Keyword() and PrescribedAccelerometerRigid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for prescribed accelerometer rigid par in keyword format

```
var s = par.toString();
```

PrescribedOrientationRigid class

The PrescribedOrientationRigid class gives you access to define *BOUNDARY_PRESCRIBED_ORIENTATION_RIGID cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

PrescribedOrientationRigid constants

Name	Description
PrescribedOrientationRigid.ANGLES	Boundary is *BOUNDARY_PRESCRIBED_ORIENTATION_RIGID_ANGLES.
PrescribedOrientationRigid.DIRCOS	Boundary is *BOUNDARY_PRESCRIBED_ORIENTATION_RIGID_DIRCOS.

PrescribedOrientationRigid.EULERP	Boundary is *BOUNDARY_PRESCRIBED_ORIENTATION_RIGID_EULERP.
PrescribedOrientationRigid.VECTOR	Boundary is *BOUNDARY_PRESCRIBED_ORIENTATION_RIGID_VECTOR.

PrescribedOrientationRigid properties

Name	Type	Description
birth	real	Time prior to which the body moves freely under the action of other agents.
body	integer	Reference axes: 0 for rotations about axes fixed in PIDA or 1 for those fixed in PIDB.
death	real	Time when the body is freed from the restriction.
exists (read only)	logical	true if prescribed orientation rigid exists, false if referred to but not defined.
heading	string	PrescribedOrientationRigid heading
id	logical	true if _ID option is set, false if not.
include	integer	The Include file number that the prescribed orientation rigid is in.
intrp	integer	Interpolation method: 1 for linear interpolation or 2 for cubic spline interpolation.
intrp	integer	Interpolation method: 1 for linear interpolation or 2 for cubic spline interpolation.
iseq	integer	Specifies the sequence in which the rotations are performed.
ishft	integer	Angle shift: 1 for unaltered angle curves or 2 for angle data shift in LCIDQi curves eliminating discontinuities.
lcidc11	integer	Load curve ID specifying direction cosine C11 as function of time.
lcidc12	integer	Load curve ID specifying direction cosine C12 as function of time.
lcidc13	integer	Load curve ID specifying direction cosine C13 as function of time.
lcidc21	integer	Load curve ID specifying direction cosine C21 as function of time.
lcidc22	integer	Load curve ID specifying direction cosine C22 as function of time.
lcidc23	integer	Load curve ID specifying direction cosine C23 as function of time.
lcidc31	integer	Load curve ID specifying direction cosine C31 as function of time.
lcidc32	integer	Load curve ID specifying direction cosine C32 as function of time.
lcidc33	integer	Load curve ID specifying direction cosine C33 as function of time.
lcide1	integer	Load curve ID specifying Euler parameter e1 as function of time.
lcide2	integer	Load curve ID specifying Euler parameter e2 as function of time.
lcide3	integer	Load curve ID specifying Euler parameter e3 as function of time.
lcide4	integer	Load curve ID specifying Euler parameter e4 as function of time.
lcidq1	integer	Load curve ID specifying orientation angle q1 as function of time.
lcidq2	integer	Load curve ID specifying orientation angle q2 as function of time.
lcidq3	integer	Load curve ID specifying orientation angle q3 as function of time.
lcids	integer	Load curve ID specifying spin speed of PIDB about axis parallel to vector.
lcidv1	integer	Load curve ID specifying vector measure number v1 as function of time.
lcidv2	integer	Load curve ID specifying vector measure number v2 as function of time.
lcidv3	integer	Load curve ID specifying vector measure number v3 as function of time.

model (read only)	integer	The Model number that the prescribed orientation rigid is in.
option	constant	The Boundary Prescribed Orientation Rigid option. Can be PrescribedOrientationRigid.DIRCOS, PrescribedOrientationRigid.ANGLES, PrescribedOrientationRigid.EULERP or PrescribedOrientationRigid.VECTOR.
pida	integer	Part ID for rigid body A.
pidb	integer	Part ID for rigid body B whose orientation is prescribed.
toffset	integer	Time offset flag.
valspin	real	Constant value for spin speed of PIDB about axis parallel to vector. Used when LCIDS is 0.

Detailed Description

The PrescribedOrientationRigid class allows you to create, modify, edit and manipulate boundary prescribed orientation rigid cards. See the documentation below for more details.

Constructor

new PrescribedOrientationRigid(Model*[Model]*, option*[constant]*, pidb*[integer]*, label (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new PrescribedOrientationRigid object.

Arguments

- **Model** (Model)

Model that prescribed orientation rigid will be created in

- **option** (constant)

Suffix for boundary prescribed orientation rigid. Can be PrescribedOrientationRigid.DIRCOS PrescribedOrientationRigid.ANGLES PrescribedOrientationRigid.EULERP PrescribedOrientationRigid.VECTOR

- **pidb** (integer)

Part ID for rigid body B whose orientation is prescribed.

- **label (optional)** (integer)

PrescribedOrientationRigid number

- **heading (optional)** (string)

Title for the PrescribedOrientationRigid

Returns

PrescribedOrientationRigid object

Return type

PrescribedOrientationRigid

Example

To create a new prescribed orientation rigid in model m with part ID 10 and suffix _DIRCOS:

```
var por = new PrescribedOrientationRigid(m, PrescribedOrientationRigid.DIRCOS,
10);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a prescribed orientation rigid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the prescribed orientation rigid

Returns

No return value

Example

To associate comment c to the prescribed orientation rigid por:

```
por.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse prescribed orientation rigid por:

```
por.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the prescribed orientation rigid.

Arguments

- **flag** (Flag)

Flag to clear on the prescribed orientation rigid

Returns

No return value

Example

To clear flag f for prescribed orientation rigid por:

```
por.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the prescribed orientation rigid. The target include of the copied prescribed orientation rigid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

PrescribedOrientationRigid object

Return type

PrescribedOrientationRigid

Example

To copy prescribed orientation rigid por into prescribed orientation rigid z:

```
var z = por.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a boundary prescribed orientation rigid definition.

Arguments

- **Model** (Model)

Model that the prescribed orientation rigid will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

PrescribedOrientationRigid object (or null if not made)

Return type

PrescribedOrientationRigid

Example

To start creating a boundary prescribed orientation rigid definition in model m:

```
var por = PrescribedOrientationRigid.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a prescribed orientation rigid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the prescribed orientation rigid

Returns

No return value

Example

To detach comment c from the prescribed orientation rigid por:

```
por.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit prescribed orientation rigid por:

```
por.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for prescribed orientation rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for prescribed orientation rigid por:

```
por.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first prescribed orientation rigid in the model.

Arguments

- **Model** (Model)

Model to get first prescribed orientation rigid in

Returns

PrescribedOrientationRigid object (or null if there are no prescribed orientation rigids in the model).

Return type

PrescribedOrientationRigid

Example

To get the first prescribed orientation rigid in model m:

```
var por = PrescribedOrientationRigid.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the prescribed orientation rigids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all prescribed orientation rigids will be flagged in

- **flag** (Flag)

Flag to set on the prescribed orientation rigids

Returns

No return value

Example

To flag all of the prescribed orientation rigids with flag f in model m:

```
PrescribedOrientationRigid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the prescribed orientation rigid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the prescribed orientation rigid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if prescribed orientation rigid por has flag f set on it:

```
if (por.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each prescribed orientation rigid in the model.
Note that ForEach has been designed to make looping over prescribed orientation rigids as fast as possible and so has some limitations.
Firstly, a single temporary PrescribedOrientationRigid object is created and on each function call it is updated with the current prescribed orientation rigid data. This means that you should not try to store the PrescribedOrientationRigid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new prescribed orientation rigids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all prescribed orientation rigids are in

- **func** (function)

Function to call for each prescribed orientation rigid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the prescribed orientation rigids in model m:

```
PrescribedOrientationRigid.ForEach(m, test);
function test(por)
{
// por is PrescribedOrientationRigid object
}
```

To call function test for all of the prescribed orientation rigids in model m with optional object:

```
var data = { x:0, y:0 };
PrescribedOrientationRigid.ForEach(m, test, data);
function test(por, extra)
{
// por is PrescribedOrientationRigid object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of PrescribedOrientationRigid objects for all of the prescribed orientation rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get prescribed orientation rigids from

Returns

Array of PrescribedOrientationRigid objects

Return type

Array

Example

To make an array of PrescribedOrientationRigid objects for all of the prescribed orientation rigids in model m

```
var por = PrescribedOrientationRigid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a prescribed orientation rigid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the prescribed orientation rigid por:

```
var comm_array = por.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of PrescribedOrientationRigid objects for all of the flagged prescribed orientation rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get prescribed orientation rigids from

- **flag** (Flag)

Flag set on the prescribed orientation rigids that you want to retrieve

Returns

Array of PrescribedOrientationRigid objects

Return type

Array

Example

To make an array of PrescribedOrientationRigid objects for all of the prescribed orientation rigids in model m flagged with f

```
var por = PrescribedOrientationRigid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the PrescribedOrientationRigid object for a prescribed orientation rigid ID.

Arguments

- **Model** (Model)

Model to find the prescribed orientation rigid in

- **number** (integer)

number of the prescribed orientation rigid you want the PrescribedOrientationRigid object for

Returns

PrescribedOrientationRigid object (or null if prescribed orientation rigid does not exist).

Return type

PrescribedOrientationRigid

Example

To get the PrescribedOrientationRigid object for prescribed orientation rigid 100 in model m

```
var por = PrescribedOrientationRigid.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a PrescribedOrientationRigid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the PrescribedOrientationRigid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

prescribed orientation rigid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if PrescribedOrientationRigid property por.example is a parameter:

```
Options.property_parameter_names = true;
if (por.GetParameter(por.example) ) do_something...
Options.property_parameter_names = false;
```

To check if PrescribedOrientationRigid property por.example is a parameter by using the GetParameter method:

```
if (por.ViewParameters().GetParameter(por.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this prescribed orientation rigid. **Note that a carriage return is not added**. See also PrescribedOrientationRigid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for prescribed orientation rigid por:

```
var key = por.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the prescribed orientation rigid. **Note that a carriage return is not added**. See also PrescribedOrientationRigid.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for prescribed orientation rigid por:

```
var cards = por.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last prescribed orientation rigid in the model.

Arguments

- **Model** (Model)

Model to get last prescribed orientation rigid in

Returns

PrescribedOrientationRigid object (or null if there are no prescribed orientation rigids in the model).

Return type

PrescribedOrientationRigid

Example

To get the last prescribed orientation rigid in model m:

```
var por = PrescribedOrientationRigid.Last(m);
```

Next()

Description

Returns the next prescribed orientation rigid in the model.

Arguments

No arguments

Returns

PrescribedOrientationRigid object (or null if there are no more prescribed orientation rigids in the model).

Return type

PrescribedOrientationRigid

Example

To get the prescribed orientation rigid in model m after prescribed orientation rigid por:

```
var por = por.Next();
```

Previous()

Description

Returns the previous prescribed orientation rigid in the model.

Arguments

No arguments

Returns

PrescribedOrientationRigid object (or null if there are no more prescribed orientation rigids in the model).

Return type

PrescribedOrientationRigid

Example

To get the prescribed orientation rigid in model m before prescribed orientation rigid por:

```
var por = por.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select prescribed orientation rigids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting prescribed orientation rigids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only prescribed orientation rigids from that model can be selected. If the argument is a Flag then only prescribed orientation rigids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any prescribed orientation rigids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of prescribed orientation rigids selected or null if menu cancelled

Return type

Number

Example

To select prescribed orientation rigids from model m, flagging those selected with flag f, giving the prompt 'Select prescribed orientation rigids':

```
PrescribedOrientationRigid.Select(f, 'Select prescribed orientation rigids', m);
```

To select prescribed orientation rigids, flagging those selected with flag f but limiting selection to prescribed orientation rigids flagged with flag l, giving the prompt 'Select prescribed orientation rigids':

```
PrescribedOrientationRigid.Select(f, 'Select prescribed orientation rigids', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the prescribed orientation rigid.

Arguments

- **flag** (Flag)

Flag to set on the prescribed orientation rigid

Returns

No return value

Example

To set flag f for prescribed orientation rigid por:

```
por.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the prescribed orientation rigid. The prescribed orientation rigid will be sketched until you either call PrescribedOrientationRigid.Unsketch(), PrescribedOrientationRigid.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the prescribed orientation rigid is sketched. If omitted redraw is true. If you want to sketch several prescribed orientation rigids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch prescribed orientation rigid por:

```
por.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged prescribed orientation rigids in the model. The prescribed orientation rigids will be sketched until you either call PrescribedOrientationRigid.Unsketch(), PrescribedOrientationRigid.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged prescribed orientation rigids will be sketched in

- **flag** (Flag)

Flag set on the prescribed orientation rigids that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the prescribed orientation rigids are sketched. If omitted redraw is true. If you want to sketch flagged prescribed orientation rigids several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all prescribed orientation rigids flagged with flag in model m:

```
PrescribedOrientationRigid.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of prescribed orientation rigids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing prescribed orientation rigids should be counted. If false or omitted referenced but undefined prescribed orientation rigids will also be included in the total.

Returns

number of prescribed orientation rigids

Return type

Number

Example

To get the total number of prescribed orientation rigids in model m:

```
var total = PrescribedOrientationRigid.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the prescribed orientation rigids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all prescribed orientation rigids will be unset in

- **flag** (Flag)

Flag to unset on the prescribed orientation rigids

Returns

No return value

Example

To unset the flag f on all the prescribed orientation rigids in model m:

```
PrescribedOrientationRigid.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the prescribed orientation rigid.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the prescribed orientation rigid is unsketched. If omitted redraw is true. If you want to unsketch several prescribed orientation rigids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch prescribed orientation rigid por:

```
por.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all prescribed orientation rigids.

Arguments

- **Model** (Model)

Model that all prescribed orientation rigids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the prescribed orientation rigids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all prescribed orientation rigids in model m:

```
PrescribedOrientationRigid.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged prescribed orientation rigids in the model.

Arguments

- **Model** (Model)

Model that all prescribed orientation rigids will be unsketched in

- **flag** (Flag)

Flag set on the prescribed orientation rigids that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the prescribed orientation rigids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all prescribed orientation rigids flagged with flag in model m:

```
PrescribedOrientationRigid.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

PrescribedOrientationRigid object.

Return type

PrescribedOrientationRigid

Example

To check if PrescribedOrientationRigid property por.example is a parameter by using the PrescribedOrientationRigid.GetParameter() method:

```
if (por.ViewParameters().GetParameter(por.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for prescribed orientation rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for prescribed orientation rigid por:

```
por.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this prescribed orientation rigid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for prescribed orientation rigid por:

```
var xrefs = por.Xrefs();
```

---

toString()

Description

Creates a string containing the prescribed orientation rigid data in keyword format. Note that this contains the keyword header and the keyword cards. See also PrescribedOrientationRigid.Keyword() and PrescribedOrientationRigid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for prescribed orientation rigid por in keyword format

```
var s = por.toString();
```

PrescribedFinalGeometry class

The PrescribedFinalGeometry class gives you access to define boundary prescribed final_geometry cards in PRIMER.
More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

PrescribedFinalGeometry properties

Name	Type	Description
bpfgid	integer	PrescribedFinalGeometry number. Also see the label property which is an alternative name for this.
deathd	real	Default death time.
exists (read only)	logical	true if boundary prescribed final_geometry exists, false if referred to but not defined.
id	integer	PrescribedFinalGeometry number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the boundary prescribed final_geometry is in.
label	integer	PrescribedFinalGeometry number. Also see the bpfgid property which is an alternative name for this.
lcidf	integer	Default loadcurve number.
lines (read only)	integer	Number of lines of nodal data on the card.
model (read only)	integer	The Model number that the boundary prescribed final geometry is in.

Detailed Description

The PrescribedFinalGeometry class allows you to create, modify, edit and boundary prescribed final_geometry cards. See the documentation below for more details.

Constructor

new PrescribedFinalGeometry(Model*[Model]*, bpfgid*[PrescribedFinalGeometry]*)

Description

Create a new PrescribedFinalGeometry object.

Arguments

- **Model** (Model)

Model that PrescribedFinalGeometry will be created in

- **bpfgid** (PrescribedFinalGeometry)

PrescribedFinalGeometry number.

Returns

PrescribedFinalGeometry object

Return type

PrescribedFinalGeometry

Example

To create a new final geometry 99 in model m

```
var b = new PrescribedFinalGeometry(m, 99);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a boundary prescribed final geometry.

Arguments

- **Comment** (Comment)

Comment that will be attached to the boundary prescribed final geometry

Returns

No return value

Example

To associate comment c to the boundary prescribed final geometry b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the boundary prescribed final geometry

Arguments

No arguments

Returns

No return value

Example

To blank boundary prescribed final geometry b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary prescribed final geometrys in model m:

```
PrescribedFinalGeometry.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed final geometrys will be blanked in

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary prescribed final geometrys in model m flagged with f:

```
PrescribedFinalGeometry.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the boundary prescribed final geometry is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if boundary prescribed final geometry b is blanked:

```
if (b.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse boundary prescribed final geometry b:

```
b.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the boundary prescribed final geometry.

Arguments

- **flag** (Flag)

Flag to clear on the boundary prescribed final geometry

Returns

No return value

Example

To clear flag f for boundary prescribed final geometry b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the boundary prescribed final geometry. The target include of the copied boundary prescribed final geometry can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

PrescribedFinalGeometry object

Return type

PrescribedFinalGeometry

Example

To copy boundary prescribed final geometry b into boundary prescribed final geometry z:

```
var z = b.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a bpfg.

Arguments

- **Model** (Model)

Model that the bpfg will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

PrescribedFinalGeometry object (or null if not made)

Return type

PrescribedFinalGeometry

Example

To start creating a bpfg n in model m:

```
var n = PrescribedFinalGeometry.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a boundary prescribed final geometry.

Arguments

- **Comment** (Comment)

Comment that will be detached from the boundary prescribed final geometry

Returns

No return value

Example

To detach comment c from the boundary prescribed final geometry b:

```
b.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit boundary prescribed final geometry b:

```
b.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for boundary prescribed final geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for boundary prescribed final geometry b:

```
b.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first boundary prescribed final geometry in the model.

Arguments

- **Model** (Model)

Model to get first boundary prescribed final geometry in

Returns

PrescribedFinalGeometry object (or null if there are no boundary prescribed final geometrys in the model).

Return type

PrescribedFinalGeometry

Example

To get the first boundary prescribed final geometry in model m:

```
var b = PrescribedFinalGeometry.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free boundary prescribed final geometry label in the model. Also see PrescribedFinalGeometry.LastFreeLabel(), PrescribedFinalGeometry.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free boundary prescribed final geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

PrescribedFinalGeometry label.

Return type

Number

Example

To get the first free boundary prescribed final geometry label in model m:

```
var label = PrescribedFinalGeometry.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the boundary prescribed final geometrys in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be flagged in

- **flag** (Flag)

Flag to set on the boundary prescribed final geometrys

Returns

No return value

Example

To flag all of the boundary prescribed final geometrys with flag f in model m:

```
PrescribedFinalGeometry.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the boundary prescribed final geometry is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the boundary prescribed final geometry

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if boundary prescribed final geometry b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each boundary prescribed final geometry in the model.
Note that ForEach has been designed to make looping over boundary prescribed final geometrys as fast as possible and so has some limitations.
Firstly, a single temporary PrescribedFinalGeometry object is created and on each function call it is updated with the current boundary prescribed final geometry data. This means that you should not try to store the PrescribedFinalGeometry object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new boundary prescribed final geometrys inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys are in

- **func** (function)

Function to call for each boundary prescribed final geometry

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the boundary prescribed final geometrys in model m:

```
PrescribedFinalGeometry.ForEach(m, test);
function test(b)
{
// b is PrescribedFinalGeometry object
}
```

To call function test for all of the boundary prescribed final geometrys in model m with optional object:

```
var data = { x:0, y:0 };
PrescribedFinalGeometry.ForEach(m, test, data);
function test(b, extra)
{
// b is PrescribedFinalGeometry object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of PrescribedFinalGeometry objects for all of the boundary prescribed final geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary prescribed final geometrys from

Returns

Array of PrescribedFinalGeometry objects

Return type

Array

Example

To make an array of PrescribedFinalGeometry objects for all of the boundary prescribed final geometrys in model m

```
var b = PrescribedFinalGeometry.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a boundary prescribed final geometry.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the boundary prescribed final geometry b:

```
var comm_array = b.GetComments();
```

GetData(index*[integer]*)

Description

Returns data for open-ended cards for a given row number in *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY.

Arguments

- **index** (integer)

Index of open-ended card you want the data for. **Note that indices start at 0, not 1**.
0 <= index < lines

Returns

An array containing data (NID, X, Y, Z, LCID, DEATH).

Return type

Array

Example

To get the data for the 3rd open-ended row for boundary prescribed final geometry b:

```
var data = b.GetData(2);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of PrescribedFinalGeometry objects for all of the flagged boundary prescribed final geometrys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary prescribed final geometrys from

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to retrieve

Returns

Array of PrescribedFinalGeometry objects

Return type

Array

Example

To make an array of PrescribedFinalGeometry objects for all of the boundary prescribed final geometrys in model m flagged with f

```
var b = PrescribedFinalGeometry.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the PrescribedFinalGeometry object for a boundary prescribed final geometry ID.

Arguments

- **Model** (Model)

Model to find the boundary prescribed final geometry in

- **number** (integer)

number of the boundary prescribed final geometry you want the PrescribedFinalGeometry object for

Returns

PrescribedFinalGeometry object (or null if boundary prescribed final geometry does not exist).

Return type

PrescribedFinalGeometry

Example

To get the PrescribedFinalGeometry object for boundary prescribed final geometry 100 in model m

```
var b = PrescribedFinalGeometry.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a PrescribedFinalGeometry property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the PrescribedFinalGeometry.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

boundary prescribed final geometry property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if PrescribedFinalGeometry property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if PrescribedFinalGeometry property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this PrescribedFinalGeometry (*BOUNDARY_PRESCRIBED_FINAL_GEOMETRY). **Note that a carriage return is not added**. See also PrescribedFinalGeometry.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for PrescribedFinalGeometry bfg:

```
var key = bfg.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the PrescribedFinalGeometry. **Note that a carriage return is not added**. See also PrescribedFinalGeometry.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for PrescribedFinalGeometry bfg:

```
var cards = bfg.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last boundary prescribed final geometry in the model.

Arguments

- **Model** (Model)

Model to get last boundary prescribed final geometry in

Returns

PrescribedFinalGeometry object (or null if there are no boundary prescribed final geometrys in the model).

Return type

PrescribedFinalGeometry

Example

To get the last boundary prescribed final geometry in model m:

```
var b = PrescribedFinalGeometry.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free boundary prescribed final geometry label in the model. Also see PrescribedFinalGeometry.FirstFreeLabel(), PrescribedFinalGeometry.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free boundary prescribed final geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted

the whole model will be used.

Returns

PrescribedFinalGeometry label.

Return type

Number

Example

To get the last free boundary prescribed final geometry label in model m:

```
var label = PrescribedFinalGeometry.LastFreeLabel(m);
```

Next()

Description

Returns the next boundary prescribed final geometry in the model.

Arguments

No arguments

Returns

PrescribedFinalGeometry object (or null if there are no more boundary prescribed final geometrys in the model).

Return type

PrescribedFinalGeometry

Example

To get the boundary prescribed final geometry in model m after boundary prescribed final geometry b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) boundary prescribed final geometry label in the model. Also see PrescribedFinalGeometry.FirstFreeLabel(), PrescribedFinalGeometry.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free boundary prescribed final geometry label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

PrescribedFinalGeometry label.

Return type

Number

Example

To get the next free boundary prescribed final geometry label in model m:

```
var label = PrescribedFinalGeometry.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a boundary prescribed final geometry.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary prescribed final geometrys from that model can be picked. If the argument is a Flag then only boundary prescribed final geometrys that are flagged with *limit* can be selected. If omitted, or null, any boundary prescribed final geometrys from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

PrescribedFinalGeometry object (or null if not picked)

Return type

PrescribedFinalGeometry

Example

To pick a boundary prescribed final geometry from model m giving the prompt 'Pick boundary prescribed final geometry from screen':

```
var b = PrescribedFinalGeometry.Pick('Pick boundary prescribed final geometry
from screen', m);
```

Previous()

Description

Returns the previous boundary prescribed final geometry in the model.

Arguments

No arguments

Returns

PrescribedFinalGeometry object (or null if there are no more boundary prescribed final geometrys in the model).

Return type

PrescribedFinalGeometry

Example

To get the boundary prescribed final geometry in model m before boundary prescribed final geometry b:

```
var b = b.Previous();
```

RemoveData(index*[Integer]*)

Description

Removes a line of data for a *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY.

Arguments

- **index** (Integer)

The index of the *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY data to remove. **Note that indices start at 0, not 1**.
0 <= index < lines

Returns

No return value.

Example

To remove row 2 (indices start with 0) of open-ended cards for *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY b:

```
b.RemoveData(1);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary prescribed final geometrys in model m, from 1000000:

```
PrescribedFinalGeometry.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed final geometrys will be renumbered in

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary prescribed final geometrys in model m flagged with f, from 1000000:

```
PrescribedFinalGeometry.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select boundary prescribed final geometrys using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting boundary prescribed final geometrys

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary prescribed final geometrys from that model can be selected. If the argument is a Flag then only boundary prescribed final geometrys that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any boundary prescribed final geometrys can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of boundary prescribed final geometrys selected or null if menu cancelled

Return type

Number

Example

To select boundary prescribed final geometrys from model m, flagging those selected with flag f, giving the prompt 'Select boundary prescribed final geometrys':

```
PrescribedFinalGeometry.Select(f, 'Select boundary prescribed final geometrys', m);
```

To select boundary prescribed final geometrys, flagging those selected with flag f but limiting selection to boundary prescribed final geometrys flagged with flag l, giving the prompt 'Select boundary prescribed final geometrys':

```
PrescribedFinalGeometry.Select(f, 'Select boundary prescribed final geometrys', l);
```

SetData(index*[Integer]*, nid*[integer]*, x*[real]*, y*[real]*, z*[real]*, lcid (optional)*[integer]*, death (optional)*[real]*)

Description

Sets a line of data for a *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY.

Arguments

- **index** (Integer)

The index of the *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY data to set. **Note that indices start at 0, not 1**. 0 <= index <= lines

- **nid** (integer)

Node or negative node set number.

- **x** (real)

X coordinates of final geometry.

- **y** (real)

Y coordinates of final geometry.

- **z** (real)

Z coordinates of final geometry.

- **lcid (optional)** (integer)

Loadcurve number.

- **death (optional)** (real)

Death time.

Returns

No return value.

Example

To set values for row 2 (indices start with 0) of open-ended cards for *BOUNDARY_PRESCRIBED_FINAL_GEOMETRY b with the following specification: nid, x, y, z, lcid, death are 99, 0.1, 0.2, 0.3, 88, 100.0 respectively

```
b.SetData(1, 99, 0.1, 0.2, 0.3, 88, 100.0);
```

To append a new line of data (using the same example values):

```
b.SetData(b.lines, 99, 0.1, 0.2, 0.3, 88, 100.0);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the boundary prescribed final geometry.

Arguments

- **flag** (Flag)

Flag to set on the boundary prescribed final geometry

Returns

No return value

Example

To set flag f for boundary prescribed final geometry b:

```
b.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the boundary prescribed final geometry. The boundary prescribed final geometry will be sketched until you either call PrescribedFinalGeometry.Unsketch(), PrescribedFinalGeometry.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed final geometry is sketched. If omitted redraw is true. If you want to sketch several boundary prescribed final geometrys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch boundary prescribed final geometry b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged boundary prescribed final geometrys in the model. The boundary prescribed final geometrys will be sketched until you either call PrescribedFinalGeometry.Unsketch(), PrescribedFinalGeometry.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed final geometrys will be sketched in

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed final geometrys are sketched. If omitted redraw is true. If you want to sketch flagged boundary prescribed final geometrys several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all boundary prescribed final geometrys flagged with flag in model m:

```
PrescribedFinalGeometry.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing boundary prescribed final geometrys should be counted. If false or omitted referenced but undefined boundary prescribed final geometrys will also be included in the total.

Returns

number of boundary prescribed final geometrys

Return type

Number

Example

To get the total number of boundary prescribed final geometrys in model m:

```
var total = PrescribedFinalGeometry.Total(m);
```

Unblank()

Description

Unblanks the boundary prescribed final geometry

Arguments

No arguments

Returns

No return value

Example

To unblank boundary prescribed final geometry b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary prescribed final geometrys in model m:

```
PrescribedFinalGeometry.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that the flagged boundary prescribed final geometrys will be unblanked in

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary prescribed final geometrys in model m flagged with f:

```
PrescribedFinalGeometry.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all boundary prescribed final geometrys will be unset in

- **flag** (Flag)

Flag to unset on the boundary prescribed final geometrys

Returns

No return value

Example

To unset the flag f on all the boundary prescribed final geometrys in model m:

```
PrescribedFinalGeometry.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the boundary prescribed final geometry.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed final geometry is unsketched. If omitted redraw is true. If you want to unsketch several boundary prescribed final geometrys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch boundary prescribed final geometry b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all boundary prescribed final geometrys.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed final geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boundary prescribed final geometrys in model m:

```
PrescribedFinalGeometry.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged boundary prescribed final geometrys in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed final geometrys will be unsketched in

- **flag** (Flag)

Flag set on the boundary prescribed final geometrys that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed final geometrys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boundary prescribed final geometrys flagged with flag in model m:

```
PrescribedFinalGeometry.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

PrescribedFinalGeometry object.

Return type

PrescribedFinalGeometry

Example

To check if PrescribedFinalGeometry property b.example is a parameter by using the PrescribedFinalGeometry.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for boundary prescribed final geometry. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for boundary prescribed final geometry b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this boundary prescribed final geometry.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for boundary prescribed final geometry b:

```
var xrefs = b.Xrefs();
```

---

toString()

Description

Creates a string containing the PrescribedFinalGeometry data in keyword format. Note that this contains the keyword header and the keyword cards. See also PrescribedFinalGeometry.Keyword() and PrescribedFinalGeometry.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for PrescribedFinalGeometry bfg in keyword format

```
var s = bfg.toString();
```

PrescribedMotion class

The PrescribedMotion class gives you access to define boundary prescribed motion cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

PrescribedMotion constants

Name	Description
PrescribedMotion.EDGE_UVW	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_EDGE_UVW.
PrescribedMotion.FACE_XYZ	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_FACE_XYZ.
PrescribedMotion.NODE	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_NODE.
PrescribedMotion.NRBC	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_RIGID, with an NRB, not a part.
PrescribedMotion.NRBC_LOCAL	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_RIGID_LOCAL, with an NRB, not a part.
PrescribedMotion.POINT_UVW	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_POINT_UVW.
PrescribedMotion.RIGID	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_RIGID.
PrescribedMotion.RIGID_LOCAL	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_RIGID_LOCAL.
PrescribedMotion.SET	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET.
PrescribedMotion.SET_BOX	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_BOX.
PrescribedMotion.SET_EDGE_UVW	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_EDGE_UVW.
PrescribedMotion.SET_FACE_XYZ	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_FACE_XYZ.
PrescribedMotion.SET_LINE	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_LINE.
PrescribedMotion.SET_POINT_UVW	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_POINT_UVW.
PrescribedMotion.SET_SEGMENT	Prescribed motion is *BOUNDARY_PRESCRIBED_MOTION_SET_SEGMENT.

PrescribedMotion properties

Name	Type	Description
birth	real	Birth time
bndout2dynain	logical	true if _BNDOUT2DYNAIN option is set, false if not
death	real	Death time
dof	integer	Degree of freedom
exists (read only)	logical	true if boundary prescribed motion exists, false if referred to but not defined.
form	integer	Formulation type. Used for Card 6.
heading	string	PrescribedMotion heading
id	logical	true if _ID option is set, false if not

include	integer	The Include file number that the boundary prescribed motion is in.
label	integer	PrescribedMotion number.
lcid	integer	Load curve of motion vs. time
lrb	integer	Lead rigid body for measuring relative displacement
model (read only)	integer	The Model number that the boundary prescribed motion is in.
nbeg	integer	Node ID of a starting node. Used for PrescribedMotion.SET_LINE
nend	integer	Node ID of a ending node. Used for PrescribedMotion.SET_LINE
node1	integer	Optional orientation node for relative displacement
node2	integer	Optional orientation node for relative displacement
offset1	real	Offset 1 for types 9-11
offset2	real	Offset 2 for types 9-11
prmr	string	String representing the name of the parameter to be output to the dynain file. Used when PrescribedMotion.bndout2dynain is set to true.
sf	real	Load curve scale factor
sfd	real	Scale factor for displacement penalty stiffness. Used for Card 6.
sfr	real	This property is deprecated in version 14.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Scale factor for rotational penalty stiffness. Used for Card 6. [deprecated]
type	constant	The Prescribed motion type. Can be PrescribedMotion.NODE, PrescribedMotion.SET, PrescribedMotion.RIGID, PrescribedMotion.RIGID_LOCAL, PrescribedMotion.NRBC, PrescribedMotion.NRBC_LOCAL, PrescribedMotion.SET_BOX, PrescribedMotion.SET_SEGMENT, PrescribedMotion.SET_LINE, PrescribedMotion.POINT_UVW, PrescribedMotion.EDGE_UVW, PrescribedMotion.FACE_XYZ, PrescribedMotion.SET_POINT_UVW, PrescribedMotion.SET_EDGE_UVW or PrescribedMotion.SET_FACE_XYZ
typeid	integer	Node ID, node set ID, part ID or NRB
vad	integer	Velocity/acceleration/displacement flag
vid	integer	Vector ID

Detailed Description

The PrescribedMotion class allows you to create, modify, edit and boundary prescribed motion cards. See the documentation below for more details.

Constructor

new PrescribedMotion(Model*[Model]*, typeid*[integer]*, dof*[integer]*, vad*[integer]*, lcid*[integer]*, type*[constant]*, label (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new PrescribedMotion object.

Arguments

- **Model** (Model)

Model that PrescribedMotion will be created in

- **typeid** (integer)

Node ID, node set ID or part ID

- **dof** (integer)

Degree of freedom

- **vad** (integer)

Velocity/acceleration/displacement flag

- **lcid** (integer)

Load curve for motion

- **type** (constant)

Specify the type of prescribed motion (Can be PrescribedMotion.NODE, PrescribedMotion.SET, PrescribedMotion.RIGID, PrescribedMotion.RIGID_LOCAL, PrescribedMotion.NRBC, PrescribedMotion.NRBC_LOCAL, PrescribedMotion.SET_BOX, PrescribedMotion.SET_SEGMENT, PrescribedMotion.SET_LINE, PrescribedMotion.POINT_UVW, PrescribedMotion.EDGE_UVW, PrescribedMotion.FACE_XYZ, PrescribedMotion.SET_POINT_UVW, PrescribedMotion.SET_EDGE_UVW or PrescribedMotion.SET_FACE_XYZ)

- **label (optional)** (integer)

PrescribedMotion number

- **heading (optional)** (string)

Title for the PrescribedMotion

Returns

PrescribedMotion object

Return type

PrescribedMotion

Example

To create a new displacement for node 100 in x using loadcurve 10 model m with label 200, of type SET

```
var b = new PrescribedMotion(m, 100, 1, 2, 10, PrescribedMotion.SET, 200);
```

Details of functions

AnimationBackward() [static]

Description

Moves backward one frame of a PrescribedMotion animation (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To move backward one frame of an animation:

```
PrescribedMotion.AnimationBackward();
```

AnimationBegin(Model[*Model*], flag[*Flag*]) [static]

Description

Begins a PrescribedMotion animation. This **MUST** be called before any of the other Animation methods. Also see the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

- **Model** (Model)

Model that PrescribedMotions are in

- **flag** (Flag)

Flag set on the PrescribedMotions that you want to animate

Returns

Object with the following properties:

Name	Type	Description
end	real	End time
frame	integer	Current frame
frames	integer	Number of frames
rate	integer	Animation speed in fps
repeat	integer	Animation repeat (0=off, 1=on)
start	real	Start time
time	real	Current time
timestep	real	Timestep

Return type

object

Example

To begin an animation of the PrescribedMotions in model m flagged with f:

```
var aprops = PrescribedMotion.AnimationBegin(m, f);
```

AnimationFinish() [static]

Description

Finishes a PrescribedMotion animation. This **MUST** be called to finish animating. This will restore nodal coordinates but will **not** perform a graphics update. Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating.

Arguments

No arguments

Returns

No return value

Example

To finish animating:

```
PrescribedMotion.AnimationFinish();
```

AnimationForward() [static]

Description

Moves forward one frame of a PrescribedMotion animation (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To move forward one frame of an animation:

```
PrescribedMotion.AnimationForward();
```

AnimationGetData() [static]

Description

Returns the animation data (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
end	real	End time
frame	integer	Current frame
frames	integer	Number of frames
rate	integer	Animation speed in fps
repeat	integer	Animation repeat (0=off, 1=on)
start	real	Start time
time	real	Current time
timestep	real	Timestep

Return type

object

Example

To get the current animation data:

```
PrescribedMotion.AnimationGetData();
```

AnimationPause() [static]

Description

Pauses playback of a PrescribedMotion animation. Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To pause playback of an animation:

```
PrescribedMotion.AnimationPause();
```

AnimationPlay() [static]

Description

Starts playback of a PrescribedMotion animation. Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.
This method should only be used from a script which implements a user interface so you can actually stop the animation! Don't forget to add a pause/stop button that calls PrescribedMotion.AnimationPause()!

Arguments

No arguments

Returns

No return value

Example

To start playback of an animation:

```
PrescribedMotion.AnimationPlay();
```

AnimationSetData(data*[object]*) [static]

Description

Sets the current animation data (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

- **data** (object)

data returned from PrescribedMotion.AnimationBegin() or PrescribedMotion.AnimationGetData()

Object has the following properties:

Name	Type	Description
end	real	End time
frame	integer	Current frame
frames	integer	Number of frames
rate	integer	Animation speed in fps
repeat	integer	Animation repeat (0=off, 1=on)
start	real	Start time
time	real	Current time
timestep	real	Timestep

Returns

No return value

Example

To set the animation frame rate to 10 frames/sec:

```
data = PrescribedMotion.AnimationGetData();
data.rate = 10;
PrescribedMotion.AnimationSetData(data);
```

AnimationToEnd() [static]

Description

Moves to the end of a PrescribedMotion animation (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To move to the end of an animation:

```
PrescribedMotion.AnimationToEnd();
```

AnimationToStart() [static]

Description

Moves to the start of a PrescribedMotion animation (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To move to the start of an animation:

```
PrescribedMotion.AnimationToStart();
```

AnimationToTime() [static]

Description

Moves to a specific time in a PrescribedMotion animation (pausing animation first if required). Also see the PrescribedMotion.AnimationBegin() method which **MUST** be called before you start animating and the PrescribedMotion.AnimationFinish() method which **MUST** be called after you have finished animating.

Arguments

No arguments

Returns

No return value

Example

To move to time 28.0 in an animation:

```
PrescribedMotion.AnimationToTime(28.0);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a boundary prescribed motion.

Arguments

- **Comment** (Comment)

Comment that will be attached to the boundary prescribed motion

Returns

No return value

Example

To associate comment c to the boundary prescribed motion b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the boundary prescribed motion

Arguments

No arguments

Returns

No return value

Example

To blank boundary prescribed motion b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary prescribed motions in model m:

```
PrescribedMotion.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed motions will be blanked in

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary prescribed motions in model m flagged with f:

```
PrescribedMotion.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the boundary prescribed motion is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if boundary prescribed motion b is blanked:

```
if (b.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the boundary prescribed motion.

Arguments

- **flag** (Flag)

Flag to clear on the boundary prescribed motion

Returns

No return value

Example

To clear flag f for boundary prescribed motion b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the boundary prescribed motion. The target include of the copied boundary prescribed motion can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

PrescribedMotion object

Return type

PrescribedMotion

Example

To copy boundary prescribed motion b into boundary prescribed motion z:

```
var z = b.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a boundary prescribed motion.

Arguments

- **Comment** (Comment)

Comment that will be detached from the boundary prescribed motion

Returns

No return value

Example

To detach comment c from the boundary prescribed motion b:

```
b.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for boundary prescribed motion. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for boundary prescribed motion b:

```
b.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first boundary prescribed motion in the model.

Arguments

- **Model** (Model)

Model to get first boundary prescribed motion in

Returns

PrescribedMotion object (or null if there are no boundary prescribed motions in the model).

Return type

PrescribedMotion

Example

To get the first boundary prescribed motion in model m:

```
var b = PrescribedMotion.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free boundary prescribed motion label in the model. Also see PrescribedMotion.LastFreeLabel(), PrescribedMotion.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free boundary prescribed motion label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

PrescribedMotion label.

Return type

Number

Example

To get the first free boundary prescribed motion label in model m:

```
var label = PrescribedMotion.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the boundary prescribed motions in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be flagged in

- **flag** (Flag)

Flag to set on the boundary prescribed motions

Returns

No return value

Example

To flag all of the boundary prescribed motions with flag f in model m:

```
PrescribedMotion.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the boundary prescribed motion is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the boundary prescribed motion

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if boundary prescribed motion b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each boundary prescribed motion in the model.
Note that ForEach has been designed to make looping over boundary prescribed motions as fast as possible and so has some limitations.
Firstly, a single temporary PrescribedMotion object is created and on each function call it is updated with the current boundary prescribed motion data. This means that you should not try to store the PrescribedMotion object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new boundary prescribed motions inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions are in

- **func** (function)

Function to call for each boundary prescribed motion

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the boundary prescribed motions in model m:

```
PrescribedMotion.ForEach(m, test);
function test(b)
{
// b is PrescribedMotion object
}
```

To call function test for all of the boundary prescribed motions in model m with optional object:

```
var data = { x:0, y:0 };
PrescribedMotion.ForEach(m, test, data);
function test(b, extra)
{
// b is PrescribedMotion object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of PrescribedMotion objects for all of the boundary prescribed motions in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary prescribed motions from

Returns

Array of PrescribedMotion objects

Return type

Array

Example

To make an array of PrescribedMotion objects for all of the boundary prescribed motions in model m

```
var b = PrescribedMotion.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a boundary prescribed motion.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the boundary prescribed motion b:

```
var comm_array = b.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of PrescribedMotion objects for all of the flagged boundary prescribed motions in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary prescribed motions from

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to retrieve

Returns

Array of PrescribedMotion objects

Return type

Array

Example

To make an array of PrescribedMotion objects for all of the boundary prescribed motions in model m flagged with f

```
var b = PrescribedMotion.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the PrescribedMotion object for a boundary prescribed motion ID.

Arguments

- **Model** (Model)

Model to find the boundary prescribed motion in

- **number** (integer)

number of the boundary prescribed motion you want the PrescribedMotion object for

Returns

PrescribedMotion object (or null if boundary prescribed motion does not exist).

Return type

PrescribedMotion

Example

To get the PrescribedMotion object for boundary prescribed motion 100 in model m

```
var b = PrescribedMotion.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a PrescribedMotion property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the PrescribedMotion.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

boundary prescribed motion property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if PrescribedMotion property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if PrescribedMotion property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this PrescribedMotion (*BOUNDARY_PRESCRIBED_MOTION_xxxx). **Note that a carriage return is not added**. See also PrescribedMotion.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for PrescribedMotion pm:

```
var key = pm.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the PrescribedMotion. **Note that a carriage return is not added**. See also PrescribedMotion.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for PrescribedMotion pm:

```
var cards = pm.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last boundary prescribed motion in the model.

Arguments

- **Model** (Model)

Model to get last boundary prescribed motion in

Returns

PrescribedMotion object (or null if there are no boundary prescribed motions in the model).

Return type

PrescribedMotion

Example

To get the last boundary prescribed motion in model m:

```
var b = PrescribedMotion.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free boundary prescribed motion label in the model. Also see PrescribedMotion.FirstFreeLabel(), PrescribedMotion.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free boundary prescribed motion label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

PrescribedMotion label.

Return type

Number

Example

To get the last free boundary prescribed motion label in model m:

```
var label = PrescribedMotion.LastFreeLabel(m);
```

Next()

Description

Returns the next boundary prescribed motion in the model.

Arguments

No arguments

Returns

PrescribedMotion object (or null if there are no more boundary prescribed motions in the model).

Return type

PrescribedMotion

Example

To get the boundary prescribed motion in model m after boundary prescribed motion b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) boundary prescribed motion label in the model. Also see PrescribedMotion.FirstFreeLabel(), PrescribedMotion.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free boundary prescribed motion label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

PrescribedMotion label.

Return type

Number

Example

To get the next free boundary prescribed motion label in model m:

```
var label = PrescribedMotion.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a boundary prescribed motion.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary prescribed motions from that model can be picked. If the argument is a Flag then only boundary prescribed motions that are flagged with *limit* can be selected. If omitted, or null, any boundary prescribed motions from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

PrescribedMotion object (or null if not picked)

Return type

PrescribedMotion

Example

To pick a boundary prescribed motion from model m giving the prompt 'Pick boundary prescribed motion from screen':

```
var b = PrescribedMotion.Pick('Pick boundary prescribed motion from screen', m);
```

Previous()

Description

Returns the previous boundary prescribed motion in the model.

Arguments

No arguments

Returns

PrescribedMotion object (or null if there are no more boundary prescribed motions in the model).

Return type

PrescribedMotion

Example

To get the boundary prescribed motion in model m before boundary prescribed motion b:

```
var b = b.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary prescribed motions in model m, from 1000000:

```
PrescribedMotion.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed motions will be renumbered in

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary prescribed motions in model m flagged with f, from 1000000:

```
PrescribedMotion.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select boundary prescribed motions using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting boundary prescribed motions

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary prescribed motions from that model can be selected. If the argument is a Flag then only boundary prescribed motions that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any boundary prescribed motions can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of boundary prescribed motions selected or null if menu cancelled

Return type

Number

Example

To select boundary prescribed motions from model m, flagging those selected with flag f, giving the prompt 'Select boundary prescribed motions':

```
PrescribedMotion.Select(f, 'Select boundary prescribed motions', m);
```

To select boundary prescribed motions, flagging those selected with flag f but limiting selection to boundary prescribed motions flagged with flag l, giving the prompt 'Select boundary prescribed motions':

```
PrescribedMotion.Select(f, 'Select boundary prescribed motions', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the boundary prescribed motion.

Arguments

- **flag** (Flag)

Flag to set on the boundary prescribed motion

Returns

No return value

Example

To set flag f for boundary prescribed motion b:

```
b.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the boundary prescribed motion. The boundary prescribed motion will be sketched until you either call PrescribedMotion.Unsketch(), PrescribedMotion.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed motion is sketched. If omitted redraw is true. If you want to sketch several boundary prescribed motions and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch boundary prescribed motion b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged boundary prescribed motions in the model. The boundary prescribed motions will be sketched until you either call PrescribedMotion.Unsketch(), PrescribedMotion.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged boundary prescribed motions will be sketched in

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed motions are sketched. If omitted redraw is true. If you want to sketch flagged boundary prescribed motions several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all boundary prescribed motions flagged with flag in model m:

```
PrescribedMotion.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing boundary prescribed motions should be counted. If false or omitted referenced but undefined boundary prescribed motions will also be included in the total.

Returns

number of boundary prescribed motions

Return type

Number

Example

To get the total number of boundary prescribed motions in model m:

```
var total = PrescribedMotion.Total(m);
```

Unblank()

Description

Unblanks the boundary prescribed motion

Arguments

No arguments

Returns

No return value

Example

To unblank boundary prescribed motion b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary prescribed motions in model m:

```
PrescribedMotion.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that the flagged boundary prescribed motions will be unblanked in

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary prescribed motions in model m flagged with f:

```
PrescribedMotion.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all boundary prescribed motions will be unset in

- **flag** (Flag)

Flag to unset on the boundary prescribed motions

Returns

No return value

Example

To unset the flag f on all the boundary prescribed motions in model m:

```
PrescribedMotion.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the boundary prescribed motion.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed motion is unsketched. If omitted redraw is true. If you want to unsketch several boundary prescribed motions and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch boundary prescribed motion b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all boundary prescribed motions.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed motions are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boundary prescribed motions in model m:

```
PrescribedMotion.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged boundary prescribed motions in the model.

Arguments

- **Model** (Model)

Model that all boundary prescribed motions will be unsketched in

- **flag** (Flag)

Flag set on the boundary prescribed motions that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boundary prescribed motions are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boundary prescribed motions flagged with flag in model m:

```
PrescribedMotion.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

PrescribedMotion object.

Return type

PrescribedMotion

Example

To check if PrescribedMotion property b.example is a parameter by using the PrescribedMotion.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for boundary prescribed motion. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for boundary prescribed motion b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this boundary prescribed motion.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for boundary prescribed motion b:

```
var xrefs = b.Xrefs();
```

---

toString()

Description

Creates a string containing the PrescribedMotion data in keyword format. Note that this contains the keyword header and the keyword cards. See also PrescribedMotion.Keyword() and PrescribedMotion.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for PrescribedMotion pm in keyword format

```
var s = pm.toString();
```

Spc class

The Spc class gives you access to define spc cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Spc constants

Constants for sketching mode

Name	Description
Spc.ROTATIONAL	Sketch rotational degrees of freedom.
Spc.TRANSLATIONAL	Sketch translational degrees of freedom.

Constants for suffix

Name	Description
Spc.NODE	SPC is *BOUNDARY_SPC_NODE.
Spc.SET	SPC is *BOUNDARY_SPC_SET.

Spc properties

Name	Type	Description
cid	integer	Coordinate system ID
dofrx	integer	Rotational constraint in local x direction
dofry	integer	Rotational constraint in local y direction
dofrz	integer	Rotational constraint in local z direction
dofx	integer	Translational constraint in local x direction
dofy	integer	Translational constraint in local y direction
dofz	integer	Translational constraint in local z direction
exists (read only)	logical	true if spc exists, false if referred to but not defined.
heading	string	Spc heading
id	logical	true if _ID option is set, false if not.
include	integer	The Include file number that the spc is in.
label	integer	Spc number.
model (read only)	integer	The Model number that the boundary SPC is in.
nid	integer	Node ID or node set ID
type	constant	The Spc type. Can be Spc.NODE or Spc.SET.

Properties for _BIRTH_DEATH option

Name	Type	Description
bd_flag	logical	true if _BIRTH_DEATH option is set, false if not
birth	real	Activation time for constraint
death	real	Deactivation time for constraint

Detailed Description

The Spc class allows you to create, modify, edit and manipulate spc cards. See the documentation below for more details.

Constructor

new Spc(Model*[Model]*, nid*[integer]*, cid*[integer]*, dofx*[integer]*, dofy*[integer]*, dofz*[integer]*, dofrx*[integer]*, dofry*[integer]*, dofrz*[integer]*, type*[constant]*, label (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new Spc object.

Arguments

- **Model** (Model)

Model that spc will be created in

- **nid** (integer)

Node ID or node set ID

- **cid** (integer)

Coordinate system ID

- **dofx** (integer)

Translational constraint in local x direction

- **dofy** (integer)

Translational constraint in local y direction

- **dofz** (integer)

Translational constraint in local z direction

- **dofrx** (integer)

Rotational constraint in local x direction

- **dofry** (integer)

Rotational constraint in local y direction

- **dofrz** (integer)

Rotational constraint in local z direction

- **type** (constant)

Specify the type of boundary spc (Can be Spc.NODE or Spc.SET)

- **label (optional)** (integer)

Spc number

- **heading (optional)** (string)

Title for the spc

Returns

Spc object

Return type

Spc

Example

To create a new boundary spc in model m with label 200, of type SET

```
var b = new Spc(m, 200, 0, 1, 0, 0, 1, 0, 0, Spc.SET, 200);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a boundary SPC.

Arguments

- **Comment** (Comment)

Comment that will be attached to the boundary SPC

Returns

No return value

Example

To associate comment c to the boundary SPC s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the boundary SPC

Arguments

No arguments

Returns

No return value

Example

To blank boundary SPC s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that all boundary SPCs will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary SPCs in model m:

```
Spc.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary SPCs will be blanked in

- **flag** (Flag)

Flag set on the boundary SPCs that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boundary SPCs in model m flagged with f:

```
Spc.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the boundary SPC is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if boundary SPC s is blanked:

```
if (s.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the boundary SPC.

Arguments

- **flag** (Flag)

Flag to clear on the boundary SPC

Returns

No return value

Example

To clear flag f for boundary SPC s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the boundary SPC. The target include of the copied boundary SPC can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Spc object

Return type

Spc

Example

To copy boundary SPC s into boundary SPC z:

```
var z = s.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a boundary SPC.

Arguments

- **Comment** (Comment)

Comment that will be detached from the boundary SPC

Returns

No return value

Example

To detach comment c from the boundary SPC s:

```
s.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for boundary SPC. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for boundary SPC s:

```
s.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first boundary SPC in the model.

Arguments

- **Model** (Model)

Model to get first boundary SPC in

Returns

Spc object (or null if there are no boundary SPCs in the model).

Return type

Spc

Example

To get the first boundary SPC in model m:

```
var s = Spc.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free boundary SPC label in the model. Also see Spc.LastFreeLabel(), Spc.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free boundary SPC label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Spc label.

Return type

Number

Example

To get the first free boundary SPC label in model m:

```
var label = Spc.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the boundary SPCs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all boundary SPCs will be flagged in

- **flag** (Flag)

Flag to set on the boundary SPCs

Returns

No return value

Example

To flag all of the boundary SPCs with flag f in model m:

```
Spc.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the boundary SPC is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the boundary SPC

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if boundary SPC s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each boundary SPC in the model.
Note that ForEach has been designed to make looping over boundary SPCs as fast as possible and so has some limitations.
Firstly, a single temporary Spc object is created and on each function call it is updated with the current boundary SPC data. This means that you should not try to store the Spc object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new boundary SPCs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all boundary SPCs are in

- **func** (function)

Function to call for each boundary SPC

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the boundary SPCs in model m:

```
Spc.ForEach(m, test);
function test(s)
{
// s is Spc object
}
```

To call function test for all of the boundary SPCs in model m with optional object:

```
var data = { x:0, y:0 };
Spc.ForEach(m, test, data);
function test(s, extra)
{
// s is Spc object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Spc objects for all of the boundary SPCs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary SPCs from

Returns

Array of Spc objects

Return type

Array

Example

To make an array of Spc objects for all of the boundary SPCs in model m

```
var s = Spc.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a boundary SPC.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the boundary SPC s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Spc objects for all of the flagged boundary SPCs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boundary SPCs from

- **flag** (Flag)

Flag set on the boundary SPCs that you want to retrieve

Returns

Array of Spc objects

Return type

Array

Example

To make an array of Spc objects for all of the boundary SPCs in model m flagged with f

```
var s = Spc.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Spc object for a boundary SPC ID.

Arguments

- **Model** (Model)

Model to find the boundary SPC in

- **number** (integer)

number of the boundary SPC you want the Spc object for

Returns

Spc object (or null if boundary SPC does not exist).

Return type

Spc

Example

To get the Spc object for boundary SPC 100 in model m

```
var s = Spc.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Spc property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Spc.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

boundary SPC property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Spc property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Spc property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this spc (*BOUNDARY_SPC_xxxx). **Note that a carriage return is not added**. See also Spc.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for spc s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the spc. **Note that a carriage return is not added**. See also Spc.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for spc s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last boundary SPC in the model.

Arguments

- **Model** (Model)

Model to get last boundary SPC in

Returns

Spc object (or null if there are no boundary SPCs in the model).

Return type

Spc

Example

To get the last boundary SPC in model m:

```
var s = Spc.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free boundary SPC label in the model. Also see Spc.FirstFreeLabel(), Spc.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free boundary SPC label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Spc label.

Return type

Number

Example

To get the last free boundary SPC label in model m:

```
var label = Spc.LastFreeLabel(m);
```

Next()

Description

Returns the next boundary SPC in the model.

Arguments

No arguments

Returns

Spc object (or null if there are no more boundary SPCs in the model).

Return type

Spc

Example

To get the boundary SPC in model m after boundary SPC s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) boundary SPC label in the model. Also see Spc.FirstFreeLabel(), Spc.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free boundary SPC label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Spc label.

Return type

Number

Example

To get the next free boundary SPC label in model m:

```
var label = Spc.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a boundary SPC.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary SPCs from that model can be picked. If the argument is a Flag then only boundary SPCs that are flagged with *limit* can be selected. If omitted, or null, any boundary SPCs from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Spc object (or null if not picked)

Return type

Spc

Example

To pick a boundary SPC from model m giving the prompt 'Pick boundary SPC from screen':

```
var s = Spc.Pick('Pick boundary SPC from screen', m);
```

Previous()

Description

Returns the previous boundary SPC in the model.

Arguments

No arguments

Returns

Spc object (or null if there are no more boundary SPCs in the model).

Return type

Spc

Example

To get the boundary SPC in model m before boundary SPC s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that all boundary SPCs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary SPCs in model m, from 1000000:

```
Spc.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boundary SPCs will be renumbered in

- **flag** (Flag)

Flag set on the boundary SPCs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boundary SPCs in model m flagged with f, from 1000000:

```
Spc.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select boundary SPCs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting boundary SPCs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boundary SPCs from that model can be selected. If the argument is a Flag then only boundary SPCs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any boundary SPCs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of boundary SPCs selected or null if menu cancelled

Return type

Number

Example

To select boundary SPCs from model m, flagging those selected with flag f, giving the prompt 'Select boundary SPCs':

```
Spc.Select(f, 'Select boundary SPCs', m);
```

To select boundary SPCs, flagging those selected with flag f but limiting selection to boundary SPCs flagged with flag l, giving the prompt 'Select boundary SPCs':

```
Spc.Select(f, 'Select boundary SPCs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the boundary SPC.

Arguments

- **flag** (Flag)

Flag to set on the boundary SPC

Returns

No return value

Example

To set flag f for boundary SPC s:

```
s.SetFlag(f);
```

Sketch(type*[constant]*, redraw (optional)*[boolean]*)

Description

Sketches the Boundary SPC. The SPC will be sketched until you do a graphics update or delete the model

Arguments

- **type** (constant)

Type of constraints to be drawn. Can be Spc.TRANSLATIONAL or Spc.ROTATIONAL.

- **redraw (optional)** (boolean)

If set to true (or omitted) the plot will be redrawn each time. If sketching a large number of items, efficiency will be gained by setting the argument to false for all but the last item sketched. The final call will redraw.

Returns

No return value

Example

To sketch SPC s - Translational constraint

```
s1.Sketch(Spc.TRANSLATIONAL, false);
s2.Sketch(Spc.TRANSLATIONAL, false);
s3.Sketch(Spc.TRANSLATIONAL, true);
```

SketchFlagged(type*[integer]*, Model*[Model]*, flag*[Flag]*) [static]

Description

Sketches all the flagged boundary SPCs in the model and update the plot. The SPCs will be sketched until you do a graphics update or delete the model.

Arguments

- **type** (integer)

Type of constraints to be drawn. Can be Spc.TRANSLATIONAL or Spc.ROTATIONAL.

- **Model** (Model)

Model that all the flagged boundary SPCs will be sketched in

- **flag** (Flag)

Flag set on the boundary SPCs that you want to sketch

Returns

No return value

Example

To sketch translational SPCs flagged with f in model m and redraw

```
Spc.SketchFlagged(Spc.TRANSLATIONAL, m, f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of boundary SPCs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing boundary SPCs should be counted. If false or omitted referenced but undefined boundary SPCs will also be included in the total.

Returns

number of boundary SPCs

Return type

Number

Example

To get the total number of boundary SPCs in model m:

```
var total = Spc.Total(m);
```

Unblank()

Description

Unblanks the boundary SPC

Arguments

No arguments

Returns

No return value

Example

To unblank boundary SPC s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that all boundary SPCs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary SPCs in model m:

```
Spc.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that the flagged boundary SPCs will be unblanked in

- **flag** (Flag)

Flag set on the boundary SPCs that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boundary SPCs in model m flagged with f:

```
Spc.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the boundary SPCs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all boundary SPCs will be unset in

- **flag** (Flag)

Flag to unset on the boundary SPCs

Returns

No return value

Example

To unset the flag f on all the boundary SPCs in model m:

```
Spc.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the Spc.

Arguments

- **redraw (optional)** (boolean)

If set to true (or omitted) the plot will be redrawn each time. If unsketching a large number of items, efficiency will be gained by setting the argument to false for all but the last item unsketched. The final call will redraw.

Returns

No return value

Example

To unsketch SPC s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*) [static]

Description

Unsketches all SPCs.

Arguments

- **Model** (Model)

Model that all SPCs will be unblanked in

Returns

No return value

Example

To unsketch all SPCs in model m and redraw:

```
SPC.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsketches all flagged SPCs.

Arguments

- **Model** (Model)

Model that all SPCs will be unsketched in

- **flag** (Flag)

Flag set on the SPCs that you want to unsketch

Returns

No return value

Example

To unsketch all SPCs in model m which are flagged with f and redraw:

```
SPC.UnsketchFlagged(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Spc object.

Return type

Spc

Example

To check if Spc property s.example is a parameter by using the Spc.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for boundary SPC. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for boundary SPC s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this boundary SPC.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for boundary SPC s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the spc data in keyword format. Note that this contains the keyword header and the keyword cards. See also Spc.Keyword() and Spc.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for spc s in keyword format

```
var str = s.toString();
```

Comment class

The Comment class gives you access to comment cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Previous()
- SetFlag(flag*[Flag]*)
- ViewParameters()
- Warning(message*[string]*, details (optional)*[string]*)
- Xrefs()
- toString()

Comment constants

Constants for Comment anchor_mode types

Name	Description
Comment.MULTIPLE	The *COMMENT is associated with all cards in the next block of keywords.
Comment.SINGLE	The *COMMENT is associated with just the one immediately following keyword.

Comment properties

Name	Type	Description

anchor_mode	integer	Anchor mode. Can be Comment.SINGLE, Comment.MULTIPLE.
exists (read only)	logical	True if comment exists, false if referred to but not defined.
header	string	The header of the comment, or empty if the comment has no header.
include	integer	The Include file number that the comment is in.
model (read only)	integer	The Model number that the comment is in.
nlines	integer	Number of lines in the comment.
noecho	logical	true if _NOECHO option is set, false if not.

Detailed Description

The Comment class allows you to create, modify, edit and manipulate comment cards. See the documentation below for more details.

Constructor

new Comment(Model*[Model]*, Header (optional)*[string]*, Mode (optional)*[constant]*)

Description

Create a new Comment object.

Arguments

- **Model** (Model)

Model that comment will be created in

- **Header (optional)** (string)

Comment number

- **Mode (optional)** (constant)

Anchor: single or multiple

Returns

Comment object

Return type

Comment

Example

To create a new comment in model m with header "My header", and multiple anchor:

```
var c = new Comment(m, "My header", Comment.MULTIPLE);
```

To create a new comment in model m without header, and single anchor:

```
var c = new Comment(m);
```

Details of functions

AddLine(Line content*[String or array of strings]*, Line number (optional)*[Integer]*)

Description

Adds a line, or an array of lines, to a comment object.

Arguments

- **Line content** (String or array of strings)

String that will be added to a line

- **Line number (optional)** (Integer)

0: First line, 1: Second line, etc.

If array of lines has been passed in the first argument, the first line of the array will be inserted in the line number specified in second argument, the second line of the array will be inserted in the following line number, etc.

If that line already exists, that line and rest of them below will be shifted down.

If greater than number of existing lines, blank lines will be added.

If lower than 0, not valid argument.

If no argument, the line(s) will be appended at the end.

Returns

no return value

Example

To add a new line in the second row of comment c:

```
var str = c.AddLine("New line", 1);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse comment c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the comment.

Arguments

- **flag** (Flag)

Flag to clear on the comment

Returns

No return value

Example

To clear flag f for comment c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the comment. The target include of the copied comment can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Comment object

Return type

Comment

Example

To copy comment c into comment z:

```
var z = c.Copy();
```

DeleteLine(Line number*[Integer]*)

Description

Deletes a line of a comment.

Arguments

- **Line number** (Integer)

Line number to delete (starting at 0). The following lines will be shifted up.

Returns

no return value

Example

To delete the line in the second row of comment c:

```
var str = c.DeleteLine(1);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit comment c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for comment. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for comment c:

```
c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first comment in the model.

Arguments

- **Model** (Model)

Model to get first comment in

Returns

Comment object (or null if there are no comments in the model).

Return type

Comment

Example

To get the first comment in model m:

```
var c = Comment.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the comments in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all comments will be flagged in

- **flag** (Flag)

Flag to set on the comments

Returns

No return value

Example

To flag all of the comments with flag f in model m:

```
Comment.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the comment is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the comment

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if comment c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each comment in the model.
Note that ForEach has been designed to make looping over comments as fast as possible and so has some limitations.
Firstly, a single temporary Comment object is created and on each function call it is updated with the current comment data. This means that you should not try to store the Comment object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new comments inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all comments are in

- **func** (function)

Function to call for each comment

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the comments in model m:

```
Comment.ForEach(m, test);
function test(c)
{
// c is Comment object
}
```

To call function test for all of the comments in model m with optional object:

```
var data = { x:0, y:0 };
Comment.ForEach(m, test, data);
function test(c, extra)
{
// c is Comment object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Comment objects for all of the comments in a model in PRIMER

Arguments

- **Model** (Model)

Model to get comments from

Returns

Array of Comment objects

Return type

Array

Example

To make an array of Comment objects for all of the comments in model m

```
var c = Comment.GetAll(m);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Comment objects for all of the flagged comments in a model in PRIMER

Arguments

- **Model** (Model)

Model to get comments from

- **flag** (Flag)

Flag set on the comments that you want to retrieve

Returns

Array of Comment objects

Return type

Array

Example

To make an array of Comment objects for all of the comments in model m flagged with f

```
var c = Comment.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Comment object for a comment ID.

Arguments

- **Model** (Model)

Model to find the comment in

- **number** (integer)

number of the comment you want the Comment object for

Returns

Comment object (or null if comment does not exist).

Return type

Comment

Example

To get the Comment object for comment 100 in model m

```
var c = Comment.GetFromID(m, 100);
```

GetLine(Line (optional)*[integer]*)

Description

Extracts the lines (the strings) from a comment object.

Arguments

- **Line (optional)** (integer)

Line number to be extracted. Default value: 0 (first line)

Returns

String (or null if no lines in the comment and not argument passed)

Return type

String

Example

To extract the first line of comment c:

```
var str = c.GetLine();
```

GetParameter(prop*[string]*)

Description

Checks if a Comment property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Comment.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

comment property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Comment property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Comment property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this comment (*COMMENT) and the header of the comment if there is one. **Note that a carriage return is not added**. See also Comment.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for comment c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the comment. **Note that a carriage return is not added**. See also Comment.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for comment c:

```
var cards = c.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last comment in the model.

Arguments

- **Model** (Model)

Model to get last comment in

Returns

Comment object (or null if there are no comments in the model).

Return type

Comment

Example

To get the last comment in model m:

```
var c = Comment.Last(m);
```

ModifyLine(Line number*[Integer]*, New line content*[String]*)

Description

Modifies the content of a line in a comment.

Arguments

- **Line number** (Integer)

Line number to modify (starting at 0)

- **New line content** (String)

String that replaces the existing one in a line

Returns

no return value

Example

To modify the line in the second row of comment c:

```
var str = c.ModifyLine(1, "Modified line");
```

Next()

Description

Returns the next comment in the model.

Arguments

No arguments

Returns

Comment object (or null if there are no more comments in the model).

Return type

Comment

Example

To get the comment in model m after comment c:

```
var c = c.Next();
```

Previous()

Description

Returns the previous comment in the model.

Arguments

No arguments

Returns

Comment object (or null if there are no more comments in the model).

Return type

Comment

Example

To get the comment in model m before comment c:

```
var c = c.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select comments using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting comments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only comments from that model can be selected. If the argument is a Flag then only comments that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any comments can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of comments selected or null if menu cancelled

Return type

Number

Example

To select comments from model m, flagging those selected with flag f, giving the prompt 'Select comments':

```
Comment.Select(f, 'Select comments', m);
```

To select comments, flagging those selected with flag f but limiting selection to comments flagged with flag l, giving the prompt 'Select comments':

```
Comment.Select(f, 'Select comments', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the comment.

Arguments

- **flag** (Flag)

Flag to set on the comment

Returns

No return value

Example

To set flag f for comment c:

```
c.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of comments in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing comments should be counted. If false or omitted referenced but undefined comments will also be included in the total.

Returns

number of comments

Return type

Number

Example

To get the total number of comments in model m:

```
var total = Comment.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the comments in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all comments will be unset in

- **flag** (Flag)

Flag to unset on the comments

Returns

No return value

Example

To unset the flag f on all the comments in model m:

```
Comment.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Comment object.

Return type

Comment

Example

To check if Comment property c.example is a parameter by using the Comment.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for comment. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for comment c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this comment.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for comment c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the comment data in keyword format. Note that this contains the keyword header and the keyword cards. See also Comment.Keyword() and Comment.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for comment c in keyword format

```
var s = c.toString();
```

ExtraNodes class

The ExtraNodes class gives you access to constrained extra nodes cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

ExtraNodes constants

Name	Description
ExtraNodes.NODE	CNST is *CONSTRAINED_EXTRA_NODES_NODE.
ExtraNodes.SET	CNST is *CONSTRAINED_EXTRA_NODES_SET.

ExtraNodes properties

Name	Type	Description
colour	Colour	The colour of the extra nodes
exists (read only)	logical	true if constrained extra nodes exists, false if referred to but not defined
id	integer	Node ID or node set ID (not internal label)
iflag	logical	Flag for adding node mass inertia to PART_INERTIA
include	integer	The Include file number that the constrained extra nodes is in.
label (read only)	integer	The label the constrained extra nodes has in PRIMER
model (read only)	integer	The Model number that the constrained extra node is in.
option	constant	The Constrained Extra Nodes option. Can be ExtraNodes.NODE or ExtraNodes.SET.
pid	integer	Part ID of rigid body.

Detailed Description

The ExtraNodes class allows you to create, modify, edit and manipulate constrained extra nodes cards. See the documentation below for more details.

Constructor

new ExtraNodes(Model*[Model]*, option*[constant]*, pid*[integer]*, id*[integer]*, iflag*[boolean]*)

Description

Create a new ExtraNodes object.

Arguments

- **Model** (Model)

Model that constrained extra nodes will be created in

- **option** (constant)

Specify the type of constrained extra nodes. Can be ExtraNodes.NODE or ExtraNodes.SET)

- **pid** (integer)

Part ID of rigid body

- **id** (integer)

Node node ID or node set ID

- **iflag** (boolean)

Flag for adding node mass inertia to PART_INERTIA

Returns

ExtraNodes object

Return type

ExtraNodes

Example

To create a new constrained extra nodes in model m, of type SET, with part 9, node set 18 and iflag 0

```
var e = new ExtraNodes(m, ExtraNodes.SET, 9, 18, 0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a constrained extra node.

Arguments

- **Comment** (Comment)

Comment that will be attached to the constrained extra node

Returns

No return value

Example

To associate comment c to the constrained extra node en:

```
en.AssociateComment(c);
```

Blank()

Description

Blanks the constrained extra node

Arguments

No arguments

Returns

No return value

Example

To blank constrained extra node en:

```
en.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that all constrained extra nodes will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained extra nodes in model m:

```
ExtraNodes.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that all the flagged constrained extra nodes will be blanked in

- **flag** (Flag)

Flag set on the constrained extra nodes that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained extra nodes in model m flagged with f:

```
ExtraNodes.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the constrained extra node is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if constrained extra node en is blanked:

```
if (en.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse constrained extra node en:

```
en.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the constrained extra node.

Arguments

- **flag** (Flag)

Flag to clear on the constrained extra node

Returns

No return value

Example

To clear flag f for constrained extra node en:

```
en.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the constrained extra node. The target include of the copied constrained extra node can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ExtraNodes object

Return type

ExtraNodes

Example

To copy constrained extra node en into constrained extra node z:

```
var z = en.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a constrained extra nodes card.

Arguments

- **Model** (Model)

Model that the constrained extra nodes card will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ExtraNodes object (or null if not made)

Return type

ExtraNodes

Example

To start creating a constrained extra nodes card in model m:

```
var e = ExtraNodes.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a constrained extra node.

Arguments

- **Comment** (Comment)

Comment that will be detached from the constrained extra node

Returns

No return value

Example

To detach comment c from the constrained extra node en:

```
en.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit constrained extra node en:

```
en.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for constrained extra node. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for constrained extra node en:

```
en.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for constrained extra node.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the constrained extra node colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the constrained extra node.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing constrained extra node en:

```
var colour = en.ExtractColour();
```

First(Model[*Model*]) [static]

Description

Returns the first constrained extra node in the model.

Arguments

- **Model** (Model)

Model to get first constrained extra node in

Returns

ExtraNodes object (or null if there are no constrained extra nodes in the model).

Return type

ExtraNodes

Example

To get the first constrained extra node in model m:

```
var en = ExtraNodes.First(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the constrained extra nodes in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all constrained extra nodes will be flagged in

- **flag** (Flag)

Flag to set on the constrained extra nodes

Returns

No return value

Example

To flag all of the constrained extra nodes with flag f in model m:

```
ExtraNodes.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the constrained extra node is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the constrained extra node

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if constrained extra node en has flag f set on it:

```
if (en.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each constrained extra node in the model.
Note that ForEach has been designed to make looping over constrained extra nodes as fast as possible and so has some limitations.
Firstly, a single temporary ExtraNodes object is created and on each function call it is updated with the current constrained extra node data. This means that you should not try to store the ExtraNodes object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new constrained extra nodes inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all constrained extra nodes are in

- **func** (function)

Function to call for each constrained extra node

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the constrained extra nodes in model m:

```
ExtraNodes.ForEach(m, test);
function test(en)
{
// en is ExtraNodes object
}
```

To call function test for all of the constrained extra nodes in model m with optional object:

```
var data = { x:0, y:0 };
ExtraNodes.ForEach(m, test, data);
function test(en, extra)
{
// en is ExtraNodes object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of ExtraNodes objects for all of the constrained extra nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained extra nodes from

Returns

Array of ExtraNodes objects

Return type

Array

Example

To make an array of ExtraNodes objects for all of the constrained extra nodes in model m

```
var en = ExtraNodes.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a constrained extra node.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the constrained extra node en:

```
var comm_array = en.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ExtraNodes objects for all of the flagged constrained extra nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained extra nodes from

- **flag** (Flag)

Flag set on the constrained extra nodes that you want to retrieve

Returns

Array of ExtraNodes objects

Return type

Array

Example

To make an array of ExtraNodes objects for all of the constrained extra nodes in model m flagged with f

```
var en = ExtraNodes.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ExtraNodes object for a constrained extra node ID.

Arguments

- **Model** (Model)

Model to find the constrained extra node in

- **number** (integer)

number of the constrained extra node you want the ExtraNodes object for

Returns

ExtraNodes object (or null if constrained extra node does not exist).

Return type

ExtraNodes

Example

To get the ExtraNodes object for constrained extra node 100 in model m

```
var en = ExtraNodes.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a ExtraNodes property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ExtraNodes.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

constrained extra node property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ExtraNodes property en.example is a parameter:

```
Options.property_parameter_names = true;
if (en.GetParameter(en.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ExtraNodes property en.example is a parameter by using the GetParameter method:

```
if (en.ViewParameters().GetParameter(en.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this constrained extra nodes (*CONSTRAINED_EXTRA_NODES). **Note that a carriage return is not added**. See also ExtraNodes.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for constrained extra nodes e:

```
var key = e.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the constrained extra nodes. **Note that a carriage return is not added**. See also ExtraNodes.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for constrained extra nodes e:

```
var cards = e.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last constrained extra node in the model.

Arguments

- **Model** (Model)

Model to get last constrained extra node in

Returns

ExtraNodes object (or null if there are no constrained extra nodes in the model).

Return type

ExtraNodes

Example

To get the last constrained extra node in model m:

```
var en = ExtraNodes.Last(m);
```

Next()

Description

Returns the next constrained extra node in the model.

Arguments

No arguments

Returns

ExtraNodes object (or null if there are no more constrained extra nodes in the model).

Return type

ExtraNodes

Example

To get the constrained extra node in model m after constrained extra node en:

```
var en = en.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a constrained extra node.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained extra nodes from that model can be picked. If the argument is a Flag then only constrained extra nodes that are flagged with *limit* can be selected. If omitted, or null, any constrained extra nodes from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

ExtraNodes object (or null if not picked)

Return type

ExtraNodes

Example

To pick a constrained extra node from model m giving the prompt 'Pick constrained extra node from screen':

```
var en = ExtraNodes.Pick('Pick constrained extra node from screen', m);
```

Previous()

Description

Returns the previous constrained extra node in the model.

Arguments

No arguments

Returns

ExtraNodes object (or null if there are no more constrained extra nodes in the model).

Return type

ExtraNodes

Example

To get the constrained extra node in model m before constrained extra node en:

```
var en = en.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select constrained extra nodes using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting constrained extra nodes

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained extra nodes from that model can be selected. If the argument is a Flag then only constrained extra nodes that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any constrained extra nodes can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of constrained extra nodes selected or null if menu cancelled

Return type

Number

Example

To select constrained extra nodes from model m, flagging those selected with flag f, giving the prompt 'Select constrained extra nodes':

```
ExtraNodes.Select(f, 'Select constrained extra nodes', m);
```

To select constrained extra nodes, flagging those selected with flag f but limiting selection to constrained extra nodes flagged with flag l, giving the prompt 'Select constrained extra nodes':

```
ExtraNodes.Select(f, 'Select constrained extra nodes', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the constrained extra node.

Arguments

- **flag** (Flag)

Flag to set on the constrained extra node

Returns

No return value

Example

To set flag f for constrained extra node en:

```
en.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the constrained extra node. The constrained extra node will be sketched until you either call ExtraNodes.Unsketch(), ExtraNodes.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained extra node is sketched. If omitted redraw is true. If you want to sketch several constrained extra nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch constrained extra node en:

```
en.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged constrained extra nodes in the model. The constrained extra nodes will be sketched until you either call ExtraNodes.Unsketch(), ExtraNodes.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged constrained extra nodes will be sketched in

- **flag** (Flag)

Flag set on the constrained extra nodes that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained extra nodes are sketched. If omitted redraw is true. If you want to sketch flagged constrained extra nodes several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all constrained extra nodes flagged with flag in model m:

```
ExtraNodes.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing constrained extra nodes should be counted. If false or omitted referenced but undefined constrained extra nodes will also be included in the total.

Returns

number of constrained extra nodes

Return type

Number

Example

To get the total number of constrained extra nodes in model m:

```
var total = ExtraNodes.Total(m);
```

Unblank()

Description

Unblanks the constrained extra node

Arguments

No arguments

Returns

No return value

Example

To unblank constrained extra node en:

```
en.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that all constrained extra nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained extra nodes in model m:

```
ExtraNodes.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that the flagged constrained extra nodes will be unblanked in

- **flag** (Flag)

Flag set on the constrained extra nodes that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained extra nodes in model m flagged with f:

```
ExtraNodes.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all constrained extra nodes will be unset in

- **flag** (Flag)

Flag to unset on the constrained extra nodes

Returns

No return value

Example

To unset the flag f on all the constrained extra nodes in model m:

```
ExtraNodes.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the constrained extra node.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained extra node is unsketched. If omitted redraw is true. If you want to unsketch several constrained extra nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch constrained extra node en:

```
en.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all constrained extra nodes.

Arguments

- **Model** (Model)

Model that all constrained extra nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained extra nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained extra nodes in model m:

```
ExtraNodes.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged constrained extra nodes in the model.

Arguments

- **Model** (Model)

Model that all constrained extra nodes will be unsketched in

- **flag** (Flag)

Flag set on the constrained extra nodes that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained extra nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained extra nodes flagged with flag in model m:

```
ExtraNodes.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ExtraNodes object.

Return type

ExtraNodes

Example

To check if ExtraNodes property en.example is a parameter by using the ExtraNodes.GetParameter() method:

```
if (en.ViewParameters().GetParameter(en.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for constrained extra node. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for constrained extra node en:

```
en.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this constrained extra node.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for constrained extra node en:

```
var xrefs = en.Xrefs();
```

---

toString()

Description

Creates a string containing the constrained extra nodes data in keyword format. Note that this contains the keyword header and the keyword cards. See also ExtraNodes.Keyword() and ExtraNodes.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for constrained extra nodes e in keyword format

```
var s = e.toString();
```

GeneralizedWeld (Gwld) class

The GeneralizedWeld class gives you access to constrained generalized weld cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

GeneralizedWeld constants

Name	Description
GeneralizedWeld.BUTT	GeneralizedWeld is *CONSTRAINED_GENERALIZED_WELD_BUTT.
GeneralizedWeld.COMBINED	GeneralizedWeld is *CONSTRAINED_GENERALIZED_WELD_COMBINED.
GeneralizedWeld.CROSS_ FILLET	GeneralizedWeld is *CONSTRAINED_GENERALIZED_WELD_CROSS_ FILLET.
GeneralizedWeld.FILLET	GeneralizedWeld is *CONSTRAINED_GENERALIZED_WELD_FILLET.
GeneralizedWeld.SPOT	GeneralizedWeld is *CONSTRAINED_GENERALIZED_WELD_SPOT.

GeneralizedWeld properties

Name	Type	Description
a	real	Width of fillet (GeneralizedWeld.FILLET, GeneralizedWeld.CROSS_FILLET)
alpha	real	Weld angle (GeneralizedWeld.FILLET, GeneralizedWeld.CROSS_FILLET)
beta	real	Failure parameter (GeneralizedWeld.FILLET, GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET)
cid	integer	Coordinate System ID.
d	real	Thickness of weld (GeneralizedWeld.BUTT)
epsf	real	Effective plastic strain at failure (GeneralizedWeld.SPOT, GeneralizedWeld.FILLET, GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET)
exists (read only)	logical	true if gwld exists, false if referred to but not defined.
filter	integer	Number of force vectors saved for filtering.
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the gwld is in.
l	real	Length of weld (GeneralizedWeld.FILLET, GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET)
label	integer	Constrained Generalized weld number.
lt	real	Transverse length (GeneralizedWeld.BUTT)
m	real	Exponent for shear force (GeneralizedWeld.SPOT)
model (read only)	integer	The Model number that the generalized weld is in.
n	real	Exponent for normal force (GeneralizedWeld.SPOT)
npr	integer	Number of individual nodal pairs in cross fillet and combined weld.
nprt	integer	Printout option.
nsid	integer	Set Node Set ID.

option	constant	GeneralizedWeld type. Can be GeneralizedWeld.SPOT, GeneralizedWeld.FILLET, GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET, GeneralizedWeld.COMBINED
sigf	real	Stress at failure (GeneralizedWeld.FILLET)
sigy	real	Stress at failure (GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET)
sn	real	Normal force at failure (GeneralizedWeld.SPOT)
ss	real	Shear force at faliure (GeneralizedWeld.SPOT)
tfail	real	Failure time for constraint set (GeneralizedWeld.SPOT, GeneralizedWeld.FILLET, GeneralizedWeld.BUTT, GeneralizedWeld.CROSS_FILLET)
w	real	Width of flange (GeneralizedWeld.FILLET, GeneralizedWeld.CROSS_FILLET)
wid	integer	Constrained Generalized weld number (identical to label).
window	real	Filter time window.

Detailed Description

The GeneralizedWeld class allows you to create, modify, edit and manipulate generalized weld cards. See the documentation below for more details.

For convenience "Gwld" can also be used as the class name instead of "GeneralizedWeld".

Constructor

new GeneralizedWeld(Model*[Model]*, option*[constant]*, nsid*[integer]*, cid (optional)*[integer]*, filter (optional)*[integer]*, window (optional)*[real]*, npr (optional)*[integer]*, nprt (optional)*[integer]*, wid (optional)*[integer]*)

Description

Create a new GeneralizedWeld object.

Arguments

- **Model** (Model)

Model that gwld will be created in

- **option** (constant)

Constrained generalized weld type (any).

- **nsid** (integer)

Set Node Set ID.

- **cid (optional)** (integer)

Coordinate System ID.

- **filter (optional)** (integer)

Number of force vectors saved for filtering.

- **window (optional)** (real)

Filter time window.

- **npr (optional)** (integer)

Number of individual nodal pairs in cross fillet and combined weld.

- **nprt (optional)** (integer)

Printout option.

- **wid (optional)** (integer)

Constrained Generalized weld number.

Returns

GeneralizedWeld object

Return type

GeneralizedWeld

Example

To create a new gwld 1000 of type SPOT in model m with specifiction: nsid, cid, filter, window, nprt are 91, 92, 81, 0.5, 82 respectively

```
var w = new GeneralizedWeld(m, GeneralizedWeld.SPOT, 91, 92, 81, 0.5, 82, 1000);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a generalized weld.

Arguments

- **Comment** (Comment)

Comment that will be attached to the generalized weld

Returns

No return value

Example

To associate comment c to the generalized weld gw:

```
gw.AssociateComment(c);
```

Blank()

Description

Blanks the generalized weld

Arguments

No arguments

Returns

No return value

Example

To blank generalized weld gw:

```
gw.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the generalized welds in the model.

Arguments

- **Model** (Model)

Model that all generalized welds will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the generalized welds in model m:

```
GeneralizedWeld.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged generalized welds in the model.

Arguments

- **Model** (Model)

Model that all the flagged generalized welds will be blanked in

- **flag** (Flag)

Flag set on the generalized welds that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the generalized welds in model m flagged with f:

```
GeneralizedWeld.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the generalized weld is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if generalized weld gw is blanked:

```
if (gw.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse generalized weld gw:

```
gw.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the generalized weld.

Arguments

- **flag** (Flag)

Flag to clear on the generalized weld

Returns

No return value

Example

To clear flag f for generalized weld gw:

```
gw.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the generalized weld. The target include of the copied generalized weld can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

GeneralizedWeld object

Return type

GeneralizedWeld

Example

To copy generalized weld gw into generalized weld z:

```
var z = gw.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a gwld.

Arguments

- **Model** (Model)

Model that the gwld will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

GeneralizedWeld object (or null if not made)

Return type

GeneralizedWeld

Example

To start creating a generalized weld in model m:

```
var gw = GeneralizedWeld.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a generalized weld.

Arguments

- **Comment** (Comment)

Comment that will be detached from the generalized weld

Returns

No return value

Example

To detach comment c from the generalized weld gw:

```
gw.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit generalized weld gw:

```
gw.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for generalized weld. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for generalized weld gw:

```
gw.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first generalized weld in the model.

Arguments

- **Model** (Model)

Model to get first generalized weld in

Returns

GeneralizedWeld object (or null if there are no generalized welds in the model).

Return type

GeneralizedWeld

Example

To get the first generalized weld in model m:

```
var gw = GeneralizedWeld.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free generalized weld label in the model. Also see GeneralizedWeld.LastFreeLabel(), GeneralizedWeld.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free generalized weld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

GeneralizedWeld label.

Return type

Number

Example

To get the first free generalized weld label in model m:

```
var label = GeneralizedWeld.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the generalized welds in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all generalized welds will be flagged in

- **flag** (Flag)

Flag to set on the generalized welds

Returns

No return value

Example

To flag all of the generalized welds with flag f in model m:

```
GeneralizedWeld.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the generalized weld is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the generalized weld

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if generalized weld gw has flag f set on it:

```
if (gw.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each generalized weld in the model.
Note that ForEach has been designed to make looping over generalized welds as fast as possible and so has some limitations.
Firstly, a single temporary GeneralizedWeld object is created and on each function call it is updated with the current generalized weld data. This means that you should not try to store the GeneralizedWeld object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new generalized welds inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all generalized welds are in

- **func** (function)

Function to call for each generalized weld

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the generalized welds in model m:

```
GeneralizedWeld.ForEach(m, test);
function test(gw)
{
// gw is GeneralizedWeld object
}
```

To call function test for all of the generalized welds in model m with optional object:

```
var data = { x:0, y:0 };
GeneralizedWeld.ForEach(m, test, data);
function test(gw, extra)
{
// gw is GeneralizedWeld object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of GeneralizedWeld objects for all of the generalized welds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get generalized welds from

Returns

Array of GeneralizedWeld objects

Return type

Array

Example

To make an array of GeneralizedWeld objects for all of the generalized welds in model m

```
var gw = GeneralizedWeld.GetAll(m);
```

GetCombinedData(index*[integer]*)

Description

Returns the combined data for a specific nodal pair as an array.

Arguments

- **index** (integer)

Index you want the data for. **Note that indices start at 0**.

Returns

An array containing the data (tfail, epsf, sigy, beta, l, w, a, alpha, nodea, nodeb, ncid, wtyp).

Return type

Array

Example

To get the data for the 3rd node pair for generalized weld gw:

```
var data = gw.GetCombinedData(2);
```

GetComments()

Description

Extracts the comments associated to a generalized weld.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the generalized weld gw:

```
var comm_array = gw.GetComments();
```

GetCrossFilletData(index*[integer]*)

Description

Returns the cross fillet data for a specific nodal pair as an array.

Arguments

- **index** (integer)

Index you want the data for. **Note that indices start at 0**.

Returns

An array containing the data (nodea, nodeb, ncid).

Return type

Array

Example

To get the data for the 3rd node pair for generalized weld gw:

```
var data = gw.GetCrossFilletData(2);
```

GetFailureData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Access the properties directly or use GeneralizedWeld.GetCombinedData() for GeneralizedWeld.COMBINED instead.

Arguments

No arguments

Returns

No return value

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of GeneralizedWeld objects for all of the flagged generalized welds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get generalized welds from

- **flag** (Flag)

Flag set on the generalized welds that you want to retrieve

Returns

Array of GeneralizedWeld objects

Return type

Array

Example

To make an array of GeneralizedWeld objects for all of the generalized welds in model m flagged with f

```
var gw = GeneralizedWeld.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the GeneralizedWeld object for a generalized weld ID.

Arguments

- **Model** (Model)

Model to find the generalized weld in

- **number** (integer)

number of the generalized weld you want the GeneralizedWeld object for

Returns

GeneralizedWeld object (or null if generalized weld does not exist).

Return type

GeneralizedWeld

Example

To get the GeneralizedWeld object for generalized weld 100 in model m

```
var gw = GeneralizedWeld.GetFromID(m, 100);
```

GetNodalPair() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use GeneralizedWeld.GetCombinedData() for GeneralizedWeld.COMBINED or GeneralizedWeld.GetCrossFilletData() for GeneralizedWeld.CROSS_FILLET instead.

Arguments

No arguments

Returns

No return value

GetParameter(prop*[string]*)

Description

Checks if a GeneralizedWeld property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the GeneralizedWeld.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

generalized weld property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if GeneralizedWeld property gw.example is a parameter:

```
Options.property_parameter_names = true;
if (gw.GetParameter(gw.example) ) do_something...
Options.property_parameter_names = false;
```

To check if GeneralizedWeld property gw.example is a parameter by using the GetParameter method:

```
if (gw.ViewParameters().GetParameter(gw.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this gwld (*CONSTRAINED_GENERALIZED_WELD_xxxx). **Note that a carriage return is not added**. See also GeneralizedWeld.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for generalized weld gw:

```
var key = gw.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the gwld. **Note that a carriage return is not added**. See also GeneralizedWeld.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for generalized weld gw:

```
var cards = gw.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last generalized weld in the model.

Arguments

- **Model** (Model)

Model to get last generalized weld in

Returns

GeneralizedWeld object (or null if there are no generalized welds in the model).

Return type

GeneralizedWeld

Example

To get the last generalized weld in model m:

```
var gw = GeneralizedWeld.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free generalized weld label in the model. Also see GeneralizedWeld.FirstFreeLabel(), GeneralizedWeld.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free generalized weld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

GeneralizedWeld label.

Return type

Number

Example

To get the last free generalized weld label in model m:

```
var label = GeneralizedWeld.LastFreeLabel(m);
```

Next()

Description

Returns the next generalized weld in the model.

Arguments

No arguments

Returns

GeneralizedWeld object (or null if there are no more generalized welds in the model).

Return type

GeneralizedWeld

Example

To get the generalized weld in model m after generalized weld gw:

```
var gw = gw.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) generalized weld label in the model. Also see GeneralizedWeld.FirstFreeLabel(), GeneralizedWeld.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free generalized weld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

GeneralizedWeld label.

Return type

Number

Example

To get the next free generalized weld label in model m:

```
var label = GeneralizedWeld.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a generalized weld.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only generalized welds from that model can be picked. If the argument is a Flag then only generalized welds that are flagged with *limit* can be selected. If omitted, or null, any generalized welds from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

GeneralizedWeld object (or null if not picked)

Return type

GeneralizedWeld

Example

To pick a generalized weld from model m giving the prompt 'Pick generalized weld from screen':

```
var gw = GeneralizedWeld.Pick('Pick generalized weld from screen', m);
```

Previous()

Description

Returns the previous generalized weld in the model.

Arguments

No arguments

Returns

GeneralizedWeld object (or null if there are no more generalized welds in the model).

Return type

GeneralizedWeld

Example

To get the generalized weld in model m before generalized weld gw:

```
var gw = gw.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the generalized welds in the model.

Arguments

- **Model** (Model)

Model that all generalized welds will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the generalized welds in model m, from 1000000:

```
GeneralizedWeld.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged generalized welds in the model.

Arguments

- **Model** (Model)

Model that all the flagged generalized welds will be renumbered in

- **flag** (Flag)

Flag set on the generalized welds that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the generalized welds in model m flagged with f, from 1000000:

```
GeneralizedWeld.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select generalized welds using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting generalized welds

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only generalized welds from that model can be selected. If the argument is a Flag then only generalized welds that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any generalized welds can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of generalized welds selected or null if menu cancelled

Return type

Number

Example

To select generalized welds from model m, flagging those selected with flag f, giving the prompt 'Select generalized welds':

```
GeneralizedWeld.Select(f, 'Select generalized welds', m);
```

To select generalized welds, flagging those selected with flag f but limiting selection to generalized welds flagged with flag l, giving the prompt 'Select generalized welds':

```
GeneralizedWeld.Select(f, 'Select generalized welds', l);
```

SetCombinedData(index*[integer]*, data*[Array of numbers]*)

Description

Sets the combined data for a specific nodal pair.

Arguments

- **index** (integer)

Index you want to set the data for. **Note that indices start at 0**.

- **data** (Array of numbers)

Array containing the data. The array length should be 12 (tfail, epsf, sigy, beta, l, w, a, alpha, nodea, nodeb, ncid, wtyp)

Returns

No return value.

Example

To set the data for the 3rd nodal pair for generalized weld gw to the values in array adata:

```
gw.SetCombinedData(2, adata);
```

SetCrossFilletData(index*[integer]*, data*[Array of numbers]*)

Description

Sets the cross fillet data for a specific nodal pair.

Arguments

- **index** (integer)

Index you want to set the data for. **Note that indices start at 0**.

- **data** (Array of numbers)

Array containing the data. The array length should be 3 (nodea, nodeb, ncid)

Returns

No return value.

Example

To set the data for the 3rd nodal pair for generalized weld gw to the values in array adata:

```
gw.SetCrossFilletData(2, adata);
```

SetFailureData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Access the properties directly or use GeneralizedWeld.SetCombinedData() for GeneralizedWeld.COMBINED instead.

Arguments

No arguments

Returns

No return value

SetFlag(flag*[Flag]*)

Description

Sets a flag on the generalized weld.

Arguments

- **flag** (Flag)

Flag to set on the generalized weld

Returns

No return value

Example

To set flag f for generalized weld gw:

```
gw.SetFlag(f);
```

SetNodalPair() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use GeneralizedWeld.SetCombinedData() for GeneralizedWeld.COMBINED or GeneralizedWeld.SetCrossFilletData() for GeneralizedWeld.CROSS_FILLET instead.

Arguments

No arguments

Returns

No return value

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the generalized weld. The generalized weld will be sketched until you either call GeneralizedWeld.Unsketch(), GeneralizedWeld.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the generalized weld is sketched. If omitted redraw is true. If you want to sketch several generalized welds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch generalized weld gw:

```
gw.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged generalized welds in the model. The generalized welds will be sketched until you either call GeneralizedWeld.Unsketch(), GeneralizedWeld.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged generalized welds will be sketched in

- **flag** (Flag)

Flag set on the generalized welds that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the generalized welds are sketched. If omitted redraw is true. If you want to sketch flagged generalized welds several times and only redraw after the last one then use false for redraw and call

View.Redraw().

Returns

No return value

Example

To sketch all generalized welds flagged with flag in model m:

```
GeneralizedWeld.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of generalized welds in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing generalized welds should be counted. If false or omitted referenced but undefined generalized welds will also be included in the total.

Returns

number of generalized welds

Return type

Number

Example

To get the total number of generalized welds in model m:

```
var total = GeneralizedWeld.Total(m);
```

Unblank()

Description

Unblanks the generalized weld

Arguments

No arguments

Returns

No return value

Example

To unblank generalized weld gw:

```
gw.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the generalized welds in the model.

Arguments

- **Model** (Model)

Model that all generalized welds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the generalized welds in model m:

```
GeneralizedWeld.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged generalized welds in the model.

Arguments

- **Model** (Model)

Model that the flagged generalized welds will be unblanked in

- **flag** (Flag)

Flag set on the generalized welds that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the generalized welds in model m flagged with f:

```
GeneralizedWeld.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the generalized welds in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all generalized welds will be unset in

- **flag** (Flag)

Flag to unset on the generalized welds

Returns

No return value

Example

To unset the flag f on all the generalized welds in model m:

```
GeneralizedWeld.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the generalized weld.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the generalized weld is unsketched. If omitted redraw is true. If you want to unsketch several generalized welds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch generalized weld gw:

```
gw.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all generalized welds.

Arguments

- **Model** (Model)

Model that all generalized welds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the generalized welds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all generalized welds in model m:

```
GeneralizedWeld.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged generalized welds in the model.

Arguments

- **Model** (Model)

Model that all generalized welds will be unsketched in

- **flag** (Flag)

Flag set on the generalized welds that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the generalized welds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all generalized welds flagged with flag in model m:

```
GeneralizedWeld.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

GeneralizedWeld object.

Return type

GeneralizedWeld

Example

To check if GeneralizedWeld property gw.example is a parameter by using the GeneralizedWeld.GetParameter() method:

```
if (gw.ViewParameters().GetParameter(gw.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for generalized weld. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for generalized weld gw:

```
gw.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this generalized weld.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for generalized weld gw:

```
var xrefs = gw.Xrefs();
```

---

toString()

Description

Creates a string containing the gwld data in keyword format. Note that this contains the keyword header and the keyword cards. See also GeneralizedWeld.Keyword() and GeneralizedWeld.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for generalized weld gw in keyword format

```
var s = gw.toString();
```

Interpolation class

The Interpolation class gives you access to define *CONSTRAINED_INTERPOLATION cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Interpolation constants

Name	Description
Interpolation.NODE	INID is a node.
Interpolation.NODE_SET	INID is a node set.

Interpolation properties

Name	Type	Description
cidd	integer	Coordinate System ID if LOCAL option is active.
ddof	integer	Dependent Degrees-of-Freedom.
dnid	integer	Dependent Node id.
exists (read only)	logical	true if Interpolation exists, false if referred to but not defined.
fgm	integer	Flag for special treatment of this constraint for implicit problems only.
icid	integer	Interpolation label
include	integer	The Include file number that the Interpolation is in.
indsw	integer	Switch for controlling the explicit solution when an independent (or dependent) node is deleted.
ityp	constant	The Independent Node type. Can be Interpolation.NODE or Interpolation.NODE_SET.
local	logical	true if _LOCAL is set.
model (read only)	integer	The Model number that the constrained interpolation is in.
total (read only)	integer	Total number of INID fields in the keyword.

Detailed Description

The Interpolation class allows you to create, modify, edit and manipulate *CONSTRAINED_INTERPOLATION cards. See the documentation below for more details.

Constructor

new Interpolation(Model*[Model]*, icid*[integer]*, dnid*[integer]*, inid*[integer]*, ddof (optional)*[integer]*, local (optional)*[boolean]*, cidd (optional)*[integer]*, ityp (optional)*[constant]*, idof (optional)*[integer]*, twghtx (optional)*[real]*, twghty (optional)*[real]*, twghtz (optional)*[real]*, rwghtx (optional)*[real]*, rwghty (optional)*[real]*, rwghtz (optional)*[real]*, cidi (optional)*[integer]*)

Description

Create a new Interpolation object.

Arguments

- **Model** (Model)

Model that Interpolation will be created in

- **icid** (integer)

Interpolation label

- **dnid** (integer)

Dependent Node id.

- **inid** (integer)

Independent Node or Node Set id.

- **ddof (optional)** (integer)

Dependent Degrees-of-Freedom. The default value is 123456.

- **local (optional)** (boolean)

true if _LOCAL is set.

- **cidd (optional)** (integer)

Coordinate System ID if LOCAL option is active. The default value is 0.

- **ityp (optional)** (constant)

The Independent Node type. Can be Interpolation.NODE or Interpolation.NODE_SET. The default value is Interpolation.NODE.

- **idof (optional)** (integer)

Independent Degrees-of-Freedom. The default value is 123456.

- **twghtx (optional)** (real)

Weighting factor for INID. Scales the x-translational component. The default value is 1.0.

- **twghty (optional)** (real)

Weighting factor for INID. Scales the y-translational component. The default value is twghtx.

- **twghtz (optional)** (real)

Weighting factor for INID. Scales the z-translational component. The default value is twghtx.

- **rwghtx (optional)** (real)

Weighting factor for INID. Scales the x-rotational component. The default value is twghtx.

- **rwghty (optional)** (real)

Weighting factor for INID. Scales the y-rotational component. The default value is twghtx.

- **rwghtz (optional)** (real)

Weighting factor for INID. Scales the z-rotational component. The default value is twghtx.

- **cidi (optional)** (integer)

Coordinate System ID if LOCAL option is active. The default value is 0

Returns

Interpolation object

Return type

Interpolation

Example

To create a new constrained interpolation in model m, of icid 2, dnid 12, inid 10, ddof 123, local true, cidd 22, ityp NODE_SET, idof 12, and twghtx 2.24.

```
var c_i = new Interpolation(m,2,12,10,123,true,22,Interpolation.NODE_
SET,12,2.24);
```

Details of functions

AddRowData(inid*[integer]*, idof (optional)*[integer]*, twghtx (optional)*[real]*, twghty (optional)*[real]*, twghtz (optional)*[real]*, rwghtx (optional)*[real]*, rwghty (optional)*[real]*, rwghtz (optional)*[real]*, cidi (optional)*[integer]*)

Description

Used to add additional independent node card and local coordinate card (if ITYP is Interpolation.NODE_SET) to the keyword. Adds this data to the end of the selected *CONSTRAINED_INTERPOLATION

Arguments

- **inid** (integer)

Independent Node or Node Set id.

- **idof (optional)** (integer)

Independent Degrees-of-Freedom. The default value is 123456.

- **twghtx (optional)** (real)

Weighting factor for INID. Scales the x-translational component. The default value is 1.0.

- **twghty (optional)** (real)

Weighting factor for INID. Scales the y-translational component. The default value is twghtx.

- **twghtz (optional)** (real)

Weighting factor for INID. Scales the z-translational component. The default value is twghtx.

- **rwghtx (optional)** (real)

Weighting factor for INID. Scales the x-rotational component. The default value is twghtx.

- **rwghty (optional)** (real)

Weighting factor for INID. Scales the y-rotational component. The default value is twghtx.

- **rwghtz (optional)** (real)

Weighting factor for INID. Scales the z-rotational component. The default value is twghtx.

- **cidi (optional)** (integer)

Coordinate System ID if LOCAL option is active. The default value is 0.

Returns

No return value

Example

To add INID 10 to the keyword c_i with idof 123, twghtx 1.2, twghty 2.2:

```
c_i.AddRowData(10,123,1.2,2.2);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a constrained interpolation.

Arguments

- **Comment** (Comment)

Comment that will be attached to the constrained interpolation

Returns

No return value

Example

To associate comment c to the constrained interpolation c_i:

```
c_i.AssociateComment(c);
```

Blank()

Description

Blanks the constrained interpolation

Arguments

No arguments

Returns

No return value

Example

To blank constrained interpolation c_i:

```
c_i.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained interpolations in model m:

```
Interpolation.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all the flagged constrained interpolations will be blanked in

- **flag** (Flag)

Flag set on the constrained interpolations that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained interpolations in model m flagged with f:

```
Interpolation.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the constrained interpolation is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if constrained interpolation c_i is blanked:

```
if (c_i.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse constrained interpolation c_i:

```
c_i.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the constrained interpolation.

Arguments

- **flag** (Flag)

Flag to clear on the constrained interpolation

Returns

No return value

Example

To clear flag f for constrained interpolation c_i:

```
c_i.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the constrained interpolation. The target include of the copied constrained interpolation can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Interpolation object

Return type

Interpolation

Example

To copy constrained interpolation c_i into constrained interpolation z:

```
var z = c_i.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a Interpolation.

Arguments

- **Model** (Model)

Model that the constrainedInterpolation will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Interpolation object (or null if not made)

Return type

Interpolation

Example

To start creating a constrainedInterpolation in model n:

```
var c_i = Interpolation.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a constrained interpolation.

Arguments

- **Comment** (Comment)

Comment that will be detached from the constrained interpolation

Returns

No return value

Example

To detach comment c from the constrained interpolation c_i:

```
c_i.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit constrained interpolation c_i:

```
c_i.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for constrained interpolation. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for constrained interpolation c_i:

```
c_i.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first constrained interpolation in the model.

Arguments

- **Model** (Model)

Model to get first constrained interpolation in

Returns

Interpolation object (or null if there are no constrained interpolations in the model).

Return type

Interpolation

Example

To get the first constrained interpolation in model m:

```
var c_i = Interpolation.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free constrained interpolation label in the model. Also see Interpolation.LastFreeLabel(), Interpolation.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free constrained interpolation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Interpolation label.

Return type

Number

Example

To get the first free constrained interpolation label in model m:

```
var label = Interpolation.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the constrained interpolations in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be flagged in

- **flag** (Flag)

Flag to set on the constrained interpolations

Returns

No return value

Example

To flag all of the constrained interpolations with flag f in model m:

```
Interpolation.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the constrained interpolation is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the constrained interpolation

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if constrained interpolation c_i has flag f set on it:

```
if (c_i.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each constrained interpolation in the model.
Note that ForEach has been designed to make looping over constrained interpolations as fast as possible and so has some limitations.
Firstly, a single temporary Interpolation object is created and on each function call it is updated with the current constrained interpolation data. This means that you should not try to store the Interpolation object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new constrained interpolations inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all constrained interpolations are in

- **func** (function)

Function to call for each constrained interpolation

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the constrained interpolations in model m:

```
Interpolation.ForEach(m, test);
function test(c_i)
{
// c_i is Interpolation object
}
```

To call function test for all of the constrained interpolations in model m with optional object:

```
var data = { x:0, y:0 };
Interpolation.ForEach(m, test, data);
function test(c_i, extra)
{
// c_i is Interpolation object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Interpolation objects for all of the constrained interpolations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained interpolations from

Returns

Array of Interpolation objects

Return type

Array

Example

To make an array of Interpolation objects for all of the constrained interpolations in model m

```
var c_i = Interpolation.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a constrained interpolation.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the constrained interpolation c_i:

```
var comm_array = c_i.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Interpolation objects for all of the flagged constrained interpolations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained interpolations from

- **flag** (Flag)

Flag set on the constrained interpolations that you want to retrieve

Returns

Array of Interpolation objects

Return type

Array

Example

To make an array of Interpolation objects for all of the constrained interpolations in model m flagged with f

```
var c_i = Interpolation.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Interpolation object for a constrained interpolation ID.

Arguments

- **Model** (Model)

Model to find the constrained interpolation in

- **number** (integer)

number of the constrained interpolation you want the Interpolation object for

Returns

Interpolation object (or null if constrained interpolation does not exist).

Return type

Interpolation

Example

To get the Interpolation object for constrained interpolation 100 in model m

```
var c_i = Interpolation.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Interpolation property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Interpolation.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

constrained interpolation property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Interpolation property c_i.example is a parameter:

```
Options.property_parameter_names = true;
if (c_i.GetParameter(c_i.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Interpolation property c_i.example is a parameter by using the GetParameter method:

```
if (c_i.ViewParameters().GetParameter(c_i.example) ) do_something...
```

GetRowData(row_index*[Integer]*)

Description

Returns independent node cards and local coordinate cards (if ITYP is Interpolation.NODE_SET) for the selected row of the *CONSTRAINED_INTERPOLATION.

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Interpolation.total

Returns

Array containing data.

Return type

Array

Example

To loop over all the lines of the keyword for c_i:

```
for (i=0; i<c_i.total; i++)
        var data = c_i.GetRowData(i);
```

Keyword()

Description

Returns the keyword for this Interpolation (*constrained_interpolation). **Note that a carriage return is not added**. See also Interpolation.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Interpolation c_i:

```
var key = c_i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Interpolation. **Note that a carriage return is not added**. See also Interpolation.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Interpolation c_i:

```
var cards = c_i.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last constrained interpolation in the model.

Arguments

- **Model** (Model)

Model to get last constrained interpolation in

Returns

Interpolation object (or null if there are no constrained interpolations in the model).

Return type

Interpolation

Example

To get the last constrained interpolation in model m:

```
var c_i = Interpolation.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free constrained interpolation label in the model. Also see Interpolation.FirstFreeLabel(), Interpolation.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free constrained interpolation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Interpolation label.

Return type

Number

Example

To get the last free constrained interpolation label in model m:

```
var label = Interpolation.LastFreeLabel(m);
```

Next()

Description

Returns the next constrained interpolation in the model.

Arguments

No arguments

Returns

Interpolation object (or null if there are no more constrained interpolations in the model).

Return type

Interpolation

Example

To get the constrained interpolation in model m after constrained interpolation c_i:

```
var c_i = c_i.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) constrained interpolation label in the model. Also see Interpolation.FirstFreeLabel(), Interpolation.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free constrained interpolation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Interpolation label.

Return type

Number

Example

To get the next free constrained interpolation label in model m:

```
var label = Interpolation.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a constrained interpolation.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained interpolations from that model can be picked. If the argument is a Flag then only constrained interpolations that are flagged with *limit* can be selected. If omitted, or null, any constrained interpolations from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Interpolation object (or null if not picked)

Return type

Interpolation

Example

To pick a constrained interpolation from model m giving the prompt 'Pick constrained interpolation from screen':

```
var c_i = Interpolation.Pick('Pick constrained interpolation from screen', m);
```

Previous()

Description

Returns the previous constrained interpolation in the model.

Arguments

No arguments

Returns

Interpolation object (or null if there are no more constrained interpolations in the model).

Return type

Interpolation

Example

To get the constrained interpolation in model m before constrained interpolation c_i:

```
var c_i = c_i.Previous();
```

RemoveRowData(row_index*[Integer]*)

Description

Removes an independent node card and a local coordinate card (if ITYP is Interpolation.NODE_SET) for the selected row on the *CONSTRAINED_INTERPOLATION.

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Interpolation.total

Returns

No return value.

Example

To remove row 2 for c_i:

```
c_i.RemoveRowData(1);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the constrained interpolations in model m, from 1000000:

```
Interpolation.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all the flagged constrained interpolations will be renumbered in

- **flag** (Flag)

Flag set on the constrained interpolations that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the constrained interpolations in model m flagged with f, from 1000000:

```
Interpolation.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select constrained interpolations using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting constrained interpolations

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained interpolations from that model can be selected. If the argument is a Flag then only constrained interpolations that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any constrained interpolations can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of constrained interpolations selected or null if menu cancelled

Return type

Number

Example

To select constrained interpolations from model m, flagging those selected with flag f, giving the prompt ’Select constrained interpolations’:

```
Interpolation.Select(f, ’Select constrained interpolations’, m);
```

To select constrained interpolations, flagging those selected with flag f but limiting selection to constrained interpolations flagged with flag l, giving the prompt ’Select constrained interpolations’:

```
Interpolation.Select(f, ’Select constrained interpolations’, l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the constrained interpolation.

Arguments

- **flag** (Flag)

Flag to set on the constrained interpolation

Returns

No return value

Example

To set flag f for constrained interpolation c_i:

```
c_i.SetFlag(f);
```

SetRowData(row_index*[Integer]*, inid*[integer]*, idof (optional)*[integer]*, twghtx (optional)*[real]*, twghty (optional)*[real]*, twghtz (optional)*[real]*, rwghtx (optional)*[real]*, rwghty (optional)*[real]*, rwghtz (optional)*[real]*, cidi (optional)*[integer]*)

Description

Used to reset values in already existing independent node cards and local coordinate cards (if ITYP is Interpolation.NODE_SET) in the selected row of *CONSTRAINED_INTERPOLATION

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Interpolation.total

- **inid** (integer)

Independent Node or Node Set id.

- **idof (optional)** (integer)

Independent Degrees-of-Freedom. The default value is 123456.

- **twghtx (optional)** (real)

Weighting factor for INID. Scales the x-translational component. The default value is 1.0.

- **twghty (optional)** (real)

Weighting factor for INID. Scales the y-translational component. The default value is twghtx.

- **twghtz (optional)** (real)

Weighting factor for INID. Scales the z-translational component. The default value is twghtx.

- **rwghtx (optional)** (real)

Weighting factor for INID. Scales the x-rotational component. The default value is twghtx.

- **rwghty (optional)** (real)

Weighting factor for INID. Scales the y-rotational component. The default value is twghtx.

- **rwghtz (optional)** (real)

Weighting factor for INID. Scales the z-rotational component. The default value is twghtx.

- **cidi (optional)** (integer)

Coordinate System ID if LOCAL option is active. The default value is 0

Returns

No return value

Example

To reset the values of row 3 of the keyword with INID 11, idof 1234, twghtx 2.2, twghty 4.2:

```
c_i.SetRowData(2,11,1234,2.2,4.2);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the constrained interpolation. The constrained interpolation will be sketched until you either call Interpolation.Unsketch(), Interpolation.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained interpolation is sketched. If omitted redraw is true. If you want to sketch several constrained interpolations and only redraw after the last one then use false for redraw and call

View.Redraw().

Returns

No return value

Example

To sketch constrained interpolation c_i:

```
c_i.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged constrained interpolations in the model. The constrained interpolations will be sketched until you either call Interpolation.Unsketch(), Interpolation.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged constrained interpolations will be sketched in

- **flag** (Flag)

Flag set on the constrained interpolations that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained interpolations are sketched. If omitted redraw is true. If you want to sketch flagged constrained interpolations several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all constrained interpolations flagged with flag in model m:

```
Interpolation.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of constrained interpolations in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing constrained interpolations should be counted. If false or omitted referenced but undefined constrained interpolations will also be included in the total.

Returns

number of constrained interpolations

Return type

Number

Example

To get the total number of constrained interpolations in model m:

```
var total = Interpolation.Total(m);
```

Unblank()

Description

Unblanks the constrained interpolation

Arguments

No arguments

Returns

No return value

Example

To unblank constrained interpolation c_i:

```
c_i.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained interpolations in model m:

```
Interpolation.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that the flagged constrained interpolations will be unblanked in

- **flag** (Flag)

Flag set on the constrained interpolations that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained interpolations in model m flagged with f:

```
Interpolation.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all constrained interpolations will be unset in

- **flag** (Flag)

Flag to unset on the constrained interpolations

Returns

No return value

Example

To unset the flag f on all the constrained interpolations in model m:

```
Interpolation.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the constrained interpolation.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained interpolation is unsketched. If omitted redraw is true. If you want to unsketch several constrained interpolations and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch constrained interpolation c_i:

```
c_i.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all constrained interpolations.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained interpolations are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained interpolations in model m:

```
Interpolation.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged constrained interpolations in the model.

Arguments

- **Model** (Model)

Model that all constrained interpolations will be unsketched in

- **flag** (Flag)

Flag set on the constrained interpolations that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained interpolations are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained interpolations flagged with flag in model m:

```
Interpolation.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Interpolation object.

Return type

Interpolation

Example

To check if Interpolation property c_i.example is a parameter by using the Interpolation.GetParameter() method:

```
if (c_i.ViewParameters().GetParameter(c_i.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for constrained interpolation. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for constrained interpolation c_i:

```
c_i.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this constrained interpolation.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for constrained interpolation c_i:

```
var xrefs = c_i.Xrefs();
```

---

toString()

Description

Creates a string containing the Interpolation data in keyword format. Note that this contains the keyword header and the keyword cards. See also Interpolation.Keyword() and Interpolation.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Interpolation c_i in keyword format

```
var s = c_i.toString();
```

InterpolationSpotweld (Spr3) class

The InterpolationSpotweld class gives you access to constrained Interpolation Spotweld (spr3) cards in PRIMER.
More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

InterpolationSpotweld constants

Constants for Flags for Interpolation

Name	Description
InterpolationSpotweld.INVERSE	Property INTP value EQ.2.0: Inverse distance weighting.
InterpolationSpotweld.LINEAR	Property INTP value EQ.0.0: Linear (default).
InterpolationSpotweld.UNIFORM	Property INTP value EQ.1.0: Uniform.

Constants for Material behaviour and damage model

Name	Description
InterpolationSpotweld.SPR3	SPR3 (default)
InterpolationSpotweld.SPR3_MAT_PARAM	SPR3 with selected material parameters as functions
InterpolationSpotweld.SPR3_MAT_PARAM_MOD	SPR3 with selected material parameters as functions and slight modification
InterpolationSpotweld.SPR4	SPR4
InterpolationSpotweld.SPR4_MAT_PARAM	SPR4 with selected material parameters as functions
InterpolationSpotweld.SPR4_MAT_PARAM_MOD	SPR4 with selected material parameters as functions and slight modification

InterpolationSpotweld properties

Name	Type	Description
alpha1	real/integer	Scaling factor alpha 1. Function ID if MODEL > 10.
alpha2	real	Plastic initiation displacement scaling factor alpha2.
alpha3	real	Plastic initiation displacement scaling factor alpha3.
bdmodel	real	Material behaviour and damage model. Values can be InterpolationSpotweld.SPR3, InterpolationSpotweld.SPR4, InterpolationSpotweld.SPR3_MAT_PARAM, InterpolationSpotweld.SPR4_MAT_PARAM, InterpolationSpotweld.SPR3_MAT_PARAM_MOD or InterpolationSpotweld.SPR4_MAT_PARAM_MOD
beta	real	Exponent for plastic potential beta 1. Function ID if MODEL > 10.
beta2	real	Exponent for plastic initiation displacement beta2.
beta3	real	Exponent for plastic initiation displacement beta3.
dens	real	Spotweld density (necessary for time step calculation).
exists (read only)	logical	true if constrained interpolation spotweld exists, false if referred to but not defined.
gamma	real	Scaling factor.
include	integer	The Include file number that the constrained interpolation spotweld is in.
intp	real	Flag for interpolation. Values can be InterpolationSpotweld.LINEAR, InterpolationSpotweld.UNIFORM or InterpolationSpotweld.INVERSE.
lcdexp	integer	Load curve ID for damage exponent vs. mode mixity
lcf	integer	Load curve ID describing force versus plastic displacement.
lcupf	integer	Load curve ID describing plastic initiation displacement versus mode mixity. Required only for material behaviour and damage models InterpolationSpotweld.SPR3, InterpolationSpotweld.SPR3_MAT_PARAM or InterpolationSpotweld.SPR3_MAT_PARAM_MOD.

lcupr	integer	Load curve ID describing plastic rupture displacement versus mode mixity. Required only for material behaviour and damage models InterpolationSpotweld.SPR3, InterpolationSpotweld.SPR3_MAT_PARAM or InterpolationSpotweld.SPR3_MAT_PARAM_MOD.
model (read only)	integer	The Model number that the interpolation spotweld is in.
mrn	real	Proportionality factor for dependency RN.
mrs	real	Proportionality factor for dependency RS.
nsid	integer	Node Set ID of spotweld location nodes.
pid1	integer	Part ID of first sheet.
pid2	integer	Part ID
pidvb	real	Part ID for visualization beams representing SPR3 in post-processing.
r	real	Spotweld Radius.
rn	real/integer	Tensile strength factor or negative Load curve with ID giving as a function of peel ratio . Function ID if MODEL > 10.
rs	real	Shear strength factor. Function ID if MODEL > 10.
scarn	real	Scale factor for tensile strength factor RN
scars	real	Scale factor for tensile strength factor RS
sropt	real	Shear rotation option.
stiff	real/integer	Elastic stiffness OR material ID if less than 0. Function ID if MODEL > 10.
stiff2	real	Elastic shear stiffness.
stiff3	real	Elastic bending stiffness.
stiff4	real	Elastic torsional stiffness.
thick	real	Total thickness of both sheets.
upfn	real	Plastic initiation displacement in normal direction.
upfs	real	Plastic initiation displacement in shear direction.
uprn	real	Plastic rupture displacement in normal direction.
uprs	real	Plastic rupture displacement in shear direction.

Detailed Description

The InterpolationSpotweld class allows you to create, modify, edit and manipulate constrained interpolation spotweld (spr3) cards. See the documentation below for more details.

For convenience "Spr3" can also be used as the class name instead of "InterpolationSpotweld".

Constructor

new InterpolationSpotweld(Model*[Model]*, pid1*[integer]*, pid2*[integer]*, nsid*[integer]*)

Description

Create a new InterpolationSpotweld object.

Arguments

- **Model** (Model)

Model that constrained interpolation spotweld will be created in

- **pid1** (integer)

Part ID of first sheet.

- **pid2** (integer)

Part ID of second sheet.

- **nsid** (integer)

Node Set ID of spotweld location nodes.

Returns

InterpolationSpotweld object

Return type

InterpolationSpotweld

Example

To create a new constrained interpolation spotweld in model m with first sheet 100, second sheet 200 and spotweld node set 100

```
var s = new InterpolationSpotweld(m, 100, 200, 100);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a interpolation spotweld.

Arguments

- **Comment** (Comment)

Comment that will be attached to the interpolation spotweld

Returns

No return value

Example

To associate comment c to the interpolation spotweld s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the interpolation spotweld

Arguments

No arguments

Returns

No return value

Example

To blank interpolation spotweld s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the interpolation spotwelds in model m:

```
InterpolationSpotweld.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that all the flagged interpolation spotwelds will be blanked in

- **flag** (Flag)

Flag set on the interpolation spotwelds that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the interpolation spotwelds in model m flagged with f:

```
InterpolationSpotweld.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the interpolation spotweld is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if interpolation spotweld s is blanked:

```
if (s.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the interpolation spotweld.

Arguments

- **flag** (Flag)

Flag to clear on the interpolation spotweld

Returns

No return value

Example

To clear flag f for interpolation spotweld s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the interpolation spotweld. The target include of the copied interpolation spotweld can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

InterpolationSpotweld object

Return type

InterpolationSpotweld

Example

To copy interpolation spotweld s into interpolation spotweld z:

```
var z = s.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a interpolation spotweld.

Arguments

- **Comment** (Comment)

Comment that will be detached from the interpolation spotweld

Returns

No return value

Example

To detach comment c from the interpolation spotweld s:

```
s.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for interpolation spotweld. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for interpolation spotweld s:

```
s.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first interpolation spotweld in the model.

Arguments

- **Model** (Model)

Model to get first interpolation spotweld in

Returns

InterpolationSpotweld object (or null if there are no interpolation spotwelds in the model).

Return type

InterpolationSpotweld

Example

To get the first interpolation spotweld in model m:

```
var s = InterpolationSpotweld.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the interpolation spotwelds in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds will be flagged in

- **flag** (Flag)

Flag to set on the interpolation spotwelds

Returns

No return value

Example

To flag all of the interpolation spotwelds with flag f in model m:

```
InterpolationSpotweld.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the interpolation spotweld is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the interpolation spotweld

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if interpolation spotweld s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each interpolation spotweld in the model.
Note that ForEach has been designed to make looping over interpolation spotwelds as fast as possible and so has some limitations.
Firstly, a single temporary InterpolationSpotweld object is created and on each function call it is updated with the current interpolation spotweld data. This means that you should not try to store the InterpolationSpotweld object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new interpolation spotwelds inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds are in

- **func** (function)

Function to call for each interpolation spotweld

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the interpolation spotwelds in model m:

```
InterpolationSpotweld.ForEach(m, test);
function test(s)
{
// s is InterpolationSpotweld object
}
```

To call function test for all of the interpolation spotwelds in model m with optional object:

```
var data = { x:0, y:0 };
InterpolationSpotweld.ForEach(m, test, data);
function test(s, extra)
{
// s is InterpolationSpotweld object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of InterpolationSpotweld objects for all of the interpolation spotwelds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interpolation spotwelds from

Returns

Array of InterpolationSpotweld objects

Return type

Array

Example

To make an array of InterpolationSpotweld objects for all of the interpolation spotwelds in model m

```
var s = InterpolationSpotweld.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a interpolation spotweld.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the interpolation spotweld s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of InterpolationSpotweld objects for all of the flagged interpolation spotwelds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interpolation spotwelds from

- **flag** (Flag)

Flag set on the interpolation spotwelds that you want to retrieve

Returns

Array of InterpolationSpotweld objects

Return type

Array

Example

To make an array of InterpolationSpotweld objects for all of the interpolation spotwelds in model m flagged with f

```
var s = InterpolationSpotweld.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the InterpolationSpotweld object for a interpolation spotweld ID.

Arguments

- **Model** (Model)

Model to find the interpolation spotweld in

- **number** (integer)

number of the interpolation spotweld you want the InterpolationSpotweld object for

Returns

InterpolationSpotweld object (or null if interpolation spotweld does not exist).

Return type

InterpolationSpotweld

Example

To get the InterpolationSpotweld object for interpolation spotweld 100 in model m

```
var s = InterpolationSpotweld.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a InterpolationSpotweld property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the InterpolationSpotweld.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

interpolation spotweld property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if InterpolationSpotweld property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if InterpolationSpotweld property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this interpolation spotweld (*CONSTRAINED_INTERPOLATION_SPOTWELD). **Note that a carriage return is not added**. See also InterpolationSpotweld.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for interpolation spotweld s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the interpolation spotweld. **Note that a carriage return is not added**. See also InterpolationSpotweld.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for interpolation spotweld s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last interpolation spotweld in the model.

Arguments

- **Model** (Model)

Model to get last interpolation spotweld in

Returns

InterpolationSpotweld object (or null if there are no interpolation spotwelds in the model).

Return type

InterpolationSpotweld

Example

To get the last interpolation spotweld in model m:

```
var s = InterpolationSpotweld.Last(m);
```

Next()

Description

Returns the next interpolation spotweld in the model.

Arguments

No arguments

Returns

InterpolationSpotweld object (or null if there are no more interpolation spotwelds in the model).

Return type

InterpolationSpotweld

Example

To get the interpolation spotweld in model m after interpolation spotweld s:

```
var s = s.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a interpolation spotweld.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only interpolation spotwelds from that model can be picked. If the argument is a Flag then only interpolation spotwelds that are flagged with *limit* can be selected. If omitted, or null, any interpolation spotwelds from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

InterpolationSpotweld object (or null if not picked)

Return type

InterpolationSpotweld

Example

To pick a interpolation spotweld from model m giving the prompt 'Pick interpolation spotweld from screen':

```
var s = InterpolationSpotweld.Pick('Pick interpolation spotweld from screen',
m);
```

Previous()

Description

Returns the previous interpolation spotweld in the model.

Arguments

No arguments

Returns

InterpolationSpotweld object (or null if there are no more interpolation spotwelds in the model).

Return type

InterpolationSpotweld

Example

To get the interpolation spotweld in model m before interpolation spotweld s:

```
var s = s.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select interpolation spotwelds using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting interpolation spotwelds

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only interpolation spotwelds from that model can be selected. If the argument is a Flag then only interpolation spotwelds that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any interpolation spotwelds can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of interpolation spotwelds selected or null if menu cancelled

Return type

Number

Example

To select interpolation spotwelds from model m, flagging those selected with flag f, giving the prompt 'Select interpolation spotwelds':

```
InterpolationSpotweld.Select(f, 'Select interpolation spotwelds', m);
```

To select interpolation spotwelds, flagging those selected with flag f but limiting selection to interpolation spotwelds flagged with flag l, giving the prompt 'Select interpolation spotwelds':

```
InterpolationSpotweld.Select(f, 'Select interpolation spotwelds', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the interpolation spotweld.

Arguments

- **flag** (Flag)

Flag to set on the interpolation spotweld

Returns

No return value

Example

To set flag f for interpolation spotweld s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the interpolation spotweld. The interpolation spotweld will be sketched until you either call InterpolationSpotweld.Unsketch(), InterpolationSpotweld.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the interpolation spotweld is sketched. If omitted redraw is true. If you want to sketch several interpolation spotwelds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch interpolation spotweld s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged interpolation spotwelds in the model. The interpolation spotwelds will be sketched until you either call InterpolationSpotweld.Unsketch(), InterpolationSpotweld.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged interpolation spotwelds will be sketched in

- **flag** (Flag)

Flag set on the interpolation spotwelds that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the interpolation spotwelds are sketched. If omitted redraw is true. If you want to sketch flagged interpolation spotwelds several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all interpolation spotwelds flagged with flag in model m:

```
InterpolationSpotweld.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing interpolation spotwelds should be counted. If false or omitted referenced but undefined interpolation spotwelds will also be included in the total.

Returns

number of interpolation spotwelds

Return type

Number

Example

To get the total number of interpolation spotwelds in model m:

```
var total = InterpolationSpotweld.Total(m);
```

Unblank()

Description

Unblanks the interpolation spotweld

Arguments

No arguments

Returns

No return value

Example

To unblank interpolation spotweld s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the interpolation spotwelds in model m:

```
InterpolationSpotweld.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that the flagged interpolation spotwelds will be unblanked in

- **flag** (Flag)

Flag set on the interpolation spotwelds that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the interpolation spotwelds in model m flagged with f:

```
InterpolationSpotweld.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all interpolation spotwelds will be unset in

- **flag** (Flag)

Flag to unset on the interpolation spotwelds

Returns

No return value

Example

To unset the flag f on all the interpolation spotwelds in model m:

```
InterpolationSpotweld.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the interpolation spotweld.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the interpolation spotweld is unsketched. If omitted redraw is true. If you want to unsketch several interpolation spotwelds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch interpolation spotweld s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all interpolation spotwelds.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the interpolation spotwelds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all interpolation spotwelds in model m:

```
InterpolationSpotweld.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged interpolation spotwelds in the model.

Arguments

- **Model** (Model)

Model that all interpolation spotwelds will be unsketched in

- **flag** (Flag)

Flag set on the interpolation spotwelds that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the interpolation spotwelds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all interpolation spotwelds flagged with flag in model m:

```
InterpolationSpotweld.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

InterpolationSpotweld object.

Return type

InterpolationSpotweld

Example

To check if InterpolationSpotweld property s.example is a parameter by using the InterpolationSpotweld.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for interpolation spotweld. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for interpolation spotweld s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this interpolation spotweld.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for interpolation spotweld s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the interpolation spotweld data in keyword format. Note that this contains the keyword header and the keyword cards. See also InterpolationSpotweld.Keyword() and InterpolationSpotweld.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for interpolation spotweld s in keyword format

```
var str = s.toString();
```

Joint class

The Joint class gives you access to constrained joint cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Joint constants

Name	Description
Joint.CONSTANT_VELOCITY	CONSTANT_VELOCITY is *CONSTRAINED_JOINT_CONSTANT_VELOCITY.
Joint.CYLINDRICAL	CYLINDRICAL is *CONSTRAINED_JOINT_CYLINDRICAL.
Joint.GEARS	GEARS is *CONSTRAINED_JOINT_GEARS.
Joint.LOCKING	LOCKING is *CONSTRAINED_JOINT_LOCKING.
Joint.PLANAR	PLANAR is *CONSTRAINED_JOINT_PLANAR.
Joint.PULLEY	PULLEY is *CONSTRAINED_JOINT_PULLEY.
Joint.RACK_AND_PINION	RACK_AND_PINION is *CONSTRAINED_JOINT_RACK_AND_PINION.
Joint.REVOLUTE	REVOLUTE is *CONSTRAINED_JOINT_REVOLUTE.
Joint.ROTATIONAL_MOTOR	ROTATIONAL_MOTOR is *CONSTRAINED_JOINT_ROTATIONAL_MOTOR.
Joint.SCREW	SCREW is *CONSTRAINED_JOINT_SCREW.
Joint.SPHERICAL	SPHERICAL is *CONSTRAINED_JOINT_SPHERICAL.
Joint.TRANSLATIONAL	TRANSLATIONAL is *CONSTRAINED_JOINT_TRANSLATIONAL.
Joint.TRANSLATIONAL_MOTOR	TRANSLATIONAL_MOTOR is *CONSTRAINED_JOINT_TRANSLATIONAL_MOTOR.
Joint.UNIVERSAL	UNIVERSAL is *CONSTRAINED_JOINT_UNIVERSAL.

Joint properties

Name	Type	Description
cid	integer	Coordinate system number.
colour	Colour	The colour of the joint
coupl	real	Coupling between force and moment failure.
damp	real	Damping scale factor.
exists (read only)	logical	true if constrained joint exists, false if referred to but not defined.
failure	logical	true if _FAILURE option is set, false if not.
h_angle	real	Helix angle for gears.
heading	string	Constrained joint heading.
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the constrained joint is in.
jid	integer	Constrained joint number (identical to label).
label	integer	Constrained joint number.
lcid	integer	Loadcuve number.
local	logical	true if _LOCAL option is set, false if not.

lst	integer	Local system type is accelerometer if lst is 1, rigid body if 0.
model (read only)	integer	The Model number that the joint is in.
mxx	real	Torsional moment resultant at failure.
myy	real	Moment resultant at failure.
mzz	real	Moment resultant at failure.
n1	integer	Node number 1.
n2	integer	Node number 2.
n3	integer	Node number 3.
n4	integer	Node number 4.
n5	integer	Node number 5.
n6	integer	Node number 6.
nxx	real	Axial force resultant at failure.
nyy	real	Force resultant at failure.
nzz	real	Force resultant at failure.
option	constant	The Constrained Joint option. Can be: Joint.SPHERICAL, Joint.REVOLUTE, Joint.CYLINDRICAL, Joint.PLANAR, Joint.UNIVERSAL, Joint.TRANSLATIONAL, Joint.LOCKING, Joint.TRANSLATIONAL_MOTOR, Joint.ROTATIONAL_MOTOR, Joint.GEARS, Joint.RACK_AND_PINION, Joint.CONSTANT_VELOCITY, Joint.PULLEY or Joint.SCREW
parm	real	Parameter for function.
r1	real	Gear and pulley radius.
raid	integer	Rigid body or accelerometer number.
rps	real	Relative penalty stiffness.
tfail	real	Time for joint failure.
type	integer	Flag for motor type.

Detailed Description

The Joint class allows you to create, modify, edit and manipulate constrained joint cards. See the documentation below for more details.

Constructor

new Joint(Model*[Model]*, options *[object]*)

Description

Create a new Joint object

Arguments

- **Model** (Model)

Model that constrained joint will be created in

- **options** (object)

Options for creating the joint

Object has the following properties:

Name	Type	Description
heading (optional)	string	Constrained joint title
id (optional)	integer	Constrained joint ID. If omitted, the joint will be created without the _ID option
nodes	array	Array of Node IDs for the joint. At least 2 nodes must be given
type	constant	Constrained joint type (any)

Returns

Joint object

Return type

Joint

Example

To create a new constrained joint 500 called "test spherical joint" of type _SPHERICAL in model m with nodes 50 and 150

```
var j = new Joint(m, { type: Joint.SPHERICAL, nodes: [50, 150], id: 500,
heading: "test spherical joint" } );
```

To create a new constrained joint 500 called "test revolute joint" of type _REVOLUTE in model m with nodes 50, 100, 150 and 200

```
var j = new Joint(m, { type: Joint.REVOLUTE, nodes: [50, 100, 150, 200], id:
500, heading: "test revolute joint" } );
```

To create a new constrained joint 500 called "test translational joint" of type _TRANSLATIONAL in model m with nodes 50, 100, 150, 200, 250 and 300

```
var j = new Joint(m, { type: Joint.TRANSLATIONAL, nodes: [50, 100, 150, 200,
250, 300], id: 500, heading: "test translational joint" } );
```

new Joint(Model*[Model]*, option*[constant]*, n1*[integer]*, n2*[integer]*, jid (optional)*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Joint object.

Arguments

- **Model** (Model)

Model that constrained joint will be created in

- **option** (constant)

Constrained joint type (any).

- **n1** (integer)

Node 1.

- **n2** (integer)

Node 2.

- **jid (optional)** (integer)

Constrained joint number.

- **heading (optional)** (string)

Constrained joint title.

Returns

Joint object

Return type

Joint

Example

To create a new constrained joint 500 called "test spherical joint" of type _SPHERICAL in model m with nodes 50 and 150

```
var j = new Joint(m, Joint.SPHERICAL, 50, 150, 500, "test spherical joint");
```

To create a new constrained joint 500 called "test revolute joint" of type _REVOLUTE in model m with nodes 50, 100, 150 and 200

```
var j = new Joint(m, Joint.REVOLUTE, 50, 100, 500, "test revolute joint");
j.n3 = 150;
j.n4 = 200;
```

new Joint(Model*[Model]*, option*[constant]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*, jid (optional)*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Joint object.

Arguments

- **Model** (Model)

Model that constrained joint will be created in

- **option** (constant)

Constrained joint type. Can be Joint.REVOLUTE, Joint.CYLINDRICAL, Joint.PLANAR, Joint.UNIVERSAL or Joint.TRANSLATIONAL_MOTOR.

- **n1** (integer)

Node 1.

- **n2** (integer)

Node 2.

- **n3** (integer)

Node 3.

- **n4** (integer)

Node 4.

- **jid (optional)** (integer)

Constrained joint number.

- **heading (optional)** (string)

Constrained joint title.

Returns

Joint object

Return type

Joint

Example

To create a new constrained joint 500 called "test revolute joint" of type _REVOLUTE in model m with nodes 50, 100, 150 and 200

```
var j = new Joint(m, Joint.REVOLUTE, 50, 100, 150, 200, 500, "test revolute joint");
```

new Joint(Model*[Model]*, option*[constant]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*, n5*[integer]*, n6*[integer]*, jid (optional)*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Joint object.

Arguments

- **Model** (Model)

Model that constrained joint will be created in

- **option** (constant)

Constrained joint type. Can be Joint.TRANSLATIONAL, Joint.LOCKING, Joint.ROTATIONAL_MOTOR, Joint.GEARS, Joint.RACK_AND_PINION, Joint.CONSTANT_VELOCITY, Joint.PULLEY or Joint.SCREW.

- **n1** (integer)

Node 1.

- **n2** (integer)

Node 2.

- **n3** (integer)

Node 3.

- **n4** (integer)

Node 4.

- **n5** (integer)

Node 5.

- **n6** (integer)

Node 6.

- **jid (optional)** (integer)

Constrained joint number.

- **heading (optional)** (string)

Constrained joint title.

Returns

Joint object

Return type

Joint

Example

To create a new constrained joint 500 called "test translational joint" of type _TRANSLATIONAL in model m with nodes 50, 100, 150, 300, 250 and 300

```
var j = new Joint(m, Joint.TRANSLATIONAL, 50, 100, 150, 200, 250, 300, 500,
"test translational joint");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a joint.

Arguments

- **Comment** (Comment)

Comment that will be attached to the joint

Returns

No return value

Example

To associate comment c to the joint j:

```
j.AssociateComment(c);
```

Blank()

Description

Blanks the joint

Arguments

No arguments

Returns

No return value

Example

To blank joint j:

```
j.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the joints in the model.

Arguments

- **Model** (Model)

Model that all joints will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the joints in model m:

```
Joint.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged joints in the model.

Arguments

- **Model** (Model)

Model that all the flagged joints will be blanked in

- **flag** (Flag)

Flag set on the joints that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the joints in model m flagged with f:

```
Joint.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the joint is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if joint j is blanked:

```
if (j.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse joint j:

```
j.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the joint.

Arguments

- **flag** (Flag)

Flag to clear on the joint

Returns

No return value

Example

To clear flag f for joint j:

```
j.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the joint. The target include of the copied joint can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Joint object

Return type

Joint

Example

To copy joint j into joint z:

```
var z = j.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a joint.

Arguments

- **Model** (Model)

Model that the joint will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Joint object (or null if not made)

Return type

Joint

Example

To start creating a joint in model n:

```
var j = Joint.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a joint.

Arguments

- **Comment** (Comment)

Comment that will be detached from the joint

Returns

No return value

Example

To detach comment c from the joint j:

```
j.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit joint j:

```
j.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for joint. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for joint j:

```
j.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for joint.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the joint colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the joint.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing joint j:

```
var colour = j.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first joint in the model.

Arguments

- **Model** (Model)

Model to get first joint in

Returns

Joint object (or null if there are no joints in the model).

Return type

Joint

Example

To get the first joint in model m:

```
var j = Joint.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free joint label in the model. Also see Joint.LastFreeLabel(), Joint.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free joint label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Joint label.

Return type

Number

Example

To get the first free joint label in model m:

```
var label = Joint.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the joints in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all joints will be flagged in

- **flag** (Flag)

Flag to set on the joints

Returns

No return value

Example

To flag all of the joints with flag f in model m:

```
Joint.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the joint is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the joint

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if joint j has flag f set on it:

```
if (j.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each joint in the model.
Note that ForEach has been designed to make looping over joints as fast as possible and so has some limitations. Firstly, a single temporary Joint object is created and on each function call it is updated with the current joint data. This means that you should not try to store the Joint object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new joints inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all joints are in

- **func** (function)

Function to call for each joint

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the joints in model m:

```
Joint.ForEach(m, test);
function test(j)
{
// j is Joint object
}
```

To call function test for all of the joints in model m with optional object:

```
var data = { x:0, y:0 };
Joint.ForEach(m, test, data);
function test(j, extra)
{
// j is Joint object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Joint objects for all of the joints in a model in PRIMER

Arguments

- **Model** (Model)

Model to get joints from

Returns

Array of Joint objects

Return type

Array

Example

To make an array of Joint objects for all of the joints in model m

```
var j = Joint.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a joint.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the joint j:

```
var comm_array = j.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Joint objects for all of the flagged joints in a model in PRIMER

Arguments

- **Model** (Model)

Model to get joints from

- **flag** (Flag)

Flag set on the joints that you want to retrieve

Returns

Array of Joint objects

Return type

Array

Example

To make an array of Joint objects for all of the joints in model m flagged with f

```
var j = Joint.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Joint object for a joint ID.

Arguments

- **Model** (Model)

Model to find the joint in

- **number** (integer)

number of the joint you want the Joint object for

Returns

Joint object (or null if joint does not exist).

Return type

Joint

Example

To get the Joint object for joint 100 in model m

```
var j = Joint.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Joint property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Joint.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

joint property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Joint property j.example is a parameter:

```
Options.property_parameter_names = true;
if (j.GetParameter(j.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Joint property j.example is a parameter by using the GetParameter method:

```
if (j.ViewParameters().GetParameter(j.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this joint (*CONSTRAINED_JOINT). **Note that a carriage return is not added**. See also Joint.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for joint j:

```
var key = j.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the joint. **Note that a carriage return is not added**. See also Joint.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for joint j:

```
var cards = j.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last joint in the model.

Arguments

- **Model** (Model)

Model to get last joint in

Returns

Joint object (or null if there are no joints in the model).

Return type

Joint

Example

To get the last joint in model m:

```
var j = Joint.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free joint label in the model. Also see Joint.FirstFreeLabel(), Joint.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free joint label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Joint label.

Return type

Number

Example

To get the last free joint label in model m:

```
var label = Joint.LastFreeLabel(m);
```

Next()

Description

Returns the next joint in the model.

Arguments

No arguments

Returns

Joint object (or null if there are no more joints in the model).

Return type

Joint

Example

To get the joint in model m after joint j:

```
var j = j.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) joint label in the model. Also see Joint.FirstFreeLabel(), Joint.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free joint label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Joint label.

Return type

Number

Example

To get the next free joint label in model m:

```
var label = Joint.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a joint.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only joints from that model can be picked. If the argument is a Flag then only joints that are flagged with *limit* can be selected. If omitted, or null, any joints from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Joint object (or null if not picked)

Return type

Joint

Example

To pick a joint from model m giving the prompt 'Pick joint from screen':

```
var j = Joint.Pick('Pick joint from screen', m);
```

Previous()

Description

Returns the previous joint in the model.

Arguments

No arguments

Returns

Joint object (or null if there are no more joints in the model).

Return type

Joint

Example

To get the joint in model m before joint j:

```
var j = j.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the joints in the model.

Arguments

- **Model** (Model)

Model that all joints will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the joints in model m, from 1000000:

```
Joint.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged joints in the model.

Arguments

- **Model** (Model)

Model that all the flagged joints will be renumbered in

- **flag** (Flag)

Flag set on the joints that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the joints in model m flagged with f, from 1000000:

```
Joint.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select joints using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting joints

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only joints from that model can be selected. If the argument is a Flag then only joints that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any joints can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of joints selected or null if menu cancelled

Return type

Number

Example

To select joints from model m, flagging those selected with flag f, giving the prompt 'Select joints':

```
Joint.Select(f, 'Select joints', m);
```

To select joints, flagging those selected with flag f but limiting selection to joints flagged with flag l, giving the prompt 'Select joints':

```
Joint.Select(f, 'Select joints', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the joint.

Arguments

- **flag** (Flag)

Flag to set on the joint

Returns

No return value

Example

To set flag f for joint j:

```
j.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the joint. The joint will be sketched until you either call Joint.Unsketch(), Joint.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint is sketched. If omitted redraw is true. If you want to sketch several joints and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch joint j:

```
j.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged joints in the model. The joints will be sketched until you either call Joint.Unsketch(), Joint.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged joints will be sketched in

- **flag** (Flag)

Flag set on the joints that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joints are sketched. If omitted redraw is true. If you want to sketch flagged joints several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all joints flagged with flag in model m:

```
Joint.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of joints in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing joints should be counted. If false or omitted referenced but undefined joints will also be included in the total.

Returns

number of joints

Return type

Number

Example

To get the total number of joints in model m:

```
var total = Joint.Total(m);
```

Unblank()

Description

Unblanks the joint

Arguments

No arguments

Returns

No return value

Example

To unblank joint j:

```
j.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the joints in the model.

Arguments

- **Model** (Model)

Model that all joints will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the joints in model m:

```
Joint.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged joints in the model.

Arguments

- **Model** (Model)

Model that the flagged joints will be unblanked in

- **flag** (Flag)

Flag set on the joints that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the joints in model m flagged with f:

```
Joint.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the joints in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all joints will be unset in

- **flag** (Flag)

Flag to unset on the joints

Returns

No return value

Example

To unset the flag f on all the joints in model m:

```
Joint.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the joint.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint is unsketched. If omitted redraw is true. If you want to unsketch several joints and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch joint j:

```
j.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all joints.

Arguments

- **Model** (Model)

Model that all joints will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joints are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all joints in model m:

```
Joint.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged joints in the model.

Arguments

- **Model** (Model)

Model that all joints will be unsketched in

- **flag** (Flag)

Flag set on the joints that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joints are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all joints flagged with flag in model m:

```
Joint.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Joint object.

Return type

Joint

Example

To check if Joint property j.example is a parameter by using the Joint.GetParameter() method:

```
if (j.ViewParameters().GetParameter(j.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for joint. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for joint j:

```
j.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this joint.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for joint j:

```
var xrefs = j.Xrefs();
```

---

toString()

Description

Creates a string containing the joint data in keyword format. Note that this contains the keyword header and the keyword cards. See also Joint.Keyword() and Joint.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for joint j in keyword format

```
var s = j.toString();
```

JointStiffness (Jstf) class

The JointStiffness class gives you access to constrained joint stiffness cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

JointStiffness constants

Name	Description
JointStiffness.CYLINDRICAL	JointStiffness is *CONSTRAINED_JOINT_STIFFNESS_CYLINDRICAL.
JointStiffness.FLEXION_ TORSION	JointStiffness is *CONSTRAINED_JOINT_STIFFNESS_ FLEXION-TORSION.
JointStiffness.GENERALIZED	JointStiffness is *CONSTRAINED_JOINT_STIFFNESS_GENERALIZED.
JointStiffness.TRANSLATIONAL	JointStiffness is *CONSTRAINED_JOINT_STIFFNESS_TRANSLATIONAL.

JointStiffness properties

Name	Type	Description
cida	integer	Coordinate System ID #A.
cidb	integer	Coordinate System ID #B.
dlcidal	integer	LC: Alpha damping moment vs Rotl vel.
dlcidbt	integer	LC: Beta damping moment vs Rotl vel.
dlcidg	integer	LC: Gamma damping factor vs factor on Alpha damping moment.
dlcidp	integer	LC: P damping vs P rel velocity.
dlcidph	integer	LC: Phi damping moment vs rotation vel.
dlcidps	integer	LC: Psi damping moment vs rotation vel.
dlcidr	integer	LC: R damping vs R rel velocity.
dlcidt	integer	LC: Theta damping moment vs rotation vel.
dlcidx	integer	LC: X damping vs X rel velocity.
dlcidy	integer	LC: Y damping vs Y rel velocity.
dlcidz	integer	LC: Z damping vs Z rel velocity.
esal	real	Stiffness/angle in Alpha direction.
esbt	real	Stiffness/angle in Beta direction.
esph	real	Stiffness/angle in Phi direction.
esps	real	Stiffness/angle in Psi direction.
esr	real	Elastic stiffness for R stop and friction.
est	real	Stiffness/angle in Theta direction.
esx	real	Elastic stiffness for X stop and friction.
esy	real	Elastic stiffness for Y stop and friction.
esz	real	Elastic stiffness for Z stop and friction.
exists (read only)	logical	true if jstf exists, false if referred to but not defined.
fd	real	Dynamic friction coefficient.
ffr	integer	LC: Lim R force, or yield force vs R translation.
ffx	integer	LC: Lim X force, or yield force vs X translation.
ffy	integer	LC: Lim Y force, or yield force vs Y translation.
ffz	integer	LC: Lim Z force, or yield force vs Z translation.

fmal	integer	LC: Alpha Frictional moment vs rotation.
fmbt	integer	LC: Beta Frictional moment vs rotation.
fmph	integer	LC: Psi frictional moment vs rotation.
fmps	integer	LC: Psi frictional moment vs rotation.
fmt	integer	LC: Theta frictional moment vs rotation.
fs	real	Static friction coefficient.
heading	string	This property is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. JointStiffness heading. Use the title property instead [deprecated]
include	integer	The Include file number that the jstf is in.
jid	integer	Joint for restraint/table uses.
jsid	integer	ID of the JointStiffness. Also see the label property which is an alternative name for this
label	integer	Label of the JointStiffness
lcidal	integer	LC: Alpha moment vs Rotation.
lcidbt	integer	LC: Beta moment vs Rotation.
lcidg	integer	LC: Gamma angle vs factor on Alpha blending.
lcidph	integer	LC: Phi moment vs rotation.
lcidps	integer	LC: Psi moment vs rotation.
lcidr	integer	LC: R force vs R rel displ.
lcidt	integer	LC: Theta moment vs rotation.
lcidx	integer	LC: X force vs X rel displ.
lcidy	integer	LC: Y force vs Y rel displ.
lcidz	integer	LC: Z force vs Z rel displ.
model (read only)	integer	The Model number that the joint stiffness is in.
nsabt	real	Stop angle for -ve Beta rotation.
nsaph	real	Stop angle for -ve Phi rotation.
nsaps	real	Stop angle for -ve Psi rotation.
nsat	real	Stop angle for -ve Theta rotation.
nsdx	real	Limiting -ve X translation.
nsdy	real	Limiting -ve Y translation.
nsdz	real	Limiting -ve Z translation.
option	constant	JointStiffness type. Can be JointStiffness.GENERALIZED, JointStiffness.FLEXION_TORSION, JointStiffness.TRANSLATIONAL or JointStiffness.CYLINDRICAL
pida	integer	Part ID #A.
pidb	integer	Part ID #B.
psabt	real	Stop angle for +ve Beta rotation.
psaph	real	Stop angle for +ve Phi rotation.
psaps	real	Stop angle for +ve Psi rotation.
psat	real	Stop angle for +ve Theta rotation.
psdr	real	Limiting R translation.

psdx	real	Limiting +ve X translation.
psdy	real	Limiting +ve Y translation.
psdz	real	Limiting +ve Z translation.
rad1	real	Radius of pin.
rad2	real	Radius of hole.
rps	real	Relative penalty stiffness.
saal	real	Stop angle for Alpha rotation.
title	string	JointStiffness title

Detailed Description

The JointStiffness class allows you to create, modify, edit and manipulate joint stiffness cards. See the documentation below for more details.

For convenience "Jstf" can also be used as the class name instead of "JointStiffness".

Constructor

new JointStiffness(Model*[Model]*, options *[object]*)

Description

Create a new JointStiffness object. The fields on card 1 of the joint stiffness can be set in the constructor using the option argument. To set any other values use properties.

Arguments

- **Model** (Model)

Model that the joint stiffness will be created in

- **options** (object)

Options for creating the joint stiffness

Object has the following properties:

Name	Type	Description
cida (optional)	integer	Coordinate System ID #A
cidb (optional)	integer	Coordinate System ID #B
id	integer	Joint stiffness ID
jid (optional)	integer	Joint for restraint/table uses
option	constant	Constrained joint stiffness option. Can be JointStiffness.GENERALIZED, JointStiffness.FLEXION_TORSION, JointStiffness.TRANSLATIONAL or JointStiffness.CYLINDRICAL
pida (optional)	integer	Part ID #A
pidb (optional)	integer	Part ID #B
rps (optional)	real	Relative penalty stiffness (for JointStiffness.TRANSLATIONAL or JointStiffness.CYLINDRICAL)
title (optional)	string	Joint stiffness title

Returns

JointStiffness object

Return type

JointStiffness

Example

To create a new joint stiffness 500 with title "test" of type GENERALIZED in model m with rigid body parts 50 and 150 and lcidph 10

```
var j = new JointStiffness(m, { type: JointStiffness.GENERALIZED, id: 500, pida:
50, pidb: 50, title: "test" } );
j.lcidph = 10;
```

new JointStiffness(Model*[Model]*, option*[constant]*, label*[integer]*, pida*[integer]*, pidb*[integer]*, cida*[integer]*, cidb*[integer]*, jid*[integer]*, lcidph*[integer]*, lcidt*[integer]*, lcidps*[integer]*, dlcidph*[integer]*, dlcidt*[integer]*, dlcidps*[integer]*, esph*[real]*, fmph*[integer]*, est*[real]*, fmt*[integer]*, esps*[real]*, fmps*[integer]*, nsaph*[real]*, psaph*[real]*, nsat*[real]*, psat*[real]*, nsaps*[real]*, psaps*[real]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new JointStiffness object for *CONSTRAINED_JOINT_STIFFNESS_GENERALIZED.

Arguments

- **Model** (Model)

Model that jstf will be created in

- **option** (constant)

Must be JointStiffness.GENERALIZED.

- **label** (integer)

JointStiffness ID of the JSTF. Also see the label argument which is an alternative name for this.

- **pida** (integer)

Part ID #A.

- **pidb** (integer)

Part ID #B.

- **cida** (integer)

Coordinate System ID #A.

- **cidb** (integer)

Coordinate System ID #B.

- **jid** (integer)

Joint for restraint/table uses.

- **lcidph** (integer)

LC: Phi moment vs rotation.

- **lcidt** (integer)

LC: Theta moment vs rotation.

- **lcidps** (integer)

LC: Psi moment vs rotation.

- **dlcidph** (integer)

LC: Phi damping moment vs rotation vel.

- **dlcidt** (integer)

LC: Theta damping moment vs rotation vel.

- **dlcidps** (integer)

LC: Psi damping moment vs rotation vel.

- **esph** (real)

Stiffness/angle in Phi direction.

- **fmph** (integer)

LC: Psi frictional moment vs rotation.

- **est** (real)

Stiffness/angle in Theta direction.

- **fmt** (integer)

LC: Theta frictional moment vs rotation.

- **esps** (real)

Stiffness/angle in Psi direction.

- **fmps** (integer)

LC: Psi frictional moment vs rotation.

- **nsaph** (real)

Stop angle for -ve Phi rotation.

- **psaph** (real)

Stop angle for +ve Phi rotation.

- **nsat** (real)

Stop angle for -ve Theta rotation.

- **psat** (real)

Stop angle for +ve Theta rotation.

- **nsaps** (real)

Stop angle for -ve Psi rotation.

- **psaps** (real)

Stop angle for +ve Psi rotation.

Returns

JointStiffness object

Return type

JointStiffness

Example

To create a new jstf 1000 of type GENERALIZED in model m with the following specifiction: pida, pidb, cida, cidb, jid are 91, 92, 81, 82, 71 respectively; lcidph, lcidt, lcidps, dlcidph, dlcidt, dlcidps are 1, 2, 3, 4, 5, 6 respectively; esph, fmph, est, fmt, esps, fmps are 11.0, 11, 12.0, 12, 13.0, 13 respectively; nsaph, psaph, nsat, psat, nsaps, psaps are -20, 20, -30, 30, -40, 40 respectively.

```
var j = new JointStiffness(m, JointStiffness.GENERALIZED, 1000, 91, 92, 81, 82,
71, 1, 2, 3, 4, 5, 6, 11.0, 11, 12.0, 12, 13.0, 13, -20, 20, -30, 30, -40, 40);
```

new JointStiffness(Model*[Model]*, option*[constant]*, label*[integer]*, pida*[integer]*, pidb*[integer]*, cida*[integer]*, cidb*[integer]*, jid*[integer]*, lcidal*[integer]*, lcidg*[integer]*, lcidbt*[integer]*, dlcidal*[integer]*, dlcidg*[integer]*, dlcidbt*[integer]*, esal*[real]*, fmal*[integer]*, esbt*[real]*, fmbt*[integer]*, saal*[real]*, nsabt*[real]*, psabt*[real]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new JointStiffness object for *CONSTRAINED_JOINT_STIFFNESS_FLEXION-TORSION.

Arguments

- **Model** (Model)

Model that jstf will be created in

- **option** (constant)

Must be JointStiffness.FLEXION_TORSION.

- **label** (integer)

JointStiffness ID of the JSTF. Also see the label argument which is an alternative name for this.

- **pida** (integer)

Part ID #A.

- **pidb** (integer)

Part ID #B.

- **cida** (integer)

Coordinate System ID #A.

- **cidb** (integer)

Coordinate System ID #B.

- **jid** (integer)

Joint for restraint/table uses.

- **lcidal** (integer)

LC: Alpha moment vs Rotation.

- **lcidg** (integer)

LC: Gamma angle vs factor on Alpha blending.

- **lcidbt** (integer)

LC: Beta moment vs Rotation.

- **dlcidal** (integer)

LC: Alpha damping moment vs Rotl vel.

- **dlcidg** (integer)

LC: Gamma damping factor vs factor on Alpha damping moment.

- **dlcidbt** (integer)

LC: Beta damping moment vs Rotl vel.

- **esal** (real)

Stiffness/angle in Alpha direction.

- **fmal** (integer)

LC: Alpha Frictional moment vs rotation.

- **esbt** (real)

Stiffness/angle in Beta direction.

- **fmbt** (integer)

LC: Beta Frictional moment vs rotation.

- **saal** (real)

Stop angle for Alpha rotation.

- **nsabt** (real)

Stop angle for -ve Beta rotation.

- **psabt** (real)

Stop angle for +ve Beta rotation.

Returns

JointStiffness object

Return type

JointStiffness

Example

To create a new jstf 2000 of type GENERALIZED in model m with the following specifiction: pida, pidb, cida, cidb, jid are 81, 82, 71, 72, 61 respectively; lcidal, lcidg, lcidbt, dlcidal, dlcidg, dlcidbt are 1, 2, 3, 4, 5, 6 respectively; esal, fmal, esbt, fmbt are 11.5, 12, 12.5, 13 respectively; saal, nsabt, psabt are 22.5, 25.0, 27.5 respectively.

```
var j = new JointStiffness(m, JointStiffness.FLEXION_TORSION, 2000, 81, 82, 71,
72, 61, 1, 2, 3, 4, 5, 6, 11.5, 12, 12.5, 13, 22.5, 25.0, 27.5);
```

new JointStiffness(Model*[Model]*, option*[constant]*, label*[integer]*, pida*[integer]*, pidb*[integer]*, cida*[integer]*, cidb*[integer]*, jid*[integer]*, rps*[real]*, lcidx*[integer]*, lcidy*[integer]*, lcidz*[integer]*, dlcidx*[integer]*, dlcidy*[integer]*, dlcidz*[integer]*, esx*[real]*, ffx*[integer]*, esy*[real]*, ffy*[integer]*, esz*[real]*, ffz*[integer]*, nsdx*[real]*, psdx*[real]*, nsdy*[real]*, psdy*[real]*, nsdz*[real]*, psdz*[real]*, fs*[real]*, fd*[real]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new JointStiffness object for *CONSTRAINED_JOINT_STIFFNESS_TRANSLATIONAL.

Arguments

- **Model** (Model)

Model that jstf will be created in

- **option** (constant)

Must be JointStiffness.TRANSLATIONAL.

- **label** (integer)

JointStiffness ID of the JSTF. Also see the label argument which is an alternative name for this.

- **pida** (integer)

Part ID #A.

- **pidb** (integer)

Part ID #B.

- **cida** (integer)

Coordinate System ID #A.

- **cidb** (integer)

Coordinate System ID #B.

- **jid** (integer)

Joint for restraint/table uses.

- **rps** (real)

Relative penalty stiffness.

- **lcidx** (integer)

LC: X force vs X rel displ.

- **lcidy** (integer)

LC: Y force vs Y rel displ.

- **lcidz** (integer)

LC: Z force vs Z rel displ.

- **dlcidx** (integer)

LC: X damping vs X rel velocity.

- **dlcidy** (integer)

LC: Y damping vs Y rel velocity.

- **dlcidz** (integer)

LC: Z damping vs Z rel velocity.

- **esx** (real)

Elastic stiffness for X stop and friction.

- **ffx** (integer)

LC: Lim X force, or yield force vs X translation.

- **esy** (real)

Elastic stiffness for Y stop and friction.

- **ffy** (integer)

LC: Lim Y force, or yield force vs Y translation.

- **esz** (real)

Elastic stiffness for Z stop and friction.

- **ffz** (integer)

LC: Lim Z force, or yield force vs Z translation.

- **nsdx** (real)

Limiting -ve X translation.

- **psdx** (real)

Limiting +ve X translation.

- **nsdy** (real)

Limiting -ve Y translation.

- **psdy** (real)

Limiting +ve Y translation.

- **nsdz** (real)

Limiting -ve Z translation.

- **psdz** (real)

Limiting +ve Z translation.

- **fs** (real)

Static friction coefficient.

- **fd** (real)

Dynamic friction coefficient.

Returns

JointStiffness object

Return type

JointStiffness

Example

To create a new jstf 3000 of type TRANSLATIONAL in model m with the following specifiction: pida, pidb, cida, cidb, jid, rps are 71, 72, 61, 62, 51, 2 respectively; lcidx, lcidy, lcidz, dlcidx, dlcidy, dlcidz are 1, 2, 3, 4, 5, 6 respectively; esx, ffx, esy, ffy, esz, ffz are are 12.5, 13, 13.5, 14, 14.5, 15 respectively; nsdx, psdx, nsdy, psdy, nsdz, psdz, fs, fd are -30, 30, -40, 40, -50, 50, 0.2, 0.1 respectively.

```
var j = new JointStiffness(m, JointStiffness.TRANSLATIONAL, 3000, 71, 72, 61,
62, 51, 2, 1, 2, 3, 4, 5, 6, 12.5, 13, 13.5, 14, 14.5, 15, -30, 30, -40, 40,
-50, 50, 0.2, 0.1);
```

new JointStiffness(Model*[Model]*, option*[constant]*, label*[integer]*, pida*[integer]*, pidb*[integer]*, cida*[integer]*, cidb*[integer]*, jid*[integer]*, rps*[real]*, lcidr*[integer]*, lcidz*[integer]*, dlcidr*[integer]*, dlcidp*[integer]*, dlcidz*[integer]*, lcidt*[integer]*, dlcidt*[integer]*, esr*[real]*, ffr*[integer]*, esz*[real]*, ffz*[integer]*, rad1*[real]*, rad2*[real]*, psdr*[real]*, nsdz*[real]*, psdz*[real]*, fs*[real]*, fd*[real]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new JointStiffness object for *CONSTRAINED_JOINT_STIFFNESS_CYLINDRICAL.

Arguments

- **Model** (Model)

Model that jstf will be created in

- **option** (constant)

Must be JointStiffness.CYLINDRICAL.

- **label** (integer)

JointStiffness ID of the JSTF. Also see the label argument which is an alternative name for this.

- **pida** (integer)

Part ID #A.

- **pidb** (integer)

Part ID #B.

- **cida** (integer)

Coordinate System ID #A.

- **cidb** (integer)

Coordinate System ID #B.

- **jid** (integer)

Joint for restraint/table uses.

- **rps** (real)

Relative penalty stiffness.

- **lcidr** (integer)

LC: R force vs R rel displ.

- **lcidz** (integer)

LC: Z force vs Z rel displ.

- **dlcidr** (integer)

LC: R damping vs R rel velocity.

- **dlcidp** (integer)

LC: P damping vs P rel velocity.

- **dlcidz** (integer)

LC: Z damping vs Z rel velocity.

- **lcidt** (integer)

LC: Theta moment vs rotation.

- **dlcidt** (integer)

LC: Theta damping moment vs rotation vel.

- **esr** (real)

Elastic stiffness for R stop and friction.

- **ffr** (integer)

LC: Lim R force, or yield force vs R translation.

- **esz** (real)

Elastic stiffness for Z stop and friction.

- **ffz** (integer)

LC: Lim Z force, or yield force vs Z translation.

- **rad1** (real)

Radius of pin.

- **rad2** (real)

Radius of hole.

- **psdr** (real)

Limiting R translation.

- **nsdz** (real)

Limiting -ve Z translation.

- **psdz** (real)

Limiting +ve Z translation.

- **fs** (real)

Static friction coefficient.

- **fd** (real)

Dynamic friction coefficient.

Returns

JointStiffness object

Return type

JointStiffness

Example

To create a new jstf 4000 of type CYLINDRICAL in model m with the following specifiction: pida, pidb, cida, cidb, jid, rps are 61, 62, 51, 52, 41, 2 respectively; lcidr, lcidz, dlcidr, dlcidp, dlcidz, lcidt, dlcidt are 1, 2, 3, 4, 5, 6, 7 respectively; esr, ffr, esz, ffz, rad1, rad2 are are 12.5, 13, 13.5, 14, 14.5, 15.5 respectively; psdr, nsdz, psdz, fs, fd are 30, -40, 50, 0.2, 0.1 respectively.

```
var j = new JointStiffness(m, JointStiffness.CYLINDRICAL, 4000, 61, 62, 51, 52, 41, 2, 1, 2, 3, 4, 5, 6, 7, 12.5, 13, 13.5, 14, 14.5, 15.5, 30, -40, 50, 0.2, 0.1);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a joint stiffness.

Arguments

- **Comment** (Comment)

Comment that will be attached to the joint stiffness

Returns

No return value

Example

To associate comment c to the joint stiffness js:

```
js.AssociateComment(c);
```

Blank()

Description

Blanks the joint stiffness

Arguments

No arguments

Returns

No return value

Example

To blank joint stiffness js:

```
js.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the joint stiffnesses in model m:

```
JointStiffness.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all the flagged joint stiffnesses will be blanked in

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the joint stiffnesses in model m flagged with f:

```
JointStiffness.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the joint stiffness is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if joint stiffness js is blanked:

```
if (js.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse joint stiffness js:

```
js.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the joint stiffness.

Arguments

- **flag** (Flag)

Flag to clear on the joint stiffness

Returns

No return value

Example

To clear flag f for joint stiffness js:

```
js.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the joint stiffness. The target include of the copied joint stiffness can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

JointStiffness object

Return type

JointStiffness

Example

To copy joint stiffness js into joint stiffness z:

```
var z = js.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a jstf.

Arguments

- **Model** (Model)

Model that the jstf will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

JointStiffness object (or null if not made)

Return type

JointStiffness

Example

To start creating a jstf in model m:

```
var m = JointStiffness.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a joint stiffness.

Arguments

- **Comment** (Comment)

Comment that will be detached from the joint stiffness

Returns

No return value

Example

To detach comment c from the joint stiffness js:

```
js.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit joint stiffness js:

```
js.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for joint stiffness. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for joint stiffness js:

```
js.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first joint stiffness in the model.

Arguments

- **Model** (Model)

Model to get first joint stiffness in

Returns

JointStiffness object (or null if there are no joint stiffnesses in the model).

Return type

JointStiffness

Example

To get the first joint stiffness in model m:

```
var js = JointStiffness.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free joint stiffness label in the model. Also see JointStiffness.LastFreeLabel(), JointStiffness.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free joint stiffness label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

JointStiffness label.

Return type

Number

Example

To get the first free joint stiffness label in model m:

```
var label = JointStiffness.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the joint stiffnesses in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be flagged in

- **flag** (Flag)

Flag to set on the joint stiffnesses

Returns

No return value

Example

To flag all of the joint stiffnesses with flag f in model m:

```
JointStiffness.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the joint stiffness is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the joint stiffness

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if joint stiffness js has flag f set on it:

```
if (js.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each joint stiffness in the model.
Note that ForEach has been designed to make looping over joint stiffnesses as fast as possible and so has some limitations.
Firstly, a single temporary JointStiffness object is created and on each function call it is updated with the current joint stiffness data. This means that you should not try to store the JointStiffness object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new joint stiffnesses inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all joint stiffnesses are in

- **func** (function)

Function to call for each joint stiffness

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the joint stiffnesses in model m:

```
JointStiffness.ForEach(m, test);
function test(js)
{
// js is JointStiffness object
}
```

To call function test for all of the joint stiffnesses in model m with optional object:

```
var data = { x:0, y:0 };
JointStiffness.ForEach(m, test, data);
function test(js, extra)
{
// js is JointStiffness object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of JointStiffness objects for all of the joint stiffnesses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get joint stiffnesses from

Returns

Array of JointStiffness objects

Return type

Array

Example

To make an array of JointStiffness objects for all of the joint stiffnesses in model m

```
var js = JointStiffness.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a joint stiffness.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the joint stiffness js:

```
var comm_array = js.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of JointStiffness objects for all of the flagged joint stiffnesses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get joint stiffnesses from

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to retrieve

Returns

Array of JointStiffness objects

Return type

Array

Example

To make an array of JointStiffness objects for all of the joint stiffnesses in model m flagged with f

```
var js = JointStiffness.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the JointStiffness object for a joint stiffness ID.

Arguments

- **Model** (Model)

Model to find the joint stiffness in

- **number** (integer)

number of the joint stiffness you want the JointStiffness object for

Returns

JointStiffness object (or null if joint stiffness does not exist).

Return type

JointStiffness

Example

To get the JointStiffness object for joint stiffness 100 in model m

```
var js = JointStiffness.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a JointStiffness property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the JointStiffness.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

joint stiffness property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if JointStiffness property js.example is a parameter:

```
Options.property_parameter_names = true;
if (js.GetParameter(js.example) ) do_something...
Options.property_parameter_names = false;
```

To check if JointStiffness property js.example is a parameter by using the GetParameter method:

```
if (js.ViewParameters().GetParameter(js.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this jstf (*CONSTRAINED_JOINT_STIFFNESS). **Note that a carriage return is not added**. See also JointStiffness.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for jstf n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the jstf. **Note that a carriage return is not added**. See also JointStiffness.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for jstf n:

```
var cards = n.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last joint stiffness in the model.

Arguments

- **Model** (Model)

Model to get last joint stiffness in

Returns

JointStiffness object (or null if there are no joint stiffnesses in the model).

Return type

JointStiffness

Example

To get the last joint stiffness in model m:

```
var js = JointStiffness.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free joint stiffness label in the model. Also see JointStiffness.FirstFreeLabel(), JointStiffness.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free joint stiffness label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

JointStiffness label.

Return type

Number

Example

To get the last free joint stiffness label in model m:

```
var label = JointStiffness.LastFreeLabel(m);
```

Next()

Description

Returns the next joint stiffness in the model.

Arguments

No arguments

Returns

JointStiffness object (or null if there are no more joint stiffnesses in the model).

Return type

JointStiffness

Example

To get the joint stiffness in model m after joint stiffness js:

```
var js = js.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) joint stiffness label in the model. Also see JointStiffness.FirstFreeLabel(), JointStiffness.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free joint stiffness label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

JointStiffness label.

Return type

Number

Example

To get the next free joint stiffness label in model m:

```
var label = JointStiffness.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a joint stiffness.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only joint stiffnesses from that model can be picked. If the argument is a Flag then only joint stiffnesses that are flagged with *limit* can be selected. If omitted, or null, any joint stiffnesses from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

JointStiffness object (or null if not picked)

Return type

JointStiffness

Example

To pick a joint stiffness from model m giving the prompt 'Pick joint stiffness from screen':

```
var js = JointStiffness.Pick('Pick joint stiffness from screen', m);
```

Previous()

Description

Returns the previous joint stiffness in the model.

Arguments

No arguments

Returns

JointStiffness object (or null if there are no more joint stiffnesses in the model).

Return type

JointStiffness

Example

To get the joint stiffness in model m before joint stiffness js:

```
var js = js.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the joint stiffnesses in model m, from 1000000:

```
JointStiffness.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all the flagged joint stiffnesses will be renumbered in

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the joint stiffnesses in model m flagged with f, from 1000000:

```
JointStiffness.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select joint stiffnesses using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting joint stiffnesses

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only joint stiffnesses from that model can be selected. If the argument is a Flag then only joint stiffnesses that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any joint stiffnesses can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of joint stiffnesses selected or null if menu cancelled

Return type

Number

Example

To select joint stiffnesses from model m, flagging those selected with flag f, giving the prompt 'Select joint stiffnesses':

```
JointStiffness.Select(f, 'Select joint stiffnesses', m);
```

To select joint stiffnesses, flagging those selected with flag f but limiting selection to joint stiffnesses flagged with flag l, giving the prompt 'Select joint stiffnesses':

```
JointStiffness.Select(f, 'Select joint stiffnesses', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the joint stiffness.

Arguments

- **flag** (Flag)

Flag to set on the joint stiffness

Returns

No return value

Example

To set flag f for joint stiffness js:

```
js.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the joint stiffness. The joint stiffness will be sketched until you either call JointStiffness.Unsketch(), JointStiffness.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint stiffness is sketched. If omitted redraw is true. If you want to sketch several joint stiffnesses and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch joint stiffness js:

```
js.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged joint stiffnesses in the model. The joint stiffnesses will be sketched until you either call JointStiffness.Unsketch(), JointStiffness.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged joint stiffnesses will be sketched in

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint stiffnesses are sketched. If omitted redraw is true. If you want to sketch flagged joint stiffnesses several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all joint stiffnesses flagged with flag in model m:

```
JointStiffness.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing joint stiffnesses should be counted. If false or omitted referenced but undefined joint stiffnesses will also be included in the total.

Returns

number of joint stiffnesses

Return type

Number

Example

To get the total number of joint stiffnesses in model m:

```
var total = JointStiffness.Total(m);
```

Unblank()

Description

Unblanks the joint stiffness

Arguments

No arguments

Returns

No return value

Example

To unblank joint stiffness js:

```
js.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the joint stiffnesses in model m:

```
JointStiffness.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that the flagged joint stiffnesses will be unblanked in

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the joint stiffnesses in model m flagged with f:

```
JointStiffness.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all joint stiffnesses will be unset in

- **flag** (Flag)

Flag to unset on the joint stiffnesses

Returns

No return value

Example

To unset the flag f on all the joint stiffnesses in model m:

```
JointStiffness.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the joint stiffness.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint stiffness is unsketched. If omitted redraw is true. If you want to unsketch several joint stiffnesses and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch joint stiffness js:

```
js.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all joint stiffnesses.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint stiffnesses are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all joint stiffnesses in model m:

```
JointStiffness.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged joint stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all joint stiffnesses will be unsketched in

- **flag** (Flag)

Flag set on the joint stiffnesses that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the joint stiffnesses are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all joint stiffnesses flagged with flag in model m:

```
JointStiffness.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

JointStiffness object.

Return type

JointStiffness

Example

To check if JointStiffness property js.example is a parameter by using the JointStiffness.GetParameter() method:

```
if (js.ViewParameters().GetParameter(js.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for joint stiffness. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for joint stiffness js:

```
js.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this joint stiffness.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for joint stiffness js:

```
var xrefs = js.Xrefs();
```

---

toString()

Description

Creates a string containing the jstf data in keyword format. Note that this contains the keyword header and the keyword cards. See also JointStiffness.Keyword() and JointStiffness.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for jstf n in keyword format

```
var s = n.toString();
```

Linear class

The Linear class gives you access to define *CONSTRAINED_LINEAR cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Linear constants

Name	Description
Linear.GLOBAL	CNST is *CONSTRAINED_LINEAR_GLOBAL.
Linear.LOCAL	CNST is *CONSTRAINED_LINEAR_LOCAL.

Linear properties

Name	Type	Description
exists (read only)	logical	true if Linear exists, false if referred to but not defined.
format	constant	The Constrained Linear option. Can be Linear.GLOBAL or Linear.LOCAL.
include	integer	The Include file number that the Linear is in.
lcid	integer	Linear label
model (read only)	integer	The Model number that the constrained linear is in.
total (read only)	integer	Number of degree-of-freedom cards.

Detailed Description

The Linear class allows you to create, modify, edit and manipulate *CONSTRAINED_LINEAR cards. See the documentation below for more details.

Constructor

new Linear(Model*[Model]*, format*[constant]*, lcid*[integer]*, nid*[integer]*, dof*[integer]*, coeff*[real]*, cid (optional)*[integer]*)

Description

Create a new Linear object.

Arguments

- **Model** (Model)

Model that Linear will be created in

- **format** (constant)

Specify the type of constrained linear. Can be Linear.GLOBAL or Linear.LOCAL)

- **lcid** (integer)

Linear label

- **nid** (integer)

Node id.

- **dof** (integer)

Degrees-of-Freedom.

- **coeff** (real)

Non-zero coefficient.

- **cid (optional)** (integer)

Coordinate System ID if format is Linear.LOCAL. The default value is 0.

Returns

Linear object

Return type

Linear

Example

To create a new constrained linear in model m of type LOCAL with lcid 1, nid 1, dof 3, coeff 0.5 and cid 2

```
var c_l = new Linear(m,Linear.LOCAL,1,1,3,0.5,2);
```

Details of functions

AddRowData(nid*[integer]*, dof*[integer]*, coeff*[real]*, cid (optional)*[integer]*)

Description

Used to add additional independent card 2 to the keyword. Adds this data to the end of the selected *CONSTRAINED_LINEAR

Arguments

- **nid** (integer)

Node id.

- **dof** (integer)

Degrees-of-Freedom.

- **coeff** (real)

Non-zero coefficient.

- **cid (optional)** (integer)

Coordinate System ID if format is Linear.LOCAL. The default value is 0.

Returns

No return value

Example

To add NID 10 to the keyword c_l with dof 4, coeff 1.3, cid 2:

```
c_l.AddRowData(10,4,1.3,2);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a constrained linear.

Arguments

- **Comment** (Comment)

Comment that will be attached to the constrained linear

Returns

No return value

Example

To associate comment c to the constrained linear c_l:

```
c_l.AssociateComment(c);
```

Blank()

Description

Blanks the constrained linear

Arguments

No arguments

Returns

No return value

Example

To blank constrained linear c_l:

```
c_l.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the constrained linears in the model.

Arguments

- **Model** (Model)

Model that all constrained linears will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained linears in model m:

```
Linear.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged constrained linears in the model.

Arguments

- **Model** (Model)

Model that all the flagged constrained linears will be blanked in

- **flag** (Flag)

Flag set on the constrained linears that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the constrained linears in model m flagged with f:

```
Linear.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the constrained linear is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if constrained linear c_l is blanked:

```
if (c_l.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse constrained linear c_l:

```
c_l.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the constrained linear.

Arguments

- **flag** (Flag)

Flag to clear on the constrained linear

Returns

No return value

Example

To clear flag f for constrained linear c_l:

```
c_l.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the constrained linear. The target include of the copied constrained linear can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Linear object

Return type

Linear

Example

To copy constrained linear c_l into constrained linear z:

```
var z = c_l.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a Linear.

Arguments

- **Model** (Model)

Model that the constrainedLinear will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Linear object (or null if not made)

Return type

Linear

Example

To start creating a constrainedLinear in model m:

```
var c_l = Linear.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a constrained linear.

Arguments

- **Comment** (Comment)

Comment that will be detached from the constrained linear

Returns

No return value

Example

To detach comment c from the constrained linear c_l:

```
c_l.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit constrained linear c_l:

```
c_l.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for constrained linear. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for constrained linear c_l:

```
c_l.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first constrained linear in the model.

Arguments

- **Model** (Model)

Model to get first constrained linear in

Returns

Linear object (or null if there are no constrained linears in the model).

Return type

Linear

Example

To get the first constrained linear in model m:

```
var c_l = Linear.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free constrained linear label in the model. Also see Linear.LastFreeLabel(), Linear.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free constrained linear label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Linear label.

Return type

Number

Example

To get the first free constrained linear label in model m:

```
var label = Linear.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the constrained linears in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all constrained linears will be flagged in

- **flag** (Flag)

Flag to set on the constrained linears

Returns

No return value

Example

To flag all of the constrained linears with flag f in model m:

```
Linear.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the constrained linear is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the constrained linear

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if constrained linear c_l has flag f set on it:

```
if (c_l.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each constrained linear in the model.
Note that ForEach has been designed to make looping over constrained linears as fast as possible and so has some limitations.
Firstly, a single temporary Linear object is created and on each function call it is updated with the current constrained linear data. This means that you should not try to store the Linear object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new constrained linears inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all constrained linears are in

- **func** (function)

Function to call for each constrained linear

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the constrained linears in model m:

```
Linear.ForEach(m, test);
function test(c_l)
{
// c_l is Linear object
}
```

To call function test for all of the constrained linears in model m with optional object:

```
var data = { x:0, y:0 };
Linear.ForEach(m, test, data);
function test(c_l, extra)
{
// c_l is Linear object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Linear objects for all of the constrained linears in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained linears from

Returns

Array of Linear objects

Return type

Array

Example

To make an array of Linear objects for all of the constrained linears in model m

```
var c_l = Linear.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a constrained linear.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the constrained linear c_l:

```
var comm_array = c_l.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Linear objects for all of the flagged constrained linears in a model in PRIMER

Arguments

- **Model** (Model)

Model to get constrained linears from

- **flag** (Flag)

Flag set on the constrained linears that you want to retrieve

Returns

Array of Linear objects

Return type

Array

Example

To make an array of Linear objects for all of the constrained linears in model m flagged with f

```
var c_l = Linear.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Linear object for a constrained linear ID.

Arguments

- **Model** (Model)

Model to find the constrained linear in

- **number** (integer)

number of the constrained linear you want the Linear object for

Returns

Linear object (or null if constrained linear does not exist).

Return type

Linear

Example

To get the Linear object for constrained linear 100 in model m

```
var c_l = Linear.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Linear property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Linear.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

constrained linear property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Linear property c_l.example is a parameter:

```
Options.property_parameter_names = true;
if (c_l.GetParameter(c_l.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Linear property c_l.example is a parameter by using the GetParameter method:

```
if (c_l.ViewParameters().GetParameter(c_l.example) ) do_something...
```

GetRowData(row_index*[Integer]*)

Description

Returns independent card 2 for the selected row of the *CONSTRAINED_LINEAR.

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Linear.total

Returns

Array containing data.

Return type

Array

Example

To loop over all the lines of the keyword for c_l:

```
for (i=0; i<c_l.total; i++)
        var data = c_l.GetRowData(i);
```

Keyword()

Description

Returns the keyword for this Linear (*constrained_linear). **Note that a carriage return is not added**. See also Linear.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Linear c_l:

```
var key = c_l.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Linear. **Note that a carriage return is not added**. See also Linear.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Linear c_l:

```
var cards = c_l.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last constrained linear in the model.

Arguments

- **Model** (Model)

Model to get last constrained linear in

Returns

Linear object (or null if there are no constrained linears in the model).

Return type

Linear

Example

To get the last constrained linear in model m:

```
var c_l = Linear.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free constrained linear label in the model. Also see Linear.FirstFreeLabel(), Linear.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free constrained linear label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Linear label.

Return type

Number

Example

To get the last free constrained linear label in model m:

```
var label = Linear.LastFreeLabel(m);
```

Next()

Description

Returns the next constrained linear in the model.

Arguments

No arguments

Returns

Linear object (or null if there are no more constrained linears in the model).

Return type

Linear

Example

To get the constrained linear in model m after constrained linear c_l:

```
var c_l = c_l.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) constrained linear label in the model. Also see Linear.FirstFreeLabel(), Linear.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free constrained linear label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Linear label.

Return type

Number

Example

To get the next free constrained linear label in model m:

```
var label = Linear.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a constrained linear.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained linears from that model can be picked. If the argument is a Flag then only constrained linears that are flagged with *limit* can be selected. If omitted, or null, any constrained linears from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Linear object (or null if not picked)

Return type

Linear

Example

To pick a constrained linear from model m giving the prompt 'Pick constrained linear from screen':

```
var c_l = Linear.Pick('Pick constrained linear from screen', m);
```

Previous()

Description

Returns the previous constrained linear in the model.

Arguments

No arguments

Returns

Linear object (or null if there are no more constrained linears in the model).

Return type

Linear

Example

To get the constrained linear in model m before constrained linear c_l:

```
var c_l = c_l.Previous();
```

RemoveRowData(row_index*[Integer]*)

Description

Removes an independent card 2 for the selected row on the *CONSTRAINED_LINEAR.

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Linear.total

Returns

No return value.

Example

To remove row 2 for c_l:

```
c_l.RemoveRowData(1);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the constrained linears in the model.

Arguments

- **Model** (Model)

Model that all constrained linears will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the constrained linears in model m, from 1000000:

```
Linear.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged constrained linears in the model.

Arguments

- **Model** (Model)

Model that all the flagged constrained linears will be renumbered in

- **flag** (Flag)

Flag set on the constrained linears that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the constrained linears in model m flagged with f, from 1000000:

```
Linear.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select constrained linears using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting constrained linears

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only constrained linears from that model can be selected. If the argument is a Flag then only constrained linears that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any constrained linears can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of constrained linears selected or null if menu cancelled

Return type

Number

Example

To select constrained linears from model m, flagging those selected with flag f, giving the prompt 'Select constrained linears':

```
Linear.Select(f, 'Select constrained linears', m);
```

To select constrained linears, flagging those selected with flag f but limiting selection to constrained linears flagged with flag l, giving the prompt 'Select constrained linears':

```
Linear.Select(f, 'Select constrained linears', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the constrained linear.

Arguments

- **flag** (Flag)

Flag to set on the constrained linear

Returns

No return value

Example

To set flag f for constrained linear c_l:

```
c_l.SetFlag(f);
```

SetRowData(row_index*[Integer]*, nid*[integer]*, dof*[integer]*, coeff*[real]*, cid (optional)*[integer]*)

Description

Used to reset values in already existing card 2 in the selected row of *CONSTRAINED_LINEAR

Arguments

- **row_index** (Integer)

The row index of the data to return. **Note that indices start at 0, not 1**.
0 <= row_index < Linear.total

- **nid** (integer)

Node id.

- **dof** (integer)

Degrees-of-Freedom.

- **coeff** (real)

Non-zero coefficient.

- **cid (optional)** (integer)

Coordinate System ID if format is Linear.LOCAL. The default value is 0.

Returns

No return value

Example

To reset the values of row 3 of the keyword with NID 11, dof 2, coeff 3.2, cid 4:

```
c_l.SetRowData(2,11,2,3.2,4);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the constrained linear. The constrained linear will be sketched until you either call Linear.Unsketch(), Linear.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained linear is sketched. If omitted redraw is true. If you want to sketch several constrained linears and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch constrained linear c_l:

```
c_l.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged constrained linears in the model. The constrained linears will be sketched until you either call Linear.Unsketch(), Linear.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged constrained linears will be sketched in

- **flag** (Flag)

Flag set on the constrained linears that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained linears are sketched. If omitted redraw is true. If you want to sketch flagged constrained linears several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all constrained linears flagged with flag in model m:

```
Linear.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of constrained linears in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing constrained linears should be counted. If false or omitted referenced but undefined constrained linears will also be included in the total.

Returns

number of constrained linears

Return type

Number

Example

To get the total number of constrained linears in model m:

```
var total = Linear.Total(m);
```

Unblank()

Description

Unblanks the constrained linear

Arguments

No arguments

Returns

No return value

Example

To unblank constrained linear c_l:

```
c_l.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the constrained linears in the model.

Arguments

- **Model** (Model)

Model that all constrained linears will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained linears in model m:

```
Linear.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged constrained linears in the model.

Arguments

- **Model** (Model)

Model that the flagged constrained linears will be unblanked in

- **flag** (Flag)

Flag set on the constrained linears that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the constrained linears in model m flagged with f:

```
Linear.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the constrained linears in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all constrained linears will be unset in

- **flag** (Flag)

Flag to unset on the constrained linears

Returns

No return value

Example

To unset the flag f on all the constrained linears in model m:

```
Linear.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the constrained linear.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained linear is unsketched. If omitted redraw is true. If you want to unsketch several constrained linears and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch constrained linear c_l:

```
c_l.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all constrained linears.

Arguments

- **Model** (Model)

Model that all constrained linears will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained linears are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained linears in model m:

```
Linear.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged constrained linears in the model.

Arguments

- **Model** (Model)

Model that all constrained linears will be unsketched in

- **flag** (Flag)

Flag set on the constrained linears that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the constrained linears are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all constrained linears flagged with flag in model m:

```
Linear.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Linear object.

Return type

Linear

Example

To check if Linear property c_l.example is a parameter by using the Linear.GetParameter() method:

```
if (c_l.ViewParameters().GetParameter(c_l.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for constrained linear. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for constrained linear c_l:

```
c_l.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this constrained linear.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for constrained linear c_l:

```
var xrefs = c_l.Xrefs();
```

---

toString()

Description

Creates a string containing the Linear data in keyword format. Note that this contains the keyword header and the keyword cards. See also Linear.Keyword() and Linear.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Linear c_l in keyword format

```
var s = c_l.toString();
```

NodalRigidBody (Nrb) class

The NodalRigidBody class gives you access to define nodal rigid body cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

NodalRigidBody properties

Name	Type	Description
cid	integer	Coordinate system ID
cmo	integer	Centre of mass option
colour	Colour	The colour of the nrb
con1	integer	First retraint parameter
con2	integer	Second retraint parameter
drflag	integer	Displacement release flag
exists (read only)	logical	true if nrb exists, false if referred to but not defined.
idthrm	integer	Flag for the thermal constraint
include	integer	The Include file number that the nrb is in.
inertia	logical	Flag to turn on or off _INERTIA option
iprt	integer	Print flag
ixx	real	Ixx component of inertia tensor
ixy	real	Ixy component of inertia tensor
ixz	real	Ixz component of inertia tensor
iyy	real	Iyy component of inertia tensor
iyz	real	Iyz component of inertia tensor
izz	real	Izz component of inertia tensor
label	integer	NodalRigidBody ID of the NRB. Also see the pid property which is an alternative name for this.
model (read only)	integer	The Model number that the nodal rigid body is in.
nodeid	integer	Optional node point
nsid	integer	Nodal set ID
override	logical	Flag to turn on or off _OVERRIDE option
pid	integer	NodalRigidBody ID of the NRB. Also see the label property which is an alternative name for this.
pnode	integer	Optional nodal point
rrflag	integer	Rotation release flag
spc	logical	Flag to turn on or off _SPC option
thermal	logical	Flag to turn on or off _THERMAL option
tm	real	Translational mass
vrx	real	X rigid body rotational velocity
vry	real	Y rigid body rotational velocity
vrz	real	Z rigid body rotational velocity
vtx	real	X rigid body translational velocity
vty	real	Y rigid body translational velocity

vtz	real	Z rigid body translational velocity
xc	real	X coordinate centre of mass
xl	real	X coordinate of local x axis
xlip	real	X coordinate of local in plane vector
yc	real	Y coordinate centre of mass
yl	real	Y coordinate of local x axis
ylip	real	Y coordinate of local in plane vector
zc	real	Z coordinate centre of mass
zl	real	Z coordinate of local x axis
zlip	real	Z coordinate of local in plane vector

Detailed Description

The NodalRigidBody class allows you to create, modify, edit and manipulate nodal rigid body cards. See the documentation below for more details.

For convenience "Nrb" can also be used as the class name instead of "NodalRigidBody".

Constructor

new NodalRigidBody(Model*[Model]*, nsid*[integer]*, pid (optional)*[integer]*, cid (optional)*[integer]*, pnode (optional)*[integer]*, iprt (optional)*[integer]*, drflag (optional)*[integer]*, rrflag (optional)*[integer]*)

Description

Create a new NodalRigidBody object.

Arguments

- **Model** (Model)

Model that nrb will be created in

- **nsid** (integer)

Nodal set ID

- **pid (optional)** (integer)

NodalRigidBody ID of the NRB. Also see the label property which is an alternative name for this.

- **cid (optional)** (integer)

Coordinate system ID

- **pnode (optional)** (integer)

Optional nodal point

- **iprt (optional)** (integer)

Print flag

- **drflag (optional)** (integer)

Displacement release flag

- **rrflag (optional)** (integer)

Rotation release flag

Returns

NodalRigidBody object

Return type

NodalRigidBody

Example

To create a new nrb in model m with label 200, using node set 50

```
var v = new NodalRigidBody(m, 50, 200);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a nodal rigid body.

Arguments

- **Comment** (Comment)

Comment that will be attached to the nodal rigid body

Returns

No return value

Example

To associate comment c to the nodal rigid body nrb:

```
nrb.AssociateComment(c);
```

Blank()

Description

Blanks the nodal rigid body

Arguments

No arguments

Returns

No return value

Example

To blank nodal rigid body nrb:

```
nrb.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodal rigid bodies in model m:

```
NodalRigidBody.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all the flagged nodal rigid bodies will be blanked in

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodal rigid bodies in model m flagged with f:

```
NodalRigidBody.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the nodal rigid body is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if nodal rigid body nrb is blanked:

```
if (nrb.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse nodal rigid body nrb:

```
nrb.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the nodal rigid body.

Arguments

- **flag** (Flag)

Flag to clear on the nodal rigid body

Returns

No return value

Example

To clear flag f for nodal rigid body nrb:

```
nrb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the nodal rigid body. The target include of the copied nodal rigid body can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

NodalRigidBody object

Return type

NodalRigidBody

Example

To copy nodal rigid body nrb into nodal rigid body z:

```
var z = nrb.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a nrb.

Arguments

- **Model** (Model)

Model that the nrb will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

NodalRigidBody object (or null if not made)

Return type

NodalRigidBody

Example

To start creating a nrb in model m:

```
var m = NodalRigidBody.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a nodal rigid body.

Arguments

- **Comment** (Comment)

Comment that will be detached from the nodal rigid body

Returns

No return value

Example

To detach comment c from the nodal rigid body nrb:

```
nrb.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit nodal rigid body nrb:

```
nrb.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for nodal rigid body. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for nodal rigid body nrb:

```
nrb.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for nodal rigid body.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the nodal rigid body colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the nodal rigid body.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing nodal rigid body nrb:

```
var colour = nrb.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first nodal rigid body in the model.

Arguments

- **Model** (Model)

Model to get first nodal rigid body in

Returns

NodalRigidBody object (or null if there are no nodal rigid bodies in the model).

Return type

NodalRigidBody

Example

To get the first nodal rigid body in model m:

```
var nrb = NodalRigidBody.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free nodal rigid body label in the model. Also see NodalRigidBody.LastFreeLabel(), NodalRigidBody.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free nodal rigid body label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

NodalRigidBody label.

Return type

Number

Example

To get the first free nodal rigid body label in model m:

```
var label = NodalRigidBody.FirstFreeLabel(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the nodal rigid bodies in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be flagged in

- **flag** (Flag)

Flag to set on the nodal rigid bodies

Returns

No return value

Example

To flag all of the nodal rigid bodies with flag f in model m:

```
NodalRigidBody.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the nodal rigid body is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the nodal rigid body

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if nodal rigid body nrb has flag f set on it:

```
if (nrb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each nodal rigid body in the model.
Note that ForEach has been designed to make looping over nodal rigid bodies as fast as possible and so has some limitations.
Firstly, a single temporary NodalRigidBody object is created and on each function call it is updated with the current nodal rigid body data. This means that you should not try to store the NodalRigidBody object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new nodal rigid bodies inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies are in

- **func** (function)

Function to call for each nodal rigid body

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the nodal rigid bodies in model m:

```
NodalRigidBody.ForEach(m, test);
function test(nrb)
{
// nrb is NodalRigidBody object
}
```

To call function test for all of the nodal rigid bodies in model m with optional object:

```
var data = { x:0, y:0 };
NodalRigidBody.ForEach(m, test, data);
function test(nrb, extra)
{
// nrb is NodalRigidBody object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of NodalRigidBody objects for all of the nodal rigid bodies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodal rigid bodies from

Returns

Array of NodalRigidBody objects

Return type

Array

Example

To make an array of NodalRigidBody objects for all of the nodal rigid bodies in model m

```
var nrb = NodalRigidBody.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a nodal rigid body.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the nodal rigid body nrb:

```
var comm_array = nrb.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of NodalRigidBody objects for all of the flagged nodal rigid bodies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodal rigid bodies from

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to retrieve

Returns

Array of NodalRigidBody objects

Return type

Array

Example

To make an array of NodalRigidBody objects for all of the nodal rigid bodies in model m flagged with f

```
var nrb = NodalRigidBody.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the NodalRigidBody object for a nodal rigid body ID.

Arguments

- **Model** (Model)

Model to find the nodal rigid body in

- **number** (integer)

number of the nodal rigid body you want the NodalRigidBody object for

Returns

NodalRigidBody object (or null if nodal rigid body does not exist).

Return type

NodalRigidBody

Example

To get the NodalRigidBody object for nodal rigid body 100 in model m

```
var nrb = NodalRigidBody.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a NodalRigidBody property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the NodalRigidBody.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

nodal rigid body property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if NodalRigidBody property nrb.example is a parameter:

```
Options.property_parameter_names = true;
if (nrb.GetParameter(nrb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if NodalRigidBody property nrb.example is a parameter by using the GetParameter method:

```
if (nrb.ViewParameters().GetParameter(nrb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this nrb (*CONSTRAINED_NODAL_RIGID_BODY_xxxx). **Note that a carriage return is not added**. See also NodalRigidBody.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for nrb n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the nrb. **Note that a carriage return is not added**. See also NodalRigidBody.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for nrb n:

```
var cards = n.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last nodal rigid body in the model.

Arguments

- **Model** (Model)

Model to get last nodal rigid body in

Returns

NodalRigidBody object (or null if there are no nodal rigid bodies in the model).

Return type

NodalRigidBody

Example

To get the last nodal rigid body in model m:

```
var nrb = NodalRigidBody.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free nodal rigid body label in the model. Also see NodalRigidBody.FirstFreeLabel(), NodalRigidBody.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free nodal rigid body label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

NodalRigidBody label.

Return type

Number

Example

To get the last free nodal rigid body label in model m:

```
var label = NodalRigidBody.LastFreeLabel(m);
```

Next()

Description

Returns the next nodal rigid body in the model.

Arguments

No arguments

Returns

NodalRigidBody object (or null if there are no more nodal rigid bodies in the model).

Return type

NodalRigidBody

Example

To get the nodal rigid body in model m after nodal rigid body nrb:

```
var nrb = nrb.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) nodal rigid body label in the model. Also see NodalRigidBody.FirstFreeLabel(), NodalRigidBody.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free nodal rigid body label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

NodalRigidBody label.

Return type

Number

Example

To get the next free nodal rigid body label in model m:

```
var label = NodalRigidBody.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a nodal rigid body.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodal rigid bodies from that model can be picked. If the argument is a Flag then only nodal rigid bodies that are flagged with *limit* can be selected. If omitted, or null, any nodal rigid bodies from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

NodalRigidBody object (or null if not picked)

Return type

NodalRigidBody

Example

To pick a nodal rigid body from model m giving the prompt 'Pick nodal rigid body from screen':

```
var nrb = NodalRigidBody.Pick('Pick nodal rigid body from screen', m);
```

Previous()

Description

Returns the previous nodal rigid body in the model.

Arguments

No arguments

Returns

NodalRigidBody object (or null if there are no more nodal rigid bodies in the model).

Return type

NodalRigidBody

Example

To get the nodal rigid body in model m before nodal rigid body nrb:

```
var nrb = nrb.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the nodal rigid bodies in model m, from 1000000:

```
NodalRigidBody.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all the flagged nodal rigid bodies will be renumbered in

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the nodal rigid bodies in model m flagged with f, from 1000000:

```
NodalRigidBody.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select nodal rigid bodies using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting nodal rigid bodies

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodal rigid bodies from that model can be selected. If the argument is a Flag then only nodal rigid bodies that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any nodal rigid bodies can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of nodal rigid bodies selected or null if menu cancelled

Return type

Number

Example

To select nodal rigid bodies from model m, flagging those selected with flag f, giving the prompt 'Select nodal rigid bodies':

```
NodalRigidBody.Select(f, 'Select nodal rigid bodies', m);
```

To select nodal rigid bodies, flagging those selected with flag f but limiting selection to nodal rigid bodies flagged with flag l, giving the prompt 'Select nodal rigid bodies':

```
NodalRigidBody.Select(f, 'Select nodal rigid bodies', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the nodal rigid body.

Arguments

- **flag** (Flag)

Flag to set on the nodal rigid body

Returns

No return value

Example

To set flag f for nodal rigid body nrb:

```
nrb.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the nodal rigid body. The nodal rigid body will be sketched until you either call NodalRigidBody.Unsketch(), NodalRigidBody.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal rigid body is sketched. If omitted redraw is true. If you want to sketch several nodal rigid bodies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch nodal rigid body nrb:

```
nrb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged nodal rigid bodies in the model. The nodal rigid bodies will be sketched until you either call NodalRigidBody.Unsketch(), NodalRigidBody.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged nodal rigid bodies will be sketched in

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal rigid bodies are sketched. If omitted redraw is true. If you want to sketch flagged nodal rigid bodies several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all nodal rigid bodies flagged with flag in model m:

```
NodalRigidBody.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing nodal rigid bodies should be counted. If false or omitted referenced but undefined nodal rigid bodies will also be included in the total.

Returns

number of nodal rigid bodies

Return type

Number

Example

To get the total number of nodal rigid bodies in model m:

```
var total = NodalRigidBody.Total(m);
```

Unblank()

Description

Unblanks the nodal rigid body

Arguments

No arguments

Returns

No return value

Example

To unblank nodal rigid body nrb:

```
nrb.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodal rigid bodies in model m:

```
NodalRigidBody.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that the flagged nodal rigid bodies will be unblanked in

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodal rigid bodies in model m flagged with f:

```
NodalRigidBody.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all nodal rigid bodies will be unset in

- **flag** (Flag)

Flag to unset on the nodal rigid bodies

Returns

No return value

Example

To unset the flag f on all the nodal rigid bodies in model m:

```
NodalRigidBody.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the nodal rigid body.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal rigid body is unsketched. If omitted redraw is true. If you want to unsketch several nodal rigid bodies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch nodal rigid body nrb:

```
nrb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all nodal rigid bodies.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal rigid bodies are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodal rigid bodies in model m:

```
NodalRigidBody.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged nodal rigid bodies in the model.

Arguments

- **Model** (Model)

Model that all nodal rigid bodies will be unsketched in

- **flag** (Flag)

Flag set on the nodal rigid bodies that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal rigid bodies are unsketched. If omitted redraw is true. If you want to

unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodal rigid bodies flagged with flag in model m:

```
NodalRigidBody.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

NodalRigidBody object.

Return type

NodalRigidBody

Example

To check if NodalRigidBody property nrb.example is a parameter by using the NodalRigidBody.GetParameter() method:

```
if (nrb.ViewParameters().GetParameter(nrb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for nodal rigid body. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for nodal rigid body nrb:

```
nrb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this nodal rigid body.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for nodal rigid body nrb:

```
var xrefs = nrb.Xrefs();
```

---

toString()

Description

Creates a string containing the nrb data in keyword format. Note that this contains the keyword header and the keyword cards. See also NodalRigidBody.Keyword() and NodalRigidBody.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for nrb n in keyword format

```
var s = n.toString();
```

NodeSet class

The NodeSet class gives you access to constrained node set cards in PRIMER, **not** set node cards. For access to set node cards, refer to the Set class. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

NodeSet properties

Name	Type	Description
cnsid	integer	Constrained node set number (identical to label).
colour	Colour	The colour of the node set
dof	integer	Degree of freedom.
exists (read only)	logical	true if constrained node set exists, false if referred to but not defined.
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the constrained node set is in.
label	integer	Constrained node set number.
model (read only)	integer	The Model number that the node set is in.
nsid	integer	Set Node ID.
tf	real	Failure time.

Detailed Description

The NodeSet class allows you to create, modify, edit and manipulate constrained node set cards. See the documentation below for more details.

Constructor

new NodeSet(Model*[Model]*, nsid*[integer]*, dof*[integer]*, tf*[real]*, label (optional)*[integer]*)

Description

Create a new NodeSet object.

Arguments

- **Model** (Model)

Model that constrained node set will be created in

- **nsid** (integer)

Set Node ID.

- **dof** (integer)

Degree of freedom.

- **tf** (real)

Failure time.

- **label (optional)** (integer)

Constrained node set number.

Returns

NodeSet object

Return type

NodeSet

Example

To create a new constrained node set 500 in model m, of type SET, with node set 9, degree of freedom 1 and failure time 1000

```
var n = new NodeSet(m, 9, 1, 1000, 500);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a node set.

Arguments

- **Comment** (Comment)

Comment that will be attached to the node set

Returns

No return value

Example

To associate comment c to the node set ns:

```
ns.AssociateComment(c);
```

Blank()

Description

Blanks the node set

Arguments

No arguments

Returns

No return value

Example

To blank node set ns:

```
ns.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the node sets in the model.

Arguments

- **Model** (Model)

Model that all node sets will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the node sets in model m:

```
NodeSet.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged node sets in the model.

Arguments

- **Model** (Model)

Model that all the flagged node sets will be blanked in

- **flag** (Flag)

Flag set on the node sets that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the node sets in model m flagged with f:

```
NodeSet.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the node set is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if node set ns is blanked:

```
if (ns.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse node set ns:

```
ns.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the node set.

Arguments

- **flag** (Flag)

Flag to clear on the node set

Returns

No return value

Example

To clear flag f for node set ns:

```
ns.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the node set. The target include of the copied node set can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

NodeSet object

Return type

NodeSet

Example

To copy node set ns into node set z:

```
var z = ns.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a node_set.

Arguments

- **Model** (Model)

Model that the node_set will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

NodeSet object (or null if not made)

Return type

NodeSet

Example

To start creating a node set in model n:

```
var n = NodeSet.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a node set.

Arguments

- **Comment** (Comment)

Comment that will be detached from the node set

Returns

No return value

Example

To detach comment c from the node set ns:

```
ns.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit node set ns:

```
ns.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for node set. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for node set ns:

```
ns.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for node set.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the node set colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the node set.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing node set ns:

```
var colour = ns.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first node set in the model.

Arguments

- **Model** (Model)

Model to get first node set in

Returns

NodeSet object (or null if there are no node sets in the model).

Return type

NodeSet

Example

To get the first node set in model m:

```
var ns = NodeSet.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free node set label in the model. Also see NodeSet.LastFreeLabel(), NodeSet.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free node set label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

NodeSet label.

Return type

Number

Example

To get the first free node set label in model m:

```
var label = NodeSet.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the node sets in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all node sets will be flagged in

- **flag** (Flag)

Flag to set on the node sets

Returns

No return value

Example

To flag all of the node sets with flag f in model m:

```
NodeSet.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the node set is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the node set

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if node set ns has flag f set on it:

```
if (ns.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each node set in the model.
Note that ForEach has been designed to make looping over node sets as fast as possible and so has some limitations.
Firstly, a single temporary NodeSet object is created and on each function call it is updated with the current node set data. This means that you should not try to store the NodeSet object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new node sets inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all node sets are in

- **func** (function)

Function to call for each node set

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the node sets in model m:

```
NodeSet.ForEach(m, test);
function test(ns)
{
// ns is NodeSet object
}
```

To call function test for all of the node sets in model m with optional object:

```
var data = { x:0, y:0 };
NodeSet.ForEach(m, test, data);
function test(ns, extra)
{
// ns is NodeSet object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of NodeSet objects for all of the node sets in a model in PRIMER

Arguments

- **Model** (Model)

Model to get node sets from

Returns

Array of NodeSet objects

Return type

Array

Example

To make an array of NodeSet objects for all of the node sets in model m

```
var ns = NodeSet.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a node set.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the node set ns:

```
var comm_array = ns.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of NodeSet objects for all of the flagged node sets in a model in PRIMER

Arguments

- **Model** (Model)

Model to get node sets from

- **flag** (Flag)

Flag set on the node sets that you want to retrieve

Returns

Array of NodeSet objects

Return type

Array

Example

To make an array of NodeSet objects for all of the node sets in model m flagged with f

```
var ns = NodeSet.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the NodeSet object for a node set ID.

Arguments

- **Model** (Model)

Model to find the node set in

- **number** (integer)

number of the node set you want the NodeSet object for

Returns

NodeSet object (or null if node set does not exist).

Return type

NodeSet

Example

To get the NodeSet object for node set 100 in model m

```
var ns = NodeSet.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a NodeSet property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the NodeSet.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

node set property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if NodeSet property ns.example is a parameter:

```
Options.property_parameter_names = true;
if (ns.GetParameter(ns.example) ) do_something...
Options.property_parameter_names = false;
```

To check if NodeSet property ns.example is a parameter by using the GetParameter method:

```
if (ns.ViewParameters().GetParameter(ns.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this node_set (*CONSTRAINED_NODE_SET). **Note that a carriage return is not added**. See also NodeSet.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for node_set n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the node_set. **Note that a carriage return is not added**. See also NodeSet.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for node_set n:

```
var cards = n.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last node set in the model.

Arguments

- **Model** (Model)

Model to get last node set in

Returns

NodeSet object (or null if there are no node sets in the model).

Return type

NodeSet

Example

To get the last node set in model m:

```
var ns = NodeSet.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free node set label in the model. Also see NodeSet.FirstFreeLabel(), NodeSet.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free node set label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

NodeSet label.

Return type

Number

Example

To get the last free node set label in model m:

```
var label = NodeSet.LastFreeLabel(m);
```

Next()

Description

Returns the next node set in the model.

Arguments

No arguments

Returns

NodeSet object (or null if there are no more node sets in the model).

Return type

NodeSet

Example

To get the node set in model m after node set ns:

```
var ns = ns.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) node set label in the model. Also see NodeSet.FirstFreeLabel(), NodeSet.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free node set label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

NodeSet label.

Return type

Number

Example

To get the next free node set label in model m:

```
var label = NodeSet.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a node set.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only node sets from that model can be picked. If the argument is a Flag then only node sets that are flagged with *limit* can be selected. If omitted, or null, any node sets from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

NodeSet object (or null if not picked)

Return type

NodeSet

Example

To pick a node set from model m giving the prompt 'Pick node set from screen':

```
var ns = NodeSet.Pick('Pick node set from screen', m);
```

Previous()

Description

Returns the previous node set in the model.

Arguments

No arguments

Returns

NodeSet object (or null if there are no more node sets in the model).

Return type

NodeSet

Example

To get the node set in model m before node set ns:

```
var ns = ns.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the node sets in the model.

Arguments

- **Model** (Model)

Model that all node sets will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the node sets in model m, from 1000000:

```
NodeSet.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged node sets in the model.

Arguments

- **Model** (Model)

Model that all the flagged node sets will be renumbered in

- **flag** (Flag)

Flag set on the node sets that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the node sets in model m flagged with f, from 1000000:

```
NodeSet.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select node sets using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting node sets

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only node sets from that model can be selected. If the argument is a Flag then only node sets that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any node sets can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of node sets selected or null if menu cancelled

Return type

Number

Example

To select node sets from model m, flagging those selected with flag f, giving the prompt 'Select node sets':

```
NodeSet.Select(f, 'Select node sets', m);
```

To select node sets, flagging those selected with flag f but limiting selection to node sets flagged with flag l, giving the prompt 'Select node sets':

```
NodeSet.Select(f, 'Select node sets', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the node set.

Arguments

- **flag** (Flag)

Flag to set on the node set

Returns

No return value

Example

To set flag f for node set ns:

```
ns.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the node set. The node set will be sketched until you either call NodeSet.Unsketch(), NodeSet.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node set is sketched. If omitted redraw is true. If you want to sketch several node sets and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch node set ns:

```
ns.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged node sets in the model. The node sets will be sketched until you either call NodeSet.Unsketch(), NodeSet.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged node sets will be sketched in

- **flag** (Flag)

Flag set on the node sets that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node sets are sketched. If omitted redraw is true. If you want to sketch flagged node sets several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all node sets flagged with flag in model m:

```
NodeSet.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of node sets in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing node sets should be counted. If false or omitted referenced but undefined node sets will also be included in the total.

Returns

number of node sets

Return type

Number

Example

To get the total number of node sets in model m:

```
var total = NodeSet.Total(m);
```

Unblank()

Description

Unblanks the node set

Arguments

No arguments

Returns

No return value

Example

To unblank node set ns:

```
ns.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the node sets in the model.

Arguments

- **Model** (Model)

Model that all node sets will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the node sets in model m:

```
NodeSet.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged node sets in the model.

Arguments

- **Model** (Model)

Model that the flagged node sets will be unblanked in

- **flag** (Flag)

Flag set on the node sets that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the node sets in model m flagged with f:

```
NodeSet.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the node sets in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all node sets will be unset in

- **flag** (Flag)

Flag to unset on the node sets

Returns

No return value

Example

To unset the flag f on all the node sets in model m:

```
NodeSet.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the node set.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node set is unsketched. If omitted redraw is true. If you want to unsketch several node sets and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch node set ns:

```
ns.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all node sets.

Arguments

- **Model** (Model)

Model that all node sets will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node sets are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all node sets in model m:

```
NodeSet.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged node sets in the model.

Arguments

- **Model** (Model)

Model that all node sets will be unsketched in

- **flag** (Flag)

Flag set on the node sets that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node sets are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all node sets flagged with flag in model m:

```
NodeSet.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

NodeSet object.

Return type

NodeSet

Example

To check if NodeSet property ns.example is a parameter by using the NodeSet.GetParameter() method:

```
if (ns.ViewParameters().GetParameter(ns.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for node set. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for node set ns:

```
ns.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this node set.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for node set ns:

```
var xrefs = ns.Xrefs();
```

---

toString()

Description

Creates a string containing the node_set data in keyword format. Note that this contains the keyword header and the keyword cards. See also NodeSet.Keyword() and NodeSet.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for node set n in keyword format

```
var s = n.toString();
```

RigidBodies class

The RigidBodies class gives you access to constrained rigid bodies cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

RigidBodies constants

Name	Description
RigidBodies.PART	RigidBodies is *CONSTRAINED_RIGID_BODIES.
RigidBodies.SET	RigidBodies is *CONSTRAINED_RIGID_BODIES_SET.

RigidBodies properties

Name	Type	Description
colour	Colour	The colour of the rigid body
exists (read only)	logical	true if constrained rigid bodies exists, false if referred to but not defined.
iflag	integer	Flag for adding coonstrained mass properties to part inertia.
include	integer	The Include file number that the constrained rigid bodies is in.
label (read only)	integer	The label the constrained rigid bodies has in PRIMER
model (read only)	integer	The Model number that the rigid body merge is in.
option	constant	The Constrained Rigid Bodies option. Can be RigidBodies.PART or RigidBodies.SET.
pidc	integer	Constrained rigid body part ID.
pidl	integer	Lead rigid body part ID.

Detailed Description

The RigidBodies class allows you to create, modify, edit and manipulate constrained rigid bodies cards. See the documentation below for more details.

Constructor

new RigidBodies(Model*[Model]*, options *[object]*)

Description

Create a new RigidBodies object.

Arguments

- **Model** (Model)

Model that constrained rigid bodies will be created in

- **options** (object)

Options specifying which properties would be used to create the keyword. If optional values are not used, then the default values below will be used.

Object has the following properties:

Name	Type	Description
iflag (optional)	integer	Flag for adding constrained mass properties to part inertia. (Default value 0)
option (optional)	constant	Specify the type of constrained rigid bodies. Can be RigidBodies.PART(default) or RigidBodies.SET
pidc	integer	Constrained rigid body part ID.
pidl	integer	Lead rigid body part ID.

Returns

RigidBodies object

Return type

RigidBodies

Example

To create a new constrained rigid bodies in model m with lead part 6 and constrained SET_PART 8

```
var output_obj    = new Object();
output_obj.pidl   = 6;
output_obj.pidc   = 8;
output_obj.iflag  = 1;
output_obj.option = RigidBodies.SET;

var cnst = new RigidBodies(m, output_obj);
```

new RigidBodies(Model*[Model]*, pidl*[integer]*, pidc*[integer]*, iflag (optional)*[integer]*, option (optional)*[constant]*) [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new RigidBodies object.

Arguments

- **Model** (Model)

Model that constrained rigid bodies will be created in

- **pidl** (integer)

Lead rigid body part ID.

- **pidc** (integer)

Constrained rigid body part ID.

- **iflag (optional)** (integer)

Flag for adding constrained mass properties to part inertia. (Default value 0)

- **option (optional)** (constant)

Specify the type of constrained rigid bodies. Can be RigidBodies.PART(default) or RigidBodies.SET

Returns

RigidBodies object

Return type

RigidBodies

Example

To create a new constrained rigid bodies in model m with lead part 5 and constrained part 10

```
var r = new RigidBodies(m, 5, 10, 0 , 1);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a rigid body merge.

Arguments

- **Comment** (Comment)

Comment that will be attached to the rigid body merge

Returns

No return value

Example

To associate comment c to the rigid body merge m:

```
m.AssociateComment(c);
```

Blank()

Description

Blanks the rigid body merge

Arguments

No arguments

Returns

No return value

Example

To blank rigid body merge m:

```
m.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the rigid body merges in the model.

Arguments

- **Model** (Model)

Model that all rigid body merges will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the rigid body merges in model m:

```
RigidBodies.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged rigid body merges in the model.

Arguments

- **Model** (Model)

Model that all the flagged rigid body merges will be blanked in

- **flag** (Flag)

Flag set on the rigid body merges that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the rigid body merges in model m flagged with f:

```
RigidBodies.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the rigid body merge is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if rigid body merge m is blanked:

```
if (m.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse rigid body merge m:

```
m.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the rigid body merge.

Arguments

- **flag** (Flag)

Flag to clear on the rigid body merge

Returns

No return value

Example

To clear flag f for rigid body merge m:

```
m.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the rigid body merge. The target include of the copied rigid body merge can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

RigidBodies object

Return type

RigidBodies

Example

To copy rigid body merge m into rigid body merge z:

```
var z = m.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a constrained rigid bodies definition.

Arguments

- **Model** (Model)

Model that the constrained rigid bodies definition will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

RigidBodies object (or null if not made)

Return type

RigidBodies

Example

To start creating a constrained rigid bodies definition in model m:

```
var r = RigidBodies.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a rigid body merge.

Arguments

- **Comment** (Comment)

Comment that will be detached from the rigid body merge

Returns

No return value

Example

To detach comment c from the rigid body merge m:

```
m.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit rigid body merge m:

```
m.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for rigid body merge. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for rigid body merge m:

```
m.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for rigid body merge.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the rigid body merge colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the rigid body merge.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing rigid body merge m:

```
var colour = m.ExtractColour();
```

First(Model[*Model*]) [static]

Description

Returns the first rigid body merge in the model.

Arguments

- **Model** (Model)

Model to get first rigid body merge in

Returns

RigidBodies object (or null if there are no rigid body merges in the model).

Return type

RigidBodies

Example

To get the first rigid body merge in model m:

```
var m = RigidBodies.First(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the rigid body merges in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all rigid body merges will be flagged in

- **flag** (Flag)

Flag to set on the rigid body merges

Returns

No return value

Example

To flag all of the rigid body merges with flag f in model m:

```
RigidBodies.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the rigid body merge is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the rigid body merge

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if rigid body merge m has flag f set on it:

```
if (m.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each rigid body merge in the model.
Note that ForEach has been designed to make looping over rigid body merges as fast as possible and so has some limitations.
Firstly, a single temporary RigidBodies object is created and on each function call it is updated with the current rigid body merge data. This means that you should not try to store the RigidBodies object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new rigid body merges inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all rigid body merges are in

- **func** (function)

Function to call for each rigid body merge

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the rigid body merges in model m:

```
RigidBodies.ForEach(m, test);
function test(m)
{
// m is RigidBodies object
}
```

To call function test for all of the rigid body merges in model m with optional object:

```
var data = { x:0, y:0 };
RigidBodies.ForEach(m, test, data);
function test(m, extra)
{
// m is RigidBodies object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of RigidBodies objects for all of the rigid body merges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get rigid body merges from

Returns

Array of RigidBodies objects

Return type

Array

Example

To make an array of RigidBodies objects for all of the rigid body merges in model m

```
var m = RigidBodies.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a rigid body merge.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the rigid body merge m:

```
var comm_array = m.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of RigidBodies objects for all of the flagged rigid body merges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get rigid body merges from

- **flag** (Flag)

Flag set on the rigid body merges that you want to retrieve

Returns

Array of RigidBodies objects

Return type

Array

Example

To make an array of RigidBodies objects for all of the rigid body merges in model m flagged with f

```
var m = RigidBodies.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the RigidBodies object for a rigid body merge ID.

Arguments

- **Model** (Model)

Model to find the rigid body merge in

- **number** (integer)

number of the rigid body merge you want the RigidBodies object for

Returns

RigidBodies object (or null if rigid body merge does not exist).

Return type

RigidBodies

Example

To get the RigidBodies object for rigid body merge 100 in model m

```
var m = RigidBodies.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a RigidBodies property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the RigidBodies.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

rigid body merge property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if RigidBodies property m.example is a parameter:

```
Options.property_parameter_names = true;
if (m.GetParameter(m.example) ) do_something...
Options.property_parameter_names = false;
```

To check if RigidBodies property m.example is a parameter by using the GetParameter method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this constrained rigid bodies (*CONSTRAINED_RIGID_BODIES). **Note that a carriage return is not added**. See also RigidBodies.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for constrained rigid bodies r:

```
var key = r.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the constrained rigid bodies. **Note that a carriage return is not added**. See also RigidBodies.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for constrained rigid bodies r:

```
var cards = r.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last rigid body merge in the model.

Arguments

- **Model** (Model)

Model to get last rigid body merge in

Returns

RigidBodies object (or null if there are no rigid body merges in the model).

Return type

RigidBodies

Example

To get the last rigid body merge in model m:

```
var m = RigidBodies.Last(m);
```

Next()

Description

Returns the next rigid body merge in the model.

Arguments

No arguments

Returns

RigidBodies object (or null if there are no more rigid body merges in the model).

Return type

RigidBodies

Example

To get the rigid body merge in model m after rigid body merge m:

```
var m = m.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a rigid body merge.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only rigid body merges from that model can be picked. If the argument is a Flag then only rigid body merges that are flagged with *limit* can be selected. If omitted, or null, any rigid body merges from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

RigidBodies object (or null if not picked)

Return type

RigidBodies

Example

To pick a rigid body merge from model m giving the prompt 'Pick rigid body merge from screen':

```
var m = RigidBodies.Pick('Pick rigid body merge from screen', m);
```

Previous()

Description

Returns the previous rigid body merge in the model.

Arguments

No arguments

Returns

RigidBodies object (or null if there are no more rigid body merges in the model).

Return type

RigidBodies

Example

To get the rigid body merge in model m before rigid body merge m:

```
var m = m.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select rigid body merges using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting rigid body merges

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only rigid body merges from that model can be selected. If the argument is a Flag then only rigid body merges that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any rigid body merges can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of rigid body merges selected or null if menu cancelled

Return type

Number

Example

To select rigid body merges from model m, flagging those selected with flag f, giving the prompt 'Select rigid body merges':

```
RigidBodies.Select(f, 'Select rigid body merges', m);
```

To select rigid body merges, flagging those selected with flag f but limiting selection to rigid body merges flagged with flag l, giving the prompt 'Select rigid body merges':

```
RigidBodies.Select(f, 'Select rigid body merges', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the rigid body merge.

Arguments

- **flag** (Flag)

Flag to set on the rigid body merge

Returns

No return value

Example

To set flag f for rigid body merge m:

```
m.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the rigid body merge. The rigid body merge will be sketched until you either call RigidBodies.Unsketch(), RigidBodies.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigid body merge is sketched. If omitted redraw is true. If you want to sketch several rigid body merges and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch rigid body merge m:

```
m.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged rigid body merges in the model. The rigid body merges will be sketched until you either call RigidBodies.Unsketch(), RigidBodies.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged rigid body merges will be sketched in

- **flag** (Flag)

Flag set on the rigid body merges that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigid body merges are sketched. If omitted redraw is true. If you want to sketch flagged rigid body merges several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all rigid body merges flagged with flag in model m:

```
RigidBodies.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of rigid body merges in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing rigid body merges should be counted. If false or omitted referenced but undefined rigid body merges will also be included in the total.

Returns

number of rigid body merges

Return type

Number

Example

To get the total number of rigid body merges in model m:

```
var total = RigidBodies.Total(m);
```

Unblank()

Description

Unblanks the rigid body merge

Arguments

No arguments

Returns

No return value

Example

To unblank rigid body merge m:

```
m.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the rigid body merges in the model.

Arguments

- **Model** (Model)

Model that all rigid body merges will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the rigid body merges in model m:

```
RigidBodies.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged rigid body merges in the model.

Arguments

- **Model** (Model)

Model that the flagged rigid body merges will be unblanked in

- **flag** (Flag)

Flag set on the rigid body merges that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the rigid body merges in model m flagged with f:

```
RigidBodies.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the rigid body merges in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all rigid body merges will be unset in

- **flag** (Flag)

Flag to unset on the rigid body merges

Returns

No return value

Example

To unset the flag f on all the rigid body merges in model m:

```
RigidBodies.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the rigid body merge.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigid body merge is unsketched. If omitted redraw is true. If you want to unsketch several rigid body merges and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch rigid body merge m:

```
m.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all rigid body merges.

Arguments

- **Model** (Model)

Model that all rigid body merges will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigid body merges are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all rigid body merges in model m:

```
RigidBodies.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged rigid body merges in the model.

Arguments

- **Model** (Model)

Model that all rigid body merges will be unsketched in

- **flag** (Flag)

Flag set on the rigid body merges that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigid body merges are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all rigid body merges flagged with flag in model m:

```
RigidBodies.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

RigidBodies object.

Return type

RigidBodies

Example

To check if RigidBodies property m.example is a parameter by using the RigidBodies.GetParameter() method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for rigid body merge. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for rigid body merge m:

```
m.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this rigid body merge.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for rigid body merge m:

```
var xrefs = m.Xrefs();
```

---

toString()

Description

Creates a string containing the constrained rigid bodies data in keyword format. Note that this contains the keyword header and the keyword cards. See also RigidBodies.Keyword() and RigidBodies.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for constrained rigid bodies r in keyword format

```
var s = r.toString();
```

Spotweld class

The Spotweld class gives you access to constrained spotweld cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Spotweld properties

Name	Type	Description
colour	Colour	The colour of the spotweld
ep	real	Effective plastic strain at failure
exists (read only)	logical	true if constrained spotweld exists, false if referred to but not defined.
filtered_force	logical	true if _FILTERED_FORCE option is set, false if not
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the constrained spotweld is in.
label	integer	Constrained spotweld number
m	real	Exponent for shear spotweld force
model (read only)	integer	The Model number that the spotweld is in.
n	real	Exponent for normal spotweld force
n1	integer	Node ID
n2	integer	Node ID
nf	integer	Number of force vectors stored for filtering
sn	real	Normal force at spotweld failure
ss	real	Shear force at spotweld failure
tf	real	Failure time for nodal constraint set
tw	real	Time window for filtering
wid	integer	Constrained spotweld number (identical to label)

Detailed Description

The Spotweld class allows you to create, modify, edit and manipulate constrained spotweld cards. See the documentation below for more details.

Constructor

new Spotweld(Model*[Model]*, n1*[integer]*, n2*[integer]*, label (optional)*[integer]*)

Description

Create a new Spotweld object.

Arguments

- **Model** (Model)

Model that constrained spotweld will be created in

- **n1** (integer)

Node ID 1

- **n2** (integer)

Node ID 2

- **label (optional)** (integer)

Constrained spotweld number

Returns

Spotweld object

Return type

Spotweld

Example

To create a new constrained spotweld 500 in model m between nodes 10 and 11

```
var s = new Spotweld(m, 10, 11, 500);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a spotweld.

Arguments

- **Comment** (Comment)

Comment that will be attached to the spotweld

Returns

No return value

Example

To associate comment c to the spotweld s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the spotweld

Arguments

No arguments

Returns

No return value

Example

To blank spotweld s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the spotwelds in the model.

Arguments

- **Model** (Model)

Model that all spotwelds will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the spotwelds in model m:

```
Spotweld.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged spotwelds in the model.

Arguments

- **Model** (Model)

Model that all the flagged spotwelds will be blanked in

- **flag** (Flag)

Flag set on the spotwelds that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the spotwelds in model m flagged with f:

```
Spotweld.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the spotweld is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if spotweld s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse spotweld s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the spotweld.

Arguments

- **flag** (Flag)

Flag to clear on the spotweld

Returns

No return value

Example

To clear flag f for spotweld s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the spotweld. The target include of the copied spotweld can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Spotweld object

Return type

Spotweld

Example

To copy spotweld s into spotweld z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a spotweld.

Arguments

- **Model** (Model)

Model that the spotweld will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Spotweld object (or null if not made)

Return type

Spotweld

Example

To start creating a spotweld in model s:

```
var s = Spotweld.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a spotweld.

Arguments

- **Comment** (Comment)

Comment that will be detached from the spotweld

Returns

No return value

Example

To detach comment c from the spotweld s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit spotweld s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for spotweld. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for spotweld s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for spotweld.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the spotweld colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the spotweld.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing spotweld s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first spotweld in the model.

Arguments

- **Model** (Model)

Model to get first spotweld in

Returns

Spotweld object (or null if there are no spotwelds in the model).

Return type

Spotweld

Example

To get the first spotweld in model m:

```
var s = Spotweld.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free spotweld label in the model. Also see Spotweld.LastFreeLabel(), Spotweld.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free spotweld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Spotweld label.

Return type

Number

Example

To get the first free spotweld label in model m:

```
var label = Spotweld.FirstFreeLabel(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the spotwelds in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all spotwelds will be flagged in

- **flag** (Flag)

Flag to set on the spotwelds

Returns

No return value

Example

To flag all of the spotwelds with flag f in model m:

```
Spotweld.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the spotweld is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the spotweld

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if spotweld s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each spotweld in the model.
Note that ForEach has been designed to make looping over spotwelds as fast as possible and so has some limitations.
Firstly, a single temporary Spotweld object is created and on each function call it is updated with the current spotweld data. This means that you should not try to store the Spotweld object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new spotwelds inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all spotwelds are in

- **func** (function)

Function to call for each spotweld

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the spotwelds in model m:

```
Spotweld.ForEach(m, test);
function test(s)
{
// s is Spotweld object
}
```

To call function test for all of the spotwelds in model m with optional object:

```
var data = { x:0, y:0 };
Spotweld.ForEach(m, test, data);
function test(s, extra)
{
// s is Spotweld object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Spotweld objects for all of the spotwelds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get spotwelds from

Returns

Array of Spotweld objects

Return type

Array

Example

To make an array of Spotweld objects for all of the spotwelds in model m

```
var s = Spotweld.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a spotweld.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the spotweld s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Spotweld objects for all of the flagged spotwelds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get spotwelds from

- **flag** (Flag)

Flag set on the spotwelds that you want to retrieve

Returns

Array of Spotweld objects

Return type

Array

Example

To make an array of Spotweld objects for all of the spotwelds in model m flagged with f

```
var s = Spotweld.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Spotweld object for a spotweld ID.

Arguments

- **Model** (Model)

Model to find the spotweld in

- **number** (integer)

number of the spotweld you want the Spotweld object for

Returns

Spotweld object (or null if spotweld does not exist).

Return type

Spotweld

Example

To get the Spotweld object for spotweld 100 in model m

```
var s = Spotweld.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Spotweld property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Spotweld.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

spotweld property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Spotweld property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Spotweld property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this spotweld (*CONSTRAINED_SPOTWELD). **Note that a carriage return is not added**. See also Spotweld.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for spotweld s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the spotweld. **Note that a carriage return is not added**. See also Spotweld.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for spotweld s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last spotweld in the model.

Arguments

- **Model** (Model)

Model to get last spotweld in

Returns

Spotweld object (or null if there are no spotwelds in the model).

Return type

Spotweld

Example

To get the last spotweld in model m:

```
var s = Spotweld.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free spotweld label in the model. Also see Spotweld.FirstFreeLabel(), Spotweld.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free spotweld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Spotweld label.

Return type

Number

Example

To get the last free spotweld label in model m:

```
var label = Spotweld.LastFreeLabel(m);
```

Next()

Description

Returns the next spotweld in the model.

Arguments

No arguments

Returns

Spotweld object (or null if there are no more spotwelds in the model).

Return type

Spotweld

Example

To get the spotweld in model m after spotweld s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) spotweld label in the model. Also see Spotweld.FirstFreeLabel(), Spotweld.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free spotweld label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Spotweld label.

Return type

Number

Example

To get the next free spotweld label in model m:

```
var label = Spotweld.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a spotweld.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only spotwelds from that model can be picked. If the argument is a Flag then only spotwelds that are flagged with *limit* can be selected. If omitted, or null, any spotwelds from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Spotweld object (or null if not picked)

Return type

Spotweld

Example

To pick a spotweld from model m giving the prompt 'Pick spotweld from screen':

```
var s = Spotweld.Pick('Pick spotweld from screen', m);
```

Previous()

Description

Returns the previous spotweld in the model.

Arguments

No arguments

Returns

Spotweld object (or null if there are no more spotwelds in the model).

Return type

Spotweld

Example

To get the spotweld in model m before spotweld s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the spotwelds in the model.

Arguments

- **Model** (Model)

Model that all spotwelds will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the spotwelds in model m, from 1000000:

```
Spotweld.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged spotwelds in the model.

Arguments

- **Model** (Model)

Model that all the flagged spotwelds will be renumbered in

- **flag** (Flag)

Flag set on the spotwelds that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the spotwelds in model m flagged with f, from 1000000:

```
Spotweld.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select spotwelds using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting spotwelds

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only spotwelds from that model can be selected. If the argument is a Flag then only spotwelds that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any spotwelds can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of spotwelds selected or null if menu cancelled

Return type

Number

Example

To select spotwelds from model m, flagging those selected with flag f, giving the prompt 'Select spotwelds':

```
Spotweld.Select(f, 'Select spotwelds', m);
```

To select spotwelds, flagging those selected with flag f but limiting selection to spotwelds flagged with flag l, giving the prompt 'Select spotwelds':

```
Spotweld.Select(f, 'Select spotwelds', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the spotweld.

Arguments

- **flag** (Flag)

Flag to set on the spotweld

Returns

No return value

Example

To set flag f for spotweld s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the spotweld. The spotweld will be sketched until you either call Spotweld.Unsketch(), Spotweld.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spotweld is sketched. If omitted redraw is true. If you want to sketch several spotwelds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch spotweld s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged spotwelds in the model. The spotwelds will be sketched until you either call Spotweld.Unsketch(), Spotweld.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged spotwelds will be sketched in

- **flag** (Flag)

Flag set on the spotwelds that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spotwelds are sketched. If omitted redraw is true. If you want to sketch flagged spotwelds several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all spotwelds flagged with flag in model m:

```
Spotweld.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of spotwelds in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing spotwelds should be counted. If false or omitted referenced but undefined spotwelds will also be included in the total.

Returns

number of spotwelds

Return type

Number

Example

To get the total number of spotwelds in model m:

```
var total = Spotweld.Total(m);
```

Unblank()

Description

Unblanks the spotweld

Arguments

No arguments

Returns

No return value

Example

To unblank spotweld s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the spotwelds in the model.

Arguments

- **Model** (Model)

Model that all spotwelds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the spotwelds in model m:

```
Spotweld.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged spotwelds in the model.

Arguments

- **Model** (Model)

Model that the flagged spotwelds will be unblanked in

- **flag** (Flag)

Flag set on the spotwelds that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the spotwelds in model m flagged with f:

```
Spotweld.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the spotwelds in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all spotwelds will be unset in

- **flag** (Flag)

Flag to unset on the spotwelds

Returns

No return value

Example

To unset the flag f on all the spotwelds in model m:

```
Spotweld.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the spotweld.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spotweld is unsketched. If omitted redraw is true. If you want to unsketch several spotwelds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch spotweld s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all spotwelds.

Arguments

- **Model** (Model)

Model that all spotwelds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spotwelds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all spotwelds in model m:

```
Spotweld.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged spotwelds in the model.

Arguments

- **Model** (Model)

Model that all spotwelds will be unsketched in

- **flag** (Flag)

Flag set on the spotwelds that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spotwelds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all spotwelds flagged with flag in model m:

```
Spotweld.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Spotweld object.

Return type

Spotweld

Example

To check if Spotweld property s.example is a parameter by using the Spotweld.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for spotweld. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for spotweld s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this spotweld.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for spotweld s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the spotweld data in keyword format. Note that this contains the keyword header and the keyword cards. See also Spotweld.Keyword() and Spotweld.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for spotweld s in keyword format

```
var str = s.toString();
```

Spr2 class

The Spr2 class gives you access to constrained spr2 cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Spr2 constants

Constants for Flags for Interpolation

Name	Description

Spr2.INVERSE	Property INTP value EQ.2.0: Inverse distance weighting.
Spr2.LINEAR	Property INTP value EQ.0.0: Linear (default).
Spr2.UNIFORM	Property INTP value EQ.1.0: Uniform.

Spr2 properties

Name	Type	Description
alpha1	real	Dimensionless parameter scaling the effective displacement.
alpha2	real	Dimensionless parameter scaling the effective displacement.
alpha3	real	Dimensionless parameter scaling the effective displacement. (GT.0: incremental update (default), LT.0: total update (recommended))
d	real	Rivet diameter.
dens	real	Rivet density (necessary for time step calculation).
dn	real	Failure displacement in normal direction.
dt	real	Failure displacement in tangential direction.
exists (read only)	logical	true if constrained spr2 exists, false if referred to but not defined.
expn	real	Exponent value for load function in normal direction.
expt	real	Exponent value for load function in tangential direction.
fn	real	Rivet strength in tension (pull-out) or (if -ve) label for UPID
ft	real	Rivet strength in pure shear.
include	integer	The Include file number that the constrained spr2 is in.
intp	real	Flag for interpolation. Values can be Spr2.LINEAR, Spr2.UNIFORM or Spr2.INVERSE.
lpid	integer	Lower Sheet Part ID.
model (read only)	integer	The Model number that the spr2 is in.
nsid	integer	Node Set ID of rivet location nodes.
pidvb	integer	Part ID for visualization beams representing SPR2 in postprocessing.
thick	real	Total thickness of master and slave sheet.
upid	integer	Upper Sheet Part ID.
xin	real	Fraction of failure displacement at maximum normal force.
xit	real	Fraction of failure displacement at maximum tangential force.
xpid1	integer	Extra Part ID 1 for multi-sheet connection.
xpid2	integer	Extra Part ID 2 for multi-sheet connection.
xpid3	integer	Extra Part ID 3 for multi-sheet connection.
xpid4	integer	Extra Part ID 4 for multi-sheet connection.

Detailed Description

The Spr2 class allows you to create, modify, edit and manipulate constrained spr2 cards. See the documentation below for more details.

Constructor

new Spr2(Model*[Model]*, upid*[integer]*, lpid*[integer]*, nsid*[integer]*)

Description

Create a new Spr2 object.

Arguments

- **Model** (Model)

Model that constrained spr2 will be created in

- **upid** (integer)

Upper Sheet Part ID.

- **lpid** (integer)

Lower Sheet Part ID

- **nsid** (integer)

Node Set ID of rivet location nodes.

Returns

Spr2 object

Return type

Spr2

Example

To create a new constrained spr2 in model m with master sheet 100, slave sheet 200 and rivet node set 100

```
var s = new Spr2(m, 100, 200, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a spr2.

Arguments

- **Comment** (Comment)

Comment that will be attached to the spr2

Returns

No return value

Example

To associate comment c to the spr2 s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the spr2

Arguments

No arguments

Returns

No return value

Example

To blank spr2 s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the spr2s in the model.

Arguments

- **Model** (Model)

Model that all spr2s will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the spr2s in model m:

```
Spr2.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged spr2s in the model.

Arguments

- **Model** (Model)

Model that all the flagged spr2s will be blanked in

- **flag** (Flag)

Flag set on the spr2s that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the spr2s in model m flagged with f:

```
Spr2.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the spr2 is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if spr2 s is blanked:

```
if (s.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the spr2.

Arguments

- **flag** (Flag)

Flag to clear on the spr2

Returns

No return value

Example

To clear flag f for spr2 s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the spr2. The target include of the copied spr2 can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Spr2 object

Return type

Spr2

Example

To copy spr2 s into spr2 z:

```
var z = s.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a spr2.

Arguments

- **Comment** (Comment)

Comment that will be detached from the spr2

Returns

No return value

Example

To detach comment c from the spr2 s:

```
s.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for spr2. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for spr2 s:

```
s.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first spr2 in the model.

Arguments

- **Model** (Model)

Model to get first spr2 in

Returns

Spr2 object (or null if there are no spr2s in the model).

Return type

Spr2

Example

To get the first spr2 in model m:

```
var s = Spr2.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the spr2s in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all spr2s will be flagged in

- **flag** (Flag)

Flag to set on the spr2s

Returns

No return value

Example

To flag all of the spr2s with flag f in model m:

```
Spr2.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the spr2 is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the spr2

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if spr2 s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each spr2 in the model.
Note that ForEach has been designed to make looping over spr2s as fast as possible and so has some limitations. Firstly, a single temporary Spr2 object is created and on each function call it is updated with the current spr2 data. This means that you should not try to store the Spr2 object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new spr2s inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all spr2s are in

- **func** (function)

Function to call for each spr2

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the spr2s in model m:

```
Spr2.ForEach(m, test);
function test(s)
{
// s is Spr2 object
}
```

To call function test for all of the spr2s in model m with optional object:

```
var data = { x:0, y:0 };
Spr2.ForEach(m, test, data);
function test(s, extra)
{
// s is Spr2 object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Spr2 objects for all of the spr2s in a model in PRIMER

Arguments

- **Model** (Model)

Model to get spr2s from

Returns

Array of Spr2 objects

Return type

Array

Example

To make an array of Spr2 objects for all of the spr2s in model m

```
var s = Spr2.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a spr2.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the spr2 s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Spr2 objects for all of the flagged spr2s in a model in PRIMER

Arguments

- **Model** (Model)

Model to get spr2s from

- **flag** (Flag)

Flag set on the spr2s that you want to retrieve

Returns

Array of Spr2 objects

Return type

Array

Example

To make an array of Spr2 objects for all of the spr2s in model m flagged with f

```
var s = Spr2.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Spr2 object for a spr2 ID.

Arguments

- **Model** (Model)

Model to find the spr2 in

- **number** (integer)

number of the spr2 you want the Spr2 object for

Returns

Spr2 object (or null if spr2 does not exist).

Return type

Spr2

Example

To get the Spr2 object for spr2 100 in model m

```
var s = Spr2.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Spr2 property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Spr2.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

spr2 property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Spr2 property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Spr2 property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this spr2 (*CONSTRAINED_SPR2). **Note that a carriage return is not added**. See also Spr2.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for spr2 s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the spr2. **Note that a carriage return is not added**. See also Spr2.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for spr2 s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last spr2 in the model.

Arguments

- **Model** (Model)

Model to get last spr2 in

Returns

Spr2 object (or null if there are no spr2s in the model).

Return type

Spr2

Example

To get the last spr2 in model m:

```
var s = Spr2.Last(m);
```

Next()

Description

Returns the next spr2 in the model.

Arguments

No arguments

Returns

Spr2 object (or null if there are no more spr2s in the model).

Return type

Spr2

Example

To get the spr2 in model m after spr2 s:

```
var s = s.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a spr2.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only spr2s from that model can be picked. If the argument is a Flag then only spr2s that are flagged with *limit* can be selected. If omitted, or null, any spr2s from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Spr2 object (or null if not picked)

Return type

Spr2

Example

To pick a spr2 from model m giving the prompt 'Pick spr2 from screen':

```
var s = Spr2.Pick('Pick spr2 from screen', m);
```

Previous()

Description

Returns the previous spr2 in the model.

Arguments

No arguments

Returns

Spr2 object (or null if there are no more spr2s in the model).

Return type

Spr2

Example

To get the spr2 in model m before spr2 s:

```
var s = s.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select spr2s using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting spr2s

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only spr2s from that model can be selected. If the argument is a Flag then only spr2s that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any spr2s can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of spr2s selected or null if menu cancelled

Return type

Number

Example

To select spr2s from model m, flagging those selected with flag f, giving the prompt 'Select spr2s':

```
Spr2.Select(f, 'Select spr2s', m);
```

To select spr2s, flagging those selected with flag f but limiting selection to spr2s flagged with flag l, giving the prompt 'Select spr2s':

```
Spr2.Select(f, 'Select spr2s', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the spr2.

Arguments

- **flag** (Flag)

Flag to set on the spr2

Returns

No return value

Example

To set flag f for spr2 s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the spr2. The spr2 will be sketched until you either call Spr2.Unsketch(), Spr2.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spr2 is sketched. If omitted redraw is true. If you want to sketch several spr2s and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch spr2 s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged spr2s in the model. The spr2s will be sketched until you either call Spr2.Unsketch(), Spr2.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged spr2s will be sketched in

- **flag** (Flag)

Flag set on the spr2s that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spr2s are sketched. If omitted redraw is true. If you want to sketch flagged spr2s several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all spr2s flagged with flag in model m:

```
Spr2.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of spr2s in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing spr2s should be counted. If false or omitted referenced but undefined spr2s will also be included in the total.

Returns

number of spr2s

Return type

Number

Example

To get the total number of spr2s in model m:

```
var total = Spr2.Total(m);
```

Unblank()

Description

Unblanks the spr2

Arguments

No arguments

Returns

No return value

Example

To unblank spr2 s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the spr2s in the model.

Arguments

- **Model** (Model)

Model that all spr2s will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the spr2s in model m:

```
Spr2.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged spr2s in the model.

Arguments

- **Model** (Model)

Model that the flagged spr2s will be unblanked in

- **flag** (Flag)

Flag set on the spr2s that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the spr2s in model m flagged with f:

```
Spr2.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the spr2s in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all spr2s will be unset in

- **flag** (Flag)

Flag to unset on the spr2s

Returns

No return value

Example

To unset the flag f on all the spr2s in model m:

```
Spr2.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the spr2.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spr2 is unsketched. If omitted redraw is true. If you want to unsketch several spr2s and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch spr2 s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all spr2s.

Arguments

- **Model** (Model)

Model that all spr2s will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spr2s are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all spr2s in model m:

```
Spr2.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged spr2s in the model.

Arguments

- **Model** (Model)

Model that all spr2s will be unsketched in

- **flag** (Flag)

Flag set on the spr2s that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the spr2s are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all spr2s flagged with flag in model m:

```
Spr2.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Spr2 object.

Return type

Spr2

Example

To check if Spr2 property s.example is a parameter by using the Spr2.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for spr2. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for spr2 s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this spr2.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for spr2 s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the spr2 data in keyword format. Note that this contains the keyword header and the keyword cards. See also Spr2.Keyword() and Spr2.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for spr2 s in keyword format

```
var str = s.toString();
```

TieBreak class

The TieBreak class gives you access to constrained Tie-Break cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

TieBreak properties

Name	Type	Description
eppf	real	Plastic strain at failure.

exists (read only)	logical	true if constrained tie-break exists, false if referred to but not defined.
include	integer	The Include file number that the constrained tie-break is in.
model (read only)	integer	The Model number that the tie-break is in.
nsid1	integer	First Node Set ID.
nsid2	integer	Second Node Set ID.

Detailed Description

The TieBreak class allows you to create, modify, edit and manipulate constrained tie-break cards. See the documentation below for more details.

Constructor

new TieBreak(Model*[Model]*, nsid1*[integer]*, nsid2*[integer]*, eppf (optional)*[real]*)

Description

Create a new TieBreak object.

Arguments

- **Model** (Model)

Model that constrained tie-break will be created in

- **nsid1** (integer)

First Node Set ID.

- **nsid2** (integer)

Second Node Set ID.

- **eppf (optional)** (real)

Plastic strain at failure.

Returns

TieBreak object

Return type

TieBreak

Example

To create a new constrained tie-break in model m with first node set 100, second node set 200

```
var tb = new TieBreak(m, 100, 200);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a tie-break.

Arguments

- **Comment** (Comment)

Comment that will be attached to the tie-break

Returns

No return value

Example

To associate comment c to the tie-break tb:

```
tb.AssociateComment(c);
```

Blank()

Description

Blanks the tie-break

Arguments

No arguments

Returns

No return value

Example

To blank tie-break tb:

```
tb.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the tie-breaks in the model.

Arguments

- **Model** (Model)

Model that all tie-breaks will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the tie-breaks in model m:

```
TieBreak.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged tie-breaks in the model.

Arguments

- **Model** (Model)

Model that all the flagged tie-breaks will be blanked in

- **flag** (Flag)

Flag set on the tie-breaks that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the tie-breaks in model m flagged with f:

```
TieBreak.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the tie-break is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if tie-break tb is blanked:

```
if (tb.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the tie-break.

Arguments

- **flag** (Flag)

Flag to clear on the tie-break

Returns

No return value

Example

To clear flag f for tie-break tb:

```
tb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the tie-break. The target include of the copied tie-break can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

TieBreak object

Return type

TieBreak

Example

To copy tie-break tb into tie-break z:

```
var z = tb.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a tie-break.

Arguments

- **Comment** (Comment)

Comment that will be detached from the tie-break

Returns

No return value

Example

To detach comment c from the tie-break tb:

```
tb.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for tie-break. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for tie-break tb:

```
tb.Error("My custom error");
```

First(Model[*Model*]) [static]

Description

Returns the first tie-break in the model.

Arguments

- **Model** (Model)

Model to get first tie-break in

Returns

TieBreak object (or null if there are no tie-breaks in the model).

Return type

TieBreak

Example

To get the first tie-break in model m:

```
var tb = TieBreak.First(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the tie-breaks in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all tie-breaks will be flagged in

- **flag** (Flag)

Flag to set on the tie-breaks

Returns

No return value

Example

To flag all of the tie-breaks with flag f in model m:

```
TieBreak.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the tie-break is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the tie-break

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if tie-break tb has flag f set on it:

```
if (tb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each tie-break in the model.
Note that ForEach has been designed to make looping over tie-breaks as fast as possible and so has some limitations.
Firstly, a single temporary TieBreak object is created and on each function call it is updated with the current tie-break data. This means that you should not try to store the TieBreak object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new tie-breaks inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all tie-breaks are in

- **func** (function)

Function to call for each tie-break

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the tie-breaks in model m:

```
TieBreak.ForEach(m, test);
function test(tb)
{
// tb is TieBreak object
}
```

To call function test for all of the tie-breaks in model m with optional object:

```
var data = { x:0, y:0 };
TieBreak.ForEach(m, test, data);
function test(tb, extra)
{
// tb is TieBreak object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of TieBreak objects for all of the tie-breaks in a model in PRIMER

Arguments

- **Model** (Model)

Model to get tie-breaks from

Returns

Array of TieBreak objects

Return type

Array

Example

To make an array of TieBreak objects for all of the tie-breaks in model m

```
var tb = TieBreak.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a tie-break.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the tie-break tb:

```
var comm_array = tb.GetComments();
```

GetFlagged(Model[*Model*], flag[*Flag*]) [static]

Description

Returns an array of TieBreak objects for all of the flagged tie-breaks in a model in PRIMER

Arguments

- **Model** (Model)

Model to get tie-breaks from

- **flag** (Flag)

Flag set on the tie-breaks that you want to retrieve

Returns

Array of TieBreak objects

Return type

Array

Example

To make an array of TieBreak objects for all of the tie-breaks in model m flagged with f

```
var tb = TieBreak.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the TieBreak object for a tie-break ID.

Arguments

- **Model** (Model)

Model to find the tie-break in

- **number** (integer)

number of the tie-break you want the TieBreak object for

Returns

TieBreak object (or null if tie-break does not exist).

Return type

TieBreak

Example

To get the TieBreak object for tie-break 100 in model m

```
var tb = TieBreak.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a TieBreak property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the TieBreak.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

tie-break property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if TieBreak property tb.example is a parameter:

```
Options.property_parameter_names = true;
if (tb.GetParameter(tb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if TieBreak property tb.example is a parameter by using the GetParameter method:

```
if (tb.ViewParameters().GetParameter(tb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this tie-break (**CONSTRAINED_TIE_BREAK). **Note that a carriage return is not added**. See also TieBreak.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for tie-break tb:

```
var key = tb.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the tie-break. **Note that a carriage return is not added**. See also TieBreak.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for tie-break tb:

```
var cards = tb.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last tie-break in the model.

Arguments

- **Model** (Model)

Model to get last tie-break in

Returns

TieBreak object (or null if there are no tie-breaks in the model).

Return type

TieBreak

Example

To get the last tie-break in model m:

```
var tb = TieBreak.Last(m);
```

Next()

Description

Returns the next tie-break in the model.

Arguments

No arguments

Returns

TieBreak object (or null if there are no more tie-breaks in the model).

Return type

TieBreak

Example

To get the tie-break in model m after tie-break tb:

```
var tb = tb.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a tie-break.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only tie-breaks from that model can be picked. If the argument is a Flag then only tie-breaks that are flagged with *limit* can be selected. If omitted, or null, any tie-breaks from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

TieBreak object (or null if not picked)

Return type

TieBreak

Example

To pick a tie-break from model m giving the prompt 'Pick tie-break from screen':

```
var tb = TieBreak.Pick('Pick tie-break from screen', m);
```

Previous()

Description

Returns the previous tie-break in the model.

Arguments

No arguments

Returns

TieBreak object (or null if there are no more tie-breaks in the model).

Return type

TieBreak

Example

To get the tie-break in model m before tie-break tb:

```
var tb = tb.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select tie-breaks using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting tie-breaks

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only tie-breaks from that model can be selected. If the argument is a Flag then only tie-breaks that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any tie-breaks can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of tie-breaks selected or null if menu cancelled

Return type

Number

Example

To select tie-breaks from model m, flagging those selected with flag f, giving the prompt 'Select tie-breaks':

```
TieBreak.Select(f, 'Select tie-breaks', m);
```

To select tie-breaks, flagging those selected with flag f but limiting selection to tie-breaks flagged with flag l, giving the prompt 'Select tie-breaks':

```
TieBreak.Select(f, 'Select tie-breaks', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the tie-break.

Arguments

- **flag** (Flag)

Flag to set on the tie-break

Returns

No return value

Example

To set flag f for tie-break tb:

```
tb.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the tie-break. The tie-break will be sketched until you either call TieBreak.Unsketch(), TieBreak.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the tie-break is sketched. If omitted redraw is true. If you want to sketch several tie-breaks and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch tie-break tb:

```
tb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged tie-breaks in the model. The tie-breaks will be sketched until you either call TieBreak.Unsketch(), TieBreak.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged tie-breaks will be sketched in

- **flag** (Flag)

Flag set on the tie-breaks that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the tie-breaks are sketched. If omitted redraw is true. If you want to sketch flagged tie-breaks several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all tie-breaks flagged with flag in model m:

```
TieBreak.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of tie-breaks in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing tie-breaks should be counted. If false or omitted referenced but undefined tie-breaks will also be included in the total.

Returns

number of tie-breaks

Return type

Number

Example

To get the total number of tie-breaks in model m:

```
var total = TieBreak.Total(m);
```

Unblank()

Description

Unblanks the tie-break

Arguments

No arguments

Returns

No return value

Example

To unblank tie-break tb:

```
tb.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the tie-breaks in the model.

Arguments

- **Model** (Model)

Model that all tie-breaks will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the tie-breaks in model m:

```
TieBreak.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged tie-breaks in the model.

Arguments

- **Model** (Model)

Model that the flagged tie-breaks will be unblanked in

- **flag** (Flag)

Flag set on the tie-breaks that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the tie-breaks in model m flagged with f:

```
TieBreak.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the tie-breaks in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all tie-breaks will be unset in

- **flag** (Flag)

Flag to unset on the tie-breaks

Returns

No return value

Example

To unset the flag f on all the tie-breaks in model m:

```
TieBreak.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the tie-break.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the tie-break is unsketched. If omitted redraw is true. If you want to unsketch several tie-breaks and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch tie-break tb:

```
tb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all tie-breaks.

Arguments

- **Model** (Model)

Model that all tie-breaks will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the tie-breaks are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all tie-breaks in model m:

```
TieBreak.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged tie-breaks in the model.

Arguments

- **Model** (Model)

Model that all tie-breaks will be unsketched in

- **flag** (Flag)

Flag set on the tie-breaks that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the tie-breaks are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all tie-breaks flagged with flag in model m:

```
TieBreak.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

TieBreak object.

Return type

TieBreak

Example

To check if TieBreak property tb.example is a parameter by using the TieBreak.GetParameter() method:

```
if (tb.ViewParameters().GetParameter(tb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for tie-break. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for tie-break tb:

```
tb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this tie-break.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for tie-break tb:

```
var xrefs = tb.Xrefs();
```

---

toString()

Description

Creates a string containing the tie-break data in keyword format. Note that this contains the keyword header and the keyword cards. See also TieBreak.Keyword() and TieBreak.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for tie-break tb in keyword format

```
var str = tb.toString();
```

Contact class

The Contact class gives you access to define contact cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Contact constants

Name	Description
Contact.CROSSED_EDGES	Return crossed edges in Contact.Interactions()
Contact.MPP_MODE	MPP penetration check mode
Contact.PENETRATIONS	Return penetrations in Contact.Interactions()
Contact.SMP_MODE	SMP penetration check mode

Constants for Contact _OFFSET types

Name	Description
Contact.BEAM_OFFSET	Adds _BEAM_OFFSET option
Contact.CONSTR_OFFSET	Adds _CONSTRAINED_OFFSET option
Contact.NO_OFFSET	No offset option added.
Contact.SIMPLE_OFFSET	Adds _OFFSET option

Constants for Contact penetration check_mode types

Name	Description
Contact.MPP_METHOD	Launches the penetration edit panel with the MPP methodology turned on
Contact.SMP_METHOD	Launches the penetration edit panel with the SMP methodology turned on

Constants for Contact penetration contact_penchk_dup_shells types

Name	Description
Contact.SHELL_AUTO	Launches the penetration edit panel with Automatic shell treatment of duplicate shells.
Contact.SHELL_THICK	Launches the penetration edit panel with the thickest always option for duplicate shells.
Contact.SHELL_THIN	Launches the penetration edit panel with the thinnest always option for duplicate shells.

Contact properties

Name	Type	Description
bt	real	Contact birth time
check_mode	integer	Checking mode on the pen check edit panel. (Can be Contact.MPP_METHOD, Contact.MPP_METHOD or Contact.SMP_METHOD)
cid	integer	Contact number (identical to label.
colour	Colour	The colour of the contact

contact_penchk_dup_shells	integer	Shell treatment on the pen check edit panel. (Can be Contact.SHELL_AUTO, Contact.SHELL_AUTO or Contact.SHELL_THIN or Contact.SHELL_THICK)
dc	real	Exponential decay coeff
dt	real	Contact death time
exists (read only)	logical	true if contact exists, false if referred to but not defined.
fd	real	Dynamic coeff of friction
fs	real	Static coeff of friction
fsf	real	Coulomb friction scale factor
heading	string	Contact heading
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the contact is in.
label	integer	Contact number.
model (read only)	integer	The Model number that the contact is in.
mortar	logical	_MORTAR keyword option - true if set, false if not.
offset_flag	integer	_OFFSET option. (Can be Contact.NO_OFFSET, Contact.SIMPLE_OFFSET, Contact.CONSTR_OFFSET or Contact.BEAM_OFFSET)
penchk	integer	Penetration search flag
saboxid	integer	Surface A box id
sapr	integer	Surface A side printout flag
sast	real	Optional surface A side shell thickness
sbboxid	integer	Surface B box id
sbpr	integer	Surface B side printout flag
sbst	real	Optional surface B side shell thickness
sfsa	real	Scale factor on surface A penalty stiffness
sfsat	real	Scale factor on true surface A shell thickness
sfsb	real	Scale factor on surface B penalty stiffness
sfsbt	real	Scale factor on true surface B shell thickness
surfa	integer	Surface A set id
surfatyp	integer	Surface A set type
surfb	integer	Surface B set id
surfbtyp	integer	Surface B set type
type	string	Contact type ("AUTOMATIC_GENERAL", "SINGLE_SURFACE" etc).
vc	real	Coeff for viscous friction
vdc	real	Visous damping coefficient
vsf	real	Viscous friction scale factor

Properties for COMPOSITE/LUBRICATION options

Name	Type	Description
cideta	integer	Curve ID for the viscosity
cidmu	integer	Curve ID for the coefficient of friction

d_comp	real	Composite film thickness
srmodel	integer	Model for shear response
tfail	real	Tensile traction for failure

Properties for CONSTRAINT options

Name	Type	Description
kpf	real	Kinematic partition factor

Properties for CONTRACTION_JOINT options

Name	Type	Description
alpha	real	Key amplitude parameter A
beta	real	Key amplitude parameter B
mtcj	integer	The method option for the gap function
tsvx	real	X component of the free sliding direction T
tsvy	real	Y component of the free sliding direction T
tsvz	real	Z component of the free sliding direction T

Properties for DRAWBEAD options

Name	Type	Description
dbdth	real	Draw bead depth
dbpid	integer	optional Part ID
dfscl	real	Scale factor on lcidrf
eloff	integer	optional element id offset
ending	real	Parameter to define the length of the bead
epm	real	Maximum strain the blank will experience when it passes the bead
epscale	real	Scale factor to weaken the stress-strain curve
lceps	integer	Loadcurve ID for plastic strain vs. parametric coord
lceps2	integer	Loadcurve ID for plastic strain vs. parametric coord (elements moved > offset)
lcidnf	integer	Loadcurve ID for Normal force per unit length
lcidrf	integer	Loadcurve ID for Force due to bending per unit length
numint	integer	#int points along drawbead
offset	real	distance offset
tscale	integer	

Properties for ERODING options

Name	Type	Description
erosop	integer	Erosion/interior node option
iadj	integer	Adjacent matl treatment for solids
isym	integer	Symmetry plane option

Properties for INTERFERENCE options

Name	Type	Description
lcid1	integer	Loadcurve ID for Dyn rel stiffness
lcid2	integer	Loadcurve ID for Transient stiffness

Properties for RIGID options

Name	Type	Description
fcm	integer	Force calculation method
lcid	integer	Loadcurve ID for Force vs penetration curve
us	real	Optional unloading stiffness

Properties for THERMAL options

Name	Type	Description
a	integer	Loadcurve ID for a
algo	integer	contact algorithm
b	integer	Loadcurve ID for b
bc_flg	integer	boundary condition flag
c	integer	Loadcurve ID for c
d	integer	Loadcurve ID for d
formula	integer	formula id
frad	real	Radiation conductance across gap
ftosa	real	Fraction of sliding friction energy partitioned to surface A
h0	real	Heat transfer coefficient
k	real	Conductivity of gap fluid
lcfdt	integer	Loadcurve ID for dynamic friction vs. temp
lcfst	integer	Loadcurve ID for static friction vs. temp
lch	integer	Loadcurve ID for lch
lmax	real	Max size for thermal contact
lmin	real	Critical gap size
thermal	logical	If _THERMAL option is set. Can be true or false

Properties for TIEBREAK options

Name	Type	Description
cn	real	Normal stiffness
ct2cn	real	Ratio of tangential stiffness to normal stiffness
eraten	real	Normal energy release rate used in damage calculation
erates	real	Shear energy release rate used in damage calculation
mes	real	Shear force exponent
nen	real	Normal force exponent

nfls	real	Normal failure stress
option	integer	Response option
param	real	Critical distance
sfls	real	Shear failure stress
tblcid	integer	Loadcurve ID for stress vs gap post failure
thkoff	integer	flag for thickness offset

Properties for TIEBREAK_USER options

Name	Type	Description
cn	real	Normal stiffness
ct2cn	real	Ratio of tangential to normal stiff
nhv	integer	Number of history variables
offset	integer	Flag for offset treatment. This is only valid for *CONTACT_AUTOMATIC(_ONE_WAY)_ SURFACE_TO_SURFACE_TIEBREAK_USER and should not be confused with the 'offset' property for other contact types.
option	integer	User tiebreak type
up1	real	User parameter
up10	real	User parameter
up11	real	User parameter
up12	real	User parameter
up13	real	User parameter
up14	real	User parameter
up15	real	User parameter
up16	real	User parameter
up2	real	User parameter
up3	real	User parameter
up4	real	User parameter
up5	real	User parameter
up6	real	User parameter
up7	real	User parameter
up8	real	User parameter
up9	real	User parameter

Properties for TIED_WELD options

Name	Type	Description
close	real	Surface closeness parameter
hclose	real	Thermal contact conductivity
nmhis	integer	Number of material history variables
nmtwh	integer	Number of surface B tied weld history variables
nstwh	integer	Number of surface A tied weld history variables

ntprm	integer	Number of user tied weld parameters
temp	real	Minimum temperature required.
time	real	Minimum time required

Properties for _MPP option

Name	Type	Description
bucket	integer	Bucket sorting frequency
chksegs	integer	Special check for inverted elements
cparm8	integer	Exclude beam to beam contact flag
grpable	integer	Experimental contact algorithm
inititer	integer	Number of iterations for initial penetration checking
lcbucket	integer	Bucket sorting frequency loadcurve ID
mpp	logical	true if _MPP option is set, false if not
ns2track	integer	Number of segments to track per surface A node
parmax	real	The parametric extension distance for contact segments
pensf	real	Ignore penetration scale factor

Properties for optional card A

Name	Type	Description
bsort	integer	Loadcurve for #cycles between bucket sorts
depth	integer	Loadcurve for search depth in automatic contact
frcfrq	integer	#cycles between penalty force updates
lcidab	integer	Loadcurve ID for airbag thickness vs time
maxpar	real	Max parametric coord overlap
sbopt	real	segment based contact option
sofscl	real	Soft constraint scale factor
soft	integer	Soft constraint flag

Properties for optional card B

Name	Type	Description
i2d3d	integer	Segment searching option
isym	integer	Symmetry plane option
penmax	real	Max pen distance for "old" types 3, 5, 10
shlthk	integer	Thickness consideration flag
sldstf	real	Optional solid stiffness
sldthk	real	Optional solid thickness
snlog	integer	Shooting node logic flag
thkopt	integer	Thickness option for "old" types 3, 5, 10

Properties for optional card C

Name	Type	Description
cid_rcf	integer	Coordinate system ID to output rcforc force resultants and ncforc data in a local system
dprfac	real	Depth of penetration reduction factor
dtstif	real	Timestep used in stiffness calc
flangl	real	Angle tolerance in radians for feature lines option in smooth contact
igap	integer	Implicit convergence flag
ignore	integer	Ignore initial pens in automatic types

Properties for optional card D

Name	Type	Description
dnlscl	real	Distance for nonlinear force scaling
dtpchk	real	Time interval between penetration reports
fnlscl	real	Scale factor for nonlinear force scaling
q2tri	integer	Split quads into 2 trias
sfnbr	real	Scale factor for neighbour segment contact
shledg	integer	Edge shape for shells when measuring penetration
tcso	integer	Segment treatment only flag
tiedid	integer	Incremental displacement update for tied contacts

Properties for optional card E

Name	Type	Description
cparm8smp	integer	Spotweld beam flag for SMP
fricsf	real	Scale factor for frictional stiffness
ftorq	integer	Beam torsional force computation flag
icor	integer	coefficient of restitution expressed as a percentage
ipback	integer	Create backup penalty tied contact
region	integer	Region to limit contact volume
sharec	integer	Shared constraint flag
srnde	integer	Flag for non-extended exterior shell edges

Properties for optional card F

Name	Type	Description
dbinr	integer	2dbinr - Flag to include 2d belt elements in contact (note properties cannot start with a number, so 2 has been removed).
fstol	real	Tolerance for determining flat segments.
ignroff	integer	Flag to ignore the thickness offset for shells in the calculation of the shell contact penetration depth.
pstiff	integer	Flag to choose the method for calculating the penalty stiffness
ssftyp	integer	Flag to determine how the SSF option on *PART_CONTACT behaves when SOFT = 2 on optional card A

swtpr	integer	Flag to use tapered shell contact segments adjacent to segments that are thinned by the SPOTHIN option on *CONTROL_CONTACT
tetfac	real	Scale factor for the computed volume of tetrahedral solid elements for the mass calculation in SOFT = 2 contact..

Detailed Description

The Contact class allows you to create, modify, edit and contact cards. See the documentation below for more details.

Constructor

new Contact(Model*[Model]*, type*[string]*, id (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new Contact object.

Arguments

- **Model** (Model)

Model that Contact will be created in

- **type** (string)

Type of contact

- **id (optional)** (integer)

Contact number

- **heading (optional)** (string)

Title for the Contact

Returns

Contact object

Return type

Contact

Example

To create a new AUTOMATIC_GENERIC contact n model m with label 10 and title "Test contact"

```
var c = new Contact(m, "AUTOMATIC_GENERAL", 10, "Test contact");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a contact.

Arguments

- **Comment** (Comment)

Comment that will be attached to the contact

Returns

No return value

Example

To associate comment c to the contact c:

```
c.AssociateComment(c);
```

Blank()

Description

Blanks the contact

Arguments

No arguments

Returns

No return value

Example

To blank contact c:

```
c.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the contacts in the model.

Arguments

- **Model** (Model)

Model that all contacts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the contacts in model m:

```
Contact.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged contacts in the model.

Arguments

- **Model** (Model)

Model that all the flagged contacts will be blanked in

- **flag** (Flag)

Flag set on the contacts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the contacts in model m flagged with f:

```
Contact.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the contact is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if contact c is blanked:

```
if (c.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse contact c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the contact.

Arguments

- **flag** (Flag)

Flag to clear on the contact

Returns

No return value

Example

To clear flag f for contact c:

```
c.ClearFlag(f);
```

Constrained(connection (optional)*[boolean]*)

Description

see if tied/spotweld contact uses constrained formulation

Arguments

- **connection (optional)** (boolean)

if true will only consider contacts used for PRIMER connections. The default is false.

Returns

logical

Return type

Boolean

Example

To see if contact is of type tied and constrained

```
c.Constrained();
```

Copy(range (optional)*[boolean]*)

Description

Copies the contact. The target include of the copied contact can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Contact object

Return type

Contact

Example

To copy contact c into contact z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a contact.

Arguments

- **Model** (Model)

Model that the contact will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Contact object (or null if not made)

Return type

Contact

Example

To start creating a contact in model m:

```
var c = Contact.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a contact.

Arguments

- **Comment** (Comment)

Comment that will be detached from the contact

Returns

No return value

Example

To detach comment c from the contact c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit contact c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for contact. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for contact c:

```
c.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for contact.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the contact colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the contact.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing contact c:

```
var colour = c.ExtractColour();
```

FindInteractions() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use Contact.Interactions() instead.

Arguments

No arguments

Returns

No return value

First(Model*[Model]*) [static]

Description

Returns the first contact in the model.

Arguments

- **Model** (Model)

Model to get first contact in

Returns

Contact object (or null if there are no contacts in the model).

Return type

Contact

Example

To get the first contact in model m:

```
var c = Contact.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free contact label in the model. Also see Contact.LastFreeLabel(), Contact.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free contact label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Contact label.

Return type

Number

Example

To get the first free contact label in model m:

```
var label = Contact.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the contacts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all contacts will be flagged in

- **flag** (Flag)

Flag to set on the contacts

Returns

No return value

Example

To flag all of the contacts with flag f in model m:

```
Contact.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the contact is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the contact

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if contact c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each contact in the model.
Note that ForEach has been designed to make looping over contacts as fast as possible and so has some limitations.
Firstly, a single temporary Contact object is created and on each function call it is updated with the current contact data. This means that you should not try to store the Contact object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new contacts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all contacts are in

- **func** (function)

Function to call for each contact

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the contacts in model m:

```
Contact.ForEach(m, test);
function test(c)
{
// c is Contact object
}
```

To call function test for all of the contacts in model m with optional object:

```
var data = { x:0, y:0 };
Contact.ForEach(m, test, data);
function test(c, extra)
{
// c is Contact object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Contact objects for all of the contacts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get contacts from

Returns

Array of Contact objects

Return type

Array

Example

To make an array of Contact objects for all of the contacts in model m

```
var c = Contact.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a contact.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the contact c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Contact objects for all of the flagged contacts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get contacts from

- **flag** (Flag)

Flag set on the contacts that you want to retrieve

Returns

Array of Contact objects

Return type

Array

Example

To make an array of Contact objects for all of the contacts in model m flagged with f

```
var c = Contact.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Contact object for a contact ID.

Arguments

- **Model** (Model)

Model to find the contact in

- **number** (integer)

number of the contact you want the Contact object for

Returns

Contact object (or null if contact does not exist).

Return type

Contact

Example

To get the Contact object for contact 100 in model m

```
var c = Contact.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Contact property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Contact.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

contact property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Contact property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Contact property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Interactions(type (optional)*[constant]*)

Description

Returns an array of objects describing the interactions which can either be penetrations (tracked nodes that are tied to or penetrate elements in the contact) or crossed edges (contact segments that cross).

Arguments

- **type (optional)** (constant)

What type of interactions to return. Can be bitwise code of Contact.PENETRATIONS to return penetrations and Contact.CROSSED_EDGES to return crossed edges. If omitted penetrations will be returned.

Returns

Array of objects with the following properties:

Name	Type	Description
end	Array of reals	End coordinate of intersection line (for Contact.CROSSED_EDGES)
ex	real	escape vector X component (for Contact.PENETRATIONS)
ey	real	escape vector Y component (for Contact.PENETRATIONS)
ez	real	escape vector Z component (for Contact.PENETRATIONS)
n1	Node object	Node 1 of master segment (for Contact.PENETRATIONS)
n2	Node object	Node 2 of master segment (for Contact.PENETRATIONS)
n3	Node object	Node 3 of master segment (for Contact.PENETRATIONS)
n4	Node object	Node 4 of master segment (for Contact.PENETRATIONS)
node	Node object	Penetrating node (for Contact.PENETRATIONS)
pen	real	Depth of penetration (for Contact.PENETRATIONS)
qthick	real	Remaining thickness ratio (for Contact.PENETRATIONS)
rthick	real	Remaining unpenetrated thickness (for Contact.PENETRATIONS)
s	real	s parametric coordinate of the tracked node projected onto the shell (for Contact.PENETRATIONS)
shell	Shell object	Penetrated shell (for Contact.PENETRATIONS)
shell1	Shell object	First segment if shell (for Contact.CROSSED_EDGES)
shell2	Shell object	Second segment if shell (for Contact.CROSSED_EDGES)
solid	Solid object	Penetrated solid (for Contact.PENETRATIONS)
solid1	Solid object	First segment if solid (for Contact.CROSSED_EDGES)
solid2	Solid object	Second segment if solid (for Contact.CROSSED_EDGES)
start	Array of reals	Start coordinate of intersection line (for Contact.CROSSED_EDGES)
t	real	t parametric coordinate of the tracked node projected onto the shell (for Contact.PENETRATIONS)
thick	real	Thickness of contact segment, i.e. 0.5*(t1+t2) (for Contact.PENETRATIONS)
thickshell	Tshell object	Penetrated thick shell (for Contact.PENETRATIONS)
thickshell1	Tshell object	First segment if thick shell (for Contact.CROSSED_EDGES)

thickshell2	Tshell object	Second segment if thick shell (for Contact.CROSSED_EDGES)
type	integer	The interaction type. Either Contact.PENETRATIONS or Contact.CROSSED_EDGES.

Return type

object

Example

To get the penetration interactions for contact c:

```
var interactions = c.Interactions();
for(i=0; i<interactions.length; i++)
{
    var type  = interactions[i].type; // Will be Contact.PENETRATIONS
    var node  = interactions[i].node;
    var shell = interactions[i].shell;
    var n1    = interactions[i].n1;
    var n2    = interactions[i].n2;
    var n3    = interactions[i].n3;
    var n4    = interactions[i].n4;
    var s     = interactions[i].s;
    var t     = interactions[i].t;
    var ex    = interactions[i].ex;
    var ey    = interactions[i].ey;
    var ez    = interactions[i].ez;
    var pen   = interactions[i].pen;
    var thick = interactions[i].thick;
    var rthick = interactions[i].rthick;
    var qthick = interactions[i].qthick;
    if(shell != undefined)
            ... process shell ...
}
```

To get the penetration and crossed edge interactions for contact c:

```
var interactions = c.Interactions(Contact.PENETRATIONS|Contact.CROSSED_EDGES);
for(i=0; i<interactions.length; i++)
{
    if (interactions[i].type == Contact.PENETRATIONS)
    {
        var node  = interactions[i].node;
        ...
    }
    else if (interactions[i].type == Contact.CROSSED_EDGES)
    {
        var start = interactions[i].start;
        ...
    }
}
```

Keyword()

Description

Returns the keyword for this Contact (*BOUNDARY_PRESCRIBED_MOTION_xxxx). **Note that a carriage return is not added**. See also Contact.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Contact c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Contact. **Note that a carriage return is not added**. See also Contact.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Contact c:

```
var cards = c.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last contact in the model.

Arguments

- **Model** (Model)

Model to get last contact in

Returns

Contact object (or null if there are no contacts in the model).

Return type

Contact

Example

To get the last contact in model m:

```
var c = Contact.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free contact label in the model. Also see Contact.FirstFreeLabel(), Contact.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free contact label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Contact label.

Return type

Number

Example

To get the last free contact label in model m:

```
var label = Contact.LastFreeLabel(m);
```

Next()

Description

Returns the next contact in the model.

Arguments

No arguments

Returns

Contact object (or null if there are no more contacts in the model).

Return type

Contact

Example

To get the contact in model m after contact c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) contact label in the model. Also see Contact.FirstFreeLabel(), Contact.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free contact label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Contact label.

Return type

Number

Example

To get the next free contact label in model m:

```
var label = Contact.NextFreeLabel(m);
```

PenCheck(flag*[Flag]*, eflag*[integer]*)

Description

Flags nodes that penetrate (or tie) in contact

Arguments

- **flag** (Flag)

Flag to be set on penetrating (or tied) node.

- **eflag** (integer)

Optional flag for elements. If supplied, node will be flagged only if it penetrates (or ties to) an element that is flagged. Node and element flag may be the same.

Returns

zero if contact successfully checked

Return type

Number

Example

To set flag f on tracked nodes of Contact c which tie to elements flagged with f:

```
c.PenCheck(f, f);
```

PenCheckEdit(modal (optional)*[boolean]*, check_mode (optional)*[constant]*, mpp_threshold (optional)*[real]*, report_crossed_3d_elems (optional)*[boolean]*, contact_penchk_dup_shells (optional)*[constant]*)

Description

launches the interactive edit panel for penetration check on the con

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

- **check_mode (optional)** (constant)

Check mode. Can be Model.MPP_MODE or Model.SMP_MODE. Default is set to the oa pref contact_check_mode

- **mpp_threshold (optional)** (real)

Can set the MPP threshold, by default this is set to the oa pref contact_mpp_penetration_threshold

- **report_crossed_3d_elems (optional)** (boolean)

Can set the value of reporting crossed elements to TRUE or FALSE, by default this is set to the oa pref report_crossed_3d_elems

- **contact_penchk_dup_shells (optional)** (constant)

Duplicate shell treatment Can be Model.SHELL_AUTO, Model.SHELL_THICK or Model.SHELL_THIN. Default is set to the oa pref contact_penchk_dup_shells

Returns

No return value

Example

To launch an edit panel with modal set to TRUE, check_method set to MPP, mpp_threshold set to 1.123, report_crossed_3d_elems set to true and contact_penchk_dup_shells set to thinnest always:

```
c.PenCheckEdit(true,Contact.MPP_METHOD,1.123,true,Contact.SHELL_THIN);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a contact.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only contacts from that model can be picked. If the argument is a Flag then only contacts that are flagged with *limit* can be selected. If omitted, or null, any contacts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Contact object (or null if not picked)

Return type

Contact

Example

To pick a contact from model m giving the prompt 'Pick contact from screen':

```
var c = Contact.Pick('Pick contact from screen', m);
```

Previous()

Description

Returns the previous contact in the model.

Arguments

No arguments

Returns

Contact object (or null if there are no more contacts in the model).

Return type

Contact

Example

To get the contact in model m before contact c:

```
var c = c.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the contacts in the model.

Arguments

- **Model** (Model)

Model that all contacts will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the contacts in model m, from 1000000:

```
Contact.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged contacts in the model.

Arguments

- **Model** (Model)

Model that all the flagged contacts will be renumbered in

- **flag** (Flag)

Flag set on the contacts that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the contacts in model m flagged with f, from 1000000:

```
Contact.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select contacts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting contacts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only contacts from that model can be selected. If the argument is a Flag then only contacts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any contacts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of contacts selected or null if menu cancelled

Return type

Number

Example

To select contacts from model m, flagging those selected with flag f, giving the prompt 'Select contacts':

```
Contact.Select(f, 'Select contacts', m);
```

To select contacts, flagging those selected with flag f but limiting selection to contacts flagged with flag l, giving the prompt 'Select contacts':

```
Contact.Select(f, 'Select contacts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the contact.

Arguments

- **flag** (Flag)

Flag to set on the contact

Returns

No return value

Example

To set flag f for contact c:

```
c.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the contact. The contact will be sketched until you either call Contact.Unsketch(), Contact.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact is sketched. If omitted redraw is true. If you want to sketch several contacts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch contact c:

```
c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged contacts in the model. The contacts will be sketched until you either call Contact.Unsketch(), Contact.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged contacts will be sketched in

- **flag** (Flag)

Flag set on the contacts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contacts are sketched. If omitted redraw is true. If you want to sketch flagged contacts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all contacts flagged with flag in model m:

```
Contact.SketchFlagged(m, flag);
```

StatusCheck()

Description

Checks sliding contact for crossed edges and penetrations

Arguments

No arguments

Returns

An array containing count of crossed edges, count of penetrations (note if a node penetrates more than one segment, it is only reported once here)

Return type

Array

Example

To check Contact c:

```
var status = c.StatusCheck(); ncrossed = status[0]; npens = status[1]
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of contacts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing contacts should be counted. If false or omitted referenced but undefined contacts will also be included in the total.

Returns

number of contacts

Return type

Number

Example

To get the total number of contacts in model m:

```
var total = Contact.Total(m);
```

Unblank()

Description

Unblanks the contact

Arguments

No arguments

Returns

No return value

Example

To unblank contact c:

```
c.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the contacts in the model.

Arguments

- **Model** (Model)

Model that all contacts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the contacts in model m:

```
Contact.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged contacts in the model.

Arguments

- **Model** (Model)

Model that the flagged contacts will be unblanked in

- **flag** (Flag)

Flag set on the contacts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the contacts in model m flagged with f:

```
Contact.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the contacts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all contacts will be unset in

- **flag** (Flag)

Flag to unset on the contacts

Returns

No return value

Example

To unset the flag f on all the contacts in model m:

```
Contact.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the contact.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact is unsketched. If omitted redraw is true. If you want to unsketch several contacts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch contact c:

```
c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all contacts.

Arguments

- **Model** (Model)

Model that all contacts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contacts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all contacts in model m:

```
Contact.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged contacts in the model.

Arguments

- **Model** (Model)

Model that all contacts will be unsketched in

- **flag** (Flag)

Flag set on the contacts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contacts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all contacts flagged with flag in model m:

```
Contact.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Contact object.

Return type

Contact

Example

To check if Contact property c.example is a parameter by using the Contact.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for contact. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for contact c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this contact.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for contact c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the Contact data in keyword format. Note that this contains the keyword header and the keyword cards. See also Contact.Keyword() and Contact.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Contact c in keyword format

```
var data = c.toString();
```

ContactGuidedCable class

The ContactGuidedCable class gives you access to define *CONTACT_GUIDED_CABLE cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)

ContactGuidedCable constants

Name	Description
ContactGuidedCable.PART	CONTACT is *CONTACT_GUIDED_CABLE.
ContactGuidedCable.SET_PART	CONTACT is *CONTACT_GUIDED_CABLE_SET.

ContactGuidedCable properties

Name	Type	Description
cid	integer	ContactGuidedCable number.
endtol	real	Tolerance, in length units.
exists (read only)	logical	true if ContactGuidedCable exists, false if referred to but not defined.
fric	real	Contact friction.
heading	string	ContactGuidedCable heading
id	logical	TRUE if _ID option is set, FALSE if not
include	integer	The Include file number that the ContactGuidedCable is in.
model (read only)	integer	The Model number that the contact guided_cable is in.
nsid	integer	Node Set ID that guides the 1D elements.
pid	integer	Part ID or Part Set ID
ptype	constant	The Contact Part type. Can be ContactGuidedCable.PART or ContactGuidedCable.SET_PART.
soft	integer	Flag for soft constraint option. Set to 1 for soft constraint.
ssfac	real	Stiffness scale factor for penalty stiffness value. The default value is unity. This applies to SOFT set to 0 and 1.

Detailed Description

The ContactGuidedCable class allows you to create, modify, edit and manipulate *CONTACT_GUIDED_CABLE cards. See the documentation below for more details.

Constructor

new ContactGuidedCable(Model*[Model]*, ptype*[constant]*, nsid*[integer]*, pid*[integer]*, soft (optional)*[integer]*, ssfac (optional)*[real]*, fric (optional)*[real]*, cid (optional)*[integer]*, heading (optional)*[string]*, endtol (optional)*[real]*)

Description

Create a new ContactGuidedCable object.

Arguments

- **Model** (Model)

Model that ContactGuidedCable will be created in

- **ptype** (constant)

Specify the type of ContactGuidedCable (Can be ContactGuidedCable.PART or ContactGuidedCable.SET_PART

- **nsid** (integer)

Node Set ID that guides the 1D elements.

- **pid** (integer)

Part ID or Part Set ID

- **soft (optional)** (integer)

Flag for soft constraint option. Set to 1 for soft constraint.

- **ssfac (optional)** (real)

Stiffness scale factor for penalty stiffness value. The default value is unity. This applies to SOFT set to 0 and 1.

- **fric (optional)** (real)

Contact friction.

- **cid (optional)** (integer)

ContactGuidedCable number (Same as label).

- **heading (optional)** (string)

ContactGuidedCable heading (Same as title).

- **endtol (optional)** (real)

Tolerance, in length units.

Returns

ContactGuidedCable object

Return type

ContactGuidedCable

Example

To create a new contact guided_cable in model m, of ptype PART, with nsid 100, pid 10, soft 1 and ssfac 4.5.

```
var c_g_c = new ContactGuidedCable(m, ContactGuidedCable.PART, 100, 10, 1, 4.5);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a contact guided_cable.

Arguments

- **Comment** (Comment)

Comment that will be attached to the contact guided_cable

Returns

No return value

Example

To associate comment c to the contact guided_cable c_g_c:

```
c_g_c.AssociateComment(c);
```

Blank()

Description

Blanks the contact guided_cable

Arguments

No arguments

Returns

No return value

Example

To blank contact guided_cable c_g_c:

```
c_g_c.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the contact guided_cables in model m:

```
ContactGuidedCable.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all the flagged contact guided_cables will be blanked in

- **flag** (Flag)

Flag set on the contact guided_cables that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the contact guided_cables in model m flagged with f:

```
ContactGuidedCable.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the contact guided_cable is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if contact guided_cable c_g_c is blanked:

```
if (c_g_c.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the contact guided_cable.

Arguments

- **flag** (Flag)

Flag to clear on the contact guided_cable

Returns

No return value

Example

To clear flag f for contact guided_cable c_g_c:

```
c_g_c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the contact guided_cable. The target include of the copied contact guided_cable can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ContactGuidedCable object

Return type

ContactGuidedCable

Example

To copy contact guided_cable c_g_c into contact guided_cable z:

```
var z = c_g_c.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a contact guided_cable.

Arguments

- **Comment** (Comment)

Comment that will be detached from the contact guided_cable

Returns

No return value

Example

To detach comment c from the contact guided_cable c_g_c:

```
c_g_c.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for contact guided_cable. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for contact guided_cable c_g_c:

```
c_g_c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first contact guided_cable in the model.

Arguments

- **Model** (Model)

Model to get first contact guided_cable in

Returns

ContactGuidedCable object (or null if there are no contact guided_cables in the model).

Return type

ContactGuidedCable

Example

To get the first contact guided_cable in model m:

```
var c_g_c = ContactGuidedCable.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free contact guided_cable label in the model. Also see ContactGuidedCable.LastFreeLabel(), ContactGuidedCable.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free contact guided_cable label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

ContactGuidedCable label.

Return type

Number

Example

To get the first free contact guided_cable label in model m:

```
var label = ContactGuidedCable.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the contact guided_cables in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be flagged in

- **flag** (Flag)

Flag to set on the contact guided_cables

Returns

No return value

Example

To flag all of the contact guided_cables with flag f in model m:

```
ContactGuidedCable.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the contact guided_cable is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the contact guided_cable

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if contact guided_cable c_g_c has flag f set on it:

```
if (c_g_c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each contact guided_cable in the model.
Note that ForEach has been designed to make looping over contact guided_cables as fast as possible and so has some limitations.
Firstly, a single temporary ContactGuidedCable object is created and on each function call it is updated with the current contact guided_cable data. This means that you should not try to store the ContactGuidedCable object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new contact guided_cables inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all contact guided_cables are in

- **func** (function)

Function to call for each contact guided_cable

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the contact guided_cables in model m:

```
ContactGuidedCable.ForEach(m, test);
function test(c_g_c)
{
// c_g_c is ContactGuidedCable object
}
```

To call function test for all of the contact guided_cables in model m with optional object:

```
var data = { x:0, y:0 };
ContactGuidedCable.ForEach(m, test, data);
function test(c_g_c, extra)
{
// c_g_c is ContactGuidedCable object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ContactGuidedCable objects for all of the contact guided_cables in a model in PRIMER

Arguments

- **Model** (Model)

Model to get contact guided_cables from

Returns

Array of ContactGuidedCable objects

Return type

Array

Example

To make an array of ContactGuidedCable objects for all of the contact guided_cables in model m

```
var c_g_c = ContactGuidedCable.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a contact guided_cable.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the contact guided_cable c_g_c:

```
var comm_array = c_g_c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ContactGuidedCable objects for all of the flagged contact guided_cables in a model in PRIMER

Arguments

- **Model** (Model)

Model to get contact guided_cables from

- **flag** (Flag)

Flag set on the contact guided_cables that you want to retrieve

Returns

Array of ContactGuidedCable objects

Return type

Array

Example

To make an array of ContactGuidedCable objects for all of the contact guided_cables in model m flagged with f

```
var c_g_c = ContactGuidedCable.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ContactGuidedCable object for a contact guided_cable ID.

Arguments

- **Model** (Model)

Model to find the contact guided_cable in

- **number** (integer)

number of the contact guided_cable you want the ContactGuidedCable object for

Returns

ContactGuidedCable object (or null if contact guided_cable does not exist).

Return type

ContactGuidedCable

Example

To get the ContactGuidedCable object for contact guided_cable 100 in model m

```
var c_g_c = ContactGuidedCable.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a ContactGuidedCable property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ContactGuidedCable.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

contact guided_cable property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ContactGuidedCable property c_g_c.example is a parameter:

```
Options.property_parameter_names = true;
if (c_g_c.GetParameter(c_g_c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ContactGuidedCable property c_g_c.example is a parameter by using the GetParameter method:

```
if (c_g_c.ViewParameters().GetParameter(c_g_c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this ContactGuidedCable (*contact_guided_cable). **Note that a carriage return is not added**. See also ContactGuidedCable.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for ContactGuidedCable c_g_c:

```
var key = c_g_c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the ContactGuidedCable. **Note that a carriage return is not added**. See also ContactGuidedCable.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for ContactGuidedCable c_g_c:

```
var cards = c_g_c.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last contact guided_cable in the model.

Arguments

- **Model** (Model)

Model to get last contact guided_cable in

Returns

ContactGuidedCable object (or null if there are no contact guided_cables in the model).

Return type

ContactGuidedCable

Example

To get the last contact guided_cable in model m:

```
var c_g_c = ContactGuidedCable.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free contact guided_cable label in the model. Also see ContactGuidedCable.FirstFreeLabel(), ContactGuidedCable.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free contact guided_cable label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

ContactGuidedCable label.

Return type

Number

Example

To get the last free contact guided_cable label in model m:

```
var label = ContactGuidedCable.LastFreeLabel(m);
```

Next()

Description

Returns the next contact guided_cable in the model.

Arguments

No arguments

Returns

ContactGuidedCable object (or null if there are no more contact guided_cables in the model).

Return type

ContactGuidedCable

Example

To get the contact guided_cable in model m after contact guided_cable c_g_c:

```
var c_g_c = c_g_c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) contact guided_cable label in the model. Also see ContactGuidedCable.FirstFreeLabel(), ContactGuidedCable.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free contact guided_cable label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

ContactGuidedCable label.

Return type

Number

Example

To get the next free contact guided_cable label in model m:

```
var label = ContactGuidedCable.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a contact guided_cable.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only contact guided_cables from that model can be picked. If the argument is a Flag then only contact guided_cables that are flagged with *limit* can be selected. If omitted, or null, any contact guided_cables from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

ContactGuidedCable object (or null if not picked)

Return type

ContactGuidedCable

Example

To pick a contact guided_cable from model m giving the prompt 'Pick contact guided_cable from screen':

```
var c_g_c = ContactGuidedCable.Pick('Pick contact guided_cable from screen', m);
```

Previous()

Description

Returns the previous contact guided_cable in the model.

Arguments

No arguments

Returns

ContactGuidedCable object (or null if there are no more contact guided_cables in the model).

Return type

ContactGuidedCable

Example

To get the contact guided_cable in model m before contact guided_cable c_g_c:

```
var c_g_c = c_g_c.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the contact guided_cables in model m, from 1000000:

```
ContactGuidedCable.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all the flagged contact guided_cables will be renumbered in

- **flag** (Flag)

Flag set on the contact guided_cables that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the contact guided_cables in model m flagged with f, from 1000000:

```
ContactGuidedCable.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select contact guided_cables using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting contact guided_cables

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only contact guided_cables from that model can be selected. If the argument is a Flag then only contact guided_cables that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any contact guided_cables can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of contact guided_cables selected or null if menu cancelled

Return type

Number

Example

To select contact guided_cables from model m, flagging those selected with flag f, giving the prompt 'Select contact guided_cables':

```
ContactGuidedCable.Select(f, 'Select contact guided_cables', m);
```

To select contact guided_cables, flagging those selected with flag f but limiting selection to contact guided_cables flagged with flag l, giving the prompt 'Select contact guided_cables':

```
ContactGuidedCable.Select(f, 'Select contact guided_cables', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the contact guided_cable.

Arguments

- **flag** (Flag)

Flag to set on the contact guided_cable

Returns

No return value

Example

To set flag f for contact guided_cable c_g_c:

```
c_g_c.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the contact guided_cable. The contact guided_cable will be sketched until you either call ContactGuidedCable.Unsketch(), ContactGuidedCable.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact guided_cable is sketched. If omitted redraw is true. If you want to sketch several contact guided_cables and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch contact guided_cable c_g_c:

```
c_g_c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged contact guided_cables in the model. The contact guided_cables will be sketched until you either call ContactGuidedCable.Unsketch(), ContactGuidedCable.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged contact guided_cables will be sketched in

- **flag** (Flag)

Flag set on the contact guided_cables that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact guided_cables are sketched. If omitted redraw is true. If you want to sketch flagged contact guided_cables several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all contact guided_cables flagged with flag in model m:

```
ContactGuidedCable.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of contact guided_cables in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing contact guided_cables should be counted. If false or omitted referenced but undefined contact guided_cables will also be included in the total.

Returns

number of contact guided_cables

Return type

Number

Example

To get the total number of contact guided_cables in model m:

```
var total = ContactGuidedCable.Total(m);
```

Unblank()

Description

Unblanks the contact guided_cable

Arguments

No arguments

Returns

No return value

Example

To unblank contact guided_cable c_g_c:

```
c_g_c.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the contact guided_cables in model m:

```
ContactGuidedCable.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that the flagged contact guided_cables will be unblanked in

- **flag** (Flag)

Flag set on the contact guided_cables that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the contact guided_cables in model m flagged with f:

```
ContactGuidedCable.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all contact guided_cables will be unset in

- **flag** (Flag)

Flag to unset on the contact guided_cables

Returns

No return value

Example

To unset the flag f on all the contact guided_cables in model m:

```
ContactGuidedCable.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the contact guided_cable.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact guided_cable is unsketched. If omitted redraw is true. If you want to unsketch several contact guided_cables and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch contact guided_cable c_g_c:

```
c_g_c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all contact guided_cables.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact guided_cables are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all contact guided_cables in model m:

```
ContactGuidedCable.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged contact guided_cables in the model.

Arguments

- **Model** (Model)

Model that all contact guided_cables will be unsketched in

- **flag** (Flag)

Flag set on the contact guided_cables that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the contact guided_cables are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all contact guided_cables flagged with flag in model m:

```
ContactGuidedCable.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ContactGuidedCable object.

Return type

ContactGuidedCable

Example

To check if ContactGuidedCable property c_g_c.example is a parameter by using the ContactGuidedCable.GetParameter() method:

```
if (c_g_c.ViewParameters().GetParameter(c_g_c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for contact guided_cable. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for contact guided_cable c_g_c:

```
c_g_c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this contact guided_cable.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for contact guided_cable c_g_c:

```
var xrefs = c_g_c.Xrefs();
```

---

toString()

Description

Creates a string containing the ContactGuidedCable data in keyword format. Note that this contains the keyword header and the keyword cards. See also ContactGuidedCable.Keyword() and ContactGuidedCable.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for ContactGuidedCable c_g_c in keyword format

```
var s = c_g_c.toString();
```

Control class

The Control class gives you access to control cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Detailed Description

The Control class allows you to create, modify, edit and manipulate control cards. Unlike other classes there is no constructor and there are no functions. Instead a Control object is available as the control property of a Model object. This object allows you to access all of the control cards.
For example, to activate control card *CONTROL_TERMINATION in model m and set endtim to 0.1.

```
m.control.termination.exists = true;
m.control.termination.endtim = 0.1;
```

See the properties for more details.

*CONTROL_ACCURACY

Properties for *CONTROL_ACCURACY

Name	Type	Description
exacc	real	Explicit accuracy parameter
exists	logical	true if control card exists
iacc	integer	Implicit accuracy flag
include	integer	The Include file number that the control card is in.
inn	integer	Invariant node numbering for shell element
osu	integer	Objective stress update for large timestep
pidosu	integer	Part set id for objective stress updates

*CONTROL_ACOUSTIC

Properties for *CONTROL_ACOUSTIC

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
macdvp	logical	Acoustic nodal motions will be calculated or not.

*CONTROL_ACOUSTIC_COUPLING

Properties for *CONTROL_ACOUSTIC_COUPLING

Name	Type	Description
acecf1	real	Multiplier on proximity test.
acecf2	real	Angle between normal vectors in an orientation test.
acecf3	real	Multiplier on ceiling test.
acecf4	real	Area equilibration threshold.

exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
maccpl	integer	Coupling method.

*CONTROL_ACOUSTIC_SPECTRAL

Properties for *CONTROL_ACOUSTIC_SPECTRAL

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
masehrf	integer	Optional h-refinement.
maseigx	integer	Approach to element time step calculation.
masekfl	integer	Dump flag for h-refined and spectral element meshes.
maseord	integer	Spectral element integration order.
maseplt	integer	Flag to output a high-resolution plot state form.

*CONTROL_ADAPSTEP

Properties for *CONTROL_ADAPSTEP

Name	Type	Description
dfactr	real	Incremental increase in factin
exists	logical	true if control card exists
factin	real	Initial relaxation factor for contact force
include	integer	The Include file number that the control card is in.

*CONTROL_ADAPTIVE

Properties for *CONTROL_ADAPTIVE

Name	Type	Description
adpass	integer	1 or 2 pass adaptivity flag
adpctl	real	Adaptivity error tolerance in degrees for activating fusion
adpene	real	Nodal penetration at which to refine elem
adperr	integer	Options for recovery techniques and error estimators
adpfreq	real	Time interval between refinements
adpopt	integer	Adaptive options
adpsize	real	Min element edge size for adaptivity
adpth	real	Absolute shell thickness below which remeshing should begin
adptol	real	Adaptive error tolerance (degrees)

adptyp	integer	Adaptive options
cbirth	real	Birth time for adaptive fusion
cdeath	real	Death time for adaptive fusion
cnla	real	Limit angle for corner nodes
d3trace	integer	Flag for writing out D3PLOT state
exists	logical	true if control card exists
iadpcl	integer	Fission level that fusion will start at
iadpe90	integer	Maximum no. of elements covering 90degree of radii
iadpgh	integer	Fiffion flag for neighbour splitting
ifsand	integer	Flag for forming of sandwiched parts with adaptive blank mesh
include	integer	The Include file number that the control card is in.
ioflag	integer	Flag to generate adaptive mesh
ireflg	integer	Uniform refinement level. Loadcurve if negative
lcadp	integer	Loadcurve: Adaptive interval vs time
lclvl	integer	Loadcurve of maximum refinement level vs. time
maxel	integer	Max number of elements for adaptivity
maxlvl	integer	Max #refinement levels
memory	integer	Memory limit beyond which adaptivity will cease
mmm2d	integer	Option for merging common boundaries of all adapted materials
ncfreq	integer	Frequency of fission to fusion steps
orient	integer	Flag to set the global orientation of a forming contact
tbirth	real	Birth time for adaptivity
tdeath	real	Death time for adaptivity

*CONTROL_ADAPTIVE_CURVE

Properties for *CONTROL_ADAPTIVE_CURVE

Name	Type	Description
exists	logical	true if control card exists
idset	integer	Shell/Part set id
include	integer	The Include file number that the control card is in.
itriopt	integer	Refinement option for enclosed area of trim curve
itype	integer	Set type
n	integer	Refinement option
smin	real	Element dimension limit for refining

*CONTROL_AIRBAG

Properties for *CONTROL_AIRBAG

Name	Type	Description
ckerr	integer	Flag to check and report open edge of CV airbag
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_ALE

Properties for *CONTROL_ALE

Name	Type	Description
aafac	real	ALE advection factor
afac	real	Smoothing weight factor: simple average
beamin	real	Flag for aligning beam dynamics
bfac	real	Smoothing weight factor: volume weighting
bndflx	integer	Multi-Material ALE group set if positive or -1
cfac	real	Smoothing weight factor: isoparametric
checkr	real	Parameter for ALE pressure locking
dct	integer	Default continuum treatment
dfac	real	Smoothing weight factor: equipotential
dtmufac	real	Scale time step called DTMU
ebc	integer	Automatic Euler boundary condition
efac	real	Smoothing weight factor: equipotential
end	real	End time for smoothing
exists	logical	true if control card exists
ialedr	integer	Include ALE computations in the dynamic relaxation analysis
imascl	integer	Flag for mass scaling for ALE parts
include	integer	The Include file number that the control card is in.
meth	integer	Advection method
minmas	real	Factor of the minimum mass allowed in an element
mmgpref	integer	Selects the method that is used to include a reference pressure in a calculation involving ALE multi-material groups
nadv	integer	Number of cycles between advections
nbkt	integer	Number of Lagrangian cycles between bucket sort searches
ncpl	integer	Number of Lagrangian cycles between coupling calculations
nsidebc	integer	Optional excluded node set
optimpp	integer	Optimize the MPP communications (Range 0/1)
pdifmx	real	Max pressure difference for stress zeroing
pref	real	ref pressure on boundary
prit	integer	Pressure equalibrium flag
start	real	Start time for smoothing

vfact	real	Void factor

*CONTROL_BULK_VISCOSITY

Properties for *CONTROL_BULK_VISCOSITY

Name	Type	Description
btype	integer	beam bulk viscosity type
exists	logical	true if control card exists
ibq	integer	Default bulk viscosity type (m#PR035)
include	integer	The Include file number that the control card is in.
q1	real	Default linear viscosity coefficient
q2	real	Default quadratic viscosity coefficient
tstype	integer	Thick shell bulk viscosity type

*CONTROL_CHECK

Properties for *CONTROL_CHECK

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
solitary	integer	TRUE if a plain (no _SHELL suffix) card exists

*CONTROL_COARSEN

Properties for *CONTROL_COARSEN

Name	Type	Description
angle	real	Permitted angle between neighbours
exists	logical	true if control card exists
icoarse	integer	On/Off flag
include	integer	The Include file number that the control card is in.
n1	integer	Optional seed node ID 1
n2	integer	Optional seed node ID 2
n3	integer	Optional seed node ID 3
n4	integer	Optional seed node ID 4
n5	integer	Optional seed node ID 5
n6	integer	Optional seed node ID 6
n7	integer	Optional seed node ID 7
n8	integer	Optional seed node ID 8

nseed	integer	#extra "seed" nodes below
psid	integer	excluded part set
smax	real	Maximum element size

*CONTROL_CONSTRAINED

Properties for *CONTROL_CONSTRAINED

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
sprchk	integer	Flag to check and report open edge of CV constrained
sprsmd	integer	Shear moment distribution behavior for SPR3

*CONTROL_CONTACT

Properties for *CONTROL_CONTACT

Name	Type	Description
cohtiem	integer	Flag to treat how the mass from SURFB of a tied contact affects the time step estimation of cohesive elements
dfric	real	Default dynamic coefficient of friction
dir_tie	integer	Directional tie for MPP non-groupable tied contacts
ecdt	integer	Timestep override for eroding contacts
edc	real	Default exponential decay coefficient
enmass	integer	Treatment of mass of eroded nodes
exists	logical	true if control card exists
frceng	integer	Flag to calculate internal friction energy
ftall	integer	output contact forces to rcforc
icov	integer	Invokes the covariant formulation of Konyukhov and Schweizerhof
igactc	integer	option to use isogeometric shells for contact detection
ignore	integer	Ignore initial penetrations flag
include	integer	The Include file number that the control card is in.
interm	integer	Intermittent searching flag for old contacts
irevspt	integer	Flag to revert the spot weld thinning behavior
islchk	integer	Initial penetration check flag
isym	integer	symmetry option. Node set if negative
ithcnt	integer	thermal contact heat transfer mode
ithoff	integer	Flag for offsetting thermal contact surfaces for thick thermal shells
nsbcs	integer	#cycles between 3D bucket sorts
nserod	integer	erosion option

orien	integer	Automatic contact segment orientation flag
outseg	integer	Spotweld output flag
pen_sf	real	Default local penalty scale factor
penopt	integer	Penalty stiffness option flag
pstiff	integer	method for penalty stiff calc
ptscl	real	scale factor on the contact stress exerted onto shells
rwgaps	integer	flag for gap stiffness
rwgdth	real	death time for gap stiffness
rwksf	real	penalty scale factor
rwpnal	real	Scale factor for rigid wall penalties
sfric	real	Default static coefficient of friction
shledg	integer	Flag for assuming edge shape for shells
shlthk	integer	Shell thickness consideration flag
shltrw	real	Shell thickness scale factor
skiprwg	integer	Display rigidwall flag
slsfac	real	Scale factor for sliding penalties
spotdel	integer	Spotweld deletion flag
spothin	real	Optional thickness scale factor
spotstp	integer	Error termination flag on unfound spotweld
ssthk	integer	Shell thickness use flag for type 4 contacts
swradf	real	Spot weld radius scale factor
tdcnof	integer	tied constraint offset contact update option
th	real	Default contact thickness
th_sf	real	Default thickness scale factor
thkchg	integer	Consider shell thickness change flag
tiedprj	integer	Projection bypass flag for TIED types
usrfrc	integer	Storage for user-controlled friction subroutine
usrstr	integer	Storage for user-controlled control subroutine
vfc	real	Default viscous friction coefficient
xpene	real	Surface max penetration check multiplier

*CONTROL_COUPLING

Properties for *CONTROL_COUPLING

Name	**Type**	**Description**
exists	logical	true if control card exists
flipx	integer	Flag to flip X coords
flipy	integer	Flag to flip Y coords
flipz	integer	Flag to flip Z coords

include	integer	The Include file number that the control card is in.
subcyl	integer	Subcycling flag
timidl	real	Idle time value
unforc	real	Force conversion factor
unleng	real	Length conversion factor
untime	real	Time conversion factor

*CONTROL_CPM

Properties for *CONTROL_CPM

Name	Type	Description
blkv	integer	Flag to allocate additional memory for contact nodal forces
cpmerr	integer	Disable/enable error checking
cpmmf	integer	Flag to consider airbag system velocity
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ncpmout	integer	Control CPM output database to D3PLOT
ncpmts	integer	Timestep size estimation
np2p	integer	Number of cycles for repartition particles
p2pmix	integer	Control the energy transfer during particle-to-particle collision
pmis	integer	Flag for choosing logic to use when a particle leaks out due to undetected contact
sffdc	real	Scale factor of force decay constant

*CONTROL_CPU

Properties for *CONTROL_CPU

Name	Type	Description
cputim	real	Max permitted cpu time
exists	logical	true if control card exists
iglst	integer	glstat data flag
include	integer	The Include file number that the control card is in.

*CONTROL_DEBUG

Properties for *CONTROL_DEBUG

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_DISCRETE_ELEMENT

Properties for *CONTROL_DISCRETE_ELEMENT

Name	Type	Description
ang	real	contact angle
bt	real	Birth time
cap	integer	dry/wet particle flag
cp	real	DES thermal property
dc	real	Exponential decay coefficient
dt	real	Death time
exists	logical	true if control card exists
fricd	real	Dynamic coefficient of friction
fricr	real	rolling friction coefficient
frics	real	friction coefficient
gamma	real	liquid surface tension
gap	real	parameter affecting spatial limit of liquid bridge
idesoft	integer	Flag for soft constraint formulation
ignore	integer	Ignore penetration flag
include	integer	The Include file number that the control card is in.
iskip	integer	Flag for skipping the calculation of contact force between DES:
lnorm	integer	LCID that defines the function for normal stiffness vs norm pen ratio
lshear	integer	LCID that defines the function for shear stiffness vs norm pen ratio
maxnei	integer	Number of neighbors to be tracked for DES contact and capillary force calculation
nbuf	integer	Asynchronous scheme and memory buffer option
ncrb	integer	Rebalancing frequency
ndamp	real	normal damping coefficient
normk	real	scale factor for normal spring constant
parallel	integer	Option to force calculation of bonded DES
sheark	real	ratio between sheark/normk
sofscl	real	Scale factor applied to the contact stiffness
tc	real	DES thermal property
tdamp	real	tangential damping coefficient
tfac	real	DES thermal property
vol	real	volume fraction
vtk	integer	max number of subcycling cycles

*CONTROL_DYNAMIC_RELAXATION

Properties for *CONTROL_DYNAMIC_RELAXATION

Name	Type	Description
drfctr	real	Dyn relaxation factor
drpset	integer	Part set used to check for convergence
drterm	real	Optional DR termination time
drtol	real	Convergence tolerance
edttl	real	Convergence tolerance on auto control
exists	logical	true if control card exists
idrflg	integer	Stress initialisation flag
include	integer	The Include file number that the control card is in.
irelal	integer	Automatic control flag
nrcyck	integer	#iterations between convergence checks
tssfdr	real	Optional timestep factor during DR

*CONTROL_EFG

Properties for *CONTROL_EFG

Name	Type	Description
etol	real	Error tolerance in the IMLM
exists	logical	true if control card exists
hsort	integer	Not used
ideb	integer	Output internal debug message
idila	integer	dilation param
imlm	integer	Choice for matrix operation, linear solving and memory usage
include	integer	The Include file number that the control card is in.
inint	integer	Factor needed for the estimation of maximum workspace used during initialization
ispline	integer	kernel function
ssort	integer	Flag for automatic sort of background triangular shells

*CONTROL_ENERGY

Properties for *CONTROL_ENERGY

Name	Type	Description
disen	integer	Dissipation energy calculation calc flag
drlen	integer	Drilling energy calculation flag
exists	logical	true if control card exists
hgen	integer	Hourglass energy calc flag
include	integer	The Include file number that the control card is in.
irgen	integer	Initial reference geometry calc flag
maten	integer	Detailed material energies flag

rwen	integer	Rigid wall energy calc flag
rylen	integer	Rayleigh energy calc flag
slnten	integer	Contact energy calc flag

*CONTROL_EXPLICIT_THERMAL_ALE_COUPLING

Properties for *CONTROL_EXPLICIT_THERMAL_ALE_COUPLING

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
mmset	integer	The Multi-material Set ID.
partset	integer	The Part Set ID.

*CONTROL_EXPLICIT_THERMAL_BOUNDARY

Properties for *CONTROL_EXPLICIT_THERMAL_BOUNDARY

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
lcid	integer	The Curve ID specifying Temperature vs Time.
sgset	integer	The Segment Set ID.

*CONTROL_EXPLICIT_THERMAL_CONTACT

Properties for *CONTROL_EXPLICIT_THERMAL_CONTACT

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ncycle	real	Number of cycle between checks of new contact.
partset	integer	The Part Set ID.

*CONTROL_EXPLICIT_THERMAL_INITIAL

Properties for *CONTROL_EXPLICIT_THERMAL_INITIAL

Name	Type	Description
exists	logical	true if control card exists
id	integer	If less than 0 then Element ID if greater than 0 then _Set ID. Can be SOLID, SHELL, BEAM or THICK SHELL based on value of idtyp.

idtyp	integer	Type of ID. Valid values: 1-Solid, 2-Shell, 3-Beam, 4-Thick shell .
include	integer	The Include file number that the control card is in.
tempini	real	Initial Temperature.

*CONTROL_EXPLICIT_THERMAL_OUTPUT

Properties for *CONTROL_EXPLICIT_THERMAL_OUTPUT

Name	Type	Description
dtout	real/integer	Time interval between outputs. Constant float value if DTOUTYP = 0, Curve ID if DTOUTYP = 1.
dtoutyp	integer	Type of DTOUT. Valid values: 0-Constant, 1-Time vs DTOUT Curve.
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
set	integer	The Set ID. Can be SOLID, SHELL or BEAM Set based on value of setyp.
setyp	integer	Type of Set. Valid values: 1-Solid Set, 2-Shell Set, 3-Beam Set.

*CONTROL_EXPLICIT_THERMAL_PROPERTIES

Properties for *CONTROL_EXPLICIT_THERMAL_PROPERTIES

Name	Type	Description
cp	real/integer	Heat Capacity. Constant float value if CPTYP = 0, Curve ID if CPTYP = 1.
cptyp	integer	Type of CP. Valid values: 0-Constant, 1-Temperature vs Heat Capacity Curve.
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
kxx	real/integer	Heat conductivity matrix. Constant float value if respective KxxTYP = 0, Curve ID if respective KxxTYP = 1.
kxxtyp	integer	Types of Kxx. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kxy	real/integer	Heat conductivity matrix. Constant float value if respective KxyTYP = 0, Curve ID if respective KxyTYP = 1.
kxytyp	integer	Types of Kxy. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kxz	real/integer	Heat conductivity matrix. Constant float value if respective KxzTYP = 0, Curve ID if respective KxzTYP = 1.
kxztyp	integer	Types of Kxz. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kyx	real/integer	Heat conductivity matrix. Constant float value if respective KyxTYP = 0, Curve ID if respective KyxTYP = 1.
kyxtyp	integer	Types of Kyx. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kyy	real/integer	Heat conductivity matrix. Constant float value if respective KyyTYP = 0, Curve ID if respective KyyTYP = 1.
kyytyp	integer	Types of Kyy. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kyz	real/integer	Heat conductivity matrix. Constant float value if respective KyzTYP = 0, Curve ID if respective KyzTYP = 1.
kyztyp	integer	Types of Kyz. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.

kzx	real/integer	Heat conductivity matrix. Constant float value if respective KzxTYP = 0, Curve ID if respective KzxTYP = 1.
kzxtyp	integer	Types of Kzx. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kzy	real/integer	Heat conductivity matrix. Constant float value if respective KzyTYP = 0, Curve ID if respective KzyTYP = 1.
kzytyp	integer	Types of Kzy. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
kzz	real/integer	Heat conductivity matrix. Constant float value if respective KzzTYP = 0, Curve ID if respective KzzTYP = 1.
kzztyp	integer	Types of Kzz. Valid values: 0-Constant, 1-Temperature vs Heat Conductivity Curve.
local	integer	Flag to activate an element csys. Valid values: 0-Vecids are considered in Global csys, 1-Vecids are considered in Local Csys.
partset	integer	The Part Set ID.
vecid1	integer	The Vector ID to define x-direction.
vecid2	integer	The Vector ID to define y-direction.

*CONTROL_EXPLICIT_THERMAL_SOLVER

Properties for *CONTROL_EXPLICIT_THERMAL_SOLVER

Name	Type	Description
dtfac	real	Time step factor.
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
partset	integer	The Part Set ID.

*CONTROL_EXPLOSIVE_SHADOW

Properties for *CONTROL_EXPLOSIVE_SHADOW

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
set_option	logical	true if _SET option is present.
setid	integer	Set ID of *SET_SHELL or *SET_SOLID.

*CONTROL_FORMING_BESTFIT

Properties for *CONTROL_FORMING_BESTFIT

Name	Type	Description
exists	logical	true if control card exists
filename	string	Target mesh file in keyword format
gaponly	integer	Separation distance calculation flag

ifast	integer	Computing performance optimisation flag
ifit	integer	Best fit flag
ifset	integer	Optional flag to define a node set to be included or excluded
include	integer	The Include file number that the control card is in.
nsets	integer	An optional node set ID of three nodes from the source mesh
nsett	integer	An optional node set ID of three nodes from the target mesh
nskip	integer	Optional skipping scheme
vector	logical	true if _VECTOR option is set

*CONTROL_FORMING_INITIAL_THICKNESS

Properties for *CONTROL_FORMING_INITIAL_THICKNESS

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
lcid	integer	Load curve ID defining thickness vs distance
pid	integer	Part ID of the sheet blank
vx	real	X component of vector defining the direction of distance in load curve
vy	real	Y component of vector defining the direction of distance in load curve
vz	real	Z component of vector defining the direction of distance in load curve
x0	real	Starting position x coordinate
y0	real	Starting position y coordinate
z0	real	Starting position z coordinate

*CONTROL_FORMING_MAXID

Properties for *CONTROL_FORMING_MAXID

Name	Type	Description
exists	logical	true if control card exists
i2dynain	integer	Keyword to be output to a dynain file
include	integer	The Include file number that the control card is in.
maxide	integer	Element ID number
maxidn	integer	Node ID number
pid	integer	Part ID of the sheet blank

*CONTROL_FORMING_POSITION

Properties for *CONTROL_FORMING_POSITION

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
pid	integer	Part ID
premove	real	Distance to pre-move tool in reverse direction
target	integer	

*CONTROL_FORMING_PRE_BENDING

Properties for *CONTROL_FORMING_PRE_BENDING

Name	Type	Description
cid	integer	ID of coordinate system (only for the LOCAL option)
cx	real	X component of centre of most-bent location
cy	real	Y component of centre of most-bent location
cz	real	Z component of centre of most-bent location
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
option	integer	Keyword option
pset	integer	Part set ID
radius	real	Radius of pre-bending
vx	real	X component of axis about which blank will be bent
vy	real	Y component of axis about which blank will be bent
vz	real	Z component of axis about which blank will be bent

*CONTROL_FORMING_PROJECTION

Properties for *CONTROL_FORMING_PROJECTION

Name	Type	Description
exists	logical	true if control card exists
gap	real	Minimum gap
include	integer	The Include file number that the control card is in.
nrbst	integer	Normal direction of blank
nrtst	integer	Normal direction of tool
pidb	integer	Part id for blank
pidt	integer	Part id for tool

*CONTROL_FORMING_REMOVE_ADAPTIVE_CONSTRAINTS

Properties for *CONTROL_FORMING_REMOVE_ADAPTIVE_

CONSTRAINTS

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
pid	integer	Part id to remove adaptive constraints from

*CONTROL_FORMING_SHELL_TO_TSHELL

Properties for *CONTROL_FORMING_SHELL_TO_TSHELL

Name	Type	Description
exists	logical	true if control card exists
idsegb	integer	Set id of the segments to be generated at the bottom layer
idsegt	integer	Set id of the segments to be generated at the top layer
include	integer	The Include file number that the control card is in.
midsf	integer	Mid-plane position flag
pid	integer	Part id of the thin shell elements
thick	real	Thickness of the thick shell elements

*CONTROL_FORMING_STONING

Properties for *CONTROL_FORMING_STONING

Name	Type	Description
direct	real	Number of automatically determined directions
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
istone	integer	Stoning calculation option
itype	integer	Set type designation
length	real	Length of the stone
method	integer	Stoning method
node1	integer	Tail node defining stone moving direction
node1	integer	Head node defining stone moving direction
reverse	integer	Surface normal reversing option
sid	integer	Node/Shell set id
step	real	Stepping size of moving stone
v1	real	Vector component defining stoning direction
v2	real	Vector component defining stoning direction
v3	real	Vector component defining stoning direction
width	real	Width of the stone

*CONTROL_FORMING_STRAIN_RATIO_SMOOTH

Properties for *CONTROL_FORMING_STRAIN_RATIO_SMOOTH

Name	Type	Description
dt_cycle	real	Flag for output option (time interval or cycle number)
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
weight	real	Coefficient in equation

*CONTROL_FORMING_TEMPLATE

Properties for *CONTROL_FORMING_TEMPLATE

Name	Type	Description
al_fe	string	A=Aluminium blank, F=steel
amax	real	Maximum allowable acceleration
blkid	integer	Part (stype=0) or part set (stype=1) ID that defines the blank
bndl	integer	Part that defines the lower binder
bndu	integer	Part that defines the upper binder
d3plt	integer	Number of output states in the D3PLOT database
density	real	Density
dieid	integer	Part that defines the die
e	real	Youngs modulus
exists	logical	true if control card exists
fs	real	Friction coefficient
gap	real	Home gap between rigid tools
idtemp	integer	Type of forming process
include	integer	The Include file number that the control card is in.
k	real	Strength coefficient for exponential hardening
lcss	integer	Loadcurve for stress-strain relationship
lvlada	integer	Maximum adaptive level
mtyp	integer	Material type
n	real	Exponent for exponential hardening
patern	integer	Velocity profile of moving tool
pnch	integer	Part that defines the punch
pr	real	Poissons ratio
prebd	real	Distance between lower binder and punch
r00	real	Material anisotropic parameter R00
r45	real	Material anisotropic parameter R45
r90	real	Material anisotropic parameter R90

sizeada	real	Minimum element size permitted in the adaptive mesh
stype	integer	0->blkid is PART, 1->PARTSET NOTE don’t use <type> as in stat_header
thick	real	Blank thickness
timsada	integer	Total number of adaptive steps during the forming simulation
unit	integer	Units for simulation
vid	integer	Vector ID defining direction of movement
vmax	real	Maximum allowable tool velocity
vx	real	X vector component of movement of punch
vy	real	Y vector component of movement of punch
vz	real	Z vector component of movement of punch

*CONTROL_FORMING_TOLERANC

Properties for *CONTROL_FORMING_TOLERANC

Name	Type	Description
dt_cycle	real	Flag for output option (time interval or cycle number)
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
output	integer	Output Flag
weight	real	Coefficient in equation

*CONTROL_FORMING_TRAVEL

Properties for *CONTROL_FORMING_TRAVEL

Name	Type	Description
exists	logical	true if control card exists
follow	integer	Part for tool to follow
gap	real	Min distance between tool and target in the home position
include	integer	The Include file number that the control card is in.
phase	integer	Phase number
pid	integer	Part ID of tool
target	integer	Move tool PID to meet part TARGET
travel	real	Distance to move tool along VID
vid	integer	Vector ID defining direction of travel

*CONTROL_FORMING_TRIM_MERGE

Properties for *CONTROL_FORMING_TRIM_MERGE

Name	Type	Description
exists	logical	true if control card exists
gapm	real	Gap distance between two open ends of a trim loop curve in the model
imerge	integer	Activation flag
include	integer	The Include file number that the control card is in.

*CONTROL_FORMING_TRIM_SOLID_REFINEMENT

Properties for *CONTROL_FORMING_TRIM_SOLID_REFINEMENT

Name	Type	Description
exists	logical	true if control card exists
ilevel	integer	Adaptive refinement level
include	integer	The Include file number that the control card is in.
irefine	integer	Flag to activate trimming of a multi-layer sandwiched part

*CONTROL_FORMING_UNFLANGING

Properties for *CONTROL_FORMING_UNFLANGING

Name	Type	Description
charlen	real	Max flange height
dist	real	Distance tolerance for auto-SPC along flange roots
dvid	integer	Not used
epsmx	real	Max effective plastic strain, beyond which elements are deleted
exists	logical	true if control card exists
iflimit	integer	Iteration limit for first phase of unfolding
ilinear	integer	Unfolding algorithm selection flag
include	integer	The Include file number that the control card is in.
nb1	integer	Start node ID on a flange root boundary
nb2	integer	ID of a node in the middl of the flange root boundary
nb3	integer	End node ID on a flange root boundary
ndouter	integer	A node ID on the outer flange boundary
noption	integer	Flag to turn on unfolding simulation
nunbend	integer	Estimated number of unbending
output	logical	TRUE if _<OPTION> is OUTPUT.
stfbend	real	Unflanging stiffness
stfcnt	real	Normal stiffness
thmn	real	Min thickness below which elements are deleted
thmx	real	Max thickness beyond which elements are deleted

*CONTROL_FORMING_USER

Properties for *CONTROL_FORMING_USER

Name	Type	Description
adatims	integer	Total number of adaptive steps during the forming simulation
al_fe	string	A=Aluminium blank, F=steel
amax	real	Maximum allowable acceleration
blank	integer	Part (stype=0) or part set (stype=1) ID for blank
d3plot	integer	Number of output states in the D3PLOT database
density	real	Density
e	real	Youngs modulus
exists	logical	true if control card exists
fs	real	Friction coefficient
gap	real	Minimum gap between tools
include	integer	The Include file number that the control card is in.
k	real	Strength coefficient for exponential hardening
lcss	integer	Loadcurve for stress-strain relationship
lvlada	integer	Maximum adaptive level
mtype	integer	Material type
n	real	Exponent for exponential hardening
patern	integer	Velocity profile of moving tool
pr	real	Poissons ratio
r00	real	Material anisotropic parameter R00
r45	real	Material anisotropic parameter R45
r90	real	Material anisotropic parameter R90
sizeada	real	Minimum element size permitted in the adaptive mesh
stype	integer	Flag for part/part set
thick	real	Blank thickness
unit	integer	Units for simulation
vmax	real	Maximum allowable tool velocity

*CONTROL_FREQUENCY_DOMAIN

Properties for *CONTROL_FREQUENCY_DOMAIN

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
mcf	integer	Flag for writing out MCF (Modal Coefficient File) from SSD analysis
mpn	real	Large mass added per node.

refgeo	integer	Flag for reference geometry in acoustic eigenvalue analysis

*CONTROL_FREQUENCY_RESPONSE_FUNCTION

Properties for *CONTROL_FREQUENCY_RESPONSE_FUNCTION

Name	Type	Description
dampf	real	Modal damping coefficient
dmpmas	real	Mass proportional damping constant in Rayleigh damping
dmpstf	real	Stiffness proportional damping constant in Rayleigh damping
dof1	integer	Applicable degrees-of-freedom for excitation input
dof2	integer	Applicable degrees-of-freedom for response output
exists	logical	true if control card exists
fmax	real	Maximum frequency for FRF output
fmin	real	Minimum frequency for FRF output
fnmax	real	Optional maximum natural frequency
include	integer	The Include file number that the control card is in.
lcdam	integer	Loadcurve ID defining modal damping coefficient
lctyp	integer	Type of load curve
mdmax	integer	Last mode employed in FRF computation
mdmin	integer	First mode employed in FRF computation
n1	integer	Node (n1typ=0) / node set (n1typ=1) /segment set (n1typ=2) ID for excitation input
n1typ	integer	Type of N1
n2	integer	Node (n2typ=0) /node set (n2typ=1) /segment set (n2typ=2) ID for response output
n2typ	integer	Type of N2
nfreq	integer	Number of frequencies for FRF output
restrt	integer	Restart option
vad1	integer	Excitation input type
vad2	integer	Response output type
vid	integer	Vector ID for DOF1=4

*CONTROL_HOURGLASS

Properties for *CONTROL_HOURGLASS

Name	Type	Description
exists	logical	true if control card exists
f_936	integer	Internal flag to set 936 compatibility
ihq	integer	Hourglass viscosity type
include	integer	The Include file number that the control card is in.

qh	real	Default hourglass coefficient

*CONTROL_IMPLICIT_AUTO

Properties for *CONTROL_IMPLICIT_AUTO

Name	Type	Description
dtexp	real	time in explicit before switch
dtmax	integer	Maximum allowable timestep. Loadcurve if negative
dtmin	real	Minimum allowable timestep
exists	logical	true if control card exists
hcmax	integer	Mid-point relative Euclidian residual norm max tolerance
hcmin	integer	Mid-point relative Euclidian residual norm min tolerance
hmmax	integer	Mid-point relative maximum residual norm max tolerance
hmmin	integer	Mid-point relative maximum residual norm min tolerance
hnrmax	integer	Mid-point absolute Nodal Rotational norm tolerance
hntmax	integer	Mid-point absolute Nodal Translational norm tolerance
hrrmax	integer	Mid-point absolute Rigid body Rotational norm tolerance
hrtmax	integer	Mid-point absolute Rigid body Translational norm tolerance
iauto	integer	Automatic timestep control flag. Loadcurve if negative
include	integer	The Include file number that the control card is in.
iteopt	integer	Optimum equilibrium iteration count per timestep
itewin	integer	Allowable iteration window (no. of iterations)
kcycle	integer	number of explicit cycles before switch
kfail	integer	number of failed implicit attempts before switch

*CONTROL_IMPLICIT_BUCKLE

Properties for *CONTROL_IMPLICIT_BUCKLE

Name	Type	Description
bckmth	integer	Method to extract buckling modes
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
nmode	integer	number of buckling modes to calculate

*CONTROL_IMPLICIT_CONSISTENT_MASS

Properties for *CONTROL_IMPLICIT_CONSISTENT_MASS

Name	Type	Description

exists	logical	true if control card exists
iflag	integer	Consistent mass matrix flag
include	integer	The Include file number that the control card is in.

*CONTROL_IMPLICIT_DYNAMICS

Properties for *CONTROL_IMPLICIT_DYNAMICS

Name	Type	Description
alpha	real	Composite time integration constant
beta	real	Newmark time integration constant
exists	logical	true if control card exists
gamma	real	Newmark time integration constant
imass	integer	Implicit analysis type
include	integer	The Include file number that the control card is in.
irate	integer	rate effect switch
tdybir	integer	birth time for dynamic terms. Loadcurve if negative
tdybur	real	burial
tdydth	real	death

*CONTROL_IMPLICIT_EIGENVALUE

Properties for *CONTROL_IMPLICIT_EIGENVALUE

Name	Type	Description
center	real	Centre frequency
eigmth	integer	Eigenvalue extraction method
evdump	integer	Flag for writing eigenvalues and eigenvectors
exists	logical	true if control card exists
ibeam	integer	Beam element formulation for implicit
include	integer	The Include file number that the control card is in.
iparm1	integer	Minimum block size for the Cholesky factorization (for eigmth=101) or Maximum number of iterations (for eigmth=102)
iparm2	integer	Maximum block size for the Cholesky factorization (for eigmth=101) or Block size (for eigmth=102)
iparm3	integer	Node set ID
iparm4	integer	MCMS minimum group/substructure size
ishell	integer	Shell element formulation for implicit
isolid	integer	Solid element formulation for implicit
itshell	integer	Thick shell element formulation for implicit
lflag	integer	Left end point finite flag

lftend	real	Left end point of interval
mstres	integer	stress compute flag
mstrscl	real	Scaling for computing velocity
neig	integer	#eigenvalues to extract; loadcurve if negative
rflag	integer	Right end point finite flag
rhtend	real	Right end point of interval
rotscl	real	Scale factor for the inertia of rotational degrees of freedom
rparm1	real	Eigenvalue expansion factor (for eigmth=101) or Convergence tolerance (for eigmth=102)
rparm2	real	BLR preconditioner tolerance
shfscl	real	Shift scale

*CONTROL_IMPLICIT_EXPLICIT_HYBRID

Properties for *CONTROL_IMPLICIT_EXPLICIT_HYBRID

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
psid	integer	Part set ID

*CONTROL_IMPLICIT_FORMING

Properties for *CONTROL_IMPLICIT_FORMING

Name	Type	Description
birth	real	birth time
death	real	death time
dt0	real	initial time step size
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ioption	integer	1:gravity 2:binder
nsmax	integer	max number of implicit steps
nsmin	integer	min number of implicit steps
penchk	real	penetration allowed as ratio of part thickness

*CONTROL_IMPLICIT_GENERAL

Properties for *CONTROL_IMPLICIT_GENERAL

Name	Type	Description
cnstn	integer	Consistent tangent stiffness flag

dt0	real	Initial timestep for implicit analysis
exists	logical	true if control card exists
form	integer	Element formulation to use.
igs	integer	Geometric (initial stress) stiffness flag
imflag	integer	Implicit/explicit switching flag; loadcurve if negative
imform	integer	Element formulation switching flag
include	integer	The Include file number that the control card is in.
nsbs	integer	Number of steps in non-linear springback
zero_v	integer	flag to zero vels before switch to implicit

*CONTROL_IMPLICIT_INERTIA_RELIEF

Properties for *CONTROL_IMPLICIT_INERTIA_RELIEF

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ircnt	integer	Lowest IRCNT modes
irflag	integer	Inertia relief flag
thresh	real	Threshold for rigid body node

*CONTROL_IMPLICIT_JOINTS

Properties for *CONTROL_IMPLICIT_JOINTS

Name	Type	Description
exists	logical	true if control card exists
icylin	integer	Treatment of cylindrical joints
include	integer	The Include file number that the control card is in.
irevol	integer	Treatment of revolute joints
ispher	integer	Treatment of spherical joints

*CONTROL_IMPLICIT_MODAL_DYNAMIC

Properties for *CONTROL_IMPLICIT_MODAL_DYNAMIC

Name	Type	Description
dtout	real	Modal dynamics output interval
exists	logical	true if control card exists
filename2	string	Constraint modes file name
filename	string	Eigen modes file name

include	integer	The Include file number that the control card is in.
integ	integer	Integration method
md_strs	integer	Modal dynamic stress flag
mdflag	integer	Modal dynamic flag
nsid	integer	Node set ID of the nodes in the modal model that are subjected to loads
zeta	real	Modal dynamic damping constant

*CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING

Member functions

- GetCoefficient(index*[integer]*)
- RemoveCoefficient(index*[integer]*)
- SetCoefficient(index*[integer]*, mode/frequency*[integer/real]*, zeta*[real]*)

Properties for *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING

Name	Type	Description
coefficients	integer	Number of coefficients for SPECIFIC and FREQUENCY_RANGE options
exists	logical	true if control card exists
frequency_range	boolean	If FREQUENCY_RANGE option is used
include	integer	The Include file number that the control card is in.
specific	boolean	If SPECIFIC option is used
zeta	real	Modal dynamic damping constant

Details of functions

GetCoefficient(index*[integer]*)

Description

Returns the damping coefficient data for an index in *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING.

Arguments

- **index** (integer)

The index you want the data for. **Note that indices start at 0, not 1**.

Returns

An array containing the mode id/frequency and damping coefficient values.

Return type

Array

Example

To get the damping data for the 3rd index for *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING in model m:

```
if (m.control.implicit_modal_dynamic_damping.coefficients >= 3)
{
    var data = m.control.implicit_modal_dynamic_damping.GetCoefficient(2);
}
```

RemoveCoefficient(index*[integer]*)

Description

Removes the damping coefficient data for an index in *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING.

Arguments

- **index** (integer)

The index you want to delete damping data for. **Note that indices start at 0, not 1**.

Returns

No return value.

Example

To delete the damping data for the 3rd index for *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING in model m:

```
if (m.control.implicit_modal_dynamic_damping.coefficients >= 3)
{
    m.control.implicit_modal_dynamic_damping.RemoveCoefficient(2);
}
```

SetCoefficient(index*[integer]*, mode/frequency*[integer/real]*, zeta*[real]*)

Description

Sets the damping coefficient data for an index in *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING.

Arguments

- **index** (integer)

The index you want to set the data for. **Note that indices start at 0, not 1**.

- **mode/frequency** (integer/real)

The mode ID (_SPECIFIC) or frequency (_FREQUENCY_RANGE).

- **zeta** (real)

Damping coefficient

Returns

No return value.

Example

To set the damping data for the 3rd index for *CONTROL_IMPLICIT_MODAL_DYNAMIC_DAMPING_SPECIFIC in model m to have mode ID 10 and damping coefficient 0.1:

```
m.control.implicit_modal_dynamic_damping.SetCoefficient(2, 10, 0.1);
```

---

*CONTROL_IMPLICIT_MODES

Properties for *CONTROL_IMPLICIT_MODES

Name	Type	Description
exists	logical	true if control card exists
ibase	integer	Offset for numbering

id3mode	integer	Write d3mode file flag
include	integer	The Include file number that the control card is in.
iresvec	integer	Converting the attachment modes to residual vectors flag
istress	integer	Flag to compute stresses
neig	integer	Number of eigenmodes
nsida	integer	node set for attachment modes
nsidc	integer	node set constraint modes
opt	integer	Can be <BLANK> or _BINARY
se_damp	string	Name of superelement damping matrix
se_filename	string	File name
se_inert	string	Name of superelement inertia matrix
se_mass	string	Name of superelement mass matrix
se_stiff	string	Name of superelement stiffness matrix

*CONTROL_IMPLICIT_ORDERING

Properties for *CONTROL_IMPLICIT_ORDERING

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
nmetis	integer	Number of times to use Metis
order	integer	Ordering option

*CONTROL_IMPLICIT_RESIDUAL_VECTOR

Properties for *CONTROL_IMPLICIT_RESIDUAL_VECTOR

Name	Type	Description
exists	logical	true if control card exists
iformat	integer	Format for processing eigenmodes
include	integer	The Include file number that the control card is in.
iresvec	integer	Residual vector control flag
neig	integer	Number of eigenmodes to compute for the purpose of orthogonalizing the computed load

*CONTROL_IMPLICIT_SOLUTION

Properties for *CONTROL_IMPLICIT_SOLUTION

Name	Type	Description
abstol	real	absolute convergence tol

arcalf	integer	relative influence predictor step
arcctl	integer	Arc length controlling node ID
arcdir	integer	Arc length controlling node direction
arcdmp	integer	Arc length damping option
arclen	real	Arc length size
arcmth	integer	Arc length method
arcpsi	integer	relative influence load/time parameter
arctim	integer	initiation time
awgt	real	weight factor
cpchk	integer	Contact penetration check flag
d3itctl	integer	D3ITER database control
dctol	real	Displacement convergence tolerance
diverg	integer	Divergence flag
dmtol	real	Maximum displacement convergence tolerance
dnorm	integer	Displacement norm for convergence test
ectol	real	Energy convergence tolerance
emtol	real	Maximum energy convergence tolerance
exists	logical	true if control card exists
ilimit	integer	Iteration limit between automatic stiffness reformations
include	integer	The Include file number that the control card is in.
irad	real	curve factor
istif	integer	Initial stiffness formulation flag
lsdir	integer	search direction
lsmtd	integer	search method
lstol	real	Line search convergence tolerance
maxref	integer	Stiffness reformation limit per time step
nlnorm	real	non-linear convergence type
nlprint	integer	non-linear solver print flag
nrtol	real	Nodal rotational convergence tolerance
nsolvr	integer	Non-linear equation solver method
nttol	real	Nodal translational convergence tolerance
rctol	real	Residual (force) convergence tolerance
rmtol	real	Maximum residual convergence tolerance
rrtol	real	Rigid body rotational convergence tolerance
rttol	real	Rigid body translational convergence tolerance
srad	real	radius of influence
sred	real	step reduction factor

*CONTROL_IMPLICIT_SOLVER

Properties for *CONTROL_IMPLICIT_SOLVER

Name	Type	Description
autospc	integer	AUTOSPC switch
autotol	real	AUTOSPC tolerance
drcm	integer	Drilling rotation constraint method
drcprm	real	Drilling rotation constraint parameter
emxdmp	integer	Flag for dumping elemental stiffness and mass matrices
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
iparm1	integer	Maximum number of iterations
lcpack	integer	Matrix assembly package
lprint	integer	Linear solver print flag
lsolvr	integer	Linear equation solver method
mtxdmp	integer	flag to dump matrix
negev	integer	Negative eigenvalue flag
order	integer	Ordering option
rdcmem	integer	Factor for capping the amount of dynamic memory requested
rparm1	integer	Absolute tolerance for convergence
rparm2	integer	Relative tolerance for convergence

*CONTROL_IMPLICIT_SSD_DIRECT

Properties for *CONTROL_IMPLICIT_SSD_DIRECT

Name	Type	Description
exists	logical	true if control card exists
fmax	real	Maximum frequency in the solution
fmin	real	Minimum frequency in the solution
fractn	integer	Octave fraction
fspace	real	Solution frequency assignment strategy
include	integer	The Include file number that the control card is in.
issflg	integer	Steady state vibration flag
loss	real	Structural loss factor
nfreq	integer	Number of frequencies in the solution

*CONTROL_IMPLICIT_STABILIZATION

Properties for *CONTROL_IMPLICIT_STABILIZATION

Name	Type	Description

exists	logical	true if control card exists
ias	integer	Artificial stabilization flag
include	integer	The Include file number that the control card is in.
scale	integer	scale factor for artificial stabilization. Loadcurve if negative
tend	real	End time
tstart	real	Start time

*CONTROL_IMPLICIT_STATIC_CONDENSATION

Properties for *CONTROL_IMPLICIT_STATIC_CONDENSATION

Name	Type	Description
binary	integer	flag to set _BINARY option
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
sc_flag	integer	Static condensation control flag
sc_nsid	integer	Node set ID for nodes to be preserved in the procedure
sc_psid	integer	Part set ID for parts to be included in the procedure
se_filename	string	File name
se_inert	string	Name of superelement inertia matrix
se_mass	string	Name of superelement mass matrix
se_stiff	string	Name of superelement stiffness matrix

*CONTROL_IMPLICIT_TERMINATION

Properties for *CONTROL_IMPLICIT_TERMINATION

Name	Type	Description
absol	real	Terminate based on absolute total displacement in the Euclidean norm.
delta1	real	Terminate based on rel total displacement in max norm
deltau	real	Terminate based on rel total displacement in Euclidean norm
exists	logical	true if control card exists
ietol	real	Terminate based on internal energy
include	integer	The Include file number that the control card is in.
ketol	real	Terminate based on kinetic energy
nstep	integer	Consecutive implicit time steps
tetol	real	Terminate based on total energy

*CONTROL_MPP_CONTACT_GROUPABLE

Properties for *CONTROL_MPP_CONTACT_GROUPABLE

Name	Type	Description
exists	logical	true if control card exists
grp	integer	GROUPABLE algorithm options
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_AUTOMATIC

Properties for *CONTROL_MPP_DECOMPOSITION_AUTOMATIC

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_BAGREF

Properties for *CONTROL_MPP_DECOMPOSITION_BAGREF

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_CHECK_SPEED

Properties for *CONTROL_MPP_DECOMPOSITION_CHECK_SPEED

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_CONTACT_ISOLATE

Properties for *CONTROL_MPP_DECOMPOSITION_CONTACT_ISOLATE

Name	Type	Description
exists	logical	true if control card exists
id1	integer	Contact ID 1 to distrubute
id2	integer	Contact ID 2 to distrubute
id3	integer	Contact ID 3 to distrubute
id4	integer	Contact ID 4 to distrubute
id5	integer	Contact ID 5 to distrubute
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_DISABLE_UNREF_CURVES

Properties for *CONTROL_MPP_DECOMPOSITION_DISABLE_UNREF_CURVES

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_DISTRIBUTE_ALE_ELEMENTS

Properties for *CONTROL_MPP_DECOMPOSITION_DISTRIBUTE_ALE_ELEMENTS

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
overlap	logical	Decompose the structure and ALE domains together?

*CONTROL_MPP_DECOMPOSITION_DISTRIBUTE_SPH_ELEMENTS

Properties for *CONTROL_MPP_DECOMPOSITION_DISTRIBUTE_SPH_ELEMENTS

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_ELCOST

Properties for *CONTROL_MPP_DECOMPOSITION_ELCOST

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
itype	integer	Hardware specific cost profile

*CONTROL_MPP_DECOMPOSITION_FILE

Properties for *CONTROL_MPP_DECOMPOSITION_FILE

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
name	string	decomposition file

*CONTROL_MPP_DECOMPOSITION_FLAG_STRESS_STRAIN_CURVE

Properties for *CONTROL_MPP_DECOMPOSITION_FLAG_STRESS_STRAIN_CURVE

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_METHOD

Properties for *CONTROL_MPP_DECOMPOSITION_METHOD

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
name	string	decomposition method

*CONTROL_MPP_DECOMPOSITION_NUMPROC

Properties for *CONTROL_MPP_DECOMPOSITION_NUMPROC

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
n	integer	number of processors

*CONTROL_MPP_DECOMPOSITION_OUTDECOMP

Properties for *CONTROL_MPP_DECOMPOSITION_OUTDECOMP

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
itype	integer	Database format

*CONTROL_MPP_DECOMPOSITION_RCBLOG

Properties for *CONTROL_MPP_DECOMPOSITION_RCBLOG

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
name	string	decomposition file

*CONTROL_MPP_DECOMPOSITION_ REDECOMPOSITION

Properties for *CONTROL_MPP_DECOMPOSITION_REDECOMPOSITION

Name	Type	Description
defgeo	integer	Geometry for decomposition
exists	logical	true if control card exists
freq	real	Time interval between redecomposition
include	integer	The Include file number that the control card is in.
remsph	integer	Flag to remove deactivated SPH particles
sampt	real	Time interval for collecting element cost profile to use in the next REDECOMP step.
stime	real	Start time for redecomposition
weight	real	Element cost scale factor for element in contact

*CONTROL_MPP_DECOMPOSITION_SCALE_ CONTACT_COST

Properties for *CONTROL_MPP_DECOMPOSITION_SCALE_CONTACT_ COST

Name	Type	Description
exists	logical	true if control card exists
id10	integer	Contact ID 10 to distrubute
id11	integer	Contact ID 11 to distrubute
id12	integer	Contact ID 12 to distrubute
id13	integer	Contact ID 13 to distrubute
id14	integer	Contact ID 14 to distrubute
id15	integer	Contact ID 15 to distrubute
id1	integer	Contact ID 1 to distrubute
id2	integer	Contact ID 2 to distrubute
id3	integer	Contact ID 3 to distrubute

id4	integer	Contact ID 4 to distrubute
id5	integer	Contact ID 5 to distrubute
id6	integer	Contact ID 6 to distrubute
id7	integer	Contact ID 7 to distrubute
id8	integer	Contact ID 8 to distrubute
id9	integer	Contact ID 9 to distrubute
include	integer	The Include file number that the control card is in.
sf	real	Scale factor

*CONTROL_MPP_DECOMPOSITION_SCALE_FACTOR_SPH

Properties for *CONTROL_MPP_DECOMPOSITION_SCALE_FACTOR_SPH

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
sf	real	Scale factor

*CONTROL_MPP_DECOMPOSITION_SHOW

Properties for *CONTROL_MPP_DECOMPOSITION_SHOW

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_DECOMPOSITION_TRANSFORMATION

Member functions

- GetTransformation(row*[integer]*)
- RemoveTransformation(row*[integer]*)
- SetTransformation(row*[integer]*, type or array*[string or array]*, V1*[real]*, V2 to V9 (optional)*[real]*)

Properties for *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
rows	integer	Number of rows.

Details of functions

GetTransformation(row*[integer]*)

Description

Returns the transformation for a row in *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION.

Arguments

- **row** (integer)

The row you want the data for. **Note that rows start at 0, not 1**.

Returns

An array containing the transformation type and the parameters V1 to V9.

Return type

Array

Example

To get the transformation for the 3rd row for *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION in model m:

```
if(m.control.mpp_decomposition_transformation.rows >= 3)
{
    var type = m.control.mpp_decomposition_transformation.GetTransformation(2);
}
```

RemoveTransformation(row*[integer]*)

Description

Removes a row in *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION.

Arguments

- **row** (integer)

The row number to be deleted. **Note that rows start at 0, not 1**. If there are rows under this one, they will be shifted up.

Returns

No return value.

Example

To delete the 3rd row for *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION in model m:

```
if(m.control.mpp_decomposition_transformation.rows >= 3)
{
    m.control.mpp_decomposition_transformation.RemoveTransformation(2);
}
```

SetTransformation(row*[integer]*, type or array*[string or array]*, V1*[real]*, V2 to V9 (optional)*[real]*)

Description

Sets the type and the parameters V1 to V9 for a row in *CONTROL_MPP_DECOMPOSITION_ TRANSFORMATION. Note: If the row already exists, the type and the parameters will be overwritten.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that rows start at 0, not 1**.

- **type or array** (string or array)

The string repesenting the type of the transformation. Alternatively an array with this and the following parameters on it.

- **V1** (real)

The float repesenting the parameter V1

- **V2 to V9 (optional)** (real)

The floats repesenting the parameters V2 to V9. These are only used for VEC3, C2R, S2R and MAT.

Returns

No return value.

Example

To set in the first row a transformation of type to RZ with V1=1.2 for *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION in model m:

```
m.control.implicit_modal_dynamic_damping.SetTransformation(0, "RZ", 1.2);
```

or

```
var a = new Array("RZ", 1.2);
      m.control.implicit_modal_dynamic_damping.SetTransformation(0, a);
```

To set in the third row a transformation of type to VEC3 with V1=1.0, V2=2.0... V9=9.0 for *CONTROL_MPP_DECOMPOSITION_TRANSFORMATION in model m:

```
m.control.implicit_modal_dynamic_damping.SetTransformation(2, "VEC3", 1, 2, 3,
4, 5, 6, 7, 8, 9);
```

or

```
var a = new Array("VEC3", 1, 2, 3, 4, 5, 6, 7, 8, 9);
      m.control.implicit_modal_dynamic_damping.SetTransformation(2, a);
```

---

*CONTROL_MPP_IO_BINOUTONLY

Properties for *CONTROL_MPP_IO_BINOUTONLY

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

---

*CONTROL_MPP_IO_LSTC_REDUCE

Properties for *CONTROL_MPP_IO_LSTC_REDUCE

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

---

*CONTROL_MPP_IO_NOD3DUMP

Properties for *CONTROL_MPP_IO_NOD3DUMP

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_IO_NODUMP

Properties for *CONTROL_MPP_IO_NODUMP

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_IO_NOFAIL

Properties for *CONTROL_MPP_IO_NOFAIL

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_IO_NOFULL

Properties for *CONTROL_MPP_IO_NOFULL

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_IO_SWAPBYTES

Properties for *CONTROL_MPP_IO_SWAPBYTES

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_MATERIAL_MODEL_DRIVER

Properties for *CONTROL_MPP_MATERIAL_MODEL_DRIVER

Name	Type	Description

exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_MPP_REBALANCE

Properties for *CONTROL_MPP_REBALANCE

Name	Type	Description
exists	logical	true if control card exists
icoor	integer	Coordinates used in rebalance
icost	integer	Element costs used in rebalance
include	integer	The Include file number that the control card is in.
ncycle	integer	Number of cycles between rebalance steps
thres	real	Percent threshold for rebalancing

*CONTROL_NONLOCAL

Properties for *CONTROL_NONLOCAL

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
mem	integer	%age increase in memory for *MAT_NONLOCAL usage

*CONTROL_OUTPUT

Properties for *CONTROL_OUTPUT

Name	Type	Description
cdetol	real	Tolerance for output of *DEFINE_CURVE discretization warnings
demden	integer	Output DEM density data to D3PLOT database
engout	integer	Flag to output contact sliding energy densities for mortar contact
eocs	integer	Elout coordinate system option
exists	logical	true if control card exists
frfreq	integer	Output frequency for failed element report
gmdt	real	output interval for *INTERFACE_SSI_AUX
hisnout	integer	Flag to invoke output of extra history variable names
iaccop	integer	Flag for accels in d3thdt to be averaged
ibsf	integer	Flag to invoke output of *SET_BEAM data
icrfile	integer	Output node and element sets used in computing secforc data
ierode	integer	output eroded energy

iflush	integer	i/o buffer flushing interval (t-steps)
ikedit	integer	Status report interval to d3hsp
include	integer	The Include file number that the control card is in.
insf	integer	Flag to invoke output of *SET_NODE data
ip1dblt	integer	output of 1D seatbelt created for 2D seatbelt to sbtout
ipcurv	integer	output curve data flag
ipnint	integer	Flag to print initial timesteps at cycle #1
iprtf	integer	Print flag for RBDOUT and MATSUM files
isfcnt	integer	Continuity level in applying interface linking data
isolsf	integer	Flag to invoke output of *SET_SOLID data
issf	integer	Flag to invoke output of *SET_SHELL data
kineng	integer	Flag to output kinetic energy density as a nodal field
minfo	integer	Output penetration information
mlkbag	integer	Flag to invoke output of accumulated airbag mass leakage in ABSTAT
msgflg	integer	Option for printing detail message to d3msg
msgmax	integer	max num messags
neecho	integer	Print suppression during input: echo file
newleg	integer	New legends
npopt	integer	Print suppression during input: printer file
nrefup	integer	Flag to update individual beam 3rd nodes
opifs	real	Output interval for interface file
penout	integer	Flag to output contact penetration for mortar contact
phschng	integer	Message to messag file for phase change on materials 216, 217 and 218
shlsig	integer	Flag to extrapolate stresses for shells with 8 integration points to nodes
solsig	integer	Flag to extrapolate stresses/history variables
spc2bnd	integer	Flag to convert constraints on rigid bodies to equivalent *BOUNDARY_PRESCRIBED_ MOTION_RIGID motion
tet10s8	integer	tet connectivity output
tolev	integer	Timing output levels

*CONTROL_PARALLEL

Properties for *CONTROL_PARALLEL

Name	Type	Description
consty	integer	Consistency (Accuracy) flag
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ncpu	integer	#cpus to use
numrhs	integer	#rh sides written

para	integer	Flag for parallel force assembly

*CONTROL_PORE_AIR

Properties for *CONTROL_PORE_AIR

Name	Type	Description
air_p	real	Pressure of atmospheric air
air_ro	real	Density of atmospheric air
anamsg	integer	Flag to turn off printing of pore air analysis status message
eterm	real	Event termination time
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_PORE_FLUID

Properties for *CONTROL_PORE_FLUID

Name	Type	Description
atype	integer	Analysis type
conmax	real	damping factor
conv	real	conduction factor
datum	real	Z elevation of datum
eterm	real	event time termination
etflag	integer	Flag for interpretation of time
exists	logical	true if control card exists
fmax	real	max seepage factor
fmin	real	min seepage factor
ftied	real	Analysis type
grav	real	Gravitational acceleration for Ro.g.h
include	integer	The Include file number that the control card is in.
output	integer	Output flag for stresses
pf_bulk	real	Default bulk modulus of pore fluid
pf_rho	real	Default pore water density
targ	real	target for change of excess pressure
therm	real	thermal vol expansion coeff
tmf	integer	Time magnification factor on seepage. Loadcurve if negative
wtable	real	Default elevation of water table

*CONTROL_PWP_AUTO_TMF

Properties for *CONTROL_PWP_AUTO_TMF

Name	Type	Description
dpwmax	real	Max rate of change of pwp water head (m/s)
exists	logical	true if control card exists
fmax	real	Maximum factor on seepage calc
fmin	real	Minimum factor on seepage calc
include	integer	The Include file number that the control card is in.
sprfac	real	factor for reducing feedback
targ	real	Target max pwp change/thermal timestep

*CONTROL_PZELECTRIC

Properties for *CONTROL_PZELECTRIC

Name	Type	Description
abstol	real	Absolute convergence tolerance
epzmsg	integer	Flag to determine if electric flux and electric field at the element center of piezoelectric material is outputed to D3PLOT
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
maxitr	integer	Maximum number of iterations 2
msgitr	integer	Output iteration message level
ndtrfk	real	Reform the dielectric stiffness matrix every NDTRFK time steps
reltol	real	Relative convergence tolerance
solver	integer	Piezoelectric solver type

*CONTROL_REFERENCE_CONFIGURATION

Properties for *CONTROL_REFERENCE_CONFIGURATION

Name	Type	Description
exists	logical	true if control card exists
include	integer	the Include file number that the control card is in.
iter	integer	iter keyword option
iterfile	string	base name of two files for the ITER keyword option
maxiter	integer	max number of iterations
method	integer	iterative method
step	real	step size used in iterations
targetfile	string	file containing all nodes of the target geometry
tol	real	tolerance used to determine convergence

*CONTROL_REMESHING

Properties for *CONTROL_REMESHING

Name	Type	Description
cid	integer	coordinate system id
dtmin	real	timestep size for remesh
efg	integer	efg keyword option
exists	logical	true if control card exists
iaat	integer	interactive adaptivity adjustable tolerance
iat	integer	interactive adaptivity
iat1	real	tolerance of shear distortion indicator for interactive adaptivity
iat2	real	tolerance of unbalanced nodal distribution indicator for interactive adaptivity
iat3	real	tolerance of volumetric change indicator for interactive adaptivity
icurv	integer	number of elements along radius
ier	integer	remeshing with element erosion
include	integer	The Include file number that the control card is in.
ivt	integer	internal variable transfer in adaptive EFG
mfrac	real	mass ratio gain required for remesh
mm	integer	monotonic mesh resizing
rmax	real	Maximum edge length
rmin	real	Minimum edge length
segang	real	angular mesh size in 3-D axisymmetric remeshing
vfloss	real	necessary VF loss for remesh

*CONTROL_RIGID

Properties for *CONTROL_RIGID

Name	Type	Description
exists	logical	true if control card exists
gjadstf	real	Joint rotational stiffness
gjadvsc	real	Joint rotational damping
include	integer	The Include file number that the control card is in.
jntf	integer	Generalized joint stiffness formulation
lmf	integer	Switch explicit/implicit joint formulation
metalf	integer	metalforming option
norbic	integer	Circumvent rigid body inertia check
orthmd	integer	Orthogonalise modes wrt each other
partm	integer	Use global mass matrix for mass distribution

plotel	integer	Automatic generation of *ELEMENT_PLOTEL
rbsms	integer	Flag to apply consistent treatment of rigid bodies in selective mass scaling
rcvlr2d	integer	Recover the lead rigid body of constrained rigid bodies
sparse	integer	Use sparse xply routines for modal & stiffness damping matrices
tjadstf	real	Joint translational stiffness
tjadvsc	real	Joint translational damping

*CONTROL_SHELL

Properties for *CONTROL_SHELL

Name	Type	Description
bwc	integer	Warping stiffness flag for Belytschko-Tsay shells
cntco	integer	include shell ref surface offset
cstyp6	integer	Coord sys for type 6 element
delfr	integer	delete shells where neighbours fail
drcmth	integer	drilling rotation constraint method.
drcpsid	integer	part set for drilling rotation constraint method.
drcpsrm	real	drilling rotation constraint parameter.
esort	integer	Degenerate shell sorting flag (was ITRIST)
excl	integer	.eq.1 if excl above
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
intgrd	integer	Gauss/Lobatto intg rule switch
intperr	integer	Flag for behavior in case of unwanted interp. or extrap. of initial stresses
irnxx	integer	Hughes-Liu shell normal update option
irquad	integer	intg rule
istupd	integer	Shell thickness change option
iswshl	integer	flag for switching between formulations 16 and 30.
itsflg	integer	initial transverse shear stress
keepcs	integer	keep contact segs of failed shells
lamsht	integer	Laminated shell theory update flag
lispsid	integer	Part set ID related to *INITIAL_STRESS_SHELL.
miter	integer	Plane stress plasticity option
nfail1	integer	Flag for distorted 1 intg point shell check
nfail4	integer	Flag for distorted 4 intg point shell check
nlocdt	integer	flag for time step handling for shell elements with offset.
proj	integer	Projection method for warping stiffness
psnfail	integer	part set id for check
psstupd	integer	part set for thichness update, -ve to exclude

rotascl	real	Scale factor for rotary shell mass
sidt4tu	integer	part set for type 4 thickness update where elastic strains are ignored.
stretch	real	Stretch ratio of element diagonals for element deletion
theory	integer	Shell theory to use
tshell	integer	Thermal shell option
wmode	real	W-mode amplitude for element deletion (deg)
wrpang	real	Shell warpage angle (deg)

*CONTROL_SOLID

Properties for *CONTROL_SOLID

Name	Type	Description
coheqc	integer	Cohesive element quality check
esort	integer	Automatic sort of tetra & penta flag
exists	logical	true if control card exists
fmatrix	integer	calculation method for deformation gradient
icoh	integer	global flag for cohesive element deletion
include	integer	The Include file number that the control card is in.
niptets	integer	#intg points for quadratic tets
pm1	integer	10 noded tetrahedral solid node ID 1
pm10	integer	10 noded tetrahedral solid node ID 10
pm2	integer	10 noded tetrahedral solid node ID 2
pm3	integer	10 noded tetrahedral solid node ID 3
pm4	integer	10 noded tetrahedral solid node ID 4
pm5	integer	10 noded tetrahedral solid node ID 5
pm6	integer	10 noded tetrahedral solid node ID 6
pm7	integer	10 noded tetrahedral solid node ID 7
pm8	integer	10 noded tetrahedral solid node ID 8
pm9	integer	10 noded tetrahedral solid node ID 9
psfail	integer	Optional part set id
rinrt	integer	Option to compute rotational inertia for the nodes of solid elements
swlocl	integer	output flag for stresses in solid spotwelds
t10jtol	real	tolerance for jacobian in 4-point 10-noded quadratic tetrahedra
tet13k	integer	global flag for cohesive element deletion
tet13v	integer	Choice of type 13 solid implementation

*CONTROL_SOLUTION

Properties for *CONTROL_SOLUTION

Name	Type	Description
crvp	integer	Bypass time-based evaluation of non-time-dependent curves
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
isnan	integer	Flag to check for a NaN in force and moment arrays
lcacc	integer	Flag to truncate curves: 0 = no truncation; otherwise = truncate
lcint	integer	Number of points in load curve discretization
ncdcf	integer	Cycle number at which to evaluate DEFINE_CURVE_FUNCTION
nlq	integer	Vector length
nocopy	integer	Avoid copying material history variables to temporary buffers for constitutive evaluations
soln	integer	Solution type flag

*CONTROL_SPH

Properties for *CONTROL_SPH

Name	Type	Description
boxid	integer	Box limiting application
cont	integer	Particle approx method
deriv	integer	Time integration type
dt	real	Death time
exists	logical	true if control card exists
form	integer	particle theory
iavis	integer	artificial viscosity formulation
icont	integer	contact option
idim	integer	Space system flag
ierod	integer	erosion option
include	integer	The Include file number that the control card is in.
ini	integer	bucket or global smoothing
ishift	integer	apply shifting algorithm
ishow	integer	display option
istab	integer	stabilisation type
isymp	integer	percentage of sph
ithk	integer	contact thickness option
maxv	real	max velocity
memory	integer	memory alloc
ncbs	integer	Number of cycles between particle sorting
nmneigh	integer	memory alloc
ql	real	quasi-linear coefficient
sphsort	integer	sort and move SPH

start	real	start time

*CONTROL_SPH_INCOMPRESSIBLE

Properties for *CONTROL_SPH_INCOMPRESSIBLE

Name	Type	Description
exists	logical	true if control card exists
ibndp	integer	Pressure treatment of boundary particles
ihtc	integer	Flag for Heat Transfer Coefficient calculation
imat	integer	Flag for *MAT_SPH_INCOMPRESSIBLE_FLUID formulations
include	integer	The Include file number that the control card is in.
rol	real	Deactivation criteria
tavg	real	Tolerance criteria for average relative density
tmax	real	Tolerance criteria for maximum relative density

*CONTROL_SPOTWELD_BEAM

Properties for *CONTROL_SPOTWELD_BEAM

Name	Type	Description
bmsid	integer	beam set for convert to hex assembly
exists	logical	true if control card exists
id_off	integer	part id offset
include	integer	The Include file number that the control card is in.
lcs	integer	Loadcurve: shear response vs. shell size
lct	integer	Loadcurve: tension response vs. shell size
prtflg	integer	Flag to print data for spotwelds
rpbhx	integer	Replace each beam with a cluster of RPBHX solids
t_ors	integer	Table ID for scaling shear response
t_ort	integer	Table for scaling response

*CONTROL_STAGED_CONSTRUCTION

Properties for *CONTROL_STAGED_CONSTRUCTION

Name	Type	Description
accel	real	gravity
dordel	integer	Dormant part treatment in D3PLOT file
exists	logical	true if control card exists
fact	real	default stiffness/gravity factor

include	integer	The Include file number that the control card is in.
itime	integer	Treatment of "Real time" on *DEFIN_CONSTRUCTION_STAGES
nopdel	integer	Treatment of pressure loads on deleted elements
stge	integer	end stage
stgs	integer	start stage
stref	integer	ref stage
tstart	real	start time

*CONTROL_START

Properties for *CONTROL_START

Name	Type	Description
begtim	real	start time
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.

*CONTROL_STEADY_STATE_ROLLING

Properties for *CONTROL_STEADY_STATE_ROLLING

Name	Type	Description
exists	logical	true if control card exists
imass	integer	Inertia switching flag
include	integer	The Include file number that the control card is in.
ivel	integer	Velocity switching flag
lcdmu	integer	Loadcurve for scaling friction forces
lcdmur	integer	Loadcurve for scaling friction forces during dynamic relaxation
scl_k	integer	Scale factor for friction stiffness

*CONTROL_STRUCTURED

Properties for *CONTROL_STRUCTURED

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
term	integer	_TERM flag

*CONTROL_TERMINATION

Properties for *CONTROL_TERMINATION

Name	Type	Description
dtmin	real	Scale factor on initial dt size for termination
endcyc	integer	Termination cycle #
endeng	real	%age change in energy for termination
endmas	real	%age change in mass for termination. Loadcurve if negative
endtim	real	Termination time
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
nosol	integer	flag for non-solution run

*CONTROL_THERMAL_EIGENVALUE

Properties for *CONTROL_THERMAL_EIGENVALUE

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
neig	integer	Number of eigen values to compute.

*CONTROL_THERMAL_FORMING

Properties for *CONTROL_THERMAL_FORMING

Name	Type	Description
a	integer	Load curve ID for the a coefficient used in the formula
algo	integer	Contact algorithm type
b	integer	Load curve ID for the b coefficient used in the formula
bc_flg	integer	Thermal boundary condition flag
c	integer	Load curve ID for the c coefficient used in the formula
d	integer	Explicit accuracy parameter
exists	logical	true if control card exists
formula	integer	Formula that defines the contact heat conductance as a function of temperature and pressure
frad	real	Radiation factor between the contact surfaces
ftosa	real	Fraction of sliding friction energy partitioned to the SURFA surface
fwork	real	Fraction of mechanical work converted into heat
h0	real	Heat transfer conductance for closed gaps
include	integer	The Include file number that the control card is in.
ithoff	integer	Flag for offsetting thermal contact surfaces for thick thermal shells
its	real	Initial thermal time step size
k	real	Thermal conductivity of fluid between the contact surfaces

lcfdt	integer	Load curve number for dynamic coefficient of friction as a function of temperature
lcfst	integer	Load curve number for static coefficient of friction as a function of temperature
lch	integer	Load curve ID for h (can be curve ID or function ID)
lmax	real	No thermal contact if gap is greater than this value
lmin	real	Minimum gap
ptype	integer	Thermal problem type
solver	integer	Thermal analysis solver type
thshel	integer	Thermal shell option
tsf	real	Thermal Speedup Factor

*CONTROL_THERMAL_NONLINEAR

Properties for *CONTROL_THERMAL_NONLINEAR

Name	Type	Description
dcp	real	Divergence control parameter
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
lumpbc	integer	lump boundary condition
nlthpr	integer	Thermal nonlinear printout level
phchpn	real	Phase change penalty parameter
refmax	integer	Max #matrix reformations per timestep
thlstl	real	Line search convergence tolerance
tol	real	Convergence tolerance for temperature

*CONTROL_THERMAL_SOLVER

Properties for *CONTROL_THERMAL_SOLVER

Name	Type	Description
abstol	real	Absolute convergence tolerance
atype	integer	Thermal analysis type
cgtol	real	Convergence tolerance for iterative solver
dtvf	real	Time interval between view factor updates
eqheat	integer	Mechanical equivelent of heat (J/Nm etc). Loadcurve if negative
exists	logical	true if control card exists
fwork	real	Fraction of mechanical heat converted into heat
gpt	integer	#gauss points in solids
include	integer	The Include file number that the control card is in.
maxitr	integer	Maximum number of iterations

msglvl	integer	Output message level
mxdmp	integer	Matrix dumping.
ncycl	integer	Thermal matrix reassembly frequency
ninner	integer	Number of inner iterations for GMRES solve
nouter	integer	Number of outer iterations for GMRES solve
omega	real	Relaxation parameter
ptype	integer	Thermal problem type
reltol	real	Relative convergence tolerance
sbc	real	Stefan Boltzman constant (w/m**2/K)
solver	integer	Thermal analysis solver type
tsf	integer	Thermal speedup factor. Loadcurve if negative
varden	integer	Variable thermal density flag

*CONTROL_THERMAL_TIMESTEP

Properties for *CONTROL_THERMAL_TIMESTEP

Name	Type	Description
dtemp	integer	Max delta temp permitted before timestep decrease, of LC of dt vs time if -ve
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
its	real	Initial thermal timestep
lcts	integer	Loadcurve: timestep vs time
tip	real	Thermal time integration parameter
tmax	real	Maximum thermal timestep, or LC of tmax vs time if -ve
tmin	real	Minimum thermal timestep, or LC of tmin vs time if -ve
ts	integer	Thermal timestep control flag
tscp	real	Timestep control parameter

*CONTROL_TIMESTEP

Properties for *CONTROL_TIMESTEP

Name	Type	Description
dt2ms	real	Timestep for mass scaling
dt2msf	real	Scale factor for initial timestep size to determine min permitted time step size
dt2mslc	integer	Loadcurve: DT2MS vs time
dtinit	real	Initial timestep size
dtusr	integer	User-defined time step for explicit analysis
emscl	real	Fraction of added mass from mass scaling that contributes to gravity loads

erode	integer	Erosion flag for solids & shells @ DTMIN
exists	logical	true if control card exists
igado	integer	Method for calculating time steps for IGA elements
ihdo	integer	Method for calculating solid element time steps
imscl	integer	Selective mass scaling. Part set if negative
include	integer	The Include file number that the control card is in.
isdo	integer	dt calc method for 4 noded shells
lctm	real	Loadcurve: Max timestep vs time
ms1st	integer	Limit mass scaling to 1st timestep flag
rmscl	integer	flag to activate scaling of rotational inertia
tslimt	real	Min timestep for shell modulus change
tssfac	real	Scale factor for computed timestep

*CONTROL_UNITS

Properties for *CONTROL_UNITS

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
length	string	m = meter, mm = millimeter, cm = centimeter, in = inch, ft = foot
length_ scale	real	Number of meters in the length unit for the input deck
mass	string	kg = kilogram, g = gram, mg = milligram, lb = pound, slug = pound x sec2/foot, slinch = pound x sec2/inch, mtrc_ton = metric_ton
mass_ scale	real	Number of kilograms in the mass unit for the input deck
temp	string	K = Kelvin, C = Celsius, F = Fahrenheit, R = Rankine
time	string	sec = second, ms = msec/millisec, micro_s = microsec
time_scale	real	Number of seconds in the time unit for the input deck

*CONTROL_VIBRO_ACOUSTIC

Properties for *CONTROL_VIBRO_ACOUSTIC

Name	Type	Description
exists	logical	true if control card exists
include	integer	The Include file number that the control card is in.
ipanelu	integer	Number of strips in U direction
ipanelv	integer	Number of strips in V direction
nmdstr	integer	Number of modes in modal stress/strain output
restrt	integer	Restart option

vaflag	integer	Loading type
vaplot	integer	Flag for PSD broadband plots
vaprld	integer	Flag for including preload
vapsd	integer	Flag for PSD output
varms	integer	Flag for RMS output
vastrs	integer	Flag for including stress analysis

Damping class

The Damping class gives you access to damping cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Damping properties

Name	Type	Description
global	Object	*DAMPING_GLOBAL card
modal	Object	*DAMPING_MODAL card
structural	Object	*DAMPING_STRUCTURAL card

Properties for DAMPING_GLOBAL

Name	Type	Description
exists	logical	true if damping card exists
include	integer	The Include file number that the damping card is in.
lcid	integer	Curve ID specifying system damping constant
srx	real	Scale factor on global x rotational damping moments
sry	real	Scale factor on global y rotational damping moments
srz	real	Scale factor on global z rotational damping moments
stx	real	Scale factor on global x translational damping forces
sty	real	Scale factor on global y translational damping forces
stz	real	Scale factor on global z translational damping forces
valdmp	real	System damping constant

Properties for DAMPING_MODAL

Name	Type	Description
calcdt	real	Calculation interval
exists	logical	true if damping card exists
f_name	real	Filename
include	integer	The Include file number that the damping card is in.
prflg	integer	Printout flag

Properties for DAMPING_STRUCTURAL

Name	Type	Description

exists	logical	true if damping card exists
g	real	Constant structural damping coefficient
include	integer	The Include file number that the damping card is in.
lcid	integer	Curve ID Curve ID to define frequency dependent structural damping coefficients
lctyp	integer	Type of load curve defining structural damping coefficients

Detailed Description

The Damping class allows you to create, modify, edit and manipulate damping cards. Unlike other classes there is no constructor and there are no functions. Instead a Damping object is available as the damping property of a Model object. This object allows you to access the damping cards.
For example,
To activate damping card *DAMPING_GLOBAL in model m and set valdmp to 0.001.

```
m.damping.global.exists = true;
m.damping.global.valdmp = 0.001;
```

To activate damping card *DAMPING_MODAL in model m and set prflg to 1.

```
m.damping.modal.exists = true;
m.damping.modal.prflg = 1;
```

To activate damping card *DAMPING_STRUCTURAL in model m and set g to 0.02.

```
m.damping.structural.exists = true;
m.damping.structural.g = 0.02;
```

See the properties for more details.

DampingFrequencyRange class

The DampingFrequencyRange class gives you access to define damping frequency range cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

DampingFrequencyRange constants

Name	Description

DampingFrequencyRange.DEFORM	DEFORM is *DAMPING_FREQUENCY_RANGE_DEFORM.
DampingFrequencyRange.NO_OPT	NO_OPT is *DAMPING_FREQUENCY_RANGE.

DampingFrequencyRange properties

Name	Type	Description
cdamp	real	Fraction of critical damping
exists (read only)	logical	true if Damping Frequency Range exists, false if referred to but not defined.
fhigh	real	Highest frequency in range of interest.
flow	real	Lowest frequency in range of interest
iflg	integer	Method used for internal calculation of damping constants
include	integer	The Include file number that the damping_frequency_range is in.
model (read only)	integer	The Model number that the damping frequency range is in.
option	constant	The DampingFrequencyRange option. Can be: • DampingFrequencyRange.NO_OPT or 0 • DampingFrequencyRange.DEFORM
pidref	integer	Part ID.
psid	integer	Set Part set ID.

Detailed Description

The DampingFrequencyRange class allows you to create, modify, edit and manipulate damping_frequency_range cards. See the documentation below for more details.

Constructor

new DampingFrequencyRange(Model*[Model]*, option (optional)*[constant]*, cdamp (optional)*[real]*, flow (optional)*[real]*, fhigh (optional)*[real]*, psid (optional)*[integer]*, pidref (optional)*[integer]*, iflg (optional)*[integer]*)

Description

Create a new DampingFrequencyRange object for *DAMPING_FREQUENCY_RANGE.

Arguments

- **Model** (Model)

Model that damping frequency range will be created in

- **option (optional)** (constant)

Damping frequency range type. Can be DampingFrequencyRange.NO_OPT or DampingFrequencyRange.DEFORM.

- **cdamp (optional)** (real)

Fraction of critical damping

- **flow (optional)** (real)

Lowest frequency in range of interest

- **fhigh (optional)** (real)

Highest frequency in range of interest.

- **psid (optional)** (integer)

Set Part set ID.

- **pidref (optional)** (integer)

Part ID.

- **iflg (optional)** (integer)

Method used for internal calculation of damping constants

Returns

DampingFrequencyRange object

Return type

DampingFrequencyRange

Example

To create a new damping frequency range (of type DEFORM) in model m with cdamp, flow, fhigh, psid, iflg set to 1.5, 2.5, 3.5, 4, 1 respectively:

```
var fr = new DampingFrequencyRange(m, DampingFrequencyRange.DEFORM, 1.5, 2.5, 3.5, 4, 1);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a damping frequency range.

Arguments

- **Comment** (Comment)

Comment that will be attached to the damping frequency range

Returns

No return value

Example

To associate comment c to the damping frequency range fr:

```
fr.AssociateComment(c);
```

Blank()

Description

Blanks the damping frequency range

Arguments

No arguments

Returns

No return value

Example

To blank damping frequency range fr:

```
fr.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that all damping frequency ranges will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping frequency ranges in model m:

```
DampingFrequencyRange.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that all the flagged damping frequency ranges will be blanked in

- **flag** (Flag)

Flag set on the damping frequency ranges that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping frequency ranges in model m flagged with f:

```
DampingFrequencyRange.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the damping frequency range is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if damping frequency range fr is blanked:

```
if (fr.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the damping frequency range.

Arguments

- **flag** (Flag)

Flag to clear on the damping frequency range

Returns

No return value

Example

To clear flag f for damping frequency range fr:

```
fr.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the damping frequency range. The target include of the copied damping frequency range can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DampingFrequencyRange object

Return type

DampingFrequencyRange

Example

To copy damping frequency range fr into damping frequency range z:

```
var z = fr.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a damping frequency range.

Arguments

- **Comment** (Comment)

Comment that will be detached from the damping frequency range

Returns

No return value

Example

To detach comment c from the damping frequency range fr:

```
fr.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for damping frequency range. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for damping frequency range fr:

```
fr.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first damping frequency range in the model.

Arguments

- **Model** (Model)

Model to get first damping frequency range in

Returns

DampingFrequencyRange object (or null if there are no damping frequency ranges in the model).

Return type

DampingFrequencyRange

Example

To get the first damping frequency range in model m:

```
var fr = DampingFrequencyRange.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the damping frequency ranges in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all damping frequency ranges will be flagged in

- **flag** (Flag)

Flag to set on the damping frequency ranges

Returns

No return value

Example

To flag all of the damping frequency ranges with flag f in model m:

```
DampingFrequencyRange.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the damping frequency range is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the damping frequency range

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if damping frequency range fr has flag f set on it:

```
if (fr.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each damping frequency range in the model.
Note that ForEach has been designed to make looping over damping frequency ranges as fast as possible and so has some limitations.
Firstly, a single temporary DampingFrequencyRange object is created and on each function call it is updated with the current damping frequency range data. This means that you should not try to store the DampingFrequencyRange object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new damping frequency ranges inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all damping frequency ranges are in

- **func** (function)

Function to call for each damping frequency range

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the damping frequency ranges in model m:

```
DampingFrequencyRange.ForEach(m, test);
function test(fr)
{
// fr is DampingFrequencyRange object
}
```

To call function test for all of the damping frequency ranges in model m with optional object:

```
var data = { x:0, y:0 };
DampingFrequencyRange.ForEach(m, test, data);
function test(fr, extra)
{
// fr is DampingFrequencyRange object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of DampingFrequencyRange objects for all of the damping frequency ranges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping frequency ranges from

Returns

Array of DampingFrequencyRange objects

Return type

Array

Example

To make an array of DampingFrequencyRange objects for all of the damping frequency ranges in model m

```
var fr = DampingFrequencyRange.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a damping frequency range.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the damping frequency range fr:

```
var comm_array = fr.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DampingFrequencyRange objects for all of the flagged damping frequency ranges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping frequency ranges from

- **flag** (Flag)

Flag set on the damping frequency ranges that you want to retrieve

Returns

Array of DampingFrequencyRange objects

Return type

Array

Example

To make an array of DampingFrequencyRange objects for all of the damping frequency ranges in model m flagged with f

```
var fr = DampingFrequencyRange.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DampingFrequencyRange object for a damping frequency range ID.

Arguments

- **Model** (Model)

Model to find the damping frequency range in

- **number** (integer)

number of the damping frequency range you want the DampingFrequencyRange object for

Returns

DampingFrequencyRange object (or null if damping frequency range does not exist).

Return type

DampingFrequencyRange

Example

To get the DampingFrequencyRange object for damping frequency range 100 in model m

```
var fr = DampingFrequencyRange.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DampingFrequencyRange property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DampingFrequencyRange.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

damping frequency range property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DampingFrequencyRange property fr.example is a parameter:

```
Options.property_parameter_names = true;
if (fr.GetParameter(fr.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DampingFrequencyRange property fr.example is a parameter by using the GetParameter method:

```
if (fr.ViewParameters().GetParameter(fr.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this damping frequency range (*DAMPING_FREQUENCY_RANGE). **Note that a carriage return is not added**. See also DampingFrequencyRange.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for damping frequency range m:

```
var key = fr.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the damping frequency range. **Note that a carriage return is not added**. See also DampingFrequencyRange.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for damping frequency range fr:

```
var cards = fr.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last damping frequency range in the model.

Arguments

- **Model** (Model)

Model to get last damping frequency range in

Returns

DampingFrequencyRange object (or null if there are no damping frequency ranges in the model).

Return type

DampingFrequencyRange

Example

To get the last damping frequency range in model m:

```
var fr = DampingFrequencyRange.Last(m);
```

Next()

Description

Returns the next damping frequency range in the model.

Arguments

No arguments

Returns

DampingFrequencyRange object (or null if there are no more damping frequency ranges in the model).

Return type

DampingFrequencyRange

Example

To get the damping frequency range in model m after damping frequency range fr:

```
var fr = fr.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a damping frequency range.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping frequency ranges from that model can be picked. If the argument is a Flag then only damping frequency ranges that are flagged with *limit* can be selected. If omitted, or null, any damping frequency ranges from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DampingFrequencyRange object (or null if not picked)

Return type

DampingFrequencyRange

Example

To pick a damping frequency range from model m giving the prompt 'Pick damping frequency range from screen':

```
var fr = DampingFrequencyRange.Pick('Pick damping frequency range from screen',
m);
```

Previous()

Description

Returns the previous damping frequency range in the model.

Arguments

No arguments

Returns

DampingFrequencyRange object (or null if there are no more damping frequency ranges in the model).

Return type

DampingFrequencyRange

Example

To get the damping frequency range in model m before damping frequency range fr:

```
var fr = fr.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select damping frequency ranges using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting damping frequency ranges

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping frequency ranges from that model can be selected. If the argument is a Flag then only damping frequency ranges that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any damping frequency ranges can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of damping frequency ranges selected or null if menu cancelled

Return type

Number

Example

To select damping frequency ranges from model m, flagging those selected with flag f, giving the prompt 'Select damping frequency ranges':

```
DampingFrequencyRange.Select(f, 'Select damping frequency ranges', m);
```

To select damping frequency ranges, flagging those selected with flag f but limiting selection to damping frequency ranges flagged with flag l, giving the prompt 'Select damping frequency ranges':

```
DampingFrequencyRange.Select(f, 'Select damping frequency ranges', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the damping frequency range.

Arguments

- **flag** (Flag)

Flag to set on the damping frequency range

Returns

No return value

Example

To set flag f for damping frequency range fr:

```
fr.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the damping frequency range. The damping frequency range will be sketched until you either call DampingFrequencyRange.Unsketch(), DampingFrequencyRange.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping frequency range is sketched. If omitted redraw is true. If you want to sketch several damping frequency ranges and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch damping frequency range fr:

```
fr.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged damping frequency ranges in the model. The damping frequency ranges will be sketched until you either call DampingFrequencyRange.Unsketch(), DampingFrequencyRange.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged damping frequency ranges will be sketched in

- **flag** (Flag)

Flag set on the damping frequency ranges that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping frequency ranges are sketched. If omitted redraw is true. If you want to sketch flagged damping frequency ranges several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all damping frequency ranges flagged with flag in model m:

```
DampingFrequencyRange.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing damping frequency ranges should be counted. If false or omitted referenced but undefined damping frequency ranges will also be included in the total.

Returns

number of damping frequency ranges

Return type

Number

Example

To get the total number of damping frequency ranges in model m:

```
var total = DampingFrequencyRange.Total(m);
```

Unblank()

Description

Unblanks the damping frequency range

Arguments

No arguments

Returns

No return value

Example

To unblank damping frequency range fr:

```
fr.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that all damping frequency ranges will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping frequency ranges in model m:

```
DampingFrequencyRange.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that the flagged damping frequency ranges will be unblanked in

- **flag** (Flag)

Flag set on the damping frequency ranges that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping frequency ranges in model m flagged with f:

```
DampingFrequencyRange.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all damping frequency ranges will be unset in

- **flag** (Flag)

Flag to unset on the damping frequency ranges

Returns

No return value

Example

To unset the flag f on all the damping frequency ranges in model m:

```
DampingFrequencyRange.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the damping frequency range.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping frequency range is unsketched. If omitted redraw is true. If you want to unsketch several damping frequency ranges and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch damping frequency range fr:

```
fr.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all damping frequency ranges.

Arguments

- **Model** (Model)

Model that all damping frequency ranges will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping frequency ranges are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping frequency ranges in model m:

```
DampingFrequencyRange.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged damping frequency ranges in the model.

Arguments

- **Model** (Model)

Model that all damping frequency ranges will be unsketched in

- **flag** (Flag)

Flag set on the damping frequency ranges that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping frequency ranges are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping frequency ranges flagged with flag in model m:

```
DampingFrequencyRange.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DampingFrequencyRange object.

Return type

DampingFrequencyRange

Example

To check if DampingFrequencyRange property fr.example is a parameter by using the DampingFrequencyRange.GetParameter() method:

```
if (fr.ViewParameters().GetParameter(fr.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for damping frequency range. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for damping frequency range fr:

```
fr.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this damping frequency range.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for damping frequency range fr:

```
var xrefs = fr.Xrefs();
```

---

toString()

Description

Creates a string containing the damping frequency range data in keyword format. Note that this contains the keyword header and the keyword cards. See also DampingFrequencyRange.Keyword() and DampingFrequencyRange.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for damping frequency range fr in keyword format

```
var s = fr.toString();
```

DampingPartMass class

The DampingPartMass class gives you access to define damping part mass cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

DampingPartMass constants

Name	Description
DampingPartMass.PART	PART is *DAMPING_PART_MASS.

DampingPartMass.SET	SET is *DAMPING_PART_MASS_SET.

DampingPartMass properties

Name	Type	Description
exists	logical	true if Damping Part Mass exists, false if referred to but not defined. (read only)
flag	integer	Flag for scale factors
id	integer	Part/part set id
include	integer	The Include file number that the damping_part_mass is in.
lcid	integer	LC: Damping vs time
model (read only)	integer	The Model number that the damping part mass is in.
sf	real	Scale factor on loadcurve
srx	real	Rotational x scale factor
sry	real	Rotational y scale factor
srz	real	Rotational z scale factor
stx	real	Translational x scale factor
sty	real	Translational y scale factor
stz	real	Translational z scale factor
type	constant	The DampingPartMass type. Can be: • DampingPartMass.PART or • DampingPartMass.SET

Detailed Description

The DampingPartMass class allows you to create, modify, edit and manipulate damping_part_mass cards. See the documentation below for more details.

Constructor

new DampingPartMass(Model*[Model]*, type*[constant]*, id*[integer]*, lcid*[integer]*, sf (optional)*[real]*, flag (optional)*[integer]*, stx (optional)*[real]*, sty (optional)*[real]*, stz (optional)*[real]*, srx (optional)*[real]*, sry (optional)*[real]*, srz (optional)*[real]*)

Description

Create a new DampingPartMass object for *DAMPING_PART_MASS.

Arguments

- **Model** (Model)

Model that damping part mass will be created in

- **type** (constant)

Damping part mass type. Can be DampingPartMass.PART or DampingPartMass.SET.

- **id** (integer)

Part/part set id

- **lcid** (integer)

LC: Damping vs time

- **sf (optional)** (real)

Scale factor on loadcurve

- **flag (optional)** (integer)

Flag for scale factors

- **stx (optional)** (real)

Translational x scale factor

- **sty (optional)** (real)

Translational y scale factor

- **stz (optional)** (real)

Translational z scale factor

- **srx (optional)** (real)

Rotational x scale factor

- **sry (optional)** (real)

Rotational y scale factor

- **srz (optional)** (real)

Rotational z scale factor

Returns

DampingPartMass object

Return type

DampingPartMass

Example

To create a new damping part mass (of type PART) in model m with id, lcid, sf, flag set to 11, 12, 3.5, 1 respectively:

```
var pm = new DampingPartMass(m, DampingPartMass.PART, 11, 12, 3.5, 1);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a damping part mass.

Arguments

- **Comment** (Comment)

Comment that will be attached to the damping part mass

Returns

No return value

Example

To associate comment c to the damping part mass pm:

```
pm.AssociateComment(c);
```

Blank()

Description

Blanks the damping part mass

Arguments

No arguments

Returns

No return value

Example

To blank damping part mass pm:

```
pm.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the damping part masss in the model.

Arguments

- **Model** (Model)

Model that all damping part masss will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping part masss in model m:

```
DampingPartMass.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged damping part masss in the model.

Arguments

- **Model** (Model)

Model that all the flagged damping part masss will be blanked in

- **flag** (Flag)

Flag set on the damping part masss that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping part masss in model m flagged with f:

```
DampingPartMass.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the damping part mass is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if damping part mass pm is blanked:

```
if (pm.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the damping part mass.

Arguments

- **flag** (Flag)

Flag to clear on the damping part mass

Returns

No return value

Example

To clear flag f for damping part mass pm:

```
pm.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the damping part mass. The target include of the copied damping part mass can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DampingPartMass object

Return type

DampingPartMass

Example

To copy damping part mass pm into damping part mass z:

```
var z = pm.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a damping part mass.

Arguments

- **Comment** (Comment)

Comment that will be detached from the damping part mass

Returns

No return value

Example

To detach comment c from the damping part mass pm:

```
pm.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for damping part mass. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for damping part mass pm:

```
pm.Error("My custom error");
```

First(Model[*Model*]) [static]

Description

Returns the first damping part mass in the model.

Arguments

- **Model** (Model)

Model to get first damping part mass in

Returns

DampingPartMass object (or null if there are no damping part masss in the model).

Return type

DampingPartMass

Example

To get the first damping part mass in model m:

```
var pm = DampingPartMass.First(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the damping part masss in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all damping part masss will be flagged in

- **flag** (Flag)

Flag to set on the damping part masss

Returns

No return value

Example

To flag all of the damping part masss with flag f in model m:

```
DampingPartMass.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the damping part mass is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the damping part mass

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if damping part mass pm has flag f set on it:

```
if (pm.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each damping part mass in the model.
Note that ForEach has been designed to make looping over damping part masss as fast as possible and so has some limitations.
Firstly, a single temporary DampingPartMass object is created and on each function call it is updated with the current damping part mass data. This means that you should not try to store the DampingPartMass object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new damping part masss inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all damping part masss are in

- **func** (function)

Function to call for each damping part mass

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the damping part masss in model m:

```
DampingPartMass.ForEach(m, test);
function test(pm)
{
// pm is DampingPartMass object
}
```

To call function test for all of the damping part masss in model m with optional object:

```
var data = { x:0, y:0 };
DampingPartMass.ForEach(m, test, data);
function test(pm, extra)
{
// pm is DampingPartMass object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of DampingPartMass objects for all of the damping part masss in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping part masss from

Returns

Array of DampingPartMass objects

Return type

Array

Example

To make an array of DampingPartMass objects for all of the damping part masss in model m

```
var pm = DampingPartMass.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a damping part mass.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the damping part mass pm:

```
var comm_array = pm.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DampingPartMass objects for all of the flagged damping part masss in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping part masss from

- **flag** (Flag)

Flag set on the damping part masss that you want to retrieve

Returns

Array of DampingPartMass objects

Return type

Array

Example

To make an array of DampingPartMass objects for all of the damping part masss in model m flagged with f

```
var pm = DampingPartMass.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DampingPartMass object for a damping part mass ID.

Arguments

- **Model** (Model)

Model to find the damping part mass in

- **number** (integer)

number of the damping part mass you want the DampingPartMass object for

Returns

DampingPartMass object (or null if damping part mass does not exist).

Return type

DampingPartMass

Example

To get the DampingPartMass object for damping part mass 100 in model m

```
var pm = DampingPartMass.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DampingPartMass property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DampingPartMass.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

damping part mass property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DampingPartMass property pm.example is a parameter:

```
Options.property_parameter_names = true;
if (pm.GetParameter(pm.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DampingPartMass property pm.example is a parameter by using the GetParameter method:

```
if (pm.ViewParameters().GetParameter(pm.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this damping part mass (*DAMPING_PART_MASS). **Note that a carriage return is not added**. See also DampingPartMass.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for damping part mass m:

```
var key = fr.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the damping part mass. **Note that a carriage return is not added**. See also DampingPartMass.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for damping part mass fr:

```
var cards = fr.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last damping part mass in the model.

Arguments

- **Model** (Model)

Model to get last damping part mass in

Returns

DampingPartMass object (or null if there are no damping part masss in the model).

Return type

DampingPartMass

Example

To get the last damping part mass in model m:

```
var pm = DampingPartMass.Last(m);
```

Next()

Description

Returns the next damping part mass in the model.

Arguments

No arguments

Returns

DampingPartMass object (or null if there are no more damping part masss in the model).

Return type

DampingPartMass

Example

To get the damping part mass in model m after damping part mass pm:

```
var pm = pm.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a damping part mass.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping part masss from that model can be picked. If the argument is a Flag then only damping part masss that are flagged with *limit* can be selected. If omitted, or null, any damping part masss from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DampingPartMass object (or null if not picked)

Return type

DampingPartMass

Example

To pick a damping part mass from model m giving the prompt 'Pick damping part mass from screen':

```
var pm = DampingPartMass.Pick('Pick damping part mass from screen', m);
```

Previous()

Description

Returns the previous damping part mass in the model.

Arguments

No arguments

Returns

DampingPartMass object (or null if there are no more damping part masss in the model).

Return type

DampingPartMass

Example

To get the damping part mass in model m before damping part mass pm:

```
var pm = pm.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select damping part masss using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting damping part masss

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping part masss from that model can be selected. If the argument is a Flag then only damping part masss that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any damping part masss can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of damping part masss selected or null if menu cancelled

Return type

Number

Example

To select damping part masss from model m, flagging those selected with flag f, giving the prompt 'Select damping part masss':

```
DampingPartMass.Select(f, 'Select damping part masss', m);
```

To select damping part masss, flagging those selected with flag f but limiting selection to damping part masss flagged with flag l, giving the prompt 'Select damping part masss':

```
DampingPartMass.Select(f, 'Select damping part masss', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the damping part mass.

Arguments

- **flag** (Flag)

Flag to set on the damping part mass

Returns

No return value

Example

To set flag f for damping part mass pm:

```
pm.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the damping part mass. The damping part mass will be sketched until you either call DampingPartMass.Unsketch(), DampingPartMass.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part mass is sketched. If omitted redraw is true. If you want to sketch several damping part masss and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch damping part mass pm:

```
pm.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged damping part masss in the model. The damping part masss will be sketched until you either call DampingPartMass.Unsketch(), DampingPartMass.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged damping part masss will be sketched in

- **flag** (Flag)

Flag set on the damping part masss that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part masss are sketched. If omitted redraw is true. If you want to sketch flagged damping part masss several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all damping part masss flagged with flag in model m:

```
DampingPartMass.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of damping part masss in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing damping part masss should be counted. If false or omitted referenced but undefined damping part masss will also be included in the total.

Returns

number of damping part masss

Return type

Number

Example

To get the total number of damping part masss in model m:

```
var total = DampingPartMass.Total(m);
```

Unblank()

Description

Unblanks the damping part mass

Arguments

No arguments

Returns

No return value

Example

To unblank damping part mass pm:

```
pm.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the damping part masss in the model.

Arguments

- **Model** (Model)

Model that all damping part masss will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping part masss in model m:

```
DampingPartMass.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged damping part masss in the model.

Arguments

- **Model** (Model)

Model that the flagged damping part masss will be unblanked in

- **flag** (Flag)

Flag set on the damping part masss that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping part masss in model m flagged with f:

```
DampingPartMass.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the damping part masss in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all damping part masss will be unset in

- **flag** (Flag)

Flag to unset on the damping part masss

Returns

No return value

Example

To unset the flag f on all the damping part masss in model m:

```
DampingPartMass.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the damping part mass.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part mass is unsketched. If omitted redraw is true. If you want to unsketch several damping part masss and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch damping part mass pm:

```
pm.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all damping part masss.

Arguments

- **Model** (Model)

Model that all damping part masss will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part masss are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping part masss in model m:

```
DampingPartMass.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged damping part masss in the model.

Arguments

- **Model** (Model)

Model that all damping part masss will be unsketched in

- **flag** (Flag)

Flag set on the damping part masss that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part masss are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping part masss flagged with flag in model m:

```
DampingPartMass.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DampingPartMass object.

Return type

DampingPartMass

Example

To check if DampingPartMass property pm.example is a parameter by using the DampingPartMass.GetParameter() method:

```
if (pm.ViewParameters().GetParameter(pm.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for damping part mass. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for damping part mass pm:

```
pm.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this damping part mass.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for damping part mass pm:

```
var xrefs = pm.Xrefs();
```

---

toString()

Description

Creates a string containing the damping part mass data in keyword format. Note that this contains the keyword header and the keyword cards. See also DampingPartMass.Keyword() and DampingPartMass.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for damping part mass pm in keyword format

```
var s = fr.toString();
```

DampingPartStiffness class

The DampingPartStiffness class gives you access to define damping part stiffness cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

DampingPartStiffness constants

Name	Description
DampingPartStiffness.PART	PART is *DAMPING_PART_STIFFNESS.

DampingPartStiffness.SET	SET is *DAMPING_PART_STIFFNESS_SET.

DampingPartStiffness properties

Name	Type	Description
coef	real	Rayleigh damping coefficient
exists (read only)	logical	true if Damping Part Stiffness exists, false if referred to but not defined.
id	integer	Part/part set id
include	integer	The Include file number that the damping_part_stiffness is in.
model (read only)	integer	The Model number that the damping part stiffness is in.
type	constant	The DampingPartStiffness type. Can be: • DampingPartStiffness.PART or • DampingPartStiffness.SET

Detailed Description

The DampingPartStiffness class allows you to create, modify, edit and manipulate damping_part_stiffness cards. See the documentation below for more details.

Constructor

new DampingPartStiffness(Model*[Model]*, type*[constant]*, id*[integer]*, coef (optional)*[real]*)

Description

Create a new DampingPartStiffness object for *DAMPING_PART_STIFFNESS.

Arguments

- **Model** (Model)

Model that damping part stiffness will be created in

- **type** (constant)

Damping part stiffness type. Can be DampingPartStiffness.PART or DampingPartStiffness.SET.

- **id** (integer)

Part/part set id

- **coef (optional)** (real)

Rayleigh damping coefficient

Returns

DampingPartStiffness object

Return type

DampingPartStiffness

Example

To create a new damping part stiffness (of type PART) in model m with id, coef set to 11, 2.5 respectively:

```
var ps = new DampingPartStiffness(m, DampingPartStiffness.PART, 11, 2.5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a damping part stiffness.

Arguments

- **Comment** (Comment)

Comment that will be attached to the damping part stiffness

Returns

No return value

Example

To associate comment c to the damping part stiffness ps:

```
ps.AssociateComment(c);
```

Blank()

Description

Blanks the damping part stiffness

Arguments

No arguments

Returns

No return value

Example

To blank damping part stiffness ps:

```
ps.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping part stiffnesses in model m:

```
DampingPartStiffness.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all the flagged damping part stiffnesses will be blanked in

- **flag** (Flag)

Flag set on the damping part stiffnesses that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping part stiffnesses in model m flagged with f:

```
DampingPartStiffness.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the damping part stiffness is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if damping part stiffness ps is blanked:

```
if (ps.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the damping part stiffness.

Arguments

- **flag** (Flag)

Flag to clear on the damping part stiffness

Returns

No return value

Example

To clear flag f for damping part stiffness ps:

```
ps.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the damping part stiffness. The target include of the copied damping part stiffness can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DampingPartStiffness object

Return type

DampingPartStiffness

Example

To copy damping part stiffness ps into damping part stiffness z:

```
var z = ps.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a damping part stiffness.

Arguments

- **Comment** (Comment)

Comment that will be detached from the damping part stiffness

Returns

No return value

Example

To detach comment c from the damping part stiffness ps:

```
ps.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for damping part stiffness. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for damping part stiffness ps:

```
ps.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first damping part stiffness in the model.

Arguments

- **Model** (Model)

Model to get first damping part stiffness in

Returns

DampingPartStiffness object (or null if there are no damping part stiffnesses in the model).

Return type

DampingPartStiffness

Example

To get the first damping part stiffness in model m:

```
var ps = DampingPartStiffness.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the damping part stiffnesses in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses will be flagged in

- **flag** (Flag)

Flag to set on the damping part stiffnesses

Returns

No return value

Example

To flag all of the damping part stiffnesses with flag f in model m:

```
DampingPartStiffness.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the damping part stiffness is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the damping part stiffness

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if damping part stiffness ps has flag f set on it:

```
if (ps.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each damping part stiffness in the model.
Note that ForEach has been designed to make looping over damping part stiffnesses as fast as possible and so has some limitations.
Firstly, a single temporary DampingPartStiffness object is created and on each function call it is updated with the current damping part stiffness data. This means that you should not try to store the DampingPartStiffness object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new damping part stiffnesses inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses are in

- **func** (function)

Function to call for each damping part stiffness

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the damping part stiffnesses in model m:

```
DampingPartStiffness.ForEach(m, test);
function test(ps)
{
// ps is DampingPartStiffness object
}
```

To call function test for all of the damping part stiffnesses in model m with optional object:

```
var data = { x:0, y:0 };
DampingPartStiffness.ForEach(m, test, data);
function test(ps, extra)
{
// ps is DampingPartStiffness object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of DampingPartStiffness objects for all of the damping part stiffnesses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping part stiffnesses from

Returns

Array of DampingPartStiffness objects

Return type

Array

Example

To make an array of DampingPartStiffness objects for all of the damping part stiffnesses in model m

```
var ps = DampingPartStiffness.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a damping part stiffness.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the damping part stiffness ps:

```
var comm_array = ps.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DampingPartStiffness objects for all of the flagged damping part stiffnesses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping part stiffnesses from

- **flag** (Flag)

Flag set on the damping part stiffnesses that you want to retrieve

Returns

Array of DampingPartStiffness objects

Return type

Array

Example

To make an array of DampingPartStiffness objects for all of the damping part stiffnesses in model m flagged with f

```
var ps = DampingPartStiffness.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DampingPartStiffness object for a damping part stiffness ID.

Arguments

- **Model** (Model)

Model to find the damping part stiffness in

- **number** (integer)

number of the damping part stiffness you want the DampingPartStiffness object for

Returns

DampingPartStiffness object (or null if damping part stiffness does not exist).

Return type

DampingPartStiffness

Example

To get the DampingPartStiffness object for damping part stiffness 100 in model m

```
var ps = DampingPartStiffness.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DampingPartStiffness property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DampingPartStiffness.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

damping part stiffness property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DampingPartStiffness property ps.example is a parameter:

```
Options.property_parameter_names = true;
if (ps.GetParameter(ps.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DampingPartStiffness property ps.example is a parameter by using the GetParameter method:

```
if (ps.ViewParameters().GetParameter(ps.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this damping part stiffness (*DAMPING_PART_STIFFNESS). **Note that a carriage return is not added**. See also DampingPartStiffness.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for damping part stiffness m:

```
var key = fr.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the damping part stiffness. **Note that a carriage return is not added**. See also DampingPartStiffness.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for damping part stiffness fr:

```
var cards = fr.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last damping part stiffness in the model.

Arguments

- **Model** (Model)

Model to get last damping part stiffness in

Returns

DampingPartStiffness object (or null if there are no damping part stiffnesses in the model).

Return type

DampingPartStiffness

Example

To get the last damping part stiffness in model m:

```
var ps = DampingPartStiffness.Last(m);
```

Next()

Description

Returns the next damping part stiffness in the model.

Arguments

No arguments

Returns

DampingPartStiffness object (or null if there are no more damping part stiffnesses in the model).

Return type

DampingPartStiffness

Example

To get the damping part stiffness in model m after damping part stiffness ps:

```
var ps = ps.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a damping part stiffness.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping part stiffnesses from that model can be picked. If the argument is a Flag then only damping part stiffnesses that are flagged with *limit* can be selected. If omitted, or null, any damping part stiffnesses from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DampingPartStiffness object (or null if not picked)

Return type

DampingPartStiffness

Example

To pick a damping part stiffness from model m giving the prompt 'Pick damping part stiffness from screen':

```
var ps = DampingPartStiffness.Pick('Pick damping part stiffness from screen',
m);
```

Previous()

Description

Returns the previous damping part stiffness in the model.

Arguments

No arguments

Returns

DampingPartStiffness object (or null if there are no more damping part stiffnesses in the model).

Return type

DampingPartStiffness

Example

To get the damping part stiffness in model m before damping part stiffness ps:

```
var ps = ps.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select damping part stiffnesses using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting damping part stiffnesses

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping part stiffnesses from that model can be selected. If the argument is a Flag then only damping part stiffnesses that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any damping part stiffnesses can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of damping part stiffnesses selected or null if menu cancelled

Return type

Number

Example

To select damping part stiffnesses from model m, flagging those selected with flag f, giving the prompt 'Select damping part stiffnesses':

```
DampingPartStiffness.Select(f, 'Select damping part stiffnesses', m);
```

To select damping part stiffnesses, flagging those selected with flag f but limiting selection to damping part stiffnesses flagged with flag l, giving the prompt 'Select damping part stiffnesses':

```
DampingPartStiffness.Select(f, 'Select damping part stiffnesses', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the damping part stiffness.

Arguments

- **flag** (Flag)

Flag to set on the damping part stiffness

Returns

No return value

Example

To set flag f for damping part stiffness ps:

```
ps.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the damping part stiffness. The damping part stiffness will be sketched until you either call DampingPartStiffness.Unsketch(), DampingPartStiffness.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part stiffness is sketched. If omitted redraw is true. If you want to sketch several damping part stiffnesses and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch damping part stiffness ps:

```
ps.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged damping part stiffnesses in the model. The damping part stiffnesses will be sketched until you either call DampingPartStiffness.Unsketch(), DampingPartStiffness.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged damping part stiffnesses will be sketched in

- **flag** (Flag)

Flag set on the damping part stiffnesses that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part stiffnesses are sketched. If omitted redraw is true. If you want to sketch flagged damping part stiffnesses several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all damping part stiffnesses flagged with flag in model m:

```
DampingPartStiffness.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing damping part stiffnesses should be counted. If false or omitted referenced but undefined damping part stiffnesses will also be included in the total.

Returns

number of damping part stiffnesses

Return type

Number

Example

To get the total number of damping part stiffnesses in model m:

```
var total = DampingPartStiffness.Total(m);
```

Unblank()

Description

Unblanks the damping part stiffness

Arguments

No arguments

Returns

No return value

Example

To unblank damping part stiffness ps:

```
ps.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping part stiffnesses in model m:

```
DampingPartStiffness.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that the flagged damping part stiffnesses will be unblanked in

- **flag** (Flag)

Flag set on the damping part stiffnesses that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping part stiffnesses in model m flagged with f:

```
DampingPartStiffness.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all damping part stiffnesses will be unset in

- **flag** (Flag)

Flag to unset on the damping part stiffnesses

Returns

No return value

Example

To unset the flag f on all the damping part stiffnesses in model m:

```
DampingPartStiffness.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the damping part stiffness.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part stiffness is unsketched. If omitted redraw is true. If you want to unsketch several damping part stiffnesses and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch damping part stiffness ps:

```
ps.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all damping part stiffnesses.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part stiffnesses are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping part stiffnesses in model m:

```
DampingPartStiffness.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged damping part stiffnesses in the model.

Arguments

- **Model** (Model)

Model that all damping part stiffnesses will be unsketched in

- **flag** (Flag)

Flag set on the damping part stiffnesses that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping part stiffnesses are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping part stiffnesses flagged with flag in model m:

```
DampingPartStiffness.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DampingPartStiffness object.

Return type

DampingPartStiffness

Example

To check if DampingPartStiffness property ps.example is a parameter by using the DampingPartStiffness.GetParameter() method:

```
if (ps.ViewParameters().GetParameter(ps.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for damping part stiffness. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for damping part stiffness ps:

```
ps.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this damping part stiffness.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for damping part stiffness ps:

```
var xrefs = ps.Xrefs();
```

---

toString()

Description

Creates a string containing the damping part stiffness data in keyword format. Note that this contains the keyword header and the keyword cards. See also DampingPartStiffness.Keyword() and DampingPartStiffness.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for damping part stiffness ps in keyword format

```
var s = fr.toString();
```

DampingRelative class

The DampingRelative class gives you access to define damping relative cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

DampingRelative properties

Name	Type	Description
cdamp	real	Fraction of critical damping

dv2	real	Constant for velocity squared term
exists (read only)	logical	true if Damping Frequency Range exists, false if referred to but not defined.
freq	real	Target frequency
include	integer	The Include file number that the damping_relative is in.
lcid	integer	Fraction of cricitcal damping vs time
model (read only)	integer	The Model number that the damping relative is in.
pidrb	integer	Part Rigid body ID
psid	integer	Set Part set ID.

Detailed Description

The DampingRelative class allows you to create, modify, edit and manipulate damping_relative cards. See the documentation below for more details.

Constructor

new DampingRelative(Model*[Model]*, pidrb*[integer]*, psid*[integer]*, cdamp (optional)*[real]*, freq (optional)*[real]*, dv2 (optional)*[real]*, lcid (optional)*[integer]*)

Description

Create a new DampingRelative object for *DAMPING_RELATIVE.

Arguments

- **Model** (Model)

Model that damping relative will be created in

- **pidrb** (integer)

Part Rigid body ID

- **psid** (integer)

Set Part set ID.

- **cdamp (optional)** (real)

Fraction of critical damping

- **freq (optional)** (real)

Target frequency

- **dv2 (optional)** (real)

Constant for velocity squared term

- **lcid (optional)** (integer)

Fraction of cricitcal damping vs time

Returns

DampingRelative object

Return type

DampingRelative

Example

To create a new damping relative (of no type) in model m with pidrb, psid, cdamp, freq, dv2, lcid set to 10, 20, 3.5, 4.5, 5.5, 60 respectively:

```
var r = new DampingRelative(m, 10, 20, 3.5, 4.5, 5.5, 60);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a damping relative.

Arguments

- **Comment** (Comment)

Comment that will be attached to the damping relative

Returns

No return value

Example

To associate comment c to the damping relative r:

```
r.AssociateComment(c);
```

Blank()

Description

Blanks the damping relative

Arguments

No arguments

Returns

No return value

Example

To blank damping relative r:

```
r.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the damping relatives in the model.

Arguments

- **Model** (Model)

Model that all damping relatives will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping relatives in model m:

```
DampingRelative.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged damping relatives in the model.

Arguments

- **Model** (Model)

Model that all the flagged damping relatives will be blanked in

- **flag** (Flag)

Flag set on the damping relatives that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the damping relatives in model m flagged with f:

```
DampingRelative.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the damping relative is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if damping relative r is blanked:

```
if (r.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the damping relative.

Arguments

- **flag** (Flag)

Flag to clear on the damping relative

Returns

No return value

Example

To clear flag f for damping relative r:

```
r.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the damping relative. The target include of the copied damping relative can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DampingRelative object

Return type

DampingRelative

Example

To copy damping relative r into damping relative z:

```
var z = r.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a damping relative.

Arguments

- **Comment** (Comment)

Comment that will be detached from the damping relative

Returns

No return value

Example

To detach comment c from the damping relative r:

```
r.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for damping relative. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for damping relative r:

```
r.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first damping relative in the model.

Arguments

- **Model** (Model)

Model to get first damping relative in

Returns

DampingRelative object (or null if there are no damping relatives in the model).

Return type

DampingRelative

Example

To get the first damping relative in model m:

```
var r = DampingRelative.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the damping relatives in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all damping relatives will be flagged in

- **flag** (Flag)

Flag to set on the damping relatives

Returns

No return value

Example

To flag all of the damping relatives with flag f in model m:

```
DampingRelative.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the damping relative is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the damping relative

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if damping relative r has flag f set on it:

```
if (r.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each damping relative in the model.
Note that ForEach has been designed to make looping over damping relatives as fast as possible and so has some limitations.
Firstly, a single temporary DampingRelative object is created and on each function call it is updated with the current damping relative data. This means that you should not try to store the DampingRelative object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new damping relatives inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all damping relatives are in

- **func** (function)

Function to call for each damping relative

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the damping relatives in model m:

```
DampingRelative.ForEach(m, test);
function test(r)
{
// r is DampingRelative object
}
```

To call function test for all of the damping relatives in model m with optional object:

```
var data = { x:0, y:0 };
DampingRelative.ForEach(m, test, data);
function test(r, extra)
{
// r is DampingRelative object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of DampingRelative objects for all of the damping relatives in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping relatives from

Returns

Array of DampingRelative objects

Return type

Array

Example

To make an array of DampingRelative objects for all of the damping relatives in model m

```
var r = DampingRelative.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a damping relative.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the damping relative r:

```
var comm_array = r.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DampingRelative objects for all of the flagged damping relatives in a model in PRIMER

Arguments

- **Model** (Model)

Model to get damping relatives from

- **flag** (Flag)

Flag set on the damping relatives that you want to retrieve

Returns

Array of DampingRelative objects

Return type

Array

Example

To make an array of DampingRelative objects for all of the damping relatives in model m flagged with f

```
var r = DampingRelative.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DampingRelative object for a damping relative ID.

Arguments

- **Model** (Model)

Model to find the damping relative in

- **number** (integer)

number of the damping relative you want the DampingRelative object for

Returns

DampingRelative object (or null if damping relative does not exist).

Return type

DampingRelative

Example

To get the DampingRelative object for damping relative 100 in model m

```
var r = DampingRelative.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DampingRelative property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DampingRelative.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

damping relative property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DampingRelative property r.example is a parameter:

```
Options.property_parameter_names = true;
if (r.GetParameter(r.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DampingRelative property r.example is a parameter by using the GetParameter method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this damping relative (*DAMPING_RELATIVE). **Note that a carriage return is not added**. See also DampingRelative.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for damping relative m:

```
var key = r.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the damping relative. **Note that a carriage return is not added**. See also DampingRelative.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for damping relative fr:

```
var cards = r.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last damping relative in the model.

Arguments

- **Model** (Model)

Model to get last damping relative in

Returns

DampingRelative object (or null if there are no damping relatives in the model).

Return type

DampingRelative

Example

To get the last damping relative in model m:

```
var r = DampingRelative.Last(m);
```

Next()

Description

Returns the next damping relative in the model.

Arguments

No arguments

Returns

DampingRelative object (or null if there are no more damping relatives in the model).

Return type

DampingRelative

Example

To get the damping relative in model m after damping relative r:

```
var r = r.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a damping relative.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping relatives from that model can be picked. If the argument is a Flag then only damping relatives that are flagged with *limit* can be selected. If omitted, or null, any damping relatives from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DampingRelative object (or null if not picked)

Return type

DampingRelative

Example

To pick a damping relative from model m giving the prompt 'Pick damping relative from screen':

```
var r = DampingRelative.Pick('Pick damping relative from screen', m);
```

Previous()

Description

Returns the previous damping relative in the model.

Arguments

No arguments

Returns

DampingRelative object (or null if there are no more damping relatives in the model).

Return type

DampingRelative

Example

To get the damping relative in model m before damping relative r:

```
var r = r.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select damping relatives using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting damping relatives

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only damping relatives from that model can be selected. If the argument is a Flag then only damping relatives that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any damping relatives can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of damping relatives selected or null if menu cancelled

Return type

Number

Example

To select damping relatives from model m, flagging those selected with flag f, giving the prompt 'Select damping relatives':

```
DampingRelative.Select(f, 'Select damping relatives', m);
```

To select damping relatives, flagging those selected with flag f but limiting selection to damping relatives flagged with flag l, giving the prompt 'Select damping relatives':

```
DampingRelative.Select(f, 'Select damping relatives', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the damping relative.

Arguments

- **flag** (Flag)

Flag to set on the damping relative

Returns

No return value

Example

To set flag f for damping relative r:

```
r.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the damping relative. The damping relative will be sketched until you either call DampingRelative.Unsketch(), DampingRelative.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping relative is sketched. If omitted redraw is true. If you want to sketch several damping relatives and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch damping relative r:

```
r.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged damping relatives in the model. The damping relatives will be sketched until you either call DampingRelative.Unsketch(), DampingRelative.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged damping relatives will be sketched in

- **flag** (Flag)

Flag set on the damping relatives that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping relatives are sketched. If omitted redraw is true. If you want to sketch flagged damping relatives several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all damping relatives flagged with flag in model m:

```
DampingRelative.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of damping relatives in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing damping relatives should be counted. If false or omitted referenced but undefined damping relatives will also be included in the total.

Returns

number of damping relatives

Return type

Number

Example

To get the total number of damping relatives in model m:

```
var total = DampingRelative.Total(m);
```

Unblank()

Description

Unblanks the damping relative

Arguments

No arguments

Returns

No return value

Example

To unblank damping relative r:

```
r.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the damping relatives in the model.

Arguments

- **Model** (Model)

Model that all damping relatives will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping relatives in model m:

```
DampingRelative.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged damping relatives in the model.

Arguments

- **Model** (Model)

Model that the flagged damping relatives will be unblanked in

- **flag** (Flag)

Flag set on the damping relatives that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the damping relatives in model m flagged with f:

```
DampingRelative.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the damping relatives in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all damping relatives will be unset in

- **flag** (Flag)

Flag to unset on the damping relatives

Returns

No return value

Example

To unset the flag f on all the damping relatives in model m:

```
DampingRelative.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the damping relative.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping relative is unsketched. If omitted redraw is true. If you want to unsketch several damping relatives and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch damping relative r:

```
r.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all damping relatives.

Arguments

- **Model** (Model)

Model that all damping relatives will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping relatives are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping relatives in model m:

```
DampingRelative.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged damping relatives in the model.

Arguments

- **Model** (Model)

Model that all damping relatives will be unsketched in

- **flag** (Flag)

Flag set on the damping relatives that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the damping relatives are unsketched. If omitted redraw is true. If you want to

unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all damping relatives flagged with flag in model m:

```
DampingRelative.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DampingRelative object.

Return type

DampingRelative

Example

To check if DampingRelative property r.example is a parameter by using the DampingRelative.GetParameter() method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for damping relative. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for damping relative r:

```
r.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this damping relative.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for damping relative r:

```
var xrefs = r.Xrefs();
```

---

toString()

Description

Creates a string containing the damping relative data in keyword format. Note that this contains the keyword header and the keyword cards. See also DampingRelative.Keyword() and DampingRelative.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for damping relative r in keyword format

```
var s = r.toString();
```

Database class

The Database class gives you access to database cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Properties for DATABASE_ABSTAT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_ATDOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_BEARING

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.

ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_BINARY

Name	Type	Description
blstfor	Object	*DATABASE_BINARY_BLSTFOR card
cpmfor	Object	*DATABASE_BINARY_CPMFOR card
d3crack	Object	*DATABASE_BINARY_D3CRACK card
d3drlf	Object	*DATABASE_BINARY_D3DRLF card
d3dump	Object	*DATABASE_BINARY_D3DUMP card
d3mean	Object	*DATABASE_BINARY_D3MEAN card
d3part	Object	*DATABASE_BINARY_D3PART card
d3plot	Object	*DATABASE_BINARY_D3PLOT card
d3prop	Object	*DATABASE_BINARY_D3PROP card
d3thdt	Object	*DATABASE_BINARY_D3THDT card
demfor	Object	*DATABASE_BINARY_DEMFOR card
fsifor	Object	*DATABASE_BINARY_FSIFOR card
fsilnk	Object	*DATABASE_BINARY_FSILNK card
intfor	Object	*DATABASE_BINARY_INTFOR card
isphfor	Object	*DATABASE_BINARY_ISPHFOR card
runrsf	Object	*DATABASE_BINARY_RUNRSF card
xtfile	Object	*DATABASE_BINARY_XTFILE card

Properties for DATABASE_BINARY_BLSTFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_CPMFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_D3CRACK

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists

include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_D3DRLF

Name	Type	Description
cycl	integer	Output interval in cycles
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_D3DUMP

Name	Type	Description
cycl	integer	Output interval in cycles
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_D3MEAN

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
iavg	integer	Averaging time interval
include	integer	The Include file number that the database binary card is in.
istats	integer	Level of statistics
tstart	real	Start time

Properties for DATABASE_BINARY_D3PART

Name	Type	Description
beam	integer	Beam option
bsetid	integer	Beam Set ID
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
hsetid	integer	Solid Set ID
include	integer	The Include file number that the database binary card is in.
lcdt	integer	Curve ID giving time interval between dumps
npltc	integer	Number of plot files
psetid	integer	Part Set ID
ssetid	integer	Shell Set ID
tsetid	integer	TShell Set ID

Properties for DATABASE_BINARY_D3PLOT

Name	Type	Description

beam	integer	Beam option
cutoff	real	Frequency cut-off C in Hz
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.
ioopt	integer	Flag for lcdt behaviour
lcdt	integer	Curve ID giving time interval between dumps
npltc	integer	Number of plot files
pset	integer	Part set ID for filtering
psetid	integer	Part Set ID
rate	real	Time interval T between filter sampling
type	integer	Flag for filtering options
window	real	Width of the window in units of time for storing single, forward filtering

Properties for DATABASE_BINARY_D3PROP

Name	Type	Description
exists	logical	true if database binary card exists
ifile	integer	Output data flag
imatl	integer	Output *EOS, *HOURGLASS, *MAT, *part and *SECTION data
include	integer	The Include file number that the database binary card is in.
iwall	integer	Output *RIGIDWALL data

Properties for DATABASE_BINARY_D3THDT

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.
lcdt	integer	Curve ID giving time interval between dumps

Properties for DATABASE_BINARY_DEMFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_FSIFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists

include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_FSILNK

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_INTFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
fname	string	Filename of the database for the INTFOR data
include	integer	The Include file number that the database binary card is in.
ioopt	integer	governs how the plot state frequency is determined from curve LCDT
lcdt	integer	Curve ID giving time interval between dumps

Properties for DATABASE_BINARY_ISPHFOR

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BINARY_RUNRSF

Name	Type	Description
cycl	integer	Output interval in cycles
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.
nr	integer	Number of running restart files

Properties for DATABASE_BINARY_XTFILE

Name	Type	Description
dt	real	Time interval between outputs
exists	logical	true if database binary card exists
include	integer	The Include file number that the database binary card is in.

Properties for DATABASE_BNDOUT

Name	Type	Description
binary	integer	Flag for binary file

dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_CURVOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_DCFAIL

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_DEFGEO

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_DEFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.

ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_DESTAT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_DISBOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_ELOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval
option1	integer	extra history variables for solids
option2	integer	extra history variables for shells
option3	integer	extra history variables for thick shells
option4	integer	extra history variables for beams

Properties for DATABASE_ENVELOPE

Name	Type	Description
bsetid	integer	Output for beam elements. +n is output for elements in beam set n, 0 no beam, -1 all elements
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.

output	integer	Output format. Can be 0 or 1
ssetid	integer	Output for shell elements. +n is output for elements in shell set n, 0 no shell, -1 all elements
tback	real	Time interval for backup output files during the analysis
tcheck	real	Time interval for checking whether the previous maxima/minima are exceeded

Properties for DATABASE_EXTENT_BINARY

Name	Type	Description
beamip	integer	#beam int points to output
cmpflg	integer	Flag to output composite material stress in local csys
cubsld	integer	Output flag for quadratic solid types
dcomp	integer	Data compression flag
deleres	integer	Output flag for results of deleted elements
dtdt	integer	output of nodal temp
engflg	integer	Flag to in/exclude shell energy & thickness
epsflg	integer	Flag to in/exclude shell strains
exists	logical	true if database card exists
hydro	integer	adds extra history variables
ialemat	integer	output ale materials
ieverp	integer	Every D3PLOT file to separate database flag
include	integer	The Include file number that the database card is in.
intout	string	output of intg pt data
maxint	integer	#integration points for shell output
msscl	integer	output nodal mass scaling data
n3thdt	integer	Output for material energies to D3THDT file
neipb	integer	Output of loop-stresses to D3PLOT
neiph	integer	#extra values for solids
neips	integer	#extra values for shells
nintsld	integer	number of solid integration pts
nodout	string	output of connectivity nodes
pkp_sen	integer	Flag to output peak pressure and surface energy for each contact interface
quadsld	integer	Output flag for cubic solid types
resplt	integer	Output of residual forces
rltflg	integer	Flag to in/exclude shell force/moment resultants
sclp	real	Scaling parameter used in the computation of the peak pressure
shge	integer	Shell hourglass energy output flag
sigflg	integer	Flag to in/exclude shell stress tensors
strflg	integer	Strain tensor output flag
stssz	integer	Output shell element dt flag
therm	integer	Output of thermal data to D3PLOT

Properties for DATABASE_EXTENT_BINARY_COMP

Name	Type	Description
exists	logical	true if database card exists
iacc	string	output of accleration data
iglb	string	output of global data
include	integer	The Include file number that the database card is in.
ised	string	output of strain energy density data
istra	string	output of strain data
istrs	string	output of stress data
ivel	string	output of velocity data
ixyz	string	output of geometry data

Properties for DATABASE_EXTENT_D3PART

Name	Type	Description
engflg	integer	Flag to in/exclude shell energy & thickness
epsflg	integer	Flag to in/exclude shell strains
exists	logical	true if database card exists
ieverp	integer	Every D3PLOT file to separate database flag
include	integer	The Include file number that the database card is in.
maxint	integer	#integration points for shell output
neiph	integer	#extra values for solids
neips	integer	#extra values for shells
nintsld	integer	number of solid integration pts
rltflg	integer	Flag to in/exclude shell force/moment resultants
shge	integer	Shell hourglass energy output flag
sigflg	integer	Flag to in/exclude shell stress tensors
strflg	integer	Strain tensor output flag
stssz	integer	Output shell element dt flag

Properties for DATABASE_EXTENT_INTFOR

Name	Type	Description
exists	logical	true if database card exists
ieverf	integer	Every INTFOR database to separate file flag
include	integer	The Include file number that the database card is in.
neng	integer	Output contact energy density for mortar contact and SOFT = 2 contact
nfail	integer	Display deleted contact segments flag
nforc	integer	Output forces
ngapc	integer	Output contact gaps

nglbv	integer	Output global variables
nhuf	integer	Number of user friction history variables to output from user defined friction routines
npen	integer	Output penetration information for mortar contact
npresu	integer	Output pressures
nshear	integer	Output shear stresses
ntied	integer	Output tied segments for Mortar contact
nvelo	integer	Output nodal velocity
nwear	integer	Output contact wear data mode
nwrk	integer	Output (total) sliding interface energy density for mortar contact
nwusr	integer	Number of user wear history variables

Properties for DATABASE_FORMAT

Name	Type	Description
exists	logical	true if database card exists
ibinary	integer	Word size for binary output files
iform	integer	Output format for D3PLOT and D3THDT files
include	integer	The Include file number that the database card is in.

Properties for DATABASE_GCEOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_GLSTAT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval
mass_properties	integer	Flag to include mass and inertia properties

Properties for DATABASE_H3OUT

Name	Type	Description

binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_JNTFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_MATSUM

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_NCFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_NODFOR

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists

include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_NODOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval
option1	real	High frequency output interval
option2	integer	Flag for binary file for high frequency output

Properties for DATABASE_PBSTAT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_PLLYOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_PRTUBE

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.

ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_PYRO

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_RBDOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_RCFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_RWFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SBTOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SECFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SLEOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SPCFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SPHMASSFLOW

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output

exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SPHOUT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_SWFORC

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_TPRINT

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve
lcur	integer	Curve ID specifying time interval

Properties for DATABASE_TRHIST

Name	Type	Description
binary	integer	Flag for binary file
dt	real	Time interval between output
exists	logical	true if database card exists
include	integer	The Include file number that the database card is in.
ioopt	integer	Flag for behaviour of load curve

lcur	integer	Curve ID specifying time interval

Detailed Description

The Database class allows you to create, modify, edit and manipulate database cards. Unlike other classes there is no constructor and there are no functions. Instead a Database object is available as the database property of a Model object. This object allows you to access all of the database cards. For example, to activate database card *DATABASE_SWFORC in model m and set dt to 0.001.

```
m.database.swforc.exists = true;
m.database.swforc.dt = 0.001;
```

To activate database card *DATABASE_BINARY_D3PLOT in model m and set dt to 0.001.

```
m.database.binary.d3plot.exists = true;
m.database.binary.d3plot.dt = 0.001;
```

See the properties for more details.

CrossSection class

The CrossSection class gives you access to database cross section cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

CrossSection constants

Name	Description
CrossSection.PLANE	PLANE is *DATABASE_CROSS_SECTION_PLANE.
CrossSection.SET	SET is *DATABASE_CROSS_SECTION_SET.

CrossSection properties

Name	Type	Description
bsid	integer	Beam set number.
colour	Colour	The colour of the cross section
csid	integer	Database cross section number (identical to label).
dsid	integer	Discrete set number.
exists (read only)	logical	true if database cross section exists, false if referred to but not defined.
heading	string	Database cross section heading.
hsid	integer	Solid set number.
id	integer	Rigid part or accelerometer or coordinate system number.
idset	logical	true if _ID option is set, false if not
include	integer	The Include file number that the database cross section is in.
itype	integer	Flag for local system type.
label	integer	Database cross section number.
lenl	real	Length of L edge.
lenm	real	Length of M edge.
model (read only)	integer	The Model number that the cross section is in.
nsid	integer	Node set number.
option	constant	The Database CrossSection option. Can be: • CrossSection.PLANE or • CrossSection.SET
psid	integer	Part set number.
radius	real	Radius.
ssid	integer	Shell set number.
tsid	integer	Thick shell set number.
xch	real/integer	Head X coord of N normal vector. If <radius> is negative <xch> is a node ID which, combined with <xct>, defines the normal vector of the cut plane.
xct	real/integer	Tail X coord of N normal vector. If <radius> is negative <xct> is a node ID whose coordinates define the centre of the circular cut plane.

xhev	real	Head X coord of L edge vector.
ych	real	Head Y coord of N normal vector.
yct	real	Tail Y coord of N normal vector.
yhev	real	Head Y coord of L edge vector.
zch	real	Head Z coord of N normal vector.
zct	real	Tail Z coord of N normal vector.
zhev	real	Head Z coord of L edge vector.

Detailed Description

The CrossSection class allows you to create, modify, edit and manipulate database cross section cards. See the documentation below for more details.

Constructor

new CrossSection(Model*[Model]*, option*[constant]*, nsid*[integer]*, hsid*[integer]*, bsid*[integer]*, ssid*[integer]*, tsid*[integer]*, dsid*[integer]*, id (optional)*[integer]*, itype (optional)*[integer]*, csid (optional)*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new CrossSection object for *DATABASE_CROSS_SECTION_SET.

Arguments

- **Model** (Model)

Model that database cross section will be created in

- **option** (constant)

Database cross section type. Must be CrossSection.SET

- **nsid** (integer)

Node set number.

- **hsid** (integer)

Solid set number.

- **bsid** (integer)

Beam set number.

- **ssid** (integer)

Shell set number.

- **tsid** (integer)

Thick shell set number.

- **dsid** (integer)

Discrete set number.

- **id (optional)** (integer)

Rigid part or accelerometer or coordinate system number.

- **itype (optional)** (integer)

Flag for local system type.

- **csid (optional)** (integer)

Database cross_section number.

- **heading (optional)** (string)

Database cross_section title.

Returns

CrossSection object

Return type

CrossSection

Example

To create a new Database cross section 500 called "test cross_section" of type _SET in model m with nsid, hsid, bsid, ssid, tsid, dsid, id, itype set to 11, 12, 13, 14, 15, 16, 17, 2 respectively:

```
var c = new CrossSection(m, CrossSection.SET, 11, 12, 13, 14, 15, 16, 17, 2,
500, "test cross_section");
```

new CrossSection(Model*[Model]*, option*[constant]*, psid*[integer]*, xct*[real]*, yct*[real]*, zct*[real]*, xch*[real]*, ych*[real]*, zch*[real]*, xhev*[real]*, yhev*[real]*, zhev*[real]*, lenl (optional)*[real]*, lenm (optional)*[real]*, id (optional)*[integer]*, itype (optional)*[integer]*, csid (optional)*[integer]*, heading (optional)*[string]*, autosize (optional)*[boolean]*, autosize_pct (optional)*[real]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new CrossSection object for *DATABASE_CROSS_SECTION_PLANE.

Arguments

- **Model** (Model)

Model that database cross section will be created in

- **option** (constant)

Database cross section type. Must be CrossSection.PLANE

- **psid** (integer)

Part set number.

- **xct** (real)

X coordinate of tail of normal vector.

- **yct** (real)

Y coordinate of tail of normal vector.

- **zct** (real)

Z coordinate of tail of normal vector.

- **xch** (real)

X coordinate of head of normal vector.

- **ych** (real)

Y coordinate of head of normal vector.

- **zch** (real)

Z coordinate of head of normal vector.

- **xhev** (real)

X coordinate of head of edge vector.

- **yhev** (real)

Y coordinate of head of edge vector.

- **zhev** (real)

Z coordinate of head of edge vector.

- **lenl (optional)** (real)

Length in l direction.

- **lenm (optional)** (real)

Length in m direction.

- **id (optional)** (integer)

Rigid part or accelerometer or coordinate system number.

- **itype (optional)** (integer)

Flag for local system type.

- **csid (optional)** (integer)

Database cross_section number.

- **heading (optional)** (string)

Database cross_section title.

- **autosize (optional)** (boolean)

true if the Database cross_section is to be autosized.

- **autosize_pct (optional)** (real)

Additional post-autosize scaling percentage.

Returns

CrossSection object

Return type

CrossSection

Example

To create a new Database cross section 500 called "test cross_section" of type _PLANE in model m with part set ID 100, normal tail (10, 20, 30), normal head (20, 20, 30), head of edge vector (10, 30, 30) and edge lengths 50 and 100:

```
var c = new CrossSection(m, CrossSection.PLANE, 100, 10, 20, 30, 20, 20, 30, 10, 30, 30, 50, 100, 0, 0, 500, "test cross_section");
```

new CrossSection(Model*[Model]*, option*[constant]*, settings*[object]*)

Description

Create a new CrossSection object.

Arguments

- **Model** (Model)

Model that database cross section will be created in

- **option** (constant)

Database cross section type. Must be CrossSection.SET or CrossSection.PLANE

- **settings** (object)

Options specifying various properties used to create the keyword. If optional values are not specified then their default values will be used.

Object has the following properties:

Name	Type	Description
autosize (optional) (PLANE only)	boolean	true if the Database cross_section is to be autosized.
autosize_pct (optional) (PLANE only)	real	Additional post-autosize scaling percentage. (default: same as value specified by the preference primer*cross_section_auto_size_percent)
bsid (SET only)	integer	Beam set number.
csid (optional)	integer	Database cross_section number.
dsid (SET only)	integer	Discrete set number.
heading (optional)	string	Database cross_section title.
hsid (SET only)	integer	Solid set number.
id (optional)	integer	Rigid part or accelerometer or coordinate system number.
itype (optional)	integer	Flag for local system type.
lenl (optional) (PLANE only)	real	Length in l direction.
lenm (optional) (PLANE only)	real	Length in m direction.
nsid (SET only)	integer	Node set number.
psid (PLANE only)	integer	Part set number.
ssid (SET only)	integer	Shell set number.
tsid (SET only)	integer	Thick shell set number.
vis_only (optional) (PLANE only)	real	true if autosizing should ignore non-visible elements, false otherwise. (default: true)
xch (PLANE only)	real	X coordinate of head of normal vector.
xct (PLANE only)	real	X coordinate of tail of normal vector.
xhev (PLANE only)	real	X coordinate of head of edge vector.
ych (PLANE only)	real	Y coordinate of head of normal vector.
yct (PLANE only)	real	Y coordinate of tail of normal vector.
yhev (PLANE only)	real	Y coordinate of head of edge vector.
zch (PLANE only)	real	Z coordinate of head of normal vector.
zct (PLANE only)	real	Z coordinate of tail of normal vector.
zhev (PLANE only)	real	Z coordinate of head of edge vector.

Returns

CrossSection object

Return type

CrossSection

Example

To create a new Database cross section 500 called "test cross_section" of type _SET in model m with nsid, hsid, bsid, ssid, tsid, dsid, id, itype set to 11, 12, 13, 14, 15, 16, 17, 2 respectively:

```
var settings = { nsid: 11, hsid: 12, bsid: 13, ssid: 14, tsid: 15, dsid: 16, id:
17, itype: 2, heading: "test_cross_section" };
      var c = new CrossSection(m, CrossSection.SET, settings);
```

To create a new Database cross section 500 called "test cross_section" of type _PLANE in model m with part set ID 100, normal tail (10, 20, 30), normal head (20, 20, 30), head of edge vector (10, 30, 30) and edge lengths 50 and 100:

```
var settings = { psid: 100, id: 500, heading: "test cross_section",
             xct: 10, yct: 20, zct: 30,
             xch: 20, ych: 20, zch: 30,
             xhev: 10, yhev: 30, zhev: 30,
             lenl: 50, lenm: 100 };
var c = new CrossSection(m, CrossSection.PLANE, settings);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a cross section.

Arguments

- **Comment** (Comment)

Comment that will be attached to the cross section

Returns

No return value

Example

To associate comment c to the cross section c:

```
c.AssociateComment(c);
```

Autosize(options (optional)*[object]*)

Description

Autosizes a _PLANE cross section such that it cuts through all elements in model/psid along that plane.

Arguments

- **options (optional)** (object)

Object containing additional options

Object has the following properties:

Name	Type	Description
percentage (optional)	real	Additional percentage that the autosized cross section will be scaled by. (default: same as value specified by the preference primer*cross_section_auto_size_percent)
vis_only (optional)	boolean	If true, autosizing will ignore non-visible cut elements, false otherwise. (default: true)

Returns

No return value

Example

To autosize a cross section:

```
var xsec = CrossSection.GetFromID(model, id);
if(xsec.option == CrossSection.PLANE) xsec.Autosize();
```

To autosize a cross section, scaled by an additional 5 percent, and ignoring element visiblity:

```
var xsec = CrossSection.GetFromID(model, id);
var options = { percentage: 5.0, vis_only: false };
if(xsec.option == CrossSection.PLANE) xsec.Autosize(options);
```

Blank()

Description

Blanks the cross section

Arguments

No arguments

Returns

No return value

Example

To blank cross section c:

```
c.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the cross sections in the model.

Arguments

- **Model** (Model)

Model that all cross sections will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the cross sections in model m:

```
CrossSection.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged cross sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged cross sections will be blanked in

- **flag** (Flag)

Flag set on the cross sections that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the cross sections in model m flagged with f:

```
CrossSection.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the cross section is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if cross section c is blanked:

```
if (c.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse cross section c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the cross section.

Arguments

- **flag** (Flag)

Flag to clear on the cross section

Returns

No return value

Example

To clear flag f for cross section c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the cross section. The target include of the copied cross section can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

CrossSection object

Return type

CrossSection

Example

To copy cross section c into cross section z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a cross_section.

Arguments

- **Model** (Model)

Model that the cross_section will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

CrossSection object (or null if not made)

Return type

CrossSection

Example

To start creating a cross section in model m:

```
var c = CrossSection.Create(m);
```

CreateAlongFeatureLine(Model*[Model]*, nid1*[integer]*, options*[object]*) [static]

Description

Creates a set of cross sections along a feature line and returns them as an array of CrossSection objects. Use Options.edge_angle to control the break angle for the feature line search within this function.

Arguments

- **Model** (Model)

Model that the cross_section will be created in

- **nid1** (integer)

ID of feature line starting node. The first cross section will be created at this Node's location.

- **options** (object)

Additional arguments for controlling how the cross sections are created.

Object has the following properties:

Name	Type	Description
autosize (optional)	boolean	true if cross sections are to be autosized. lenl and lenm will be ignored if set.
autosize_pct (optional)	real	If autosize is true, cross sections will be scaled by this additional percentage after being autosized. (default: same as value specified by the preference primer*cross_section_auto_size_percent)
direction (optional)	integer	Direction along feature line to create cross sections. +1 for positive direction (default), -1 for negative direction. Ignored for two node method (nid2 set).
lenl	real	Side length of plane along L vector - non-circular cross sections only.
lenm	real	Side length of plane along M vector - non-circular cross sections only.
nid2 (optional)	integer	ID of feature line ending node, can be the same as nid1. If provided, cross sections will be created between the nodes nid1 and nid2 along the shortest feature line path.
num	integer	Number of cross sections to be created. Required for single node method. For two node method either num or pitch must be specified. For two node method, the last cross section will be created at the location of node nid2 (provided nid1 != nid2).
pitch	real	Separation between adjacent cross sections. Required for single node method. For two node method either num or pitch must be specified.
psid (optional)	integer	ID of part set.
radius (optional)	real	Radius of circular cross section.
vis_only (optional)	boolean	If true, and autosize is true, autosizing will ignore non-visible cut elements, false otherwise (default: true).

Returns

Array of CrossSection objects (or null if not made). Depending on the geometry of the model and the node provided for nid1, the array may contain less CrossSection objects than requested for the single node method.

Return type

Array

Example

To create 10 autosized cross sections, separated by 15.0, in the positive direction, starting at Node 1:

```
var options = { num: 10, pitch: 15.0, direction: 1, autosize: true };
      var xsec_array = CrossSection.CreateAlongFeatureLine(model, 1, options);
```

To create 5 circular cross sections, of radius 25.0, around an entire perimeter edge (starting at Node 2):

```
var options = { num: 5, nid2: 2, radius: 25.0 };
      var xsec_array = CrossSection.CreateAlongFeatureLine(model, 2, options);
```

To create a set of cross sections separated by 10.0, of size 50.0 x 50.0, between nodes 3 and 4 (starting at Node 3):

```
var options = { pitch: 10.0, lenm: 50.0, lenl: 50.0, nid2: 4 };
      var xsec_array = CrossSection.CreateAlongFeatureLine(model, 3, options);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a cross section.

Arguments

- **Comment** (Comment)

Comment that will be detached from the cross section

Returns

No return value

Example

To detach comment c from the cross section c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit cross section c:

```
c.Edit();
```

ElemCut(Shell label*[integer]*)

Description

Returns coordinates of the intersections between a shell and a database cross section. Note, ElemCut on the Shell class may be quicker

Arguments

- **Shell label** (integer)

The label of the shell.

Returns

An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line, or NULL if it does not cut. Note this function does not check that the shell is in the cross section definition (part set)

Return type

Array

Example

To get the cut line coordinates between database cross section x and shell 300:

```
var data = x.ElemCut(300)
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for cross section. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for cross section c:

```
c.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for cross section.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the cross section colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the cross section.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing cross section c:

```
var colour = c.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first cross section in the model.

Arguments

- **Model** (Model)

Model to get first cross section in

Returns

CrossSection object (or null if there are no cross sections in the model).

Return type

CrossSection

Example

To get the first cross section in model m:

```
var c = CrossSection.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free cross section label in the model. Also see CrossSection.LastFreeLabel(), CrossSection.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free cross section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

CrossSection label.

Return type

Number

Example

To get the first free cross section label in model m:

```
var label = CrossSection.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the cross sections in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all cross sections will be flagged in

- **flag** (Flag)

Flag to set on the cross sections

Returns

No return value

Example

To flag all of the cross sections with flag f in model m:

```
CrossSection.FlagAll(m, f);
```

FlagCut(Flag*[Flag]*)

Description

Flags every element (solid,shell,tshell,beam) cut by the cross section. Note this function does not check that the element is in the cross section definition (part set)

Arguments

- **Flag** (Flag)

Flag bit.

Returns

Boolean.

Return type

Boolean

Example

To find elements cut by database cross section x:

```
x.FlagCut(flag)
```

Flagged(flag*[Flag]*)

Description

Checks if the cross section is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the cross section

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if cross section c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each cross section in the model.
Note that ForEach has been designed to make looping over cross sections as fast as possible and so has some limitations.
Firstly, a single temporary CrossSection object is created and on each function call it is updated with the current cross section data. This means that you should not try to store the CrossSection object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new cross sections inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all cross sections are in

- **func** (function)

Function to call for each cross section

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the cross sections in model m:

```
CrossSection.ForEach(m, test);
function test(c)
{
// c is CrossSection object
}
```

To call function test for all of the cross sections in model m with optional object:

```
var data = { x:0, y:0 };
CrossSection.ForEach(m, test, data);
function test(c, extra)
{
// c is CrossSection object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of CrossSection objects for all of the cross sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get cross sections from

Returns

Array of CrossSection objects

Return type

Array

Example

To make an array of CrossSection objects for all of the cross sections in model m

```
var c = CrossSection.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a cross section.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the cross section c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of CrossSection objects for all of the flagged cross sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get cross sections from

- **flag** (Flag)

Flag set on the cross sections that you want to retrieve

Returns

Array of CrossSection objects

Return type

Array

Example

To make an array of CrossSection objects for all of the cross sections in model m flagged with f

```
var c = CrossSection.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the CrossSection object for a cross section ID.

Arguments

- **Model** (Model)

Model to find the cross section in

- **number** (integer)

number of the cross section you want the CrossSection object for

Returns

CrossSection object (or null if cross section does not exist).

Return type

CrossSection

Example

To get the CrossSection object for cross section 100 in model m

```
var c = CrossSection.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a CrossSection property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the CrossSection.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

cross section property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if CrossSection property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if CrossSection property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this cross_section (*DATABASE_CROSS_SECTION). **Note that a carriage return is not added**. See also CrossSection.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for cross_section c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the cross_section. **Note that a carriage return is not added**. See also CrossSection.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for cross_section c:

```
var cards = c.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last cross section in the model.

Arguments

- **Model** (Model)

Model to get last cross section in

Returns

CrossSection object (or null if there are no cross sections in the model).

Return type

CrossSection

Example

To get the last cross section in model m:

```
var c = CrossSection.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free cross section label in the model. Also see CrossSection.FirstFreeLabel(), CrossSection.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free cross section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

CrossSection label.

Return type

Number

Example

To get the last free cross section label in model m:

```
var label = CrossSection.LastFreeLabel(m);
```

Next()

Description

Returns the next cross section in the model.

Arguments

No arguments

Returns

CrossSection object (or null if there are no more cross sections in the model).

Return type

CrossSection

Example

To get the cross section in model m after cross section c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) cross section label in the model. Also see CrossSection.FirstFreeLabel(), CrossSection.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free cross section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

CrossSection label.

Return type

Number

Example

To get the next free cross section label in model m:

```
var label = CrossSection.NextFreeLabel(m);
```

PartCut(Part label*[integer]*, Flag (optional)*[Flag]*)

Description

Returns true if cross section is cutting the part, false otherwise. If option flag is active, will flag every element of the part cut by the cross section. Note this function does not check that the part is in the cross section definition (part set)

Arguments

- **Part label** (integer)

The label of the part.

- **Flag (optional)** (Flag)

Optional Flag to flag the element which are cut by the cross section.

Returns

Boolean.

Return type

Boolean

Example

To know if a database cross section x cuts part 300:

```
x.PartCut(300)
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a cross section.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only cross sections from that model can be picked. If the argument is a Flag then only cross sections that are flagged with *limit* can be selected. If omitted, or null, any cross sections from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

CrossSection object (or null if not picked)

Return type

CrossSection

Example

To pick a cross section from model m giving the prompt ’Pick cross section from screen’:

```
var c = CrossSection.Pick(’Pick cross section from screen’, m);
```

Previous()

Description

Returns the previous cross section in the model.

Arguments

No arguments

Returns

CrossSection object (or null if there are no more cross sections in the model).

Return type

CrossSection

Example

To get the cross section in model m before cross section c:

```
var c = c.Previous();
```

Properties()

Description

Returns an object which describe various cross section properties

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
area	real	Area of material sliced by the cut section
first_yield_axial	real	First yield axial force
first_yield_mxx	real	First yield bending moment (Mxx)
first_yield_myy	real	First yield bending moment (Myy)
fully_plastic_mxx	real	Fully plastic bending moment (Mxx)
fully_plastic_myy	real	Fully plastic bending moment (Myy)
fully_plastic_xf	real	X component of equal force axis
fully_plastic_xf_g	real	X component of equal force axis calculated in global coordinates
fully_plastic_yf	real	Fully plastic axial force
fully_plastic_yf_g	real	Y component of equal force axis calculated in global coordinates

fully_plastic_zf_g	real	Z component of equal force axis calculated in global coordinates
iuu	real	Iuu principal second moments (UU - major)
ivv	real	Ivv principal second moments (VV - minor)
ixx	real	Ixx component of second moment of area
ixy	real	Ixy component of second moment of area
iyy	real	Iyy component of second moment of area
origin_x	real	X component of section origin
origin_y	real	Y component of section origin
origin_z	real	Z component of section origin
theta	real	Angle between Ixx and Iuu
x_comp_axis_x	real	X component of X-axis vector
x_comp_axis_y	real	X component of Y-axis vector
x_comp_axis_z	real	X component of Z-axis vector
xc	real	X component of centroid calculated from the first moment of area
xc_global	real	X component of centre of gravity calculated in global coordinates
xe	real	X component of equal area axis
xe_global	real	X component of equal area axis calculated in global coordinates
y_comp_axis_x	real	Y component of x-axis vector
y_comp_axis_y	real	Y component of Y-axis vector
y_comp_axis_z	real	Y component of Z-axis vector
yc	real	Y component of centroid calculated from the first moment of area
yc_global	real	Y component of centre of gravity calculated in global coordinates
ye	real	Y component of equal area axis
ye_global	real	Y component of equal area axis calculated in global coordinates
z_comp_axis_x	real	Z component of X-axis vector
z_comp_axis_y	real	Z component of Y-axis vector
z_comp_axis_z	real	Z component of Z-axis vector
zc_global	real	Z component of centre of gravity calculated in global coordinates
ze_global	real	Z component of equal area axis calculated in global coordinates
zxx	real	Plastic moduli Zxx
zyy	real	Plastic moduli Zyy

Return type

object

Example

To get the cross section properties for section c:

```
var properties = c.Properties();
    var originX  = properties.origin_x;
    var originY  = properties.origin_y;
    var Xc = properties.xc;
    var Ixx = properties.ixx;
    var Iuu = properties.iuu;
    var Theta = properties.theta;
    var plastic_Mxx = properties.fully_plastic_mxx;
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the cross sections in the model.

Arguments

- **Model** (Model)

Model that all cross sections will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the cross sections in model m, from 1000000:

```
CrossSection.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged cross sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged cross sections will be renumbered in

- **flag** (Flag)

Flag set on the cross sections that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the cross sections in model m flagged with f, from 1000000:

```
CrossSection.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select cross sections using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting cross sections

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only cross sections from that model can be selected. If the argument is a Flag then only cross sections that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any cross sections can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of cross sections selected or null if menu cancelled

Return type

Number

Example

To select cross sections from model m, flagging those selected with flag f, giving the prompt 'Select cross sections':

```
CrossSection.Select(f, 'Select cross sections', m);
```

To select cross sections, flagging those selected with flag f but limiting selection to cross sections flagged with flag l, giving the prompt 'Select cross sections':

```
CrossSection.Select(f, 'Select cross sections', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the cross section.

Arguments

- **flag** (Flag)

Flag to set on the cross section

Returns

No return value

Example

To set flag f for cross section c:

```
c.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the cross section. The cross section will be sketched until you either call CrossSection.Unsketch(), CrossSection.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the cross section is sketched. If omitted redraw is true. If you want to sketch several cross sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch cross section c:

```
c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged cross sections in the model. The cross sections will be sketched until you either call CrossSection.Unsketch(), CrossSection.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged cross sections will be sketched in

- **flag** (Flag)

Flag set on the cross sections that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the cross sections are sketched. If omitted redraw is true. If you want to sketch flagged cross sections several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all cross sections flagged with flag in model m:

```
CrossSection.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of cross sections in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing cross sections should be counted. If false or omitted referenced but undefined cross sections will also be included in the total.

Returns

number of cross sections

Return type

Number

Example

To get the total number of cross sections in model m:

```
var total = CrossSection.Total(m);
```

Unblank()

Description

Unblanks the cross section

Arguments

No arguments

Returns

No return value

Example

To unblank cross section c:

```
c.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the cross sections in the model.

Arguments

- **Model** (Model)

Model that all cross sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the cross sections in model m:

```
CrossSection.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged cross sections in the model.

Arguments

- **Model** (Model)

Model that the flagged cross sections will be unblanked in

- **flag** (Flag)

Flag set on the cross sections that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the cross sections in model m flagged with f:

```
CrossSection.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the cross sections in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all cross sections will be unset in

- **flag** (Flag)

Flag to unset on the cross sections

Returns

No return value

Example

To unset the flag f on all the cross sections in model m:

```
CrossSection.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the cross section.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the cross section is unsketched. If omitted redraw is true. If you want to unsketch several cross sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch cross section c:

```
c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all cross sections.

Arguments

- **Model** (Model)

Model that all cross sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the cross sections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all cross sections in model m:

```
CrossSection.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged cross sections in the model.

Arguments

- **Model** (Model)

Model that all cross sections will be unsketched in

- **flag** (Flag)

Flag set on the cross sections that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the cross sections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all cross sections flagged with flag in model m:

```
CrossSection.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

CrossSection object.

Return type

CrossSection

Example

To check if CrossSection property c.example is a parameter by using the CrossSection.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for cross section. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for cross section c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this cross section.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for cross section c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the cross_section data in keyword format. Note that this contains the keyword header and the keyword cards. See also CrossSection.Keyword() and CrossSection.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for cross_section c in keyword format

```
var s = c.toString();
```

History class

The History class gives you access to database history cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

History constants

Name	Description
History.ACOUSTIC	ACOUSTIC is *DATABASE_HISTORY_ACOUSTIC.
History.ALL_TYPES	All *DATABASE_HISTORY_ types.
History.BEAM	BEAM is *DATABASE_HISTORY_BEAM.
History.BEAM_SET	BEAM_SET is *DATABASE_HISTORY_BEAM_SET.
History.DISCRETE	DISCRETE is *DATABASE_HISTORY_DISCRETE.
History.DISCRETE_SET	DISCRETE_SET is *DATABASE_HISTORY_DISCRETE_SET.
History.NODE	NODE is *DATABASE_HISTORY_NODE.

History.NODE_SET	NODE_SET is *DATABASE_HISTORY_NODE_SET.
History.SEATBELT	SEATBELT is *DATABASE_HISTORY_SEATBELT.
History.SHELL	SHELL is *DATABASE_HISTORY_SHELL.
History.SHELL_SET	SHELL_SET is *DATABASE_HISTORY_SHELL_SET.
History.SOLID	SOLID is *DATABASE_HISTORY_SOLID.
History.SOLID_SET	SOLID_SET is *DATABASE_HISTORY_SOLID_SET.
History.SPH	SPH is *DATABASE_HISTORY_SPH.
History.SPH_SET	SPH_SET is *DATABASE_HISTORY_SPH_SET.
History.TSHELL	TSHELL is *DATABASE_HISTORY_TSHELL.
History.TSHELL_SET	TSHELL_SET is *DATABASE_HISTORY_TSHELL_SET.

History properties

Name	Type	Description
cid	integer	Coordinate system ID for _LOCAL
exists (read only)	logical	true if database history exists, false if referred to but not defined.
heading	string	Optional heading
hfo	integer	High frequency flag for _LOCAL
id	integer	ID of the item
include	integer	The Include file number that the database history is in.
local	logical	Turns _LOCAL on or off
model	integer	The Model number that the database history is in.
ref	integer	Output reference for _LOCAL
type (read only)	constant	The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET.

Detailed Description

The History class allows you to create, modify, edit and manipulate database history cards. See the documentation below for more details.

Constructor

new History(Model*[Model]*, type*[constant]*, id*[integer]*, heading (optional)*[string]*)

Description

Create a new History object.

Arguments

- **Model** (Model)

Model that database history will be created in

- **type** (constant)

Entity type

- **id** (integer)

ID of the item

- **heading (optional)** (string)

Optional heading

Returns

History object

Return type

History

Example

To create a new Database history on NODE 500 called "test history":

```
var c = new History(m, History.NODE, 500, "test history");
```

Details of functions

BlankAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the database histories in the model.

Arguments

- **Model** (Model)

Model that all database histories will be blanked in

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the database histories in model m:

```
History.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged database histories in the model.

Arguments

- **Model** (Model)

Model that all the flagged database histories will be blanked in

- **flag** (Flag)

Flag set on the database histories that you want to blank

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the database histories in model m flagged with f:

```
History.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the database history is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if database history c is blanked:

```
if (c.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the database history.

Arguments

- **flag** (Flag)

Flag to clear on the database history

Returns

No return value

Example

To clear flag f for database history c:

```
c.ClearFlag(f);
```

Create(Model*[Model]*, type*[constant]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a database history.

Arguments

- **Model** (Model)

Model that the database history will be created in

- **type** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET.

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

History object (or null if not made)

Return type

History

Example

To start creating a history in model m:

```
var c = History.Create(m);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel to edit the database history.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

No return value

Example

To edit database history c:

```
c.Edit();
```

First(Model*[Model]*, type (optional)*[constant]*) [static]

Description

Returns the first database history in the model.

Arguments

- **Model** (Model)

Model to get first database history in

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

History object (or null if there are no database histories in the model).

Return type

History

Example

To get the first database history in model m:

```
var history = History.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*) [static]

Description

Flags all of the database histories in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all database histories will be flagged in

- **flag** (Flag)

Flag to set on the database histories

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

No return value

Example

To flag all of the database histories with flag f in model m:

```
History.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the database history is flagged or not.

Arguments

- **flag** (Flag)

Flag to clear on the database history

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if database history c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

GetAll(Model*[Model]*, type (optional)*[constant]*) [static]

Description

Returns an array of History objects for all of the database histories in a models in PRIMER

Arguments

- **Model** (Model)

Model to get database histories from

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

Array of History objects

Return type

Array

Example

To make an array of History objects for all of the database histories in model m

```
var database history = History.GetAll(m);
```

GetFromID(Model*[Model]*, database history number*[integer]*) [static]

Description

Returns the History object for a database history ID.

Arguments

- **Model** (Model)

Model to find the database history in

- **database history number** (integer)

number of the database history you want the History object for

Returns

History object (or null if database history does not exist).

Return type

History

Example

To get the History object for database history 100 in model m

```
var database history = History.GetFromID(m, 100);
```

Keyword()

Description

Returns the keyword for this database history (*DATABASE_HISTORY). **Note that a carriage return is not added**. See also History.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for database history c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the database history. **Note that a carriage return is not added**. See also History.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for database history c:

```
var cards = c.KeywordCards();
```

Last(Model*[Model]*, type (optional)*[constant]*) [static]

Description

Returns the last database history in the model.

Arguments

- **Model** (Model)

Model to get last database history in

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

History object (or null if there are no database histories in the model).

Return type

History

Example

To get the last database history in model m:

```
var database history = History.Last(m);
```

Next()

Description

Returns the next database history in the model.

Arguments

No arguments

Returns

History object (or null if there are no more database histories in the model).

Return type

History

Example

To get the database history in model m after database history c:

```
var database history = c.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to pick a database history.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only database histories from that model can be picked. If the argument is a Flag then only database histories that are flagged with *limit* can be selected. If omitted, or null, any database histories from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

Returns

History object (or null if not picked)

Return type

History

Example

To pick a database history from model m giving the prompt ’Pick database history from screen’:

```
var database history = History.Pick(’Pick database history from screen’, m);
```

Previous()

Description

Returns the previous database history in the model.

Arguments

No arguments

Returns

History object (or null if there are no more database histories in the model).

Return type

History

Example

To get the database history in model m before this one:

```
var history = history.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select database histories using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting database histories

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only database histories from that model can be selected. If the argument is a Flag then only database histories that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any database histories from any model can be selected.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of items selected or null if menu cancelled

Return type

Number

Example

To select database histories from model m, flagging those selected which flag f, giving the prompt 'Select database histories':

```
History.Select(f, 'Select database histories', m);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the database history.

Arguments

- **flag** (Flag)

Flag to set on the database history

Returns

No return value

Example

To set flag f for database history c:

```
c.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the database history. The database history will be sketched until you either call History.Unsketch(), History.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the database history is sketched. If omitted redraw is true. If you want to sketch several database histories and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch database history c:

```
c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged database histories in the model.

Arguments

- **Model** (Model)

Model that all the flagged database histories will be sketched in

- **flag** (Flag)

Flag set on the database histories that you want to sketch

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is true. If you want to do several (un)sketches and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To sketch all of the database histories of type SHELL_SET in model m flagged with f:

```
History.SketchFlagged(m, f, History.SHELL_SET);
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*, type (optional)*[constant]*) [static]

Description

Unblanks all of the database histories in the model.

Arguments

- **Model** (Model)

Model that all database histories will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

No return value

Example

To unblank all of the database histories in model m:

```
History.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged database histories in the model.

Arguments

- **Model** (Model)

Model that the flagged database histories will be unblanked in

- **flag** (Flag)

Flag set on the database histories that you want to unblank

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the database histories in model m flagged with f:

```
History.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*) [static]

Description

Unsets a defined flag on all of the database histories in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all database histories will be unset in

- **flag** (Flag)

Flag to unset on the database histories

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

Returns

No return value

Example

To unset the flag f on all the database histories in model m:

```
History.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the database history.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the database history is unsketched. If omitted redraw is true. If you want to unsketch several database histories and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch database history c:

```
c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all database histories.

Arguments

- **Model** (Model)

Model that all database histories will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the database histories are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all database histories in model m:

```
History.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged database histories.

Arguments

- **Model** (Model)

Model that all database histories will be unblanked in

- **flag** (Flag)

Flag set on the database histories that you want to sketch

- **type (optional)** (constant)

The database history type. Can be History.ACOUSTIC or History.BEAM or History.BEAM_SET or History.DISCRETE or History.DISCRETE_SET or History.NODE or History.NODE_SET or History.SEATBELT or History.SHELL or History.SHELL_SET or History.SOLID or History.SOLID_SET or History.SPH or History.SPH_SET or History.TSHELL or History.TSHELL_SET or History.ALL_TYPES. If omitted, applied to all database history types.

- **redraw (optional)** (boolean)

If model should be redrawn or not after the database histories are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all of the database histories in model m flagged with f:

```
History.UnsketchFlagged(m, f);
```

Xrefs()

Description

Returns the cross references for this database history.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for this database history:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the database history data in keyword format. Note that this contains the keyword header and the keyword cards. See also History.Keyword() and History.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for database history c in keyword format

```
var s = c.toString();
```

NodalForceGroup (Nfgr) class

The NodalForceGroup class gives you access to database nodal force group cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)
- First(Model*[Model]*)

NodalForceGroup properties

Name	Type	Description
cid	integer	Coordinate System ID.

exists (read only)	logical	true if Nodal Force Group exists, false if referred to but not defined.
id	integer	Database Nodal Force Group number (identical to label).
include	integer	The Include file number that the Nodal Force Group is in.
label	integer	Database Nodal Force Group number.
model (read only)	integer	The Model number that the nodal force group is in.
nsid	integer	Set Node Set ID.

Detailed Description

The NodalForceGroup class allows you to create, modify, edit and manipulate nodal force group cards. See the documentation below for more details.

For convenience "Nfgr" can also be used as the class name instead of "NodalForceGroup".

Constructor

new NodalForceGroup(Model*[Model]*, nsid*[integer]*, cid (optional)*[integer]*)

Description

Create a new NodalForceGroup object.

Arguments

- **Model** (Model)

Model that nodal force group will be created in

- **nsid** (integer)

Set Node Set ID.

- **cid (optional)** (integer)

Coordinate System ID.

Returns

NodalForceGroup object

Return type

NodalForceGroup

Example

To create a new nodal force group in model m with nsid 100:

```
var nfg = new NodalForceGroup(m, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a nodal force group.

Arguments

- **Comment** (Comment)

Comment that will be attached to the nodal force group

Returns

No return value

Example

To associate comment c to the nodal force group nfg:

```
nfg.AssociateComment(c);
```

Blank()

Description

Blanks the nodal force group

Arguments

No arguments

Returns

No return value

Example

To blank nodal force group nfg:

```
nfg.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the nodal force groups in the model.

Arguments

- **Model** (Model)

Model that all nodal force groups will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodal force groups in model m:

```
NodalForceGroup.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged nodal force groups in the model.

Arguments

- **Model** (Model)

Model that all the flagged nodal force groups will be blanked in

- **flag** (Flag)

Flag set on the nodal force groups that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodal force groups in model m flagged with f:

```
NodalForceGroup.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the nodal force group is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if nodal force group nfg is blanked:

```
if (nfg.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the nodal force group.

Arguments

- **flag** (Flag)

Flag to clear on the nodal force group

Returns

No return value

Example

To clear flag f for nodal force group nfg:

```
nfg.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the nodal force group. The target include of the copied nodal force group can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

NodalForceGroup object

Return type

NodalForceGroup

Example

To copy nodal force group nfg into nodal force group z:

```
var z = nfg.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a nodal force group.

Arguments

- **Comment** (Comment)

Comment that will be detached from the nodal force group

Returns

No return value

Example

To detach comment c from the nodal force group nfg:

```
nfg.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for nodal force group. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for nodal force group nfg:

```
nfg.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first nodal force group in the model.

Arguments

- **Model** (Model)

Model to get first nodal force group in

Returns

NodalForceGroup object (or null if there are no nodal force groups in the model).

Return type

NodalForceGroup

Example

To get the first nodal force group in model m:

```
var nfg = NodalForceGroup.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the nodal force groups in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all nodal force groups will be flagged in

- **flag** (Flag)

Flag to set on the nodal force groups

Returns

No return value

Example

To flag all of the nodal force groups with flag f in model m:

```
NodalForceGroup.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the nodal force group is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the nodal force group

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if nodal force group nfg has flag f set on it:

```
if (nfg.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each nodal force group in the model.
Note that ForEach has been designed to make looping over nodal force groups as fast as possible and so has some limitations.
Firstly, a single temporary NodalForceGroup object is created and on each function call it is updated with the current nodal force group data. This means that you should not try to store the NodalForceGroup object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new nodal force groups inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all nodal force groups are in

- **func** (function)

Function to call for each nodal force group

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the nodal force groups in model m:

```
NodalForceGroup.ForEach(m, test);
function test(nfg)
{
// nfg is NodalForceGroup object
}
```

To call function test for all of the nodal force groups in model m with optional object:

```
var data = { x:0, y:0 };
NodalForceGroup.ForEach(m, test, data);
function test(nfg, extra)
{
// nfg is NodalForceGroup object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of NodalForceGroup objects for all of the nodal force groups in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodal force groups from

Returns

Array of NodalForceGroup objects

Return type

Array

Example

To make an array of NodalForceGroup objects for all of the nodal force groups in model m

```
var nfg = NodalForceGroup.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a nodal force group.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the nodal force group nfg:

```
var comm_array = nfg.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of NodalForceGroup objects for all of the flagged nodal force groups in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodal force groups from

- **flag** (Flag)

Flag set on the nodal force groups that you want to retrieve

Returns

Array of NodalForceGroup objects

Return type

Array

Example

To make an array of NodalForceGroup objects for all of the nodal force groups in model m flagged with f

```
var nfg = NodalForceGroup.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the NodalForceGroup object for a nodal force group ID.

Arguments

- **Model** (Model)

Model to find the nodal force group in

- **number** (integer)

number of the nodal force group you want the NodalForceGroup object for

Returns

NodalForceGroup object (or null if nodal force group does not exist).

Return type

NodalForceGroup

Example

To get the NodalForceGroup object for nodal force group 100 in model m

```
var nfg = NodalForceGroup.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a NodalForceGroup property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the NodalForceGroup.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

nodal force group property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if NodalForceGroup property nfg.example is a parameter:

```
Options.property_parameter_names = true;
if (nfg.GetParameter(nfg.example) ) do_something...
Options.property_parameter_names = false;
```

To check if NodalForceGroup property nfg.example is a parameter by using the GetParameter method:

```
if (nfg.ViewParameters().GetParameter(nfg.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this nodal force group. **Note that a carriage return is not added**. See also NodalForceGroup.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for nodal force group nfg:

```
var key = nfg.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the nodal force group. **Note that a carriage return is not added**. See also NodalForceGroup.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for nodal force group nfg:

```
var cards = nfg.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last nodal force group in the model.

Arguments

- **Model** (Model)

Model to get last nodal force group in

Returns

NodalForceGroup object (or null if there are no nodal force groups in the model).

Return type

NodalForceGroup

Example

To get the last nodal force group in model m:

```
var nfg = NodalForceGroup.Last(m);
```

Next()

Description

Returns the next nodal force group in the model.

Arguments

No arguments

Returns

NodalForceGroup object (or null if there are no more nodal force groups in the model).

Return type

NodalForceGroup

Example

To get the nodal force group in model m after nodal force group nfg:

```
var nfg = nfg.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a nodal force group.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodal force groups from that model can be picked. If the argument is a Flag then only nodal force groups that are flagged with *limit* can be selected. If omitted, or null, any nodal force groups from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

NodalForceGroup object (or null if not picked)

Return type

NodalForceGroup

Example

To pick a nodal force group from model m giving the prompt 'Pick nodal force group from screen':

```
var nfg = NodalForceGroup.Pick('Pick nodal force group from screen', m);
```

Previous()

Description

Returns the previous nodal force group in the model.

Arguments

No arguments

Returns

NodalForceGroup object (or null if there are no more nodal force groups in the model).

Return type

NodalForceGroup

Example

To get the nodal force group in model m before nodal force group nfg:

```
var nfg = nfg.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select nodal force groups using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting nodal force groups

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodal force groups from that model can be selected. If the argument is a Flag then only nodal force groups that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any nodal force groups can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of nodal force groups selected or null if menu cancelled

Return type

Number

Example

To select nodal force groups from model m, flagging those selected with flag f, giving the prompt 'Select nodal force groups':

```
NodalForceGroup.Select(f, 'Select nodal force groups', m);
```

To select nodal force groups, flagging those selected with flag f but limiting selection to nodal force groups flagged with flag l, giving the prompt 'Select nodal force groups':

```
NodalForceGroup.Select(f, 'Select nodal force groups', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the nodal force group.

Arguments

- **flag** (Flag)

Flag to set on the nodal force group

Returns

No return value

Example

To set flag f for nodal force group nfg:

```
nfg.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the nodal force group. The nodal force group will be sketched until you either call NodalForceGroup.Unsketch(), NodalForceGroup.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal force group is sketched. If omitted redraw is true. If you want to sketch several nodal force groups and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch nodal force group nfg:

```
nfg.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged nodal force groups in the model. The nodal force groups will be sketched until you either call NodalForceGroup.Unsketch(), NodalForceGroup.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged nodal force groups will be sketched in

- **flag** (Flag)

Flag set on the nodal force groups that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal force groups are sketched. If omitted redraw is true. If you want to sketch flagged nodal force groups several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all nodal force groups flagged with flag in model m:

```
NodalForceGroup.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of nodal force groups in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing nodal force groups should be counted. If false or omitted referenced but undefined nodal force groups will also be included in the total.

Returns

number of nodal force groups

Return type

Number

Example

To get the total number of nodal force groups in model m:

```
var total = NodalForceGroup.Total(m);
```

Unblank()

Description

Unblanks the nodal force group

Arguments

No arguments

Returns

No return value

Example

To unblank nodal force group nfg:

```
nfg.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the nodal force groups in the model.

Arguments

- **Model** (Model)

Model that all nodal force groups will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodal force groups in model m:

```
NodalForceGroup.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged nodal force groups in the model.

Arguments

- **Model** (Model)

Model that the flagged nodal force groups will be unblanked in

- **flag** (Flag)

Flag set on the nodal force groups that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodal force groups in model m flagged with f:

```
NodalForceGroup.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the nodal force groups in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all nodal force groups will be unset in

- **flag** (Flag)

Flag to unset on the nodal force groups

Returns

No return value

Example

To unset the flag f on all the nodal force groups in model m:

```
NodalForceGroup.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the nodal force group.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal force group is unsketched. If omitted redraw is true. If you want to unsketch several nodal force groups and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch nodal force group nfg:

```
nfg.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all nodal force groups.

Arguments

- **Model** (Model)

Model that all nodal force groups will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal force groups are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodal force groups in model m:

```
NodalForceGroup.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged nodal force groups in the model.

Arguments

- **Model** (Model)

Model that all nodal force groups will be unsketched in

- **flag** (Flag)

Flag set on the nodal force groups that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodal force groups are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodal force groups flagged with flag in model m:

```
NodalForceGroup.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

NodalForceGroup object.

Return type

NodalForceGroup

Example

To check if NodalForceGroup property nfg.example is a parameter by using the NodalForceGroup.GetParameter() method:

```
if (nfg.ViewParameters().GetParameter(nfg.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for nodal force group. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for nodal force group nfg:

```
nfg.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this nodal force group.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for nodal force group nfg:

```
var xrefs = nfg.Xrefs();
```

---

toString()

Description

Creates a string containing the nodal force group data in keyword format. Note that this contains the keyword header and the keyword cards. See also NodalForceGroup.Keyword() and NodalForceGroup.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for nodal force group n in keyword format

```
var s = n.toString();
```

Box class

The Box class gives you access to define box cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Box constants

Name	Description
Box.BOX	Box is *DEFINE_BOX.
Box.BOX_ADAPTIVE	Box is *DEFINE_BOX_ADAPTIVE.
Box.BOX_COARSEN	Box is *DEFINE_BOX_COARSEN.
Box.BOX_DRAWBEAD	Box is *DEFINE_BOX_DRAWBEAD.
Box.BOX_SPH	Box is *DEFINE_BOX_SPH.

Box properties

Name	Type	Description
bid	integer	Box number. Also see the label property which is an alternative name for this.
brmax	real	Maximum mesh size in 3D tetrahedron adaptivity
brmin	real	Minimum mesh size in 3D tetrahedron adaptivity
cid	integer	Optional coordinate system ID for tubular drawbead
cx	real	X coordinate of offset vector to local origin
cy	real	Y coordinate of offset vector to local origin
cz	real	Z coordinate of offset vector to local origin
exists (read only)	logical	true if box exists, false if referred to but not defined.
heading	string	Box heading
idir	integer	Direction of tooling movement. 1: x-direction, 2: y-direction, 3: z-direction
iflag	integer	Element protection flag. 0: elements inside, 1: elements outside box cannot be coarsened.
include	integer	The Include file number that the box is in.
label	integer	Box number. Also see the bid property which is an alternative name for this.
lcid	integer	Load curve ID to describe motion value versus time
level	integer	Maximum number of refinement levels for elements contained in box
lidx	integer	Box movement in global X axis or by node. The ndid property is an alternative name for this.
lidy	integer	Box movement in global Y axis
lidz	integer	Box movement in global Z axis
local	logical	Turns _LOCAL on or off
model (read only)	integer	The Model number that the box is in.
ndid	integer	Box movement in global X axis or by node. The lidx property is an alternative name for this.
nid	integer	Referential nodal ID for vd = 2
option	constant	The box option. Can be Box.BOX, Box.BOX_ADAPTIVE, Box.BOX_COARSEN, Box.BOX_DRAWBEAD or Box.BOX_SPH.
pid_adaptive	integer	Part ID for Box.BOX_ADAPTIVE option
pid_drawbead	integer	Part ID of blank for Box.BOX_DRAWBEAD option

radius	real	Radius of tube centered around draw bead
sid	integer	Part set, part or node set defining the nodal points along draw bead
stype	integer	Set type for stype. 2: part set ID, 3: part ID, 4: node set ID
vd	integer	Velocity/Displacement flag. 0: velocity, 1: displacement, 2: referential node
vid	integer	Vector ID of DOF
xmn	real	Minimum X coordinate
xmx	real	Maximum X coordinate
xv	real	Local V vector X coordinate
xx	real	Local X vector X coordinate
ymn	real	Minimum Y coordinate
ymx	real	Maximum Y coordinate
yv	real	Local V vector Y coordinate
yx	real	Local X vector Y coordinate
zmn	real	Minimum Z coordinate
zmx	real	Maximum Z coordinate
zv	real	Local V vector Z coordinate
zx	real	Local X vector Z coordinate

Detailed Description

The Box class allows you to create, modify, edit and manipulate box cards. See the documentation below for more details.

Constructor

new Box(Model*[Model]*, bid*[integer]*, xmn*[real]*, xmx*[real]*, ymn*[real]*, ymx*[real]*, zmn*[real]*, zmx*[real]*, heading (optional)*[string]*)

Description

Create a new Box object.

Arguments

- **Model** (Model)

Model that box will be created in

- **bid** (integer)

Box number

- **xmn** (real)

Minimum X coordinate

- **xmx** (real)

Maximum X coordinate

- **ymn** (real)

Minimum Y coordinate

- **ymx** (real)

Maximum Y coordinate

- **zmn** (real)

Minimum Z coordinate

- **zmx** (real)

Maximum Z coordinate

- **heading (optional)** (string)

Title for the box

Returns

Box object

Return type

Box

Example

To create a new box in model m with label 200

```
var b = new Box(m, 200, 1.5, 2.5, 1.0, 4.5, -4.0, 3.0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a box.

Arguments

- **Comment** (Comment)

Comment that will be attached to the box

Returns

No return value

Example

To associate comment c to the box b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the box

Arguments

No arguments

Returns

No return value

Example

To blank box b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boxs in model m:

```
Box.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boxs will be blanked in

- **flag** (Flag)

Flag set on the boxs that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boxs in model m flagged with f:

```
Box.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the box is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if box b is blanked:

```
if (b.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse box b:

```
b.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the box.

Arguments

- **flag** (Flag)

Flag to clear on the box

Returns

No return value

Example

To clear flag f for box b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the box. The target include of the copied box can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Box object

Return type

Box

Example

To copy box b into box z:

```
var z = b.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a box.

Arguments

- **Model** (Model)

Model that the box will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Box object (or null if not made)

Return type

Box

Example

To start creating a box in model m:

```
var m = Box.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a box.

Arguments

- **Comment** (Comment)

Comment that will be detached from the box

Returns

No return value

Example

To detach comment c from the box b:

```
b.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit box b:

```
b.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for box. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for box b:

```
b.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first box in the model.

Arguments

- **Model** (Model)

Model to get first box in

Returns

Box object (or null if there are no boxs in the model).

Return type

Box

Example

To get the first box in model m:

```
var b = Box.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free box label in the model. Also see Box.LastFreeLabel(), Box.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Box label.

Return type

Number

Example

To get the first free box label in model m:

```
var label = Box.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the boxs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all boxs will be flagged in

- **flag** (Flag)

Flag to set on the boxs

Returns

No return value

Example

To flag all of the boxs with flag f in model m:

```
Box.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the box is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the box

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if box b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each box in the model.
Note that ForEach has been designed to make looping over boxs as fast as possible and so has some limitations. Firstly, a single temporary Box object is created and on each function call it is updated with the current box data. This means that you should not try to store the Box object for later use (e.g. in an array) as it is temporary. Secondly, you cannot create new boxs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all boxs are in

- **func** (function)

Function to call for each box

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the boxs in model m:

```
Box.ForEach(m, test);
function test(b)
{
// b is Box object
}
```

To call function test for all of the boxs in model m with optional object:

```
var data = { x:0, y:0 };
Box.ForEach(m, test, data);
function test(b, extra)
{
// b is Box object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Box objects for all of the boxs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boxs from

Returns

Array of Box objects

Return type

Array

Example

To make an array of Box objects for all of the boxs in model m

```
var b = Box.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a box.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the box b:

```
var comm_array = b.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Box objects for all of the flagged boxs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boxs from

- **flag** (Flag)

Flag set on the boxs that you want to retrieve

Returns

Array of Box objects

Return type

Array

Example

To make an array of Box objects for all of the boxs in model m flagged with f

```
var b = Box.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Box object for a box ID.

Arguments

- **Model** (Model)

Model to find the box in

- **number** (integer)

number of the box you want the Box object for

Returns

Box object (or null if box does not exist).

Return type

Box

Example

To get the Box object for box 100 in model m

```
var b = Box.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Box property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Box.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

box property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Box property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Box property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this box (*DEFINE_BOX). **Note that a carriage return is not added**. See also Box.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for box m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the box. **Note that a carriage return is not added**. See also Box.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for box b:

```
var cards = b.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last box in the model.

Arguments

- **Model** (Model)

Model to get last box in

Returns

Box object (or null if there are no boxs in the model).

Return type

Box

Example

To get the last box in model m:

```
var b = Box.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free box label in the model. Also see Box.FirstFreeLabel(), Box.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Box label.

Return type

Number

Example

To get the last free box label in model m:

```
var label = Box.LastFreeLabel(m);
```

Next()

Description

Returns the next box in the model.

Arguments

No arguments

Returns

Box object (or null if there are no more boxs in the model).

Return type

Box

Example

To get the box in model m after box b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) box label in the model. Also see Box.FirstFreeLabel(), Box.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Box label.

Return type

Number

Example

To get the next free box label in model m:

```
var label = Box.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a box.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boxs from that model can be picked. If the argument is a Flag then only boxs that are flagged with *limit* can be selected. If omitted, or null, any boxs from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Box object (or null if not picked)

Return type

Box

Example

To pick a box from model m giving the prompt 'Pick box from screen':

```
var b = Box.Pick('Pick box from screen', m);
```

Previous()

Description

Returns the previous box in the model.

Arguments

No arguments

Returns

Box object (or null if there are no more boxs in the model).

Return type

Box

Example

To get the box in model m before box b:

```
var b = b.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boxs in model m, from 1000000:

```
Box.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boxs will be renumbered in

- **flag** (Flag)

Flag set on the boxs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boxs in model m flagged with f, from 1000000:

```
Box.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select boxs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting boxs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boxs from that model can be selected. If the argument is a Flag then only boxs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any boxs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of boxs selected or null if menu cancelled

Return type

Number

Example

To select boxs from model m, flagging those selected with flag f, giving the prompt 'Select boxs':

```
Box.Select(f, 'Select boxs', m);
```

To select boxs, flagging those selected with flag f but limiting selection to boxs flagged with flag l, giving the prompt 'Select boxs':

```
Box.Select(f, 'Select boxs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the box.

Arguments

- **flag** (Flag)

Flag to set on the box

Returns

No return value

Example

To set flag f for box b:

```
b.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the box. The box will be sketched until you either call Box.Unsketch(), Box.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the box is sketched. If omitted redraw is true. If you want to sketch several boxs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch box b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged boxs in the model. The boxs will be sketched until you either call Box.Unsketch(), Box.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged boxs will be sketched in

- **flag** (Flag)

Flag set on the boxs that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are sketched. If omitted redraw is true. If you want to sketch flagged boxs several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all boxs flagged with flag in model m:

```
Box.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of boxs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing boxs should be counted. If false or omitted referenced but undefined boxs will also be included in the total.

Returns

number of boxs

Return type

Number

Example

To get the total number of boxs in model m:

```
var total = Box.Total(m);
```

Unblank()

Description

Unblanks the box

Arguments

No arguments

Returns

No return value

Example

To unblank box b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boxs in model m:

```
Box.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that the flagged boxs will be unblanked in

- **flag** (Flag)

Flag set on the boxs that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boxs in model m flagged with f:

```
Box.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the boxs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all boxs will be unset in

- **flag** (Flag)

Flag to unset on the boxs

Returns

No return value

Example

To unset the flag f on all the boxs in model m:

```
Box.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the box.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the box is unsketched. If omitted redraw is true. If you want to unsketch several boxs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch box b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all boxs.

Arguments

- **Model** (Model)

Model that all boxs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boxs in model m:

```
Box.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be unsketched in

- **flag** (Flag)

Flag set on the boxs that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boxs flagged with flag in model m:

```
Box.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Box object.

Return type

Box

Example

To check if Box property b.example is a parameter by using the Box.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for box. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for box b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this box.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for box b:

```
var xrefs = b.Xrefs();
```

---

toString()

Description

Creates a string containing the box data in keyword format. Note that this contains the keyword header and the keyword cards. See also Box.Keyword() and Box.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for box b in keyword format

```
var s = b.toString();
```

ConnectionProperties class

The ConnectionProperties class gives you access to *DEFINE_CONNECTION_PROPERTIES keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

ConnectionProperties properties

Name	Type	Description
add	integer	To _ADD case's parent definition
areaeq	integer	Area equation number.
con_id	integer	*DEFINE_CONNECTION_PROPERTIES id.
d_dg_pr	real	Default damage parameter.
d_dg_prf	integer	Default damage parameter(function if proprul == 2).
d_etan	real	Default tangent modulus.
d_etanf	integer	Default tangent modulus(function if proprul == 2).
d_exsb	real	Default bending stress exponent.
d_exsbf	integer	Default bending stress exponent(function if proprul == 2).
d_exsn	real	Default normal stress exponent.
d_exsnf	integer	Default normal stress exponent(function if proprul == 2).
d_exss	real	Default shear stress exponent.
d_exssf	integer	Default shear stress exponent(function if proprul == 2).
d_gfad	real	Default fading energy.
d_gfadf	integer	Default fading energy(function if proprul == 2).
d_lcsb	integer	Default LC of bending stress scale factor wrt strain rate.
d_lcsn	integer	Default LC of normal stress scale factor wrt strain rate.
d_lcss	integer	Default LC of shear stress scale factor wrt strain rate.
d_rank	real	Default rank value.
d_sb	real	Default bending strength.
d_sbf	integer	Default bending strength(function if proprul == 2).
d_sclmrr	real	Default scaling factor for torsional moment in failure function.
d_sigy	real	Default yield stress.
d_sigyf	integer	Default yield stress(function if proprul == 2).
d_sn	real	Default normal strength.
d_snf	integer	Default normal strength(function if proprul == 2).
d_ss	real	Default shear strength.
d_ssf	integer	Default shear strength(function if proprul == 2).
dg_typ	integer	Damage type.
exists (read only)	logical	true if *DEFINE_CONNECTION_PROPERTIES exists, false if referred to but not defined.
heading	string	The title of the *DEFINE_CONNECTION_PROPERTIES or the empty string if _TITLE is not set
include	integer	The Include file number that the *DEFINE_CONNECTION_PROPERTIES is in.
moarfl	integer	Modelled area flag.
model (read only)	integer	The Model number that the *DEFINE_CONNECTION_PROPERTIES is in.
proprul	integer	Property rule number.

Detailed Description

The ConnectionProperties class allows you to create, modify, edit and manipulate *DEFINE_CONNECTION_PROPERTIES. See the documentation below for more details.

Constructor

new ConnectionProperties(Model*[Model]*, con_id*[integer]*, heading (optional)*[string]*)

Description

Create a new *DEFINE_CONNECTION_PROPERTIES object.

Arguments

- **Model** (Model)

Model that *DEFINE_CONNECTION_PROPERTIES will be created in

- **con_id** (integer)

*DEFINE_CONNECTION_PROPERTIES id.

- **heading (optional)** (string)

Title for the *DEFINE_CONNECTION_PROPERTIES

Returns

ConnectionProperties object

Return type

ConnectionProperties

Example

To create a new *DEFINE_CONNECTION_PROPERTIES in model m with label 100:

```
var c = new ConnectionProperties(m, 100);
```

Details of functions

AddMaterialDataLine()

Description

Allows user to add material data line in *DEFINE_CONNECTION_PROPERTIES.

Arguments

No arguments

Returns

No return value

Example

To Add Material data line in *DEFINE_CONNECTION_PROPERTIES c:

```
c.AddMaterialDataLine();
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *DEFINE_CONNECTION_PROPERTIES

Returns

No return value

Example

To associate comment c to the *DEFINE_CONNECTION_PROPERTIES c:

```
c.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *DEFINE_CONNECTION_PROPERTIES c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **flag** (Flag)

Flag to clear on the *DEFINE_CONNECTION_PROPERTIES

Returns

No return value

Example

To clear flag f for *DEFINE_CONNECTION_PROPERTIES c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *DEFINE_CONNECTION_PROPERTIES. The target include of the copied *DEFINE_CONNECTION_PROPERTIES can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ConnectionProperties object

Return type

ConnectionProperties

Example

To copy *DEFINE_CONNECTION_PROPERTIES c into *DEFINE_CONNECTION_PROPERTIES z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **Model** (Model)

Model that the *DEFINE_CONNECTION_PROPERTIES will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ConnectionProperties object (or null if not made)

Return type

ConnectionProperties

Example

To start creating a *DEFINE_CONNECTION_PROPERTIES in model m:

```
var c = ConnectionProperties.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *DEFINE_CONNECTION_PROPERTIES

Returns

No return value

Example

To detach comment c from the *DEFINE_CONNECTION_PROPERTIES c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *DEFINE_CONNECTION_PROPERTIES c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *DEFINE_CONNECTION_PROPERTIES. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *DEFINE_CONNECTION_PROPERTIES c:

```
c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *DEFINE_CONNECTION_PROPERTIES in the model.

Arguments

- **Model** (Model)

Model to get first *DEFINE_CONNECTION_PROPERTIES in

Returns

ConnectionProperties object (or null if there are no *DEFINE_CONNECTION_PROPERTIESs in the model).

Return type

ConnectionProperties

Example

To get the first *DEFINE_CONNECTION_PROPERTIES in model m:

```
var c = ConnectionProperties.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free *DEFINE_CONNECTION_PROPERTIES label in the model. Also see ConnectionProperties.LastFreeLabel(), ConnectionProperties.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free *DEFINE_CONNECTION_PROPERTIES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

ConnectionProperties label.

Return type

Number

Example

To get the first free *DEFINE_CONNECTION_PROPERTIES label in model m:

```
var label = ConnectionProperties.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *DEFINE_CONNECTION_PROPERTIESs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONNECTION_PROPERTIESs will be flagged in

- **flag** (Flag)

Flag to set on the *DEFINE_CONNECTION_PROPERTIESs

Returns

No return value

Example

To flag all of the *DEFINE_CONNECTION_PROPERTIESs with flag f in model m:

```
ConnectionProperties.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *DEFINE_CONNECTION_PROPERTIES is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *DEFINE_CONNECTION_PROPERTIES

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *DEFINE_CONNECTION_PROPERTIES c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *DEFINE_CONNECTION_PROPERTIES in the model.
Note that ForEach has been designed to make looping over *DEFINE_CONNECTION_PROPERTIESs as fast as possible and so has some limitations.
Firstly, a single temporary ConnectionProperties object is created and on each function call it is updated with the current *DEFINE_CONNECTION_PROPERTIES data. This means that you should not try to store the ConnectionProperties object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *DEFINE_CONNECTION_PROPERTIESs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONNECTION_PROPERTIESs are in

- **func** (function)

Function to call for each *DEFINE_CONNECTION_PROPERTIES

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *DEFINE_CONNECTION_PROPERTIESs in model m:

```
ConnectionProperties.ForEach(m, test);
function test(c)
{
// c is ConnectionProperties object
}
```

To call function test for all of the *DEFINE_CONNECTION_PROPERTIESs in model m with optional object:

```
var data = { x:0, y:0 };
ConnectionProperties.ForEach(m, test, data);
function test(c, extra)
{
// c is ConnectionProperties object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ConnectionProperties objects for all of the *DEFINE_CONNECTION_PROPERTIESs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *DEFINE_CONNECTION_PROPERTIESs from

Returns

Array of ConnectionProperties objects

Return type

Array

Example

To make an array of ConnectionProperties objects for all of the *DEFINE_CONNECTION_PROPERTIESs in model m

```
var c = ConnectionProperties.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *DEFINE_CONNECTION_PROPERTIES.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *DEFINE_CONNECTION_PROPERTIES c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ConnectionProperties objects for all of the flagged *DEFINE_CONNECTION_PROPERTIESs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *DEFINE_CONNECTION_PROPERTIESs from

- **flag** (Flag)

Flag set on the *DEFINE_CONNECTION_PROPERTIESs that you want to retrieve

Returns

Array of ConnectionProperties objects

Return type

Array

Example

To make an array of ConnectionProperties objects for all of the *DEFINE_CONNECTION_PROPERTIESs in model m flagged with f

```
var c = ConnectionProperties.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ConnectionProperties object for a *DEFINE_CONNECTION_PROPERTIES ID.

Arguments

- **Model** (Model)

Model to find the *DEFINE_CONNECTION_PROPERTIES in

- **number** (integer)

number of the *DEFINE_CONNECTION_PROPERTIES you want the ConnectionProperties object for

Returns

ConnectionProperties object (or null if *DEFINE_CONNECTION_PROPERTIES does not exist).

Return type

ConnectionProperties

Example

To get the ConnectionProperties object for *DEFINE_CONNECTION_PROPERTIES 100 in model m

```
var c = ConnectionProperties.GetFromID(m, 100);
```

GetMaterialDataLine(row*[integer]*)

Description

Returns the material data at given row in *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **row** (integer)

Material data row number, eg. for first material data, row = 0

Returns

Array of numbers containing the material id, sigy, e_tan etc. .

Return type

Number

Example

To get material data at first row, row = 0 in *DEFINE_CONNECTION_PROPERTIES c:

```
c.GetMaterialData(0);
```

GetParameter(prop*[string]*)

Description

Checks if a ConnectionProperties property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ConnectionProperties.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*DEFINE_CONNECTION_PROPERTIES property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ConnectionProperties property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ConnectionProperties property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this *DEFINE_CONNECTION_PROPERTIES **Note that a carriage return is not added**. See also ConnectionProperties.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for ConnectionProperties c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *DEFINE_CONNECTION_PROPERTIES. **Note that a carriage return is not added**. See also ConnectionProperties.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for connection_properties c:

```
var cards = c.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last *DEFINE_CONNECTION_PROPERTIES in the model.

Arguments

- **Model** (Model)

Model to get last *DEFINE_CONNECTION_PROPERTIES in

Returns

ConnectionProperties object (or null if there are no *DEFINE_CONNECTION_PROPERTIESs in the model).

Return type

ConnectionProperties

Example

To get the last *DEFINE_CONNECTION_PROPERTIES in model m:

```
var c = ConnectionProperties.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free *DEFINE_CONNECTION_PROPERTIES label in the model. Also see ConnectionProperties.FirstFreeLabel(), ConnectionProperties.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free *DEFINE_CONNECTION_PROPERTIES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

ConnectionProperties label.

Return type

Number

Example

To get the last free *DEFINE_CONNECTION_PROPERTIES label in model m:

```
var label = ConnectionProperties.LastFreeLabel(m);
```

Next()

Description

Returns the next *DEFINE_CONNECTION_PROPERTIES in the model.

Arguments

No arguments

Returns

ConnectionProperties object (or null if there are no more *DEFINE_CONNECTION_PROPERTIESs in the model).

Return type

ConnectionProperties

Example

To get the *DEFINE_CONNECTION_PROPERTIES in model m after *DEFINE_CONNECTION_PROPERTIES c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) *DEFINE_CONNECTION_PROPERTIES label in the model. Also see ConnectionProperties.FirstFreeLabel(), ConnectionProperties.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free *DEFINE_CONNECTION_PROPERTIES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

ConnectionProperties label.

Return type

Number

Example

To get the next free *DEFINE_CONNECTION_PROPERTIES label in model m:

```
var label = ConnectionProperties.NextFreeLabel(m);
```

Previous()

Description

Returns the previous *DEFINE_CONNECTION_PROPERTIES in the model.

Arguments

No arguments

Returns

ConnectionProperties object (or null if there are no more *DEFINE_CONNECTION_PROPERTIESs in the model).

Return type

ConnectionProperties

Example

To get the *DEFINE_CONNECTION_PROPERTIES in model m before *DEFINE_CONNECTION_PROPERTIES c:

```
var c = c.Previous();
```

RemoveMaterialDataLine(row*[integer]*)

Description

Allows user to remove material data line in *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **row** (integer)

Material data row number, eg. for first material data, row = 0

Returns

No return value

Example

To remove first material data line in *DEFINE_CONNECTION_PROPERTIES c:

```
c.RemoveMaterialDataLine(0);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the *DEFINE_CONNECTION_PROPERTIESs in the model.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONNECTION_PROPERTIESs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *DEFINE_CONNECTION_PROPERTIESs in model m, from 1000000:

```
ConnectionProperties.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged *DEFINE_CONNECTION_PROPERTIESs in the model.

Arguments

- **Model** (Model)

Model that all the flagged *DEFINE_CONNECTION_PROPERTIESs will be renumbered in

- **flag** (Flag)

Flag set on the *DEFINE_CONNECTION_PROPERTIESs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *DEFINE_CONNECTION_PROPERTIESs in model m flagged with f, from 1000000:

```
ConnectionProperties.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *DEFINE_CONNECTION_PROPERTIESs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *DEFINE_CONNECTION_PROPERTIESs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *DEFINE_CONNECTION_PROPERTIESs from that model can be selected. If the argument is a Flag then only *DEFINE_CONNECTION_PROPERTIESs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *DEFINE_CONNECTION_PROPERTIESs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *DEFINE_CONNECTION_PROPERTIESs selected or null if menu cancelled

Return type

Number

Example

To select *DEFINE_CONNECTION_PROPERTIESs from model m, flagging those selected with flag f, giving the prompt 'Select *DEFINE_CONNECTION_PROPERTIESs':

```
ConnectionProperties.Select(f, 'Select *DEFINE_CONNECTION_PROPERTIESs', m);
```

To select *DEFINE_CONNECTION_PROPERTIESs, flagging those selected with flag f but limiting selection to *DEFINE_CONNECTION_PROPERTIESs flagged with flag l, giving the prompt 'Select *DEFINE_CONNECTION_PROPERTIESs':

```
ConnectionProperties.Select(f, 'Select *DEFINE_CONNECTION_PROPERTIESs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **flag** (Flag)

Flag to set on the *DEFINE_CONNECTION_PROPERTIES

Returns

No return value

Example

To set flag f for *DEFINE_CONNECTION_PROPERTIES c:

```
c.SetFlag(f);
```

SetMaterialDataLine(row*[integer]*, mid*[integer]*, sigy (optional)*[real]*, etan (optional)*[real]*, dg_pr (optional)*[real]*, rank (optional)*[real]*, sn (optional)*[real]*, sb (optional)*[real]*, ss (optional)*[real]*, exsn (optional)*[real]*, exsb (optional)*[real]*, exss (optional)*[real]*, lcsn (optional)*[integer]*, lcsb (optional)*[integer]*, lcss (optional)*[integer]*, gfad (optional)*[real]*, sclmrr (optional)*[real]*)

Description

Allows user to set fields for material data line at given row in *DEFINE_CONNECTION_PROPERTIES.

Arguments

- **row** (integer)

Material data row number, eg. for first material data, row = 0

- **mid** (integer)

Material ID

- **sigy (optional)** (real)

Default yield stress

- **etan (optional)** (real)

Default tangent modulus

- **dg_pr (optional)** (real)

Default damage parameter

- **rank (optional)** (real)

Default rank value

- **sn (optional)** (real)

Default normal strength

- **sb (optional)** (real)

Default bending strength

- **ss (optional)** (real)

Default shear strength

- **exsn (optional)** (real)

Default normal stress exponent

- **exsb (optional)** (real)

Default bending stress exponent

- **exss (optional)** (real)

Default shear stress exponent

- **lcsn (optional)** (integer)

Default LC of normal stress scale factor wrt strain rate

- **lcsb (optional)** (integer)

Default LC of bending stress scale factor wrt strain rate

- **lcss (optional)** (integer)

Default LC of shear stress scale factor wrt strain rate

- **gfad (optional)** (real)

Default fading energy

- **sclmrr (optional)** (real)

Default scaling factor for torsional moment in failure function

Returns

No return value

Example

To set material data at first row (row = 0) to mat 111 in *DEFINE_CONNECTION_PROPERTIES c:

```
c.SetMaterialData(0,111);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *DEFINE_CONNECTION_PROPERTIESs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *DEFINE_CONNECTION_PROPERTIESs should be counted. If false or omitted referenced but undefined *DEFINE_CONNECTION_PROPERTIESs will also be included in the total.

Returns

number of *DEFINE_CONNECTION_PROPERTIESs

Return type

Number

Example

To get the total number of *DEFINE_CONNECTION_PROPERTIESs in model m:

```
var total = ConnectionProperties.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *DEFINE_CONNECTION_PROPERTIESs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *DEFINE_CONNECTION_PROPERTIESs will be unset in

- **flag** (Flag)

Flag to unset on the *DEFINE_CONNECTION_PROPERTIESs

Returns

No return value

Example

To unset the flag f on all the *DEFINE_CONNECTION_PROPERTIESs in model m:

```
ConnectionProperties.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ConnectionProperties object.

Return type

ConnectionProperties

Example

To check if ConnectionProperties property c.example is a parameter by using the ConnectionProperties.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *DEFINE_CONNECTION_PROPERTIES. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *DEFINE_CONNECTION_PROPERTIES c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *DEFINE_CONNECTION_PROPERTIES.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *DEFINE_CONNECTION_PROPERTIES c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the connection_properties data in keyword format. Note that this contains the keyword header and the keyword cards. See also ConnectionProperties.Keyword() and ConnectionProperties.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for connection_properties c in keyword format

```
var str = c.toString();
```

ConstructionStages class

The ConstructionStages class gives you access to *DEFINE_CONSTRUCTION_STAGES keyword in PRIMER.
More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

ConstructionStages properties

Name	Type	Description
ate	real	Analysis time at end of stage.
atr	real	Analysis time duration of stage.
ats	real	Analysis time at start of stage.

exists (read only)	logical	true if *DEFINE_CONSTRUCTION_STAGES exists, false if referred to but not defined.
heading	string	The title of the *DEFINE_CONSTRUCTION_STAGES or the empty string if _TITLE is not set
include	integer	The Include file number that the *DEFINE_CONSTRUCTION_STAGES is in.
istage	integer	ConstructionStages number. The label is an alternative name for this.
ivel0	integer	Flag to set velocities to zero at start of stage.
label	integer	ConstructionStages number. The istage is an alternative name for this.
model (read only)	integer	The Model number that the *DEFINE_CONSTRUCTION_STAGES is in.
rte	real	Real time at end of stage.
rts	real	Real time at start of stage.

Detailed Description

The ConstructionStages class allows you to create, modify, edit and manipulate *DEFINE_CONSTRUCTION_STAGES. See the documentation below for more details.

Constructor

new ConstructionStages(Model*[Model]*, Stage ID*[integer]*, heading (optional)*[string]*)

Description

Create a new ConstructionStages object.

Arguments

- **Model** (Model)

Model that *DEFINE_CONSTRUCTION_STAGES will be created in

- **Stage ID** (integer)

ConstructionStages id.

- **heading (optional)** (string)

Title for the *DEFINE_CONSTRUCTION_STAGES

Returns

ConstructionStages object

Return type

ConstructionStages

Example

To create a new *DEFINE_CONSTRUCTION_STAGES in model m with label 100:

```
var c = new ConstructionStages(m, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *DEFINE_CONSTRUCTION_STAGES.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *DEFINE_CONSTRUCTION_STAGES

Returns

No return value

Example

To associate comment c to the *DEFINE_CONSTRUCTION_STAGES c:

```
c.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *DEFINE_CONSTRUCTION_STAGES c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *DEFINE_CONSTRUCTION_STAGES.

Arguments

- **flag** (Flag)

Flag to clear on the *DEFINE_CONSTRUCTION_STAGES

Returns

No return value

Example

To clear flag f for *DEFINE_CONSTRUCTION_STAGES c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *DEFINE_CONSTRUCTION_STAGES. The target include of the copied *DEFINE_CONSTRUCTION_STAGES can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ConstructionStages object

Return type

ConstructionStages

Example

To copy *DEFINE_CONSTRUCTION_STAGES c into *DEFINE_CONSTRUCTION_STAGES z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *DEFINE_CONSTRUCTION_STAGES.

Arguments

- **Model** (Model)

Model that the *DEFINE_CONSTRUCTION_STAGES will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ConstructionStages object (or null if not made)

Return type

ConstructionStages

Example

To start creating a *DEFINE_CONSTRUCTION_STAGES in model m:

```
var c = ConstructionStages.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *DEFINE_CONSTRUCTION_STAGES.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *DEFINE_CONSTRUCTION_STAGES

Returns

No return value

Example

To detach comment c from the *DEFINE_CONSTRUCTION_STAGES c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *DEFINE_CONSTRUCTION_STAGES c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *DEFINE_CONSTRUCTION_STAGES. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *DEFINE_CONSTRUCTION_STAGES c:

```
c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *DEFINE_CONSTRUCTION_STAGES in the model.

Arguments

- **Model** (Model)

Model to get first *DEFINE_CONSTRUCTION_STAGES in

Returns

ConstructionStages object (or null if there are no *DEFINE_CONSTRUCTION_STAGESs in the model).

Return type

ConstructionStages

Example

To get the first *DEFINE_CONSTRUCTION_STAGES in model m:

```
var c = ConstructionStages.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free *DEFINE_CONSTRUCTION_STAGES label in the model. Also see ConstructionStages.LastFreeLabel(), ConstructionStages.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free *DEFINE_CONSTRUCTION_STAGES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

ConstructionStages label.

Return type

Number

Example

To get the first free *DEFINE_CONSTRUCTION_STAGES label in model m:

```
var label = ConstructionStages.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *DEFINE_CONSTRUCTION_STAGESs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONSTRUCTION_STAGESs will be flagged in

- **flag** (Flag)

Flag to set on the *DEFINE_CONSTRUCTION_STAGESs

Returns

No return value

Example

To flag all of the *DEFINE_CONSTRUCTION_STAGESs with flag f in model m:

```
ConstructionStages.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *DEFINE_CONSTRUCTION_STAGES is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *DEFINE_CONSTRUCTION_STAGES

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *DEFINE_CONSTRUCTION_STAGES c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *DEFINE_CONSTRUCTION_STAGES in the model.
Note that ForEach has been designed to make looping over *DEFINE_CONSTRUCTION_STAGESs as fast as possible and so has some limitations.
Firstly, a single temporary ConstructionStages object is created and on each function call it is updated with the current *DEFINE_CONSTRUCTION_STAGES data. This means that you should not try to store the ConstructionStages object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *DEFINE_CONSTRUCTION_STAGESs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONSTRUCTION_STAGESs are in

- **func** (function)

Function to call for each *DEFINE_CONSTRUCTION_STAGES

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *DEFINE_CONSTRUCTION_STAGESs in model m:

```
ConstructionStages.ForEach(m, test);
function test(c)
{
// c is ConstructionStages object
}
```

To call function test for all of the *DEFINE_CONSTRUCTION_STAGESs in model m with optional object:

```
var data = { x:0, y:0 };
ConstructionStages.ForEach(m, test, data);
function test(c, extra)
{
// c is ConstructionStages object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ConstructionStages objects for all of the *DEFINE_CONSTRUCTION_STAGESs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *DEFINE_CONSTRUCTION_STAGESs from

Returns

Array of ConstructionStages objects

Return type

Array

Example

To make an array of ConstructionStages objects for all of the *DEFINE_CONSTRUCTION_STAGESs in model m

```
var c = ConstructionStages.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *DEFINE_CONSTRUCTION_STAGES.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *DEFINE_CONSTRUCTION_STAGES c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ConstructionStages objects for all of the flagged *DEFINE_CONSTRUCTION_STAGESs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *DEFINE_CONSTRUCTION_STAGESs from

- **flag** (Flag)

Flag set on the *DEFINE_CONSTRUCTION_STAGESs that you want to retrieve

Returns

Array of ConstructionStages objects

Return type

Array

Example

To make an array of ConstructionStages objects for all of the *DEFINE_CONSTRUCTION_STAGESs in model m flagged with f

```
var c = ConstructionStages.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ConstructionStages object for a *DEFINE_CONSTRUCTION_STAGES ID.

Arguments

- **Model** (Model)

Model to find the *DEFINE_CONSTRUCTION_STAGES in

- **number** (integer)

number of the *DEFINE_CONSTRUCTION_STAGES you want the ConstructionStages object for

Returns

ConstructionStages object (or null if *DEFINE_CONSTRUCTION_STAGES does not exist).

Return type

ConstructionStages

Example

To get the ConstructionStages object for *DEFINE_CONSTRUCTION_STAGES 100 in model m

```
var c = ConstructionStages.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a ConstructionStages property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ConstructionStages.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*DEFINE_CONSTRUCTION_STAGES property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ConstructionStages property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ConstructionStages property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this *DEFINE_CONSTRUCTION_STAGES. **Note that a carriage return is not added**. See also ConstructionStages.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for ConstructionStages c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *DEFINE_CONSTRUCTION_STAGES. **Note that a carriage return is not added**. See also ConstructionStages.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for construction_stages c:

```
var cards = c.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *DEFINE_CONSTRUCTION_STAGES in the model.

Arguments

- **Model** (Model)

Model to get last *DEFINE_CONSTRUCTION_STAGES in

Returns

ConstructionStages object (or null if there are no *DEFINE_CONSTRUCTION_STAGESs in the model).

Return type

ConstructionStages

Example

To get the last *DEFINE_CONSTRUCTION_STAGES in model m:

```
var c = ConstructionStages.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free *DEFINE_CONSTRUCTION_STAGES label in the model. Also see ConstructionStages.FirstFreeLabel(), ConstructionStages.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free *DEFINE_CONSTRUCTION_STAGES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

ConstructionStages label.

Return type

Number

Example

To get the last free *DEFINE_CONSTRUCTION_STAGES label in model m:

```
var label = ConstructionStages.LastFreeLabel(m);
```

Next()

Description

Returns the next *DEFINE_CONSTRUCTION_STAGES in the model.

Arguments

No arguments

Returns

ConstructionStages object (or null if there are no more *DEFINE_CONSTRUCTION_STAGESs in the model).

Return type

ConstructionStages

Example

To get the *DEFINE_CONSTRUCTION_STAGES in model m after *DEFINE_CONSTRUCTION_STAGES c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) *DEFINE_CONSTRUCTION_STAGES label in the model. Also see ConstructionStages.FirstFreeLabel(), ConstructionStages.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free *DEFINE_CONSTRUCTION_STAGES label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

ConstructionStages label.

Return type

Number

Example

To get the next free *DEFINE_CONSTRUCTION_STAGES label in model m:

```
var label = ConstructionStages.NextFreeLabel(m);
```

Previous()

Description

Returns the previous *DEFINE_CONSTRUCTION_STAGES in the model.

Arguments

No arguments

Returns

ConstructionStages object (or null if there are no more *DEFINE_CONSTRUCTION_STAGESs in the model).

Return type

ConstructionStages

Example

To get the *DEFINE_CONSTRUCTION_STAGES in model m before *DEFINE_CONSTRUCTION_STAGES c:

```
var c = c.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the *DEFINE_CONSTRUCTION_STAGESs in the model.

Arguments

- **Model** (Model)

Model that all *DEFINE_CONSTRUCTION_STAGESs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *DEFINE_CONSTRUCTION_STAGESs in model m, from 1000000:

```
ConstructionStages.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged *DEFINE_CONSTRUCTION_STAGESs in the model.

Arguments

- **Model** (Model)

Model that all the flagged *DEFINE_CONSTRUCTION_STAGESs will be renumbered in

- **flag** (Flag)

Flag set on the *DEFINE_CONSTRUCTION_STAGESs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *DEFINE_CONSTRUCTION_STAGESs in model m flagged with f, from 1000000:

```
ConstructionStages.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *DEFINE_CONSTRUCTION_STAGESs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *DEFINE_CONSTRUCTION_STAGESs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *DEFINE_CONSTRUCTION_STAGESs from that model can be selected. If the argument is a Flag then only *DEFINE_CONSTRUCTION_STAGESs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *DEFINE_CONSTRUCTION_STAGESs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *DEFINE_CONSTRUCTION_STAGESs selected or null if menu cancelled

Return type

Number

Example

To select *DEFINE_CONSTRUCTION_STAGESs from model m, flagging those selected with flag f, giving the prompt 'Select *DEFINE_CONSTRUCTION_STAGESs':

```
ConstructionStages.Select(f, 'Select *DEFINE_CONSTRUCTION_STAGESs', m);
```

To select *DEFINE_CONSTRUCTION_STAGESs, flagging those selected with flag f but limiting selection to *DEFINE_CONSTRUCTION_STAGESs flagged with flag l, giving the prompt 'Select *DEFINE_CONSTRUCTION_STAGESs':

```
ConstructionStages.Select(f, 'Select *DEFINE_CONSTRUCTION_STAGESs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *DEFINE_CONSTRUCTION_STAGES.

Arguments

- **flag** (Flag)

Flag to set on the *DEFINE_CONSTRUCTION_STAGES

Returns

No return value

Example

To set flag f for *DEFINE_CONSTRUCTION_STAGES c:

```
c.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *DEFINE_CONSTRUCTION_STAGESs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *DEFINE_CONSTRUCTION_STAGESs should be counted. If false or omitted referenced but undefined *DEFINE_CONSTRUCTION_STAGESs will also be included in the total.

Returns

number of *DEFINE_CONSTRUCTION_STAGESs

Return type

Number

Example

To get the total number of *DEFINE_CONSTRUCTION_STAGESs in model m:

```
var total = ConstructionStages.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *DEFINE_CONSTRUCTION_STAGESs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *DEFINE_CONSTRUCTION_STAGESs will be unset in

- **flag** (Flag)

Flag to unset on the *DEFINE_CONSTRUCTION_STAGESs

Returns

No return value

Example

To unset the flag f on all the *DEFINE_CONSTRUCTION_STAGESs in model m:

```
ConstructionStages.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ConstructionStages object.

Return type

ConstructionStages

Example

To check if ConstructionStages property c.example is a parameter by using the ConstructionStages.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *DEFINE_CONSTRUCTION_STAGES. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *DEFINE_CONSTRUCTION_STAGES c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *DEFINE_CONSTRUCTION_STAGES.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *DEFINE_CONSTRUCTION_STAGES c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the construction stages data in keyword format. Note that this contains the keyword header and the keyword cards. See also ConstructionStages.Keyword() and ConstructionStages.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for construction stages c in keyword format

```
var str = c.toString();
```

CoordinateSystem (Csys) class

The CoordinateSystem class gives you access to define coordinate cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

CoordinateSystem constants

Name	Description
CoordinateSystem.NODES	Csys is *DEFINE_COORDINATE_NODES.
CoordinateSystem.SYSTEM	Csys is *DEFINE_COORDINATE_SYSTEM.
CoordinateSystem.VECTOR	Csys is *DEFINE_COORDINATE_VECTOR.

CoordinateSystem properties

Name	Type	Description
cid	integer	CoordinateSystem number. Also see the label number.
cidl	integer	Optional local coordinate system to define the points in
dir	int	Axis defined by N1N2
exists (read only)	logical	true if csys exists, false if referred to but not defined.
flag	logical	Flag for updating local system each timestep
heading	string	CoordinateSystem heading
include	integer	The Include file number that the csys is in.
label	integer	CoordinateSystem number. Also see the cid property which is an alternative name for this.
lx	real	X-coordinate of point on local X-axis
ly	real	Y-coordinate of point on local X-axis
lz	real	Z-coordinate of point on local X-axis
model (read only)	integer	The Model number that the coordinate system is in.
n1	int	Node located at local origin
n2	int	Node located along local (dir) axis
n3	int	Node located in local plane determined by (dir)
nid	integer	Optional node id for rotation
option	constant	CoordinateSystem type (Can be CoordinateSystem.NODES, CoordinateSystem.SYSTEM or CoordinateSystem.VECTOR).
ox	real	X-coordinate of origin
oy	real	Y-coordinate of origin
oz	real	Z-coordinate of origin
px	real	X-coordinate of point in local X-Y plane
py	real	Y-coordinate of point in local X-Y plane
pz	real	Z-coordinate of point in local X-Y plane
vx	real	X-coordinate of local X-Y vector
vy	real	Y-coordinate of local X-Y vector
vz	real	Z-coordinate of local X-Y vector
xx	real	X-coordinate on local X-axis
xy	real	Y-coordinate on local X-axis

xz	real	Z-coordinate on local X-axis

Detailed Description

The CoordinateSystem class allows you to create, modify, edit and manipulate csys cards. See the documentation below for more details.

For convenience "Csys" can also be used as the class name instead of "CoordinateSystem".

Constructor

new CoordinateSystem(Model*[Model]*, details*[object]*)

Description

Create a new CoordinateSystem object for *DEFINE_COORDINATE_NODES.

Arguments

- **Model** (Model)

Model that csys will be created in

- **details** (object)

Details for creating the CoordinateSystem

Object has the following properties:

Name	Type	Description
cid	integer	Label of CoordinateSystem
cl (optional)	array	Array of coordinates of point on local X-axis [lx, ly, lz] (for option CoordinateSystem.SYSTEM)
co (optional)	array	Array of coordinates of origin [ox, oy, oz] (for option CoordinateSystem.SYSTEM)
cp (optional)	array	Array of coordinates of point in local X-Y plane [px, py, pz] (for option CoordinateSystem.SYSTEM)
cv (optional)	array	Array of coordinates of local X-Y vector [vx, vy, vz] (for option CoordinateSystem.VECTOR)
cx (optional)	array	Array of coordinates on local X-axis [xx, xy, xz] (for option CoordinateSystem.VECTOR)
dir (optional)	integer	Axis defined by N1N2 (for option CoordinateSystem.NODES)
flag (optional)	boolean	Flag for local system update for each time step (for option CoordinateSystem.NODES)
heading (optional)	string	Title for the coordinate system
nid (optional)	integer	Optional Node ID for rotation (for option CoordinateSystem.VECTOR)
nodes (optional)	array	Array of Node IDs [n1, n2, n3] for the coordinate system (for option CoordinateSystem.NODES)
option	constant	CoordinateSystem type (can be CoordinateSystem.NODES, CoordinateSystem.SYSTEM or CoordinateSystem.VECTOR)

Returns

CoordinateSystem object

Return type

CoordinateSystem

Example

To create a new Csys of type Nodes in model m with label 200 and title "Test csys 1" defined by nodes 1, 2, 3 with where N1N2 defines local Y-axis; local system update flag is off

```
var c = new CoordinateSystem(m, {option: CoordinateSystem.NODES, cid: 200,
nodes: [1, 2, 3], flag: 0, dir: 2, heading: "Test csys nodes"});
```

To create a new Csys of type System in model m with label 300 and title "Test csys 2" with origin at (10, 10, 0), point on local X-axis at (20, 20, 0) and point in X-Y plane at (10, 20, 0)

```
var c = new CoordinateSystem(m, {option: CoordinateSystem.SYSTEM, cid: 300, co:
[10, 10, 0], cl: [20, 20, 0], cp: [10, 20, 0], heading: "Test csys system"});
```

To create a new Csys of type Vector in model m with label 400 with point on local X-axis at (50, 50, 0) and local XY vector being (-10, -20, 0) that can rotate with node 10003

```
var c = new CoordinateSystem(m, {option: CoordinateSystem.VECTOR, cid: 400, cx:
[50, 50, 0], cv: [10, -20, 0], nid: 10003, heading: "Test csys vector"});
```

new CoordinateSystem(Model*[Model]*, option*[constant]*, cid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, flag*[boolean]*, dir*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new CoordinateSystem object for *DEFINE_COORDINATE_NODES.

Arguments

- **Model** (Model)

Model that csys will be created in

- **option** (constant)

Must be CoordinateSystem.NODES

- **cid** (integer)

CoordinateSystem number

- **n1** (integer)

Node located at origin

- **n2** (integer)

Node located along (DIR) axis

- **n3** (integer)

Node located in plane defined by (DIR)

- **flag** (boolean)

Flag for local system update each time step

- **dir** (integer)

Axis defined by N1N2

- **heading (optional)** (string)

Title for the csys

Returns

CoordinateSystem object

Return type

CoordinateSystem

Example

To create a new Csys of type Nodes in model m with label 200 and title "Test csys 1" defined by nodes 1, 2, 3 with where N1N2 defines local Y-axis; local system update flag is off

```
var c = new CoordinateSystem(m, CoordinateSystem.NODES, 200, 1, 2, 3, 0, 2,
"Test csys");
```

new CoordinateSystem(Model*[Model]*, option*[constant]*, cid*[integer]*, ox*[real]*, oy*[real]*, oz*[real]*, lx*[real]*, ly*[real]*, lz*[real]*, px*[real]*, py*[real]*, pz*[real]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new CoordinateSystem object for *DEFINE_COORDINATE_SYSTEM.

Arguments

- **Model** (Model)

Model that csys will be created in

- **option** (constant)

Must be CoordinateSystem.SYSTEM

- **cid** (integer)

CoordinateSystem number

- **ox** (real)

X-coordinate of origin

- **oy** (real)

Y-coordinate of origin

- **oz** (real)

Z-coordinate of origin

- **lx** (real)

X-coordinate of point on local X-axis

- **ly** (real)

Y-coordinate of point on local X-axis

- **lz** (real)

Z-coordinate of point on local X-axis

- **px** (real)

X-coordinate of point in local X-Y plane

- **py** (real)

Y-coordinate of point in local X-Y plane

- **pz** (real)

Z-coordinate of point in local X-Y plane

- **heading (optional)** (string)

Title for the csys

Returns

No return value

Example

To create a new Csys of type System in model m with label 300 and title "Test csys 2" with origin at (10, 10, 0), point on local X-axis at (20, 20, 0) and point on X-y at (10, 20, 0)

```
var c = new CoordinateSystem(m, CoordinateSystem.SYSTEM, 300, 10, 10, 0, 20, 20,
0, 10, 20, 0, "Test csys");
```

new CoordinateSystem(Model*[Model]*, option*[constant]*, cid*[integer]*, xx*[real]*, xy*[real]*, xz*[real]*, vx*[real]*, vy*[real]*, vz*[real]*, nid (optional)*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new CoordinateSystem object for *DEFINE_COORDINATE_VECTOR.

Arguments

- **Model** (Model)

Model that csys will be created in

- **option** (constant)

Must be CoordinateSystem.VECTOR

- **cid** (integer)

CoordinateSystem number

- **xx** (real)

X-coordinate on local X-axis

- **xy** (real)

Y-coordinate on local X-axis

- **xz** (real)

Z-coordinate on local X-axis

- **vx** (real)

X-coordinate of local X-Y vector

- **vy** (real)

Y-coordinate of local X-Y vector

- **vz** (real)

Z-coordinate of local X-Z vector

- **nid (optional)** (integer)

Optional node id for rotation

- **heading (optional)** (string)

Title for the csys

Returns

No return value

Example

To create a new Csys of type Vector in model m with label 400 with point on local X-axis at (50, 50, 0) and local XY being (-10, -20, 0) that can rotate with node 10003

```
var c = new CoordinateSystem(m, CoordinateSystem.VECTOR, 400, 50, 50, 0, 10, -20
, 0, 10003);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a coordinate system.

Arguments

- **Comment** (Comment)

Comment that will be attached to the coordinate system

Returns

No return value

Example

To associate comment c to the coordinate system c:

```
c.AssociateComment(c);
```

Blank()

Description

Blanks the coordinate system

Arguments

No arguments

Returns

No return value

Example

To blank coordinate system c:

```
c.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all coordinate systems will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the coordinate systems in model m:

```
CoordinateSystem.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all the flagged coordinate systems will be blanked in

- **flag** (Flag)

Flag set on the coordinate systems that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the coordinate systems in model m flagged with f:

```
CoordinateSystem.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the coordinate system is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if coordinate system c is blanked:

```
if (c.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse coordinate system c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the coordinate system.

Arguments

- **flag** (Flag)

Flag to clear on the coordinate system

Returns

No return value

Example

To clear flag f for coordinate system c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the coordinate system. The target include of the copied coordinate system can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

CoordinateSystem object

Return type

CoordinateSystem

Example

To copy coordinate system c into coordinate system z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a csys.

Arguments

- **Model** (Model)

Model that the csys will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

CoordinateSystem object (or null if not made)

Return type

CoordinateSystem

Example

To start creating a csys in model m:

```
var m = CoordinateSystem.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a coordinate system.

Arguments

- **Comment** (Comment)

Comment that will be detached from the coordinate system

Returns

No return value

Example

To detach comment c from the coordinate system c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit coordinate system c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for coordinate system. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for coordinate system c:

```
c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first coordinate system in the model.

Arguments

- **Model** (Model)

Model to get first coordinate system in

Returns

CoordinateSystem object (or null if there are no coordinate systems in the model).

Return type

CoordinateSystem

Example

To get the first coordinate system in model m:

```
var c = CoordinateSystem.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free coordinate system label in the model. Also see CoordinateSystem.LastFreeLabel(), CoordinateSystem.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free coordinate system label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

CoordinateSystem label.

Return type

Number

Example

To get the first free coordinate system label in model m:

```
var label = CoordinateSystem.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the coordinate systems in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all coordinate systems will be flagged in

- **flag** (Flag)

Flag to set on the coordinate systems

Returns

No return value

Example

To flag all of the coordinate systems with flag f in model m:

```
CoordinateSystem.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the coordinate system is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the coordinate system

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if coordinate system c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each coordinate system in the model.
Note that ForEach has been designed to make looping over coordinate systems as fast as possible and so has some limitations.
Firstly, a single temporary CoordinateSystem object is created and on each function call it is updated with the current coordinate system data. This means that you should not try to store the CoordinateSystem object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new coordinate systems inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all coordinate systems are in

- **func** (function)

Function to call for each coordinate system

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the coordinate systems in model m:

```
CoordinateSystem.ForEach(m, test);
function test(c)
{
// c is CoordinateSystem object
}
```

To call function test for all of the coordinate systems in model m with optional object:

```
var data = { x:0, y:0 };
CoordinateSystem.ForEach(m, test, data);
function test(c, extra)
{
// c is CoordinateSystem object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of CoordinateSystem objects for all of the coordinate systems in a model in PRIMER

Arguments

- **Model** (Model)

Model to get coordinate systems from

Returns

Array of CoordinateSystem objects

Return type

Array

Example

To make an array of CoordinateSystem objects for all of the coordinate systems in model m

```
var c = CoordinateSystem.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a coordinate system.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the coordinate system c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of CoordinateSystem objects for all of the flagged coordinate systems in a model in PRIMER

Arguments

- **Model** (Model)

Model to get coordinate systems from

- **flag** (Flag)

Flag set on the coordinate systems that you want to retrieve

Returns

Array of CoordinateSystem objects

Return type

Array

Example

To make an array of CoordinateSystem objects for all of the coordinate systems in model m flagged with f

```
var c = CoordinateSystem.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the CoordinateSystem object for a coordinate system ID.

Arguments

- **Model** (Model)

Model to find the coordinate system in

- **number** (integer)

number of the coordinate system you want the CoordinateSystem object for

Returns

CoordinateSystem object (or null if coordinate system does not exist).

Return type

CoordinateSystem

Example

To get the CoordinateSystem object for coordinate system 100 in model m

```
var c = CoordinateSystem.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a CoordinateSystem property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the CoordinateSystem.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

coordinate system property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if CoordinateSystem property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if CoordinateSystem property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this csys (*DEFINE_COORDINATE). **Note that a carriage return is not added**. See also CoordinateSystem.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for csys m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the csys. **Note that a carriage return is not added**. See also CoordinateSystem.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for csys c:

```
var cards = v.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last coordinate system in the model.

Arguments

- **Model** (Model)

Model to get last coordinate system in

Returns

CoordinateSystem object (or null if there are no coordinate systems in the model).

Return type

CoordinateSystem

Example

To get the last coordinate system in model m:

```
var c = CoordinateSystem.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free coordinate system label in the model. Also see CoordinateSystem.FirstFreeLabel(), CoordinateSystem.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free coordinate system label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

CoordinateSystem label.

Return type

Number

Example

To get the last free coordinate system label in model m:

```
var label = CoordinateSystem.LastFreeLabel(m);
```

Next()

Description

Returns the next coordinate system in the model.

Arguments

No arguments

Returns

CoordinateSystem object (or null if there are no more coordinate systems in the model).

Return type

CoordinateSystem

Example

To get the coordinate system in model m after coordinate system c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) coordinate system label in the model. Also see CoordinateSystem.FirstFreeLabel(), CoordinateSystem.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free coordinate system label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

CoordinateSystem label.

Return type

Number

Example

To get the next free coordinate system label in model m:

```
var label = CoordinateSystem.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a coordinate system.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only coordinate systems from that model can be picked. If the argument is a Flag then only coordinate systems that are flagged with *limit* can be selected. If omitted, or null, any coordinate systems from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

CoordinateSystem object (or null if not picked)

Return type

CoordinateSystem

Example

To pick a coordinate system from model m giving the prompt 'Pick coordinate system from screen':

```
var c = CoordinateSystem.Pick('Pick coordinate system from screen', m);
```

Previous()

Description

Returns the previous coordinate system in the model.

Arguments

No arguments

Returns

CoordinateSystem object (or null if there are no more coordinate systems in the model).

Return type

CoordinateSystem

Example

To get the coordinate system in model m before coordinate system c:

```
var c = c.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all coordinate systems will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the coordinate systems in model m, from 1000000:

```
CoordinateSystem.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all the flagged coordinate systems will be renumbered in

- **flag** (Flag)

Flag set on the coordinate systems that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the coordinate systems in model m flagged with f, from 1000000:

```
CoordinateSystem.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select coordinate systems using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting coordinate systems

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only coordinate systems from that model can be selected. If the argument is a Flag then only coordinate systems that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any coordinate systems can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of coordinate systems selected or null if menu cancelled

Return type

Number

Example

To select coordinate systems from model m, flagging those selected with flag f, giving the prompt 'Select coordinate systems':

```
CoordinateSystem.Select(f, 'Select coordinate systems', m);
```

To select coordinate systems, flagging those selected with flag f but limiting selection to coordinate systems flagged with flag l, giving the prompt 'Select coordinate systems':

```
CoordinateSystem.Select(f, 'Select coordinate systems', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the coordinate system.

Arguments

- **flag** (Flag)

Flag to set on the coordinate system

Returns

No return value

Example

To set flag f for coordinate system c:

```
c.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the coordinate system. The coordinate system will be sketched until you either call CoordinateSystem.Unsketch(), CoordinateSystem.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the coordinate system is sketched. If omitted redraw is true. If you want to sketch several coordinate systems and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch coordinate system c:

```
c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged coordinate systems in the model. The coordinate systems will be sketched until you either call CoordinateSystem.Unsketch(), CoordinateSystem.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged coordinate systems will be sketched in

- **flag** (Flag)

Flag set on the coordinate systems that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the coordinate systems are sketched. If omitted redraw is true. If you want to sketch flagged coordinate systems several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all coordinate systems flagged with flag in model m:

```
CoordinateSystem.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of coordinate systems in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing coordinate systems should be counted. If false or omitted referenced but undefined coordinate systems will also be included in the total.

Returns

number of coordinate systems

Return type

Number

Example

To get the total number of coordinate systems in model m:

```
var total = CoordinateSystem.Total(m);
```

Unblank()

Description

Unblanks the coordinate system

Arguments

No arguments

Returns

No return value

Example

To unblank coordinate system c:

```
c.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all coordinate systems will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the coordinate systems in model m:

```
CoordinateSystem.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged coordinate systems in the model.

Arguments

- **Model** (Model)

Model that the flagged coordinate systems will be unblanked in

- **flag** (Flag)

Flag set on the coordinate systems that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the coordinate systems in model m flagged with f:

```
CoordinateSystem.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the coordinate systems in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all coordinate systems will be unset in

- **flag** (Flag)

Flag to unset on the coordinate systems

Returns

No return value

Example

To unset the flag f on all the coordinate systems in model m:

```
CoordinateSystem.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the coordinate system.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the coordinate system is unsketched. If omitted redraw is true. If you want to unsketch several coordinate systems and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch coordinate system c:

```
c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all coordinate systems.

Arguments

- **Model** (Model)

Model that all coordinate systems will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the coordinate systems are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all coordinate systems in model m:

```
CoordinateSystem.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged coordinate systems in the model.

Arguments

- **Model** (Model)

Model that all coordinate systems will be unsketched in

- **flag** (Flag)

Flag set on the coordinate systems that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the coordinate systems are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all coordinate systems flagged with flag in model m:

```
CoordinateSystem.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

CoordinateSystem object.

Return type

CoordinateSystem

Example

To check if CoordinateSystem property c.example is a parameter by using the CoordinateSystem.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for coordinate system. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for coordinate system c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this coordinate system.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for coordinate system c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the csys data in keyword format. Note that this contains the keyword header and the keyword cards. See also CoordinateSystem.Keyword() and CoordinateSystem.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for csys c in keyword format

```
var s = v.toString();
```

Curve class

The Curve class gives you access to load curve cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)

Curve constants

Name	Description
Curve.AFTER	Insertion of curve data option.
Curve.BEFORE	Insertion of curve data option.
Curve.CURVE	Load curve type *DEFINE_CURVE
Curve.CURVE_FUNCTION	Load curve type *DEFINE_CURVE_FUNCTION
Curve.CURVE_SMOOTH	Load curve type *DEFINE_CURVE_SMOOTH
Curve.FUNCTION	Load curve type *DEFINE_FUNCTION
Curve.TABLE	Load curve type *DEFINE_TABLE

Curve properties

Name	Type	Description
dattyp	integer	Data type
dist	real	Total distance tool will travel
exists (read only)	logical	true if curve exists, false if referred to but not defined.
function	string	Function expression for Curve.CURVE_FUNCTION
heading	string	Curve heading
include	integer	The Include file number that the curve is in.
label	integer	Curve number. Also see the lcid property which is an alternative name for this.
lcid	integer	Curve number. Also see the label property which is an alternative name for this.
lcint	integer	Number of discretization points for the curve
model (read only)	integer	The Model number that the curve is in.
ncurves	integer	Number of points in curve or number of curves in table. The npoints property is an alternative name for this. (read only for tables)
npoints	integer	Number of points in curve or number of curves in table. The ncurves property is an alternative name for this. (read only for tables)
offa	real	Offset for abscissa values
offo	real	Offset for ordinate values
sfa	real	Scale factor on abscissa value
sfo	real	Scale factor on ordinate value
sidr	integer	Stress initialisation by dynamic relaxation
tend	real	Time curve returns to zero
trise	real	Rise time
tstart	real	Time curve starts to rise
type	constant	Load curve type (Can be Curve.CURVE, Curve.CURVE_FUNCTION, Curve.SMOOTH, Curve.FUNCTION or Curve.TABLE).
version	string	Version for discretization. Can be blank, "3858" or "5434a"
vmax	real	Maximum velocity

Detailed Description

The Curve class allows you to create, modify, edit and manipulate curve cards. See the documentation below for more details.

Constructor

new Curve(Model*[Model]*, options *[object]*)

Description

Create a new Curve object.

Arguments

- **Model** (Model)

Model that curve will be created in

- **options** (object)

Options for creating the curve

Object has the following properties:

Name	Type	Description
dattyp (optional)	integer	Data type
dist (Type of load curve must be Curve.CURVE_SMOOTH) (optional)	real	Total distance tool will travel
function (load curve type has to be Curve.FUNCTION or Curve.CURVE_FUNCTION) (optional)	string	Function expression
heading (optional)	string	Title for the curve
lcid	integer	Curve number
lcint (optional)	integer	Data type
offa (optional)	real	Offset on abscissa value
offo (optional)	real	Offset on ordinate value
sfa (optional)	real	Scale factor on abscissa value
sfo (optional)	real	Scale factor on ordinate value
sidr (optional)	integer	Stress initialisation by dynamic relaxation
tend (Type of load curve must be Curve.CURVE_SMOOTH) (optional)	real	Time curve returns to zero
trise (Type of load curve must be Curve.CURVE_SMOOTH) (optional)	real	Rise time
tstart (Type of load curve must be Curve.CURVE_SMOOTH) (optional)	real	Time curve starts to rise
type	constant	Type of load curve. Can be Curve.CURVE, Curve.TABLE, Note this does not have to be defined. In previous versions of PRIMER you could only construct a basic load curve type, therefore the type argument was not used. PRIMER is still backwards compatible with this method of load curve creation.

vmax (Type of load curve must be Curve.CURVE_SMOOTH) (optional)	real	Maximum velocity

Returns

Curve object

Return type

Curve

Example

To create a new curve in model m with label 200

```
var l = new Curve(Curve.CURVE, m, 200);
```

To create a new curve function in model m with label 200 and function ’0.5*lc9*vm(22)**3’ (example from keyword manual)

```
var l = new Curve(Curve.CURVE_FUNCTION, m, 200, 0, "0.5*lc9*vm(22)**3");
```

To create a new function in model m with label 200 and function ’x(t)=1000*sin(100*t)’ and title ’x-velo’ (example from keyword manual)

```
var l = new Curve(Curve.FUNCTION, m, 200, "x(t)=1000*sin(100*t)", "x-velo");
```

To create a new curve function in model m with label 200’ (example from keyword manual)

```
var l = new Curve(Curve.CURVE_SMOOTH, m, 200);
```

new Curve(Load curve type*[constant]*, Model*[Model]*, lcid*[integer]*, sidr (optional)*[integer]*, sfa (optional)*[real]*, sfo (optional)*[real]*, offa (optional)*[real]*, offo (optional)*[real]*, dattyp (optional)*[integer]*, heading (optional)*[string]*, lcint (optional)*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Curve object.

Arguments

- **Load curve type** (constant)

Type of load curve. Can be Curve.CURVE, Curve.TABLE, Note this does not have to be defined. In previous versions of PRIMER you could only construct a basic load curve type, therefore the type argument was not used. PRIMER is still backwards compatible with this method of load curve creation.

- **Model** (Model)

Model that curve will be created in

- **lcid** (integer)

Curve number

- **sidr (optional)** (integer)

Stress initialisation by dynamic relaxation

- **sfa (optional)** (real)

Scale factor on abscissa value

- **sfo (optional)** (real)

Scale factor on ordinate value

- **offa (optional)** (real)

Offset on abscissa value

- **offo (optional)** (real)

Offset on ordinate value

- **dattyp (optional)** (integer)

Data type

- **heading (optional)** (string)

Title for the curve

- **lcint (optional)** (integer)

Number of discretization points for the curve

Returns

Curve object

Return type

Curve

Example

To create a new curve in model m with label 200

```
var l = new Curve(Curve.CURVE, m, 200);
```

new Curve(Load curve type*[constant]*, Model*[Model]*, lcid*[integer]*, sidr (optional)*[integer]*, function (optional)*[string]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Curve *DEFINE_CURVE_FUNCTION object.

Arguments

- **Load curve type** (constant)

Type of load curve. Must be Curve.CURVE_FUNCTION.

- **Model** (Model)

Model that curve will be created in

- **lcid** (integer)

Curve number

- **sidr (optional)** (integer)

Stress initialisation by dynamic relaxation

- **function (optional)** (string)

Function expression

- **heading (optional)** (string)

Title for the curve

Returns

Curve object

Return type

Curve

Example

To create a new curve function in model m with label 200 and function ’0.5*lc9*vm(22)**3’ (example from keyword manual)

```
var l = new Curve(Curve.CURVE_FUNCTION, m, 200, 0, "0.5*lc9*vm(22)**3");
```

new Curve(Load curve type*[constant]*, Model*[Model]*, lcid*[integer]*, function (optional)*[string]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Curve *DEFINE_FUNCTION object.

Arguments

- **Load curve type** (constant)

Type of load curve. Must be Curve.FUNCTION.

- **Model** (Model)

Model that curve will be created in

- **lcid** (integer)

Curve number

- **function (optional)** (string)

Function expression

- **heading (optional)** (string)

Title for the curve

Returns

Curve object

Return type

Curve

Example

To create a new function in model m with label 200 and function ’x(t)=1000*sin(100*t)’ and title ’x-velo’ (example from keyword manual)

```
var l = new Curve(Curve.FUNCTION, m, 200, "x(t)=1000*sin(100*t)", "x-velo");
```

new Curve(Load curve type*[constant]*, Model*[Model]*, lcid*[integer]*, sidr (optional)*[integer]*, dist (optional)*[real]*, tstart (optional)*[real]*, tend (optional)*[real]*, trise (optional)*[real]*, vmax (optional)*[real]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Curve *DEFINE_CURVE_SMOOTH object.

Arguments

- **Load curve type** (constant)

Type of load curve. Must be Curve.CURVE_SMOOTH.

- **Model** (Model)

Model that curve will be created in

- **lcid** (integer)

Curve number

- **sidr (optional)** (integer)

Stress initialisation by dynamic relaxation

- **dist (optional)** (real)

Total distance tool will travel

- **tstart (optional)** (real)

Time curve starts to rise

- **tend (optional)** (real)

Time curve returns to zero

- **trise (optional)** (real)

Rise time

- **vmax (optional)** (real)

Maximum velocity

- **heading (optional)** (string)

Title for the curve

Returns

Curve object

Return type

Curve

Example

To create a new curve function in model m with label 200’ (example from keyword manual)

```
var l = new Curve(Curve.CURVE_SMOOTH, m, 200);
```

Details of functions

AddPoint(xvalue*[real]*, yvalue*[real]*)

Description

Adds a point to a load curve.

Arguments

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

Returns

No return value.

Example

To add a point with values of x=3 and y=5 to curve l:

```
l.AddPoint(3, 5);
```

AddTableEntry(value*[real]*, load curve*[integer]*)

Description

Adds an entry line to a table.

Arguments

- **value** (real)

The value for for this entry in the table.

- **load curve** (integer)

The load curve corresponding to the defined value.

Returns

No return value.

Example

To add an entry with a value of 3 for load curve 1000:

```
l.AddTableEntry(3, 1000);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a curve.

Arguments

- **Comment** (Comment)

Comment that will be attached to the curve

Returns

No return value

Example

To associate comment c to the curve c:

```
c.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse curve c:

```
c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the curve.

Arguments

- **flag** (Flag)

Flag to clear on the curve

Returns

No return value

Example

To clear flag f for curve c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the curve. The target include of the copied curve can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Curve object

Return type

Curve

Example

To copy curve c into curve z:

```
var z = c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a curve.

Arguments

- **Model** (Model)

Model that the curve will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Curve object (or null if not made)

Return type

Curve

Example

To start creating a curve in model m:

```
var l = Curve.Create(m);
```

CreateTable(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a table.

Arguments

- **Model** (Model)

Model that the curve will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Curve object (or null if not made)

Return type

Curve

Example

To start creating a table in model m:

```
var l = Curve.CreateTable(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a curve.

Arguments

- **Comment** (Comment)

Comment that will be detached from the curve

Returns

No return value

Example

To detach comment c from the curve c:

```
c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit curve c:

```
c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for curve. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for curve c:

```
c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first curve in the model.

Arguments

- **Model** (Model)

Model to get first curve in

Returns

Curve object (or null if there are no curves in the model).

Return type

Curve

Example

To get the first curve in model m:

```
var c = Curve.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free curve label in the model. Also see Curve.LastFreeLabel(), Curve.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free curve label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Curve label.

Return type

Number

Example

To get the first free curve label in model m:

```
var label = Curve.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the curves in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all curves will be flagged in

- **flag** (Flag)

Flag to set on the curves

Returns

No return value

Example

To flag all of the curves with flag f in model m:

```
Curve.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the curve is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the curve

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if curve c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each curve in the model.
Note that ForEach has been designed to make looping over curves as fast as possible and so has some limitations. Firstly, a single temporary Curve object is created and on each function call it is updated with the current curve data. This means that you should not try to store the Curve object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new curves inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all curves are in

- **func** (function)

Function to call for each curve

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the curves in model m:

```
Curve.ForEach(m, test);
function test(c)
{
// c is Curve object
}
```

To call function test for all of the curves in model m with optional object:

```
var data = { x:0, y:0 };
Curve.ForEach(m, test, data);
function test(c, extra)
{
// c is Curve object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Curve objects for all of the curves in a model in PRIMER

Arguments

- **Model** (Model)

Model to get curves from

Returns

Array of Curve objects

Return type

Array

Example

To make an array of Curve objects for all of the curves in model m

```
var c = Curve.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a curve.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the curve c:

```
var comm_array = c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Curve objects for all of the flagged curves in a model in PRIMER

Arguments

- **Model** (Model)

Model to get curves from

- **flag** (Flag)

Flag set on the curves that you want to retrieve

Returns

Array of Curve objects

Return type

Array

Example

To make an array of Curve objects for all of the curves in model m flagged with f

```
var c = Curve.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Curve object for a curve ID.

Arguments

- **Model** (Model)

Model to find the curve in

- **number** (integer)

number of the curve you want the Curve object for

Returns

Curve object (or null if curve does not exist).

Return type

Curve

Example

To get the Curve object for curve 100 in model m

```
var c = Curve.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Curve property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Curve.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

curve property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Curve property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Curve property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

GetPoint(row*[integer]*)

Description

Returns x and y data for a point in a curve

Arguments

- **row** (integer)

The row point you want the data for. **Note that curve points start at 0, not 1**.

Returns

An array containing the x coordinate and the y coordinate.

Return type

Array

Example

To get the curve data for the 3rd point for curve l:

```
if (l.npoints >= 3)
{
    var point_data = l.GetPoint(2);
}
```

GetTableEntry(row*[integer]*)

Description

Returns the value and curve label for a row in a table

Arguments

- **row** (integer)

The row point you want the data for. **Note that curve points start at 0, not 1**.

Returns

An array containing the value and the load curve label.

Return type

Array

Example

To get the data for the 3rd point for table t:

```
if (t.npoints >= 3)
{
    var row_data = t.GetTableEntry(2);
}
```

InsertPoint(ipt*[integer]*, xvalue*[real]*, yvalue*[real]*, position*[integer]*)

Description

Inserts point values before or after a specified row of data on a load curve.

Arguments

- **ipt** (integer)

The row you want to insert the data before or after. **Note that the row data starts at 0, not 1**.

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

- **position** (integer)

Specify either before or after the selected row. Use ’Curve.BEFORE’ for before, and ’Curve.AFTER’ for after.

Returns

No return value.

Example

To insert the values after the 3rd row to x=3, y=5 for curve l:

```
l.InsertPoint(2, 3, 5, Curve.AFTER);
```

InsertTableEntry(ipt*[integer]*, value*[real]*, lcid*[integer]*, position*[integer]*)

Description

Inserts a table row before or after a specified row of data on a table.

Arguments

- **ipt** (integer)

The row you want to insert the data before or after. **Note that the row data starts at 0, not 1**.

- **value** (real)

The value of the row.

- **lcid** (integer)

The load curve corresponding to the defined value.

- **position** (integer)

Specify either before or after the selected row. Use 'Curve.BEFORE' for before, and 'Curve.AFTER' for after.

Returns

No return value.

Example

To insert the values after the 3rd row to value=3, lcur=5 for table t:

```
t.InsertTableEntry(2, 3, 5, Curve.AFTER);
```

Keyword()

Description

Returns the keyword for this curve (*DEFINE_CURVE_xxxx). **Note that a carriage return is not added**. See also Curve.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for curve l:

```
var key = l.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the curve. **Note that a carriage return is not added**. See also Curve.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for curve l:

```
var cards = l.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last curve in the model.

Arguments

- **Model** (Model)

Model to get last curve in

Returns

Curve object (or null if there are no curves in the model).

Return type

Curve

Example

To get the last curve in model m:

```
var c = Curve.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free curve label in the model. Also see Curve.FirstFreeLabel(), Curve.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free curve label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Curve label.

Return type

Number

Example

To get the last free curve label in model m:

```
var label = Curve.LastFreeLabel(m);
```

Next()

Description

Returns the next curve in the model.

Arguments

No arguments

Returns

Curve object (or null if there are no more curves in the model).

Return type

Curve

Example

To get the curve in model m after curve c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) curve label in the model. Also see Curve.FirstFreeLabel(), Curve.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free curve label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Curve label.

Return type

Number

Example

To get the next free curve label in model m:

```
var label = Curve.NextFreeLabel(m);
```

Previous()

Description

Returns the previous curve in the model.

Arguments

No arguments

Returns

Curve object (or null if there are no more curves in the model).

Return type

Curve

Example

To get the curve in model m before curve c:

```
var c = c.Previous();
```

RemovePoint(row*[integer]*)

Description

Removes a row of data from a curve

Arguments

- **row** (integer)

The row point you want to remove. **Note that curve points start at 0, not 1**.

Returns

No return value.

Example

To remove the curve data for the 3rd point for curve l:

```
if (l.npoints >= 3)
{
    var point_data = l.RemovePoint(2);
}
```

RemoveTableEntry(ipt*[integer]*)

Description

Removes the value and loadcurve values for a specified row of data on a load curve.

Arguments

- **ipt** (integer)

The row you want to remove the data for. **Note that the row data starts at 0, not 1**.

Returns

No return value.

Example

To remove an entry at row 4:

```
t.RemoveTableEntry(4);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the curves in the model.

Arguments

- **Model** (Model)

Model that all curves will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the curves in model m, from 1000000:

```
Curve.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged curves in the model.

Arguments

- **Model** (Model)

Model that all the flagged curves will be renumbered in

- **flag** (Flag)

Flag set on the curves that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the curves in model m flagged with f, from 1000000:

```
Curve.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select curves using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting curves

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only curves from that model can be selected. If the argument is a Flag then only curves that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any curves can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of curves selected or null if menu cancelled

Return type

Number

Example

To select curves from model m, flagging those selected with flag f, giving the prompt 'Select curves':

```
Curve.Select(f, 'Select curves', m);
```

To select curves, flagging those selected with flag f but limiting selection to curves flagged with flag l, giving the prompt 'Select curves':

```
Curve.Select(f, 'Select curves', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the curve.

Arguments

- **flag** (Flag)

Flag to set on the curve

Returns

No return value

Example

To set flag f for curve c:

```
c.SetFlag(f);
```

SetPoint(ipt*[integer]*, xvalue*[real]*, yvalue*[real]*)

Description

Sets the x and y values for a specified row of data on a load curve.

Arguments

- **ipt** (integer)

The row you want to set the data for. **Note that the row data starts at 0, not 1**.

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

Returns

No return value.

Example

To set the values for the 3rd row to x=3, y=5 for curve l:

```
l.SetPoint(2, 3, 5);
```

SetTableEntry(ipt*[integer]*, value*[real]*, load curve*[integer]*)

Description

Sets the value and loadcurve values for a specified row of data on a load curve.

Arguments

- **ipt** (integer)

The row you want to set the data for. **Note that the row data starts at 0, not 1**.

- **value** (real)

The value for for this entry in the table.

- **load curve** (integer)

The load curve corresponding to the defined value.

Returns

No return value.

Example

To add an entry with a value of 3 for load curve 1000 at row 4:

```
t.SetTableEntry(4, 3, 1000);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of curves in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing curves should be counted. If false or omitted referenced but undefined curves will also be included in the total.

Returns

number of curves

Return type

Number

Example

To get the total number of curves in model m:

```
var total = Curve.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the curves in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all curves will be unset in

- **flag** (Flag)

Flag to unset on the curves

Returns

No return value

Example

To unset the flag f on all the curves in model m:

```
Curve.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Curve object.

Return type

Curve

Example

To check if Curve property c.example is a parameter by using the Curve.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for curve. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for curve c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this curve.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for curve c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the curve data in keyword format. Note that this contains the keyword header and the keyword cards. See also Curve.Keyword() and Curve.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for curve l in keyword format

```
var l = d.toString();
```

ElementDeath class

The ElementDeath class gives you access to define element death cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)
- First(Model*[Model]*)
- FlagAll(Model*[Model]*, flag*[Flag]*)
- ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*)
- GetAll(Model*[Model]*)
- GetFlagged(Model*[Model]*, flag*[Flag]*)
- GetFromID(Model*[Model]*, number*[integer]*)
- Last(Model*[Model]*)
- Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*)
- Total(Model*[Model]*, exists (optional)*[boolean]*)
- UnflagAll(Model*[Model]*, flag*[Flag]*)

Member functions

- AssociateComment(Comment*[Comment]*)
- Browse(modal (optional)*[boolean]*)
- ClearFlag(flag*[Flag]*)
- Copy(range (optional)*[boolean]*)
- DetachComment(Comment*[Comment]*)
- Edit(modal (optional)*[boolean]*)
- Error(message*[string]*, details (optional)*[string]*)
- Flagged(flag*[Flag]*)
- GetComments()
- GetParameter(prop*[string]*)
- Keyword()
- KeywordCards()
- Next()
- Previous()
- SetFlag(flag*[Flag]*)
- ViewParameters()
- Warning(message*[string]*, details (optional)*[string]*)
- Xrefs()
- toString()

ElementDeath constants

Name	Description
ElementDeath.BEAM	Beam option
ElementDeath.BEAM_SET	Beam set option
ElementDeath.SHELL	Shell option
ElementDeath.SHELL_SET	Shell set option
ElementDeath.SOLID	Solid option
ElementDeath.SOLID_SET	Solid set option

ElementDeath.THICK_SHELL	Thick shell option
ElementDeath.THICK_SHELL_SET	Thick shell set option

ElementDeath properties

Name	Type	Description
boxid	integer	Box restricting element deletion
cid	integer	Coordinate ID for transforming boxid.
eid	integer	Element ID or element set ID. The sid property is an alternative name for this.
exists (read only)	logical	true if element death exists, false if referred to but not defined.
idgrp	integer	Group ID for simultaneous deletion.
include	integer	The Include file number that the element death is in.
inout	logical	If true, LS_DYNA deletes elements outside box, otherwise inside box.
model (read only)	integer	The Model number that the element death is in.
option	constant	ElementDeath option. Can be ElementDeath.SOLID, ElementDeath.SOLID_SET, ElementDeath.BEAM, ElementDeath.BEAM_SET, ElementDeath.SHELL, ElementDeath.SHELL_SET, ElementDeath.THICK_SHELL or ElementDeath.THICK_SHELL_SET. The type property is an alternative name for this.
percent	real	Deletion percentage.
sid	integer	Element ID or element set ID. The eid property is an alternative name for this.
time	real	Deletion time for elimination
title	string	ElementDeath title
type	constant	ElementDeath option. Can be ElementDeath.SOLID, ElementDeath.SOLID_SET, ElementDeath.BEAM, ElementDeath.BEAM_SET, ElementDeath.SHELL, ElementDeath.SHELL_SET, ElementDeath.THICK_SHELL or ElementDeath.THICK_SHELL_SET The option property is an alternative name for this.

Detailed Description

The ElementDeath class allows you to create, modify, edit and manipulate element death cards. See the documentation below for more details.

Constructor

new ElementDeath(Model*[Model]*, type*[string]*, eid/sid*[integer]*)

Description

Create a new ElementDeath object.

Arguments

- **Model** (Model)

Model that element death will be created in

- **type** (string)

ElementDeath type. Can be ElementDeath.SOLID, ElementDeath.SOLID_SET, ElementDeath.BEAM, ElementDeath.BEAM_SET, ElementDeath.SHELL, ElementDeath.SHELL_SET, ElementDeath.THICK_SHELL or ElementDeath.THICK_SHELL_SET

- **eid/sid** (integer)

Element or element set ID

Returns

ElementDeath object

Return type

ElementDeath

Example

To create a new element death in model m with option BEAM_SET and sid 100

```
var ed = new ElementDeath(m, ElementDeath.BEAM_SET, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a element death.

Arguments

- **Comment** (Comment)

Comment that will be attached to the element death

Returns

No return value

Example

To associate comment c to the element death ed:

```
ed.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse element death ed:

```
ed.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the element death.

Arguments

- **flag** (Flag)

Flag to clear on the element death

Returns

No return value

Example

To clear flag f for element death ed:

```
ed.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the element death. The target include of the copied element death can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

ElementDeath object

Return type

ElementDeath

Example

To copy element death ed into element death z:

```
var z = ed.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an element death.

Arguments

- **Model** (Model)

Model that the element death will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

ElementDeath object (or null if not made)

Return type

ElementDeath

Example

To start creating an element death in model m:

```
var ed = ElementDeath.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a element death.

Arguments

- **Comment** (Comment)

Comment that will be detached from the element death

Returns

No return value

Example

To detach comment c from the element death ed:

```
ed.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit element death ed:

```
ed.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for element death. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for element death ed:

```
ed.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first element death in the model.

Arguments

- **Model** (Model)

Model to get first element death in

Returns

ElementDeath object (or null if there are no element deaths in the model).

Return type

ElementDeath

Example

To get the first element death in model m:

```
var ed = ElementDeath.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the element deaths in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all element deaths will be flagged in

- **flag** (Flag)

Flag to set on the element deaths

Returns

No return value

Example

To flag all of the element deaths with flag f in model m:

```
ElementDeath.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the element death is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the element death

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if element death ed has flag f set on it:

```
if (ed.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each element death in the model.
Note that ForEach has been designed to make looping over element deaths as fast as possible and so has some limitations.
Firstly, a single temporary ElementDeath object is created and on each function call it is updated with the current element death data. This means that you should not try to store the ElementDeath object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new element deaths inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all element deaths are in

- **func** (function)

Function to call for each element death

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the element deaths in model m:

```
ElementDeath.ForEach(m, test);
function test(ed)
{
// ed is ElementDeath object
}
```

To call function test for all of the element deaths in model m with optional object:

```
var data = { x:0, y:0 };
ElementDeath.ForEach(m, test, data);
function test(ed, extra)
{
// ed is ElementDeath object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of ElementDeath objects for all of the element deaths in a model in PRIMER

Arguments

- **Model** (Model)

Model to get element deaths from

Returns

Array of ElementDeath objects

Return type

Array

Example

To make an array of ElementDeath objects for all of the element deaths in model m

```
var ed = ElementDeath.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a element death.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the element death ed:

```
var comm_array = ed.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of ElementDeath objects for all of the flagged element deaths in a model in PRIMER

Arguments

- **Model** (Model)

Model to get element deaths from

- **flag** (Flag)

Flag set on the element deaths that you want to retrieve

Returns

Array of ElementDeath objects

Return type

Array

Example

To make an array of ElementDeath objects for all of the element deaths in model m flagged with f

```
var ed = ElementDeath.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the ElementDeath object for a element death ID.

Arguments

- **Model** (Model)

Model to find the element death in

- **number** (integer)

number of the element death you want the ElementDeath object for

Returns

ElementDeath object (or null if element death does not exist).

Return type

ElementDeath

Example

To get the ElementDeath object for element death 100 in model m

```
var ed = ElementDeath.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a ElementDeath property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the ElementDeath.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

element death property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if ElementDeath property ed.example is a parameter:

```
Options.property_parameter_names = true;
if (ed.GetParameter(ed.example) ) do_something...
Options.property_parameter_names = false;
```

To check if ElementDeath property ed.example is a parameter by using the GetParameter method:

```
if (ed.ViewParameters().GetParameter(ed.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this element death (*DEFINE_ELEMENT_DEATH). **Note that a carriage return is not added**. See also ElementDeath.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for element death ed:

```
var key = ed.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the element death. **Note that a carriage return is not added**. See also ElementDeath.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for element death ed:

```
var cards = ed.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last element death in the model.

Arguments

- **Model** (Model)

Model to get last element death in

Returns

ElementDeath object (or null if there are no element deaths in the model).

Return type

ElementDeath

Example

To get the last element death in model m:

```
var ed = ElementDeath.Last(m);
```

Next()

Description

Returns the next element death in the model.

Arguments

No arguments

Returns

ElementDeath object (or null if there are no more element deaths in the model).

Return type

ElementDeath

Example

To get the element death in model m after element death ed:

```
var ed = ed.Next();
```

Previous()

Description

Returns the previous element death in the model.

Arguments

No arguments

Returns

ElementDeath object (or null if there are no more element deaths in the model).

Return type

ElementDeath

Example

To get the element death in model m before element death ed:

```
var ed = ed.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select element deaths using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting element deaths

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only element deaths from that model can be selected. If the argument is a Flag then only element deaths that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any element deaths can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of element deaths selected or null if menu cancelled

Return type

Number

Example

To select element deaths from model m, flagging those selected with flag f, giving the prompt 'Select element deaths':

```
ElementDeath.Select(f, 'Select element deaths', m);
```

To select element deaths, flagging those selected with flag f but limiting selection to element deaths flagged with flag l, giving the prompt 'Select element deaths':

```
ElementDeath.Select(f, 'Select element deaths', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the element death.

Arguments

- **flag** (Flag)

Flag to set on the element death

Returns

No return value

Example

To set flag f for element death ed:

```
ed.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of element deaths in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing element deaths should be counted. If false or omitted referenced but undefined element deaths will also be included in the total.

Returns

number of element deaths

Return type

Number

Example

To get the total number of element deaths in model m:

```
var total = ElementDeath.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the element deaths in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all element deaths will be unset in

- **flag** (Flag)

Flag to unset on the element deaths

Returns

No return value

Example

To unset the flag f on all the element deaths in model m:

```
ElementDeath.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

ElementDeath object.

Return type

ElementDeath

Example

To check if ElementDeath property ed.example is a parameter by using the ElementDeath.GetParameter() method:

```
if (ed.ViewParameters().GetParameter(ed.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for element death. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for element death ed:

```
ed.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this element death.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for element death ed:

```
var xrefs = ed.Xrefs();
```

---

toString()

Description

Creates a string containing the element death data in keyword format. Note that this contains the keyword header and the keyword cards. See also ElementDeath.Keyword() and ElementDeath.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for element death ed in keyword format

```
var s = ed.toString();
```

HexSpotweldAssembly class

The HexSpotweldAssembly class gives you access to *DEFINE_HEX_SPOTWELD_ASSEMBLY cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

HexSpotweldAssembly properties

Name	Type	Description
eid1	integer	EID 1
eid10	integer	EID 10
eid11	integer	EID 11

eid12	integer	EID 12
eid13	integer	EID 13
eid14	integer	EID 14
eid15	integer	EID 15
eid16	integer	EID 16
eid2	integer	EID 2
eid3	integer	EID 3
eid4	integer	EID 4
eid5	integer	EID 5
eid6	integer	EID 6
eid7	integer	EID 7
eid8	integer	EID 8
eid9	integer	EID 9
exists (read only)	logical	true if *DEFINE_HEX_SPOTWELD_ASSEMBLY exists, false if referred to but not defined.
id	integer	*DEFINE_HEX_SPOTWELD_ASSEMBLY id
include	integer	The Include file number that the *DEFINE_HEX_SPOTWELD_ASSEMBLY is in.
model (read only)	integer	The Model number that the DEFINE_HEX_SPOTWELD_ASSEMBLY is in.
opt	integer	*DEFINE_HEX_SPOTWELD_ASSEMBLY opt
title	string	Title (optional)

Detailed Description

The HexSpotweldAssembly class allows you to create, modify, edit and manipulate *DEFINE_HEX_SPOTWELD_ASSEMBLY cards. See the documentation below for more details.

Constructor

new HexSpotweldAssembly(Model*[Model]*, options *[object]*)

Description

Create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY object.

Arguments

- **Model** (Model)

Model that Hex Spotweld Assembly will be created in

- **options** (object)

Options for creating the HexSpotweldAssembly

Object has the following properties:

Name	Type	Description
id	integer	HexSpotweldAssembly ID.
opt	integer	HexSpotweldAssembly option indicating the length of the solids array. opt can be 4, 8 or 16.
solids	array	Array of Solid IDs, at least 4 EIDs must be given.

title (optional)	string	Optional HexSpotweldAssembly title.

Returns

HexSpotweldAssembly object

Return type

HexSpotweldAssembly

Example

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 100 in model m with 4 elements 50, 150, 250 and 350

```
var h = new HexSpotweldAssembly(m, {id: 100, opt: 4, solids: [50, 150, 250, 350]});
```

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 200 in model m with 8 elements 50, 150, 250, 350, 450, 550, 650 and 750

```
var h = new HexSpotweldAssembly(m, {id: 200, opt: 8, solids: [50, 150, 250, 350, 450, 550, 650, 750]});
```

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 300 in model m with 16 elements 50, 150, 250, 350, 450, 550, 650, 750, 850, 950, 1050, 1150, 1250, 1350, 1450 and 1550

```
var h = new HexSpotweldAssembly(m, {id: 300, opt: 16, solids: [50, 150, 250, 350, 450, 550, 650, 750, 850, 950, 1050, 1150, 1250, 1350, 1450, 1550]});
```

new HexSpotweldAssembly(Model*[Model]*, id*[integer]*, opt*[integer]*, eid1*[integer]*, eid2*[integer]*, eid3*[integer]*, eid4*[integer]*, title (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY object.

Arguments

- **Model** (Model)

Model that Hex Spotweld Assembly will be created in

- **id** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY id_sw.

- **opt** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY opt can be 4, 8 or 16

- **eid1** (integer)

EID 1.

- **eid2** (integer)

EID 2.

- **eid3** (integer)

EID 3.

- **eid4** (integer)

EID 4.

- **title (optional)** (string)

Define hex spotweld assembly title.

Returns

HexSpotweldAssembly object

Return type

HexSpotweldAssembly

Example

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 100 in model m with 4 elements 50, 150, 250 and 350

```
var h = new HexSpotweldAssembly(m, 100, 4, 50, 150, 250, 350);
```

new HexSpotweldAssembly(Model*[Model]*, id*[integer]*, opt*[integer]*, eid1*[integer]*, eid2*[integer]*, eid3*[integer]*, eid4*[integer]*, eid5*[integer]*, eid6*[integer]*, eid7*[integer]*, eid8*[integer]*, title (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY object.

Arguments

- **Model** (Model)

Model that Hex Spotweld Assembly will be created in

- **id** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY id.

- **opt** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY opt can be 4, 8 or 16

- **eid1** (integer)

EID 1.

- **eid2** (integer)

EID 2.

- **eid3** (integer)

EID 3.

- **eid4** (integer)

EID 4.

- **eid5** (integer)

EID 5.

- **eid6** (integer)

EID 6.

- **eid7** (integer)

EID 7.

- **eid8** (integer)

EID 8.

- **title (optional)** (string)

Define hex spotweld assembly title.

Returns

HexSpotweldAssembly object

Return type

HexSpotweldAssembly

Example

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 100 in model m with 8 elements 50, 150, 250, 350, 450, 550, 650 and 750

```
var h = new HexSpotweldAssembly(m, 100, 8, 50, 150, 250, 350, 450, 550, 650, 750);
```

new HexSpotweldAssembly(Model*[Model]*, id*[integer]*, opt*[integer]*, eid1*[integer]*, eid2*[integer]*, eid3*[integer]*, eid4*[integer]*, eid5*[integer]*, eid6*[integer]*, eid7*[integer]*, eid8*[integer]*, eid9*[integer]*, eid10*[integer]*, eid11*[integer]*, eid12*[integer]*, eid13*[integer]*, eid14*[integer]*, eid15*[integer]*, eid16*[integer]*, title (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY object.

Arguments

- **Model** (Model)

Model that Hex Spotweld Assembly will be created in

- **id** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY id.

- **opt** (integer)

*DEFINE_HEX_SPOTWELD_ASSEMBLY opt can be 4, 8 or 16

- **eid1** (integer)

EID 1.

- **eid2** (integer)

EID 2.

- **eid3** (integer)

EID 3.

- **eid4** (integer)

EID 4.

- **eid5** (integer)

EID 5.

- **eid6** (integer)

EID 6.

- **eid7** (integer)

EID 7.

- **eid8** (integer)

EID 8.

- **eid9** (integer)

EID 9.

- **eid10** (integer)

EID 10.

- **eid11** (integer)

EID 11.

- **eid12** (integer)

EID 12.

- **eid13** (integer)

EID 13.

- **eid14** (integer)

EID 14.

- **eid15** (integer)

EID 15.

- **eid16** (integer)

EID 16.

- **title (optional)** (string)

Define hex spotweld assembly title.

Returns

HexSpotweldAssembly object

Return type

HexSpotweldAssembly

Example

To create a new *DEFINE_HEX_SPOTWELD_ASSEMBLY with ID 100 in model m with 16 elements 50, 150, 250, 350, 450, 550, 650, 750, 850, 950, 1050, 1150, 1250, 1350, 1450 and 1550

```
var h = new HexSpotweldAssembly(m, 100, 16, 50, 150, 250, 350, 450, 550, 650,
750, 850, 950, 1050, 1150, 1250, 1350, 1450, 1550);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

- **Comment** (Comment)

Comment that will be attached to the DEFINE_HEX_SPOTWELD_ASSEMBLY

Returns

No return value

Example

To associate comment c to the DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

- **flag** (Flag)

Flag to clear on the DEFINE_HEX_SPOTWELD_ASSEMBLY

Returns

No return value

Example

To clear flag f for DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the DEFINE_HEX_SPOTWELD_ASSEMBLY. The target include of the copied DEFINE_HEX_SPOTWELD_ASSEMBLY can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

HexSpotweldAssembly object

Return type

HexSpotweldAssembly

Example

To copy DEFINE_HEX_SPOTWELD_ASSEMBLY h into DEFINE_HEX_SPOTWELD_ASSEMBLY z:

```
var z = h.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a HexSpotweldAssembly.

Arguments

- **Model** (Model)

Model that the Hex Spotweld Assembly will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

HexSpotweldAssembly object (or null if not made)

Return type

HexSpotweldAssembly

Example

To start creating a HexSpotweldAssem in model s:

```
var s = HexSpotweldAssembly.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

- **Comment** (Comment)

Comment that will be detached from the DEFINE_HEX_SPOTWELD_ASSEMBLY

Returns

No return value

Example

To detach comment c from the DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for DEFINE_HEX_SPOTWELD_ASSEMBLY. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first DEFINE_HEX_SPOTWELD_ASSEMBLY in the model.

Arguments

- **Model** (Model)

Model to get first DEFINE_HEX_SPOTWELD_ASSEMBLY in

Returns

HexSpotweldAssembly object (or null if there are no DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model).

Return type

HexSpotweldAssembly

Example

To get the first DEFINE_HEX_SPOTWELD_ASSEMBLY in model m:

```
var h = HexSpotweldAssembly.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free DEFINE_HEX_SPOTWELD_ASSEMBLY label in the model. Also see HexSpotweldAssembly.LastFreeLabel(), HexSpotweldAssembly.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free DEFINE_HEX_SPOTWELD_ASSEMBLY label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

HexSpotweldAssembly label.

Return type

Number

Example

To get the first free DEFINE_HEX_SPOTWELD_ASSEMBLY label in model m:

```
var label = HexSpotweldAssembly.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all DEFINE_HEX_SPOTWELD_ASSEMBLYs will be flagged in

- **flag** (Flag)

Flag to set on the DEFINE_HEX_SPOTWELD_ASSEMBLYs

Returns

No return value

Example

To flag all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs with flag f in model m:

```
HexSpotweldAssembly.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the DEFINE_HEX_SPOTWELD_ASSEMBLY is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the DEFINE_HEX_SPOTWELD_ASSEMBLY

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if DEFINE_HEX_SPOTWELD_ASSEMBLY h has flag f set on it:

```
if (h.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each DEFINE_HEX_SPOTWELD_ASSEMBLY in the model.
Note that ForEach has been designed to make looping over DEFINE_HEX_SPOTWELD_ASSEMBLYs as fast as possible and so has some limitations.
Firstly, a single temporary HexSpotweldAssembly object is created and on each function call it is updated with the current DEFINE_HEX_SPOTWELD_ASSEMBLY data. This means that you should not try to store the HexSpotweldAssembly object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new DEFINE_HEX_SPOTWELD_ASSEMBLYs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all DEFINE_HEX_SPOTWELD_ASSEMBLYs are in

- **func** (function)

Function to call for each DEFINE_HEX_SPOTWELD_ASSEMBLY

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m:

```
HexSpotweldAssembly.ForEach(m, test);
function test(h)
{
// h is HexSpotweldAssembly object
}
```

To call function test for all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m with optional object:

```
var data = { x:0, y:0 };
HexSpotweldAssembly.ForEach(m, test, data);
function test(h, extra)
{
// h is HexSpotweldAssembly object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of HexSpotweldAssembly objects for all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get DEFINE_HEX_SPOTWELD_ASSEMBLYs from

Returns

Array of HexSpotweldAssembly objects

Return type

Array

Example

To make an array of HexSpotweldAssembly objects for all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m

```
var h = HexSpotweldAssembly.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
var comm_array = h.GetComments();
```

GetFlagged(Model[*Model*], flag[*Flag*]) [static]

Description

Returns an array of HexSpotweldAssembly objects for all of the flagged DEFINE_HEX_SPOTWELD_ASSEMBLYs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get DEFINE_HEX_SPOTWELD_ASSEMBLYs from

- **flag** (Flag)

Flag set on the DEFINE_HEX_SPOTWELD_ASSEMBLYs that you want to retrieve

Returns

Array of HexSpotweldAssembly objects

Return type

Array

Example

To make an array of HexSpotweldAssembly objects for all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m flagged with f

```
var h = HexSpotweldAssembly.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the HexSpotweldAssembly object for a DEFINE_HEX_SPOTWELD_ASSEMBLY ID.

Arguments

- **Model** (Model)

Model to find the DEFINE_HEX_SPOTWELD_ASSEMBLY in

- **number** (integer)

number of the DEFINE_HEX_SPOTWELD_ASSEMBLY you want the HexSpotweldAssembly object for

Returns

HexSpotweldAssembly object (or null if DEFINE_HEX_SPOTWELD_ASSEMBLY does not exist).

Return type

HexSpotweldAssembly

Example

To get the HexSpotweldAssembly object for DEFINE_HEX_SPOTWELD_ASSEMBLY 100 in model m

```
var h = HexSpotweldAssembly.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a HexSpotweldAssembly property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the HexSpotweldAssembly.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

DEFINE_HEX_SPOTWELD_ASSEMBLY property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if HexSpotweldAssembly property h.example is a parameter:

```
Options.property_parameter_names = true;
if (h.GetParameter(h.example) ) do_something...
Options.property_parameter_names = false;
```

To check if HexSpotweldAssembly property h.example is a parameter by using the GetParameter method:

```
if (h.ViewParameters().GetParameter(h.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this HexSpotweldAssembly (*DEFINE_HEX_SPOTWELD_ASSEMBLY). **Note that a carriage return is not added**. See also HexSpotweldAssembly.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for HexSpotweldAssem s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the HexSpotweldAssem. **Note that a carriage return is not added**. See also HexSpotweldAssembly.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for HexSpotweldAssem s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last DEFINE_HEX_SPOTWELD_ASSEMBLY in the model.

Arguments

- **Model** (Model)

Model to get last DEFINE_HEX_SPOTWELD_ASSEMBLY in

Returns

HexSpotweldAssembly object (or null if there are no DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model).

Return type

HexSpotweldAssembly

Example

To get the last DEFINE_HEX_SPOTWELD_ASSEMBLY in model m:

```
var h = HexSpotweldAssembly.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free DEFINE_HEX_SPOTWELD_ASSEMBLY label in the model. Also see HexSpotweldAssembly.FirstFreeLabel(), HexSpotweldAssembly.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free DEFINE_HEX_SPOTWELD_ASSEMBLY label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

HexSpotweldAssembly label.

Return type

Number

Example

To get the last free DEFINE_HEX_SPOTWELD_ASSEMBLY label in model m:

```
var label = HexSpotweldAssembly.LastFreeLabel(m);
```

Next()

Description

Returns the next DEFINE_HEX_SPOTWELD_ASSEMBLY in the model.

Arguments

No arguments

Returns

HexSpotweldAssembly object (or null if there are no more DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model).

Return type

HexSpotweldAssembly

Example

To get the DEFINE_HEX_SPOTWELD_ASSEMBLY in model m after DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
var h = h.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) DEFINE_HEX_SPOTWELD_ASSEMBLY label in the model. Also see HexSpotweldAssembly.FirstFreeLabel(), HexSpotweldAssembly.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free DEFINE_HEX_SPOTWELD_ASSEMBLY label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

HexSpotweldAssembly label.

Return type

Number

Example

To get the next free DEFINE_HEX_SPOTWELD_ASSEMBLY label in model m:

```
var label = HexSpotweldAssembly.NextFreeLabel(m);
```

Previous()

Description

Returns the previous DEFINE_HEX_SPOTWELD_ASSEMBLY in the model.

Arguments

No arguments

Returns

HexSpotweldAssembly object (or null if there are no more DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model).

Return type

HexSpotweldAssembly

Example

To get the DEFINE_HEX_SPOTWELD_ASSEMBLY in model m before DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
var h = h.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model.

Arguments

- **Model** (Model)

Model that all DEFINE_HEX_SPOTWELD_ASSEMBLYs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m, from 1000000:

```
HexSpotweldAssembly.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model.

Arguments

- **Model** (Model)

Model that all the flagged DEFINE_HEX_SPOTWELD_ASSEMBLYs will be renumbered in

- **flag** (Flag)

Flag set on the DEFINE_HEX_SPOTWELD_ASSEMBLYs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m flagged with f, from 1000000:

```
HexSpotweldAssembly.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select DEFINE_HEX_SPOTWELD_ASSEMBLYs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting DEFINE_HEX_SPOTWELD_ASSEMBLYs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only DEFINE_HEX_SPOTWELD_ASSEMBLYs from that model can be selected. If the argument is a Flag then only DEFINE_HEX_SPOTWELD_ASSEMBLYs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any DEFINE_HEX_SPOTWELD_ASSEMBLYs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of DEFINE_HEX_SPOTWELD_ASSEMBLYs selected or null if menu cancelled

Return type

Number

Example

To select DEFINE_HEX_SPOTWELD_ASSEMBLYs from model m, flagging those selected with flag f, giving the prompt 'Select DEFINE_HEX_SPOTWELD_ASSEMBLYs':

```
HexSpotweldAssembly.Select(f, 'Select DEFINE_HEX_SPOTWELD_ASSEMBLYs', m);
```

To select DEFINE_HEX_SPOTWELD_ASSEMBLYs, flagging those selected with flag f but limiting selection to DEFINE_HEX_SPOTWELD_ASSEMBLYs flagged with flag l, giving the prompt 'Select DEFINE_HEX_SPOTWELD_ASSEMBLYs':

```
HexSpotweldAssembly.Select(f, 'Select DEFINE_HEX_SPOTWELD_ASSEMBLYs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

- **flag** (Flag)

Flag to set on the DEFINE_HEX_SPOTWELD_ASSEMBLY

Returns

No return value

Example

To set flag f for DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing DEFINE_HEX_SPOTWELD_ASSEMBLYs should be counted. If false or omitted referenced but undefined DEFINE_HEX_SPOTWELD_ASSEMBLYs will also be included in the total.

Returns

number of DEFINE_HEX_SPOTWELD_ASSEMBLYs

Return type

Number

Example

To get the total number of DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m:

```
var total = HexSpotweldAssembly.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the DEFINE_HEX_SPOTWELD_ASSEMBLYs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all DEFINE_HEX_SPOTWELD_ASSEMBLYs will be unset in

- **flag** (Flag)

Flag to unset on the DEFINE_HEX_SPOTWELD_ASSEMBLYs

Returns

No return value

Example

To unset the flag f on all the DEFINE_HEX_SPOTWELD_ASSEMBLYs in model m:

```
HexSpotweldAssembly.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

HexSpotweldAssembly object.

Return type

HexSpotweldAssembly

Example

To check if HexSpotweldAssembly property h.example is a parameter by using the HexSpotweldAssembly.GetParameter() method:

```
if (h.ViewParameters().GetParameter(h.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for DEFINE_HEX_SPOTWELD_ASSEMBLY. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
h.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this DEFINE_HEX_SPOTWELD_ASSEMBLY.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for DEFINE_HEX_SPOTWELD_ASSEMBLY h:

```
var xrefs = h.Xrefs();
```

---

toString()

Description

Creates a string containing the HexSpotweldAssem data in keyword format. Note that this contains the keyword header and the keyword cards. See also HexSpotweldAssembly.Keyword() and HexSpotweldAssembly.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for HexSpotweldAssem s in keyword format

```
var str = s.toString();
```

StagedConstructionPart class

The StagedConstructionPart class gives you access to Define staged construction part cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StagedConstructionPart constants

Name	Description
StagedConstructionPart.PART	DEFN is *DEFINE_STAGED_CONSTRUCTION_PART.
StagedConstructionPart.SET	DEFN is *DEFINE_STAGED_CONSTRUCTION_PART_SET.

StagedConstructionPart properties

Name	Type	Description
exists (read only)	logical	true if Define staged construction parts exists, false if referred to but not defined
id	integer	Part ID or part set ID (not internal label)
include	integer	The Include file number that the Define staged construction parts is in.
label (read only)	integer	The label the Define staged construction parts has in PRIMER
model (read only)	integer	The Model number that the Define staged construction part is in.
option	constant	The Define staged construction parts option. Can be StagedConstructionPart.PART or StagedConstructionPart.SET.
stga	integer	Construction stage at which part is added.
stgr	integer	Construction stage at which part is removed.

Detailed Description

The StagedConstructionPart class allows you to create, modify, edit and manipulate Define staged construction parts cards. See the documentation below for more details.

Constructor

new StagedConstructionPart(Model*[Model]*, option*[constant]*, id*[integer]*, stga*[integer]*, stgr*[integer]*)

Description

Create a new StagedConstructionPart object.

Arguments

- **Model** (Model)

Model that Define staged construction parts will be created in

- **option** (constant)

Specify the type of Define staged construction parts. Can be StagedConstructionPart.PART or StagedConstructionPart.SET)

- **id** (integer)

Part ID or part set ID

- **stga** (integer)

Construction stage at which part is added.

- **stgr** (integer)

Construction stage at which part is removed.

Returns

StagedConstructionPart object

Return type

StagedConstructionPart

Example

To create a new Define staged construction part in model m, of type SET, with part set 9, stga 18 and stgr 12

```
var scp = new StagedConstructionPart(m, StagedConstructionPart.SET, 9, 18, 12);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a Define staged construction part.

Arguments

- **Comment** (Comment)

Comment that will be attached to the Define staged construction part

Returns

No return value

Example

To associate comment c to the Define staged construction part scp:

```
scp.AssociateComment(c);
```

Blank()

Description

Blanks the Define staged construction part

Arguments

No arguments

Returns

No return value

Example

To blank Define staged construction part scp:

```
scp.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that all Define staged construction parts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the Define staged construction parts in model m:

```
StagedConstructionPart.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that all the flagged Define staged construction parts will be blanked in

- **flag** (Flag)

Flag set on the Define staged construction parts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the Define staged construction parts in model m flagged with f:

```
StagedConstructionPart.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the Define staged construction part is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if Define staged construction part scp is blanked:

```
if (scp.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse Define staged construction part scp:

```
scp.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the Define staged construction part.

Arguments

- **flag** (Flag)

Flag to clear on the Define staged construction part

Returns

No return value

Example

To clear flag f for Define staged construction part scp:

```
scp.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the Define staged construction part. The target include of the copied Define staged construction part can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StagedConstructionPart object

Return type

StagedConstructionPart

Example

To copy Define staged construction part scp into Define staged construction part z:

```
var z = scp.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a Define staged construction parts card.

Arguments

- **Model** (Model)

Model that the Define staged construction parts card will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

StagedConstructionPart object (or null if not made)

Return type

StagedConstructionPart

Example

To start creating a Define staged construction parts card in model m:

```
var scp = StagedConstructionPart.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a Define staged construction part.

Arguments

- **Comment** (Comment)

Comment that will be detached from the Define staged construction part

Returns

No return value

Example

To detach comment c from the Define staged construction part scp:

```
scp.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit Define staged construction part scp:

```
scp.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for Define staged construction part. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for Define staged construction part scp:

```
scp.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first Define staged construction part in the model.

Arguments

- **Model** (Model)

Model to get first Define staged construction part in

Returns

StagedConstructionPart object (or null if there are no Define staged construction parts in the model).

Return type

StagedConstructionPart

Example

To get the first Define staged construction part in model m:

```
var scp = StagedConstructionPart.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the Define staged construction parts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all Define staged construction parts will be flagged in

- **flag** (Flag)

Flag to set on the Define staged construction parts

Returns

No return value

Example

To flag all of the Define staged construction parts with flag f in model m:

```
StagedConstructionPart.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the Define staged construction part is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the Define staged construction part

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if Define staged construction part scp has flag f set on it:

```
if (scp.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each Define staged construction part in the model.
Note that ForEach has been designed to make looping over Define staged construction parts as fast as possible and so has some limitations.
Firstly, a single temporary StagedConstructionPart object is created and on each function call it is updated with the current Define staged construction part data. This means that you should not try to store the StagedConstructionPart object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new Define staged construction parts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all Define staged construction parts are in

- **func** (function)

Function to call for each Define staged construction part

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the Define staged construction parts in model m:

```
StagedConstructionPart.ForEach(m, test);
function test(scp)
{
// scp is StagedConstructionPart object
}
```

To call function test for all of the Define staged construction parts in model m with optional object:

```
var data = { x:0, y:0 };
StagedConstructionPart.ForEach(m, test, data);
function test(scp, extra)
{
// scp is StagedConstructionPart object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StagedConstructionPart objects for all of the Define staged construction parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get Define staged construction parts from

Returns

Array of StagedConstructionPart objects

Return type

Array

Example

To make an array of StagedConstructionPart objects for all of the Define staged construction parts in model m

```
var scp = StagedConstructionPart.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a Define staged construction part.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the Define staged construction part scp:

```
var comm_array = scp.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StagedConstructionPart objects for all of the flagged Define staged construction parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get Define staged construction parts from

- **flag** (Flag)

Flag set on the Define staged construction parts that you want to retrieve

Returns

Array of StagedConstructionPart objects

Return type

Array

Example

To make an array of StagedConstructionPart objects for all of the Define staged construction parts in model m flagged with f

```
var scp = StagedConstructionPart.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StagedConstructionPart object for a Define staged construction part ID.

Arguments

- **Model** (Model)

Model to find the Define staged construction part in

- **number** (integer)

number of the Define staged construction part you want the StagedConstructionPart object for

Returns

StagedConstructionPart object (or null if Define staged construction part does not exist).

Return type

StagedConstructionPart

Example

To get the StagedConstructionPart object for Define staged construction part 100 in model m

```
var scp = StagedConstructionPart.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a StagedConstructionPart property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StagedConstructionPart.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

Define staged construction part property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StagedConstructionPart property scp.example is a parameter:

```
Options.property_parameter_names = true;
if (scp.GetParameter(scp.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StagedConstructionPart property scp.example is a parameter by using the GetParameter method:

```
if (scp.ViewParameters().GetParameter(scp.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this Define staged construction parts (*Define_staged_construction_part). **Note that a carriage return is not added**. See also StagedConstructionPart.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Define staged construction parts scp:

```
var key = scp.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Define staged construction parts. **Note that a carriage return is not added**. See also StagedConstructionPart.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Define staged construction parts scp:

```
var cards = scp.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last Define staged construction part in the model.

Arguments

- **Model** (Model)

Model to get last Define staged construction part in

Returns

StagedConstructionPart object (or null if there are no Define staged construction parts in the model).

Return type

StagedConstructionPart

Example

To get the last Define staged construction part in model m:

```
var scp = StagedConstructionPart.Last(m);
```

Next()

Description

Returns the next Define staged construction part in the model.

Arguments

No arguments

Returns

StagedConstructionPart object (or null if there are no more Define staged construction parts in the model).

Return type

StagedConstructionPart

Example

To get the Define staged construction part in model m after Define staged construction part scp:

```
var scp = scp.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a Define staged construction part.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only Define staged construction parts from that model can be picked. If the argument is a Flag then only Define staged construction parts that are flagged with *limit* can be selected. If omitted, or null, any Define staged construction parts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StagedConstructionPart object (or null if not picked)

Return type

StagedConstructionPart

Example

To pick a Define staged construction part from model m giving the prompt 'Pick Define staged construction part from screen':

```
var scp = StagedConstructionPart.Pick('Pick Define staged construction part from screen', m);
```

Previous()

Description

Returns the previous Define staged construction part in the model.

Arguments

No arguments

Returns

StagedConstructionPart object (or null if there are no more Define staged construction parts in the model).

Return type

StagedConstructionPart

Example

To get the Define staged construction part in model m before Define staged construction part scp:

```
var scp = scp.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select Define staged construction parts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting Define staged construction parts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only Define staged construction parts from that model can be selected. If the argument is a Flag then only Define staged construction parts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any Define staged construction parts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of Define staged construction parts selected or null if menu cancelled

Return type

Number

Example

To select Define staged construction parts from model m, flagging those selected with flag f, giving the prompt 'Select Define staged construction parts':

```
StagedConstructionPart.Select(f, 'Select Define staged construction parts', m);
```

To select Define staged construction parts, flagging those selected with flag f but limiting selection to Define staged construction parts flagged with flag l, giving the prompt 'Select Define staged construction parts':

```
StagedConstructionPart.Select(f, 'Select Define staged construction parts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the Define staged construction part.

Arguments

- **flag** (Flag)

Flag to set on the Define staged construction part

Returns

No return value

Example

To set flag f for Define staged construction part scp:

```
scp.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the Define staged construction part. The Define staged construction part will be sketched until you either call StagedConstructionPart.Unsketch(), StagedConstructionPart.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the Define staged construction part is sketched. If omitted redraw is true. If you want to sketch several Define staged construction parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch Define staged construction part scp:

```
scp.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged Define staged construction parts in the model. The Define staged construction parts will be sketched until you either call StagedConstructionPart.Unsketch(), StagedConstructionPart.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged Define staged construction parts will be sketched in

- **flag** (Flag)

Flag set on the Define staged construction parts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the Define staged construction parts are sketched. If omitted redraw is true. If you want to sketch flagged Define staged construction parts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all Define staged construction parts flagged with flag in model m:

```
StagedConstructionPart.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing Define staged construction parts should be counted. If false or omitted referenced but undefined Define staged construction parts will also be included in the total.

Returns

number of Define staged construction parts

Return type

Number

Example

To get the total number of Define staged construction parts in model m:

```
var total = StagedConstructionPart.Total(m);
```

Unblank()

Description

Unblanks the Define staged construction part

Arguments

No arguments

Returns

No return value

Example

To unblank Define staged construction part scp:

```
scp.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that all Define staged construction parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the Define staged construction parts in model m:

```
StagedConstructionPart.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that the flagged Define staged construction parts will be unblanked in

- **flag** (Flag)

Flag set on the Define staged construction parts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the Define staged construction parts in model m flagged with f:

```
StagedConstructionPart.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all Define staged construction parts will be unset in

- **flag** (Flag)

Flag to unset on the Define staged construction parts

Returns

No return value

Example

To unset the flag f on all the Define staged construction parts in model m:

```
StagedConstructionPart.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the Define staged construction part.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the Define staged construction part is unsketched. If omitted redraw is true. If you want to unsketch several Define staged construction parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch Define staged construction part scp:

```
scp.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all Define staged construction parts.

Arguments

- **Model** (Model)

Model that all Define staged construction parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the Define staged construction parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all Define staged construction parts in model m:

```
StagedConstructionPart.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged Define staged construction parts in the model.

Arguments

- **Model** (Model)

Model that all Define staged construction parts will be unsketched in

- **flag** (Flag)

Flag set on the Define staged construction parts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the Define staged construction parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all Define staged construction parts flagged with flag in model m:

```
StagedConstructionPart.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StagedConstructionPart object.

Return type

StagedConstructionPart

Example

To check if StagedConstructionPart property scp.example is a parameter by using the StagedConstructionPart.GetParameter() method:

```
if (scp.ViewParameters().GetParameter(scp.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for Define staged construction part. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for Define staged construction part scp:

```
scp.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this Define staged construction part.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for Define staged construction part scp:

```
var xrefs = scp.Xrefs();
```

---

toString()

Description

Creates a string containing the Define staged construction parts data in keyword format. Note that this contains the keyword header and the keyword cards. See also StagedConstructionPart.Keyword() and StagedConstructionPart.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Define staged construction parts scp in keyword format

```
var s = scp.toString();
```

Transformation class

The Transformation class gives you access to define transform cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- Xrefs()
- toString()

Transformation properties

Name	Type	Description
exists (read only)	logical	true if transformation exists, false if referred to but not defined.
include	integer	The Include file number that the transformation is in.
label	integer	Transformation number. Also see the tranid property which is an alternative name for this.

model (read only)	integer	The Model number that the transformation is in.
nrow (read only)	integer	Number of rows of transformations
title	string	The title for the transformation.
tranid	integer	Transformation number. Also see the label property which is an alternative name for this.

Detailed Description

The Transformation class allows you to create, modify, edit and manipulate define transformation cards. See the documentation below for more details.

Constructor

new Transformation(Model*[Model]*, tranid*[integer]*, title (optional)*[string]*)

Description

Create a new Transformation object.

Arguments

- **Model** (Model)

Model that transformation will be created in

- **tranid** (integer)

Transformation label

- **title (optional)** (string)

Transformation title

Returns

Transformation object

Return type

Transformation

Example

To create a new transformation in model m with label 1000 and title "Example transform"

```
var t = new Transformation(m, 1000, "Example transform");
```

Details of functions

AddRow(data*[Array of data]*, row (optional)*[integer]*)

Description

Adds a row of data for a *DEFINE_TRANSFORMATION.

Arguments

- **data** (Array of data)

The data you want to add

- **row (optional)** (integer)

The row you want to add the data at. Existing transforms will be shifted. If omitted the data will be added to the end of the existing transforms. **Note that row indices start at 0**.

Returns

No return value.

Example

To add a translation of (0, 0, 100) to transformation t:

```
var array = ["TRANSL", 0, 0, 100];
t.AddRow(array);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a transformation.

Arguments

- **Comment** (Comment)

Comment that will be attached to the transformation

Returns

No return value

Example

To associate comment c to the transformation t:

```
t.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse transformation t:

```
t.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the transformation.

Arguments

- **flag** (Flag)

Flag to clear on the transformation

Returns

No return value

Example

To clear flag f for transformation t:

```
t.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the transformation. The target include of the copied transformation can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Transformation object

Return type

Transformation

Example

To copy transformation t into transformation z:

```
var z = t.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a define transformation definition.

Arguments

- **Model** (Model)

Model that the transformation will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Transformation object (or null if not made)

Return type

Transformation

Example

To start creating a define transformation definition in model m:

```
var t = Transformation.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a transformation.

Arguments

- **Comment** (Comment)

Comment that will be detached from the transformation

Returns

No return value

Example

To detach comment c from the transformation t:

```
t.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit transformation t:

```
t.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for transformation. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for transformation t:

```
t.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first transformation in the model.

Arguments

- **Model** (Model)

Model to get first transformation in

Returns

Transformation object (or null if there are no transformations in the model).

Return type

Transformation

Example

To get the first transformation in model m:

```
var t = Transformation.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free transformation label in the model. Also see Transformation.LastFreeLabel(), Transformation.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free transformation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Transformation label.

Return type

Number

Example

To get the first free transformation label in model m:

```
var label = Transformation.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the transformations in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all transformations will be flagged in

- **flag** (Flag)

Flag to set on the transformations

Returns

No return value

Example

To flag all of the transformations with flag f in model m:

```
Transformation.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the transformation is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the transformation

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if transformation t has flag f set on it:

```
if (t.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each transformation in the model.
Note that ForEach has been designed to make looping over transformations as fast as possible and so has some limitations.
Firstly, a single temporary Transformation object is created and on each function call it is updated with the current transformation data. This means that you should not try to store the Transformation object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new transformations inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all transformations are in

- **func** (function)

Function to call for each transformation

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the transformations in model m:

```
Transformation.ForEach(m, test);
function test(t)
{
// t is Transformation object
}
```

To call function test for all of the transformations in model m with optional object:

```
var data = { x:0, y:0 };
Transformation.ForEach(m, test, data);
function test(t, extra)
{
// t is Transformation object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Transformation objects for all of the transformations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get transformations from

Returns

Array of Transformation objects

Return type

Array

Example

To make an array of Transformation objects for all of the transformations in model m

```
var t = Transformation.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a transformation.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the transformation t:

```
var comm_array = t.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Transformation objects for all of the flagged transformations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get transformations from

- **flag** (Flag)

Flag set on the transformations that you want to retrieve

Returns

Array of Transformation objects

Return type

Array

Example

To make an array of Transformation objects for all of the transformations in model m flagged with f

```
var t = Transformation.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Transformation object for a transformation ID.

Arguments

- **Model** (Model)

Model to find the transformation in

- **number** (integer)

number of the transformation you want the Transformation object for

Returns

Transformation object (or null if transformation does not exist).

Return type

Transformation

Example

To get the Transformation object for transformation 100 in model m

```
var t = Transformation.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Transformation property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Transformation.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

transformation property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Transformation property t.example is a parameter:

```
Options.property_parameter_names = true;
if (t.GetParameter(t.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Transformation property t.example is a parameter by using the GetParameter method:

```
if (t.ViewParameters().GetParameter(t.example) ) do_something...
```

GetRow(row*[integer]*)

Description

Returns the data for a row in the transformation.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

An array of numbers containing the row variables.

Return type

Number

Example

To get the data for the 2nd row in transformation t:

```
var data = t.GetRow(1);
```

Keyword()

Description

Returns the keyword for this transformation. **Note that a carriage return is not added**. See also Transformation.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for transformation t:

```
var key = t.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the transformation. **Note that a carriage return is not added**. See also Transformation.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for transformation i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last transformation in the model.

Arguments

- **Model** (Model)

Model to get last transformation in

Returns

Transformation object (or null if there are no transformations in the model).

Return type

Transformation

Example

To get the last transformation in model m:

```
var t = Transformation.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free transformation label in the model. Also see Transformation.FirstFreeLabel(), Transformation.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free transformation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Transformation label.

Return type

Number

Example

To get the last free transformation label in model m:

```
var label = Transformation.LastFreeLabel(m);
```

Next()

Description

Returns the next transformation in the model.

Arguments

No arguments

Returns

Transformation object (or null if there are no more transformations in the model).

Return type

Transformation

Example

To get the transformation in model m after transformation t:

```
var t = t.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) transformation label in the model. Also see Transformation.FirstFreeLabel(), Transformation.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free transformation label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Transformation label.

Return type

Number

Example

To get the next free transformation label in model m:

```
var label = Transformation.NextFreeLabel(m);
```

Previous()

Description

Returns the previous transformation in the model.

Arguments

No arguments

Returns

Transformation object (or null if there are no more transformations in the model).

Return type

Transformation

Example

To get the transformation in model m before transformation t:

```
var t = t.Previous();
```

RemoveRow(row*[integer]*)

Description

Removes the data for a row in *DEFINE_TRANSFORMATION.

Arguments

- **row** (integer)

The row you want to remove the data for. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second row of data for transformation t:

```
t.RemoveRow(1);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select transformations using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting transformations

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only transformations from that model can be selected. If the argument is a Flag then only transformations that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any transformations can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of transformations selected or null if menu cancelled

Return type

Number

Example

To select transformations from model m, flagging those selected with flag f, giving the prompt 'Select transformations':

```
Transformation.Select(f, 'Select transformations', m);
```

To select transformations, flagging those selected with flag f but limiting selection to transformations flagged with flag l, giving the prompt 'Select transformations':

```
Transformation.Select(f, 'Select transformations', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the transformation.

Arguments

- **flag** (Flag)

Flag to set on the transformation

Returns

No return value

Example

To set flag f for transformation t:

```
t.SetFlag(f);
```

SetRow(row*[integer]*, data*[Array of data]*)

Description

Sets the data for a row in *DEFINE_TRANSFORMATION.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **data** (Array of data)

The data you want to set the row to

Returns

No return value.

Example

To set the second row of data for transformation t to be a translation of (0, 0, 100):

```
var array = ["TRANSL", 0, 0, 100];
t.SetRow(1, array);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of transformations in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing transformations should be counted. If false or omitted referenced but undefined transformations will also be included in the total.

Returns

number of transformations

Return type

Number

Example

To get the total number of transformations in model m:

```
var total = Transformation.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the transformations in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all transformations will be unset in

- **flag** (Flag)

Flag to unset on the transformations

Returns

No return value

Example

To unset the flag f on all the transformations in model m:

```
Transformation.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Transformation object.

Return type

Transformation

Example

To check if Transformation property t.example is a parameter by using the Transformation.GetParameter() method:

```
if (t.ViewParameters().GetParameter(t.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for transformation. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for transformation t:

```
t.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this transformation.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for transformation t:

```
var xrefs = t.Xrefs();
```

---

toString()

Description

Creates a string containing the transformation data in keyword format. Note that this contains the keyword header and the keyword cards. See also Transformation.Keyword() and Transformation.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for transformation t in keyword format

```
var s = t.toString();
```

Vector class

The Vector class gives you access to define vector cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Vector properties

Name	Type	Description
cid	int	Coordinate system ID
exists (read only)	logical	true if vector exists, false if referred to but not defined.
heading	string	Vector heading
include	integer	The Include file number that the vector is in.
label	integer	Vector number. Also see the vid property which is an alternative name for this.
model (read only)	integer	The Model number that the vector is in.
nodeh	int	Node ID for head of vector (for _NODES option)
nodes	logical	_NODES option
nodet	int	Node ID for tail of vector (for _NODES option)
vid	integer	Vector number. Also see the label property which is an alternative name for this.
xh	real	X coordinate of head of vector
xt	real	X coordinate of tail of vector
yh	real	Y coordinate of head of vector
yt	real	Y coordinate of tail of vector
zh	real	Z coordinate of head of vector
zt	real	Z coordinate of tail vector

Detailed Description

The Vector class allows you to create, modify, edit and manipulate vector cards. See the documentation below for more details.

Constructor

new Vector(Model*[Model]*, options*[object]*)

Description

Create a new Vector object.

Arguments

- **Model** (Model)

Model that vector will be created in

- **options** (object)

Options for creating the Vector

Object has the following properties:

Name	Type	Description
ch (optional)	array	Array of coordinates of head of vector [xh, yh, zh] (for *DEFINE_VECTOR)
cid (optional)	int	Optional coordinate system ID (for *DEFINE_VECTOR)
ct (optional)	array	Array of coordinates of tail of vector [xt, yt, zt] (for *DEFINE_VECTOR)
heading (optional)	string	Optional title for the vector

nodeh (optional)	integer	Node ID for head of vector (for *DEFINE_VECTOR_NODES)
nodes	boolean	_NODES option (true for *DEFINE_VECTOR_NODES, false for *DEFINE_VECTOR)
nodet (optional)	integer	Node ID for tail of vector (for *DEFINE_VECTOR_NODES)
vid	integer	Vector ID.

Returns

Vector object

Return type

Vector

Example

To create a new *DEFINE_VECTOR in model m with label 100 with the tail at (1.5, 2.5, 1.0) and the head at (4.5, 4.0, 3.0)

```
var v = new Vector(m, {nodes: 0, vid: 100, ct: [1.5, 2.5, 1.0], ch: [4.5, 4.0, 3.0]});
```

To create a new *DEFINE_VECTOR_NODES in model m with label 200 using node 10 for the tail and node 20 for the head

```
var v = new Vector(m, {nodes: 1, vid: 200, nodet: 10, nodeh: 20});
```

new Vector(Model*[Model]*, vid*[integer]*, xt*[real]*, yt*[real]*, zt*[real]*, xh*[real]*, yh*[real]*, zh*[real]*, cid (optional)*[int]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Vector object.

Arguments

- **Model** (Model)

Model that vector will be created in

- **vid** (integer)

Vector number

- **xt** (real)

X coordinate of tail of vector

- **yt** (real)

Y coordinate of tail of vector

- **zt** (real)

Z coordinate of tail vector

- **xh** (real)

X coordinate of head of vector

- **yh** (real)

Y coordinate of head of vector

- **zh** (real)

Z coordinate of head of vector

- **cid (optional)** (int)

Coordinate system ID

- **heading (optional)** (string)

Title for the vector

Returns

Vector object

Return type

Vector

Example

To create a new vector in model m with label 200

```
var v = new Vector(m, 200, 1.5, 2.5, 1.0, 4.5, 4.0, 3.0);
```

new Vector(Model*[Model]*, vid*[integer]*, nodet*[integer]*, nodeh*[integer]*, heading (optional)*[string]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Vector object with _NODES option.

Arguments

- **Model** (Model)

Model that vector will be created in

- **vid** (integer)

Vector number

- **nodet** (integer)

Node ID for tail of vector

- **nodeh** (integer)

Node ID for head of vector

- **heading (optional)** (string)

Title for the vector

Returns

Vector object

Return type

Vector

Example

To create a new vector in model m with label 200 using nodes 10 for the tail and 20 for the head

```
var v = new Vector(m, 200, 20, 30);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a vector.

Arguments

- **Comment** (Comment)

Comment that will be attached to the vector

Returns

No return value

Example

To associate comment c to the vector v:

```
v.AssociateComment(c);
```

Blank()

Description

Blanks the vector

Arguments

No arguments

Returns

No return value

Example

To blank vector v:

```
v.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the vectors in the model.

Arguments

- **Model** (Model)

Model that all vectors will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the vectors in model m:

```
Vector.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged vectors in the model.

Arguments

- **Model** (Model)

Model that all the flagged vectors will be blanked in

- **flag** (Flag)

Flag set on the vectors that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the vectors in model m flagged with f:

```
Vector.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the vector is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if vector v is blanked:

```
if (v.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse vector v:

```
v.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the vector.

Arguments

- **flag** (Flag)

Flag to clear on the vector

Returns

No return value

Example

To clear flag f for vector v:

```
v.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the vector. The target include of the copied vector can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Vector object

Return type

Vector

Example

To copy vector v into vector z:

```
var z = v.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a vector.

Arguments

- **Model** (Model)

Model that the vector will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Vector object (or null if not made)

Return type

Vector

Example

To start creating a vector in model m:

```
var m = Vector.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a vector.

Arguments

- **Comment** (Comment)

Comment that will be detached from the vector

Returns

No return value

Example

To detach comment c from the vector v:

```
v.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit vector v:

```
v.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for vector. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for vector v:

```
v.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first vector in the model.

Arguments

- **Model** (Model)

Model to get first vector in

Returns

Vector object (or null if there are no vectors in the model).

Return type

Vector

Example

To get the first vector in model m:

```
var v = Vector.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free vector label in the model. Also see Vector.LastFreeLabel(), Vector.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free vector label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Vector label.

Return type

Number

Example

To get the first free vector label in model m:

```
var label = Vector.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the vectors in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all vectors will be flagged in

- **flag** (Flag)

Flag to set on the vectors

Returns

No return value

Example

To flag all of the vectors with flag f in model m:

```
Vector.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the vector is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the vector

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if vector v has flag f set on it:

```
if (v.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each vector in the model.
Note that ForEach has been designed to make looping over vectors as fast as possible and so has some limitations.
Firstly, a single temporary Vector object is created and on each function call it is updated with the current vector data. This means that you should not try to store the Vector object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new vectors inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all vectors are in

- **func** (function)

Function to call for each vector

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the vectors in model m:

```
Vector.ForEach(m, test);
function test(v)
{
// v is Vector object
}
```

To call function test for all of the vectors in model m with optional object:

```
var data = { x:0, y:0 };
Vector.ForEach(m, test, data);
function test(v, extra)
{
// v is Vector object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Vector objects for all of the vectors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get vectors from

Returns

Array of Vector objects

Return type

Array

Example

To make an array of Vector objects for all of the vectors in model m

```
var v = Vector.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a vector.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the vector v:

```
var comm_array = v.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Vector objects for all of the flagged vectors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get vectors from

- **flag** (Flag)

Flag set on the vectors that you want to retrieve

Returns

Array of Vector objects

Return type

Array

Example

To make an array of Vector objects for all of the vectors in model m flagged with f

```
var v = Vector.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Vector object for a vector ID.

Arguments

- **Model** (Model)

Model to find the vector in

- **number** (integer)

number of the vector you want the Vector object for

Returns

Vector object (or null if vector does not exist).

Return type

Vector

Example

To get the Vector object for vector 100 in model m

```
var v = Vector.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Vector property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Vector.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

vector property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Vector property v.example is a parameter:

```
Options.property_parameter_names = true;
if (v.GetParameter(v.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Vector property v.example is a parameter by using the GetParameter method:

```
if (v.ViewParameters().GetParameter(v.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this vector (*DEFINE_VECTOR). **Note that a carriage return is not added**. See also Vector.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for vector m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the vector. **Note that a carriage return is not added**. See also Vector.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for vector v:

```
var cards = v.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last vector in the model.

Arguments

- **Model** (Model)

Model to get last vector in

Returns

Vector object (or null if there are no vectors in the model).

Return type

Vector

Example

To get the last vector in model m:

```
var v = Vector.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free vector label in the model. Also see Vector.FirstFreeLabel(), Vector.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free vector label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Vector label.

Return type

Number

Example

To get the last free vector label in model m:

```
var label = Vector.LastFreeLabel(m);
```

Next()

Description

Returns the next vector in the model.

Arguments

No arguments

Returns

Vector object (or null if there are no more vectors in the model).

Return type

Vector

Example

To get the vector in model m after vector v:

```
var v = v.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) vector label in the model. Also see Vector.FirstFreeLabel(), Vector.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free vector label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Vector label.

Return type

Number

Example

To get the next free vector label in model m:

```
var label = Vector.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a vector.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only vectors from that model can be picked. If the argument is a Flag then only vectors that are flagged with *limit* can be selected. If omitted, or null, any vectors from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Vector object (or null if not picked)

Return type

Vector

Example

To pick a vector from model m giving the prompt 'Pick vector from screen':

```
var v = Vector.Pick('Pick vector from screen', m);
```

Previous()

Description

Returns the previous vector in the model.

Arguments

No arguments

Returns

Vector object (or null if there are no more vectors in the model).

Return type

Vector

Example

To get the vector in model m before vector v:

```
var v = v.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the vectors in the model.

Arguments

- **Model** (Model)

Model that all vectors will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the vectors in model m, from 1000000:

```
Vector.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged vectors in the model.

Arguments

- **Model** (Model)

Model that all the flagged vectors will be renumbered in

- **flag** (Flag)

Flag set on the vectors that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the vectors in model m flagged with f, from 1000000:

```
Vector.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select vectors using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting vectors

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only vectors from that model can be selected. If the argument is a Flag then only vectors that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any vectors can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of vectors selected or null if menu cancelled

Return type

Number

Example

To select vectors from model m, flagging those selected with flag f, giving the prompt 'Select vectors':

```
Vector.Select(f, 'Select vectors', m);
```

To select vectors, flagging those selected with flag f but limiting selection to vectors flagged with flag l, giving the prompt 'Select vectors':

```
Vector.Select(f, 'Select vectors', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the vector.

Arguments

- **flag** (Flag)

Flag to set on the vector

Returns

No return value

Example

To set flag f for vector v:

```
v.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the vector. The vector will be sketched until you either call Vector.Unsketch(), Vector.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the vector is sketched. If omitted redraw is true. If you want to sketch several vectors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch vector v:

```
v.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged vectors in the model. The vectors will be sketched until you either call Vector.Unsketch(), Vector.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged vectors will be sketched in

- **flag** (Flag)

Flag set on the vectors that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the vectors are sketched. If omitted redraw is true. If you want to sketch flagged vectors several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all vectors flagged with flag in model m:

```
Vector.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of vectors in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing vectors should be counted. If false or omitted referenced but undefined vectors will also be included in the total.

Returns

number of vectors

Return type

Number

Example

To get the total number of vectors in model m:

```
var total = Vector.Total(m);
```

Unblank()

Description

Unblanks the vector

Arguments

No arguments

Returns

No return value

Example

To unblank vector v:

```
v.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the vectors in the model.

Arguments

- **Model** (Model)

Model that all vectors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the vectors in model m:

```
Vector.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged vectors in the model.

Arguments

- **Model** (Model)

Model that the flagged vectors will be unblanked in

- **flag** (Flag)

Flag set on the vectors that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the vectors in model m flagged with f:

```
Vector.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the vectors in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all vectors will be unset in

- **flag** (Flag)

Flag to unset on the vectors

Returns

No return value

Example

To unset the flag f on all the vectors in model m:

```
Vector.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the vector.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the vector is unsketched. If omitted redraw is true. If you want to unsketch several vectors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch vector v:

```
v.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all vectors.

Arguments

- **Model** (Model)

Model that all vectors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the vectors are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all vectors in model m:

```
Vector.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged vectors in the model.

Arguments

- **Model** (Model)

Model that all vectors will be unsketched in

- **flag** (Flag)

Flag set on the vectors that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the vectors are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all vectors flagged with flag in model m:

```
Vector.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Vector object.

Return type

Vector

Example

To check if Vector property v.example is a parameter by using the Vector.GetParameter() method:

```
if (v.ViewParameters().GetParameter(v.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for vector. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for vector v:

```
v.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this vector.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for vector v:

```
var xrefs = v.Xrefs();
```

---

toString()

Description

Creates a string containing the vector data in keyword format. Note that this contains the keyword header and the keyword cards. See also Vector.Keyword() and Vector.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for vector v in keyword format

```
var s = v.toString();
```

DeformableToRigid class

The DeformableToRigid class gives you access to *DEFORMABLE_TO_RIGID cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

DeformableToRigid constants

Constants for DEFORMABLE_TO_RIGID type

Name	Description
DeformableToRigid.AUTOMATIC	*DEFORMABLE_TO_RIGID_AUTOMATIC.
DeformableToRigid.INERTIA	*DEFORMABLE_TO_RIGID_INERTIA.
DeformableToRigid.SIMPLE	*DEFORMABLE_TO_RIGID.

Constants for PID field type

Name	Description
DeformableToRigid.PART	Identifies the PID type as Part. Used for field ptype. Used only for DeformableToRigid.SIMPLE or DeformableToRigid.INERTIA.
DeformableToRigid.PSET	Identifies the PID type as Part Set. Used for field ptype. Used only for DeformableToRigid.SIMPLE or DeformableToRigid.INERTIA.

Constants for automatic types

Name	Description
DeformableToRigid.D2R	Identifies that card is being written/retreived/removed as D2R card. Used in methods GetDefToRegAutoCard, SetDefToRegAutoCard and RemoveDefToRegAutoCard. Used only for DeformableToRigid.AUTOMATIC.
DeformableToRigid.R2D	Identifies that card is being written/retreived/removed as R2D card. Used in methods GetDefToRegAutoCard, SetDefToRegAutoCard and RemoveDefToRegAutoCard. Used only for DeformableToRigid.AUTOMATIC.

DeformableToRigid properties

Name	Type	Description
code	integer	Activation switch code. (Valid values: 0-5). Used only for DeformableToRigid.AUTOMATIC.
d2r	integer	Number of deformable parts to be switched to rigid plus number of rigid parts for which new lead/constrained rigid body combinations will be defined. Used only for DeformableToRigid.AUTOMATIC.
dtmax	real	Maximum permitted time step size after switch. Used only for DeformableToRigid.AUTOMATIC.
entno	integer	Rigid wall/contact surface number for switch codes 1, 2, 3, 4. Used only for DeformableToRigid.AUTOMATIC.
exists (read only)	logical	true if deformable to rigid exists, false if referred to but not defined.
include	integer	The Include file number that the deformable to rigid is in.
ixx	real	The xx component of inertia tensor. Used only for DeformableToRigid.INERTIA.
ixx	real	The xx component of inertia tensor. Used only for DeformableToRigid.INERTIA.
ixy	real	The xy component of inertia tensor. Used only for DeformableToRigid.INERTIA.

ixz	real	The xz component of inertia tensor. Used only for DeformableToRigid.INERTIA.
iyz	real	The yz component of inertia tensor. Used only for DeformableToRigid.INERTIA.
izz	real	The zz component of inertia tensor. Used only for DeformableToRigid.INERTIA.
lrb	integer	Part ID of the lead rigid body to which the part is merged. Used only for DeformableToRigid.SIMPLE.
model (read only)	integer	The Model number that the deformable to rigid is in.
ncsf	integer	Nodal constraint body flag. (Valid values : 0, 1, 2). Used only for DeformableToRigid.AUTOMATIC.
nrbf	integer	Nodal rigid body flag. (Valid values : 0, 1, 2). Used only for DeformableToRigid.AUTOMATIC.
offset	real	Optional contact thickness for switch to deformable. Used only for DeformableToRigid.AUTOMATIC.
paired	integer	Define a pair of related switches. (Valid values : -1, 0, 1). Used only for DeformableToRigid.AUTOMATIC.
pid	integer	Part or Part set ID which is switched to a rigid material. Depends on value of ptype. Used only for DeformableToRigid.SIMPLE or DeformableToRigid.INERTIA.
ptype	integer	Type of PID. Valid values are: DeformableToRigid.PART or DeformableToRigid.PSET. Used only for DeformableToRigid.SIMPLE.
r2d	integer	Number of rigid parts to be switched to deformable. Used only for DeformableToRigid.AUTOMATIC.
relsw	integer	Related switch set. Used only for DeformableToRigid.AUTOMATIC.
rwf	integer	Flag to delete or activate rigid walls. (Valid values : 0, 1, 2). Used only for DeformableToRigid.AUTOMATIC.
swset (read only)	integer	Set number for this automatic switch set. Used only for DeformableToRigid.AUTOMATIC.
time1	real	Switch will not take place before this time. Used only for DeformableToRigid.AUTOMATIC.
time2	real	Switch will not take place after this time. Used only for DeformableToRigid.AUTOMATIC.
time3	real	After this part switch has taken place, another automatic switch will not take place for the duration of the delay period. Used only for DeformableToRigid.AUTOMATIC.
tm	real	Translational mass. Used only for DeformableToRigid.INERTIA.
type (read only)	integer	Gives the type of DeformableToRigid Object.
xc	real	x-coordinate of center of mass. Used only for DeformableToRigid.INERTIA.
yc	real	y-coordinate of center of mass. Used only for DeformableToRigid.INERTIA.
zc	real	z-coordinate of center of mass. Used only for DeformableToRigid.INERTIA.

Detailed Description

The DeformableToRigid class allows you to create, modify, edit and manipulate deformable to rigid cards. See the documentation below for more details.

Constructor

new DeformableToRigid(Model*[Model]*, Type*[constant]*, pid (optional) *[integer]*, lrb (optional)*[integer]*, ptype (optional)*[integer]*)

Description

Create a new DeformableToRigid object.

Arguments

- **Model** (Model)

Model that deformable to rigid will be created in

- **Type** (constant)

Specify the type of DeformableToRigid (Can be DeformableToRigid.SIMPLE or DeformableToRigid.AUTOMATIC or DeformableToRigid.INERTIA)

- **pid (optional)** (integer)

Part or Part set ID which is switched to a rigid material. Depends on value of ptype. Used only for DeformableToRigid.SIMPLE or DeformableToRigid.INERTIA.

- **lrb (optional)** (integer)

Part ID of the lead rigid body to which the part is merged. Used only for DeformableToRigid.SIMPLE.

- **ptype (optional)** (integer)

Type of PID. Valid values are: DeformableToRigid.PART or DeformableToRigid.PSET. Used only for DeformableToRigid.SIMPLE.

Returns

DeformableToRigid object

Return type

DeformableToRigid

Example

To create a new deformable to rigid in model m, type SIMPLE, part id 100:

```
var dtor = new DeformableToRigid(m, DeformableToRigid.SIMPLE, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a deformable to rigid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the deformable to rigid

Returns

No return value

Example

To associate comment c to the deformable to rigid dtor:

```
dtor.AssociateComment(c);
```

Blank()

Description

Blanks the deformable to rigid

Arguments

No arguments

Returns

No return value

Example

To blank deformable to rigid dtor:

```
dtor.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the deformable to rigids in model m:

```
DeformableToRigid.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all the flagged deformable to rigids will be blanked in

- **flag** (Flag)

Flag set on the deformable to rigids that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the deformable to rigids in model m flagged with f:

```
DeformableToRigid.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the deformable to rigid is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if deformable to rigid dtor is blanked:

```
if (dtor.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse deformable to rigid dtor:

```
dtor.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the deformable to rigid.

Arguments

- **flag** (Flag)

Flag to clear on the deformable to rigid

Returns

No return value

Example

To clear flag f for deformable to rigid dtor:

```
dtor.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the deformable to rigid. The target include of the copied deformable to rigid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DeformableToRigid object

Return type

DeformableToRigid

Example

To copy deformable to rigid dtor into deformable to rigid z:

```
var z = dtor.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an DeformableToRigid definition.

Arguments

- **Model** (Model)

Model that the DeformableToRigid will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

DeformableToRigid object (or null if not made)

Return type

DeformableToRigid

Example

To start creating an dtor in model m:

```
var dtor = DeformableToRigid.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a deformable to rigid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the deformable to rigid

Returns

No return value

Example

To detach comment c from the deformable to rigid dtor:

```
dtor.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit deformable to rigid dtor:

```
dtor.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for deformable to rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for deformable to rigid dtor:

```
dtor.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first deformable to rigid in the model.

Arguments

- **Model** (Model)

Model to get first deformable to rigid in

Returns

DeformableToRigid object (or null if there are no deformable to rigids in the model).

Return type

DeformableToRigid

Example

To get the first deformable to rigid in model m:

```
var dtor = DeformableToRigid.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free deformable to rigid label in the model. Also see DeformableToRigid.LastFreeLabel(), DeformableToRigid.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free deformable to rigid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

DeformableToRigid label.

Return type

Number

Example

To get the first free deformable to rigid label in model m:

```
var label = DeformableToRigid.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the deformable to rigids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be flagged in

- **flag** (Flag)

Flag to set on the deformable to rigids

Returns

No return value

Example

To flag all of the deformable to rigids with flag f in model m:

```
DeformableToRigid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the deformable to rigid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the deformable to rigid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if deformable to rigid dtor has flag f set on it:

```
if (dtor.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each deformable to rigid in the model.
Note that ForEach has been designed to make looping over deformable to rigids as fast as possible and so has some limitations.
Firstly, a single temporary DeformableToRigid object is created and on each function call it is updated with the current deformable to rigid data. This means that you should not try to store the DeformableToRigid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new deformable to rigids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all deformable to rigids are in

- **func** (function)

Function to call for each deformable to rigid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the deformable to rigids in model m:

```
DeformableToRigid.ForEach(m, test);
function test(dtor)
{
// dtor is DeformableToRigid object
}
```

To call function test for all of the deformable to rigids in model m with optional object:

```
var data = { x:0, y:0 };
DeformableToRigid.ForEach(m, test, data);
function test(dtor, extra)
{
// dtor is DeformableToRigid object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of DeformableToRigid objects for all of the deformable to rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get deformable to rigids from

Returns

Array of DeformableToRigid objects

Return type

Array

Example

To make an array of DeformableToRigid objects for all of the deformable to rigids in model m

```
var dtor = DeformableToRigid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a deformable to rigid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the deformable to rigid dtor:

```
var comm_array = dtor.GetComments();
```

GetDefToRegAutoCard(ctype*[integer]*, index*[integer]*)

Description

Returns the D2R or R2D cards for *DEFORMABLE_TO_RIGID_AUTOMATC.

Arguments

- **ctype** (integer)

The card type you want the data for. Can be D2R or R2D.

- **index** (integer)

The card index you want the data for. **Note that card indices start at 0, not 1**.

Returns

An array of numbers containing the 2 or 3 member (depending on Card type): Part or Part Set ID, LRB Part ID (only for card type D2R), and part type (PTYPE - Can be DeformableToRigid.PART or DeformableToRigid.PSET).

Return type

Number

Example

To get the D2R card data for the 3rd D2R card for Deformable to Rigid dtor:

```
if (dtor.d2r >= 3)
{
    var dtor_data = dtor.GetDefToRegAutoCard(DeformableToRigid.D2R, 2);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DeformableToRigid objects for all of the flagged deformable to rigids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get deformable to rigids from

- **flag** (Flag)

Flag set on the deformable to rigids that you want to retrieve

Returns

Array of DeformableToRigid objects

Return type

Array

Example

To make an array of DeformableToRigid objects for all of the deformable to rigids in model m flagged with f

```
var dtor = DeformableToRigid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DeformableToRigid object for a deformable to rigid ID.

Arguments

- **Model** (Model)

Model to find the deformable to rigid in

- **number** (integer)

number of the deformable to rigid you want the DeformableToRigid object for

Returns

DeformableToRigid object (or null if deformable to rigid does not exist).

Return type

DeformableToRigid

Example

To get the DeformableToRigid object for deformable to rigid 100 in model m

```
var dtor = DeformableToRigid.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DeformableToRigid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DeformableToRigid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

deformable to rigid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DeformableToRigid property dtor.example is a parameter:

```
Options.property_parameter_names = true;
if (dtor.GetParameter(dtor.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DeformableToRigid property dtor.example is a parameter by using the GetParameter method:

```
if (dtor.ViewParameters().GetParameter(dtor.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this DeformableToRigid (*DEFORMABLE_TO_RIGID_xxxx) **Note that a carriage return is not added**. See also DeformableToRigid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for DeformableToRigid dtor:

```
var key = dtor.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the DeformableToRigid. **Note that a carriage return is not added**. See also DeformableToRigid.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for DeformableToRigid dtor:

```
var cards = dtor.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last deformable to rigid in the model.

Arguments

- **Model** (Model)

Model to get last deformable to rigid in

Returns

DeformableToRigid object (or null if there are no deformable to rigids in the model).

Return type

DeformableToRigid

Example

To get the last deformable to rigid in model m:

```
var dtor = DeformableToRigid.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free deformable to rigid label in the model. Also see DeformableToRigid.FirstFreeLabel(), DeformableToRigid.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free deformable to rigid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

DeformableToRigid label.

Return type

Number

Example

To get the last free deformable to rigid label in model m:

```
var label = DeformableToRigid.LastFreeLabel(m);
```

Next()

Description

Returns the next deformable to rigid in the model.

Arguments

No arguments

Returns

DeformableToRigid object (or null if there are no more deformable to rigids in the model).

Return type

DeformableToRigid

Example

To get the deformable to rigid in model m after deformable to rigid dtor:

```
var dtor = dtor.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) deformable to rigid label in the model. Also see DeformableToRigid.FirstFreeLabel(), DeformableToRigid.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free deformable to rigid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

DeformableToRigid label.

Return type

Number

Example

To get the next free deformable to rigid label in model m:

```
var label = DeformableToRigid.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a deformable to rigid.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only deformable to rigids from that model can be picked. If the argument is a Flag then only deformable to rigids that are flagged with *limit* can be selected. If omitted, or null, any deformable to rigids from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DeformableToRigid object (or null if not picked)

Return type

DeformableToRigid

Example

To pick a deformable to rigid from model m giving the prompt 'Pick deformable to rigid from screen':

```
var dtor = DeformableToRigid.Pick('Pick deformable to rigid from screen', m);
```

Previous()

Description

Returns the previous deformable to rigid in the model.

Arguments

No arguments

Returns

DeformableToRigid object (or null if there are no more deformable to rigids in the model).

Return type

DeformableToRigid

Example

To get the deformable to rigid in model m before deformable to rigid dtor:

```
var dtor = dtor.Previous();
```

RemoveDefToRegAutoCard(ctype*[integer]*, index*[integer]*)

Description

Removes the D2R or R2D cards for *DEFORMABLE_TO_RIGID_AUTOMATC.

Arguments

- **ctype** (integer)

The card type you want removed. Can be D2R or R2D.

- **index** (integer)

The card index you want removed. **Note that card indices start at 0, not 1**.

Returns

No return value.

Example

To remove the D2R card data for the 3rd D2R card from Deformable to Rigid dtor:

```
if (dtor.d2r >= 3)
{
    var dtor_data = dtor.RemoveDefToRegAutoCard(DeformableToRigid.D2R, 2);
}
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the deformable to rigids in model m, from 1000000:

```
DeformableToRigid.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all the flagged deformable to rigids will be renumbered in

- **flag** (Flag)

Flag set on the deformable to rigids that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the deformable to rigids in model m flagged with f, from 1000000:

```
DeformableToRigid.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select deformable to rigids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting deformable to rigids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only deformable to rigids from that model can be selected. If the argument is a Flag then only deformable to rigids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any deformable to rigids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of deformable to rigids selected or null if menu cancelled

Return type

Number

Example

To select deformable to rigids from model m, flagging those selected with flag f, giving the prompt 'Select deformable to rigids':

```
DeformableToRigid.Select(f, 'Select deformable to rigids', m);
```

To select deformable to rigids, flagging those selected with flag f but limiting selection to deformable to rigids flagged with flag l, giving the prompt 'Select deformable to rigids':

```
DeformableToRigid.Select(f, 'Select deformable to rigids', l);
```

SetDefToRegAutoCard(ctype*[integer]*, index*[integer]*, ptype*[integer]*, pid*[integer]*, lrb (optional)*[integer]*)

Description

Sets the D2r or R2D card data f*DEFORMABLE_TO_RIGID_AUTOMATIC.

Arguments

- **ctype** (integer)

The card type you want to set. Can be D2R or R2D.

- **index** (integer)

The D2R or R2D card index you want to set. **Note that cards start at 0, not 1**.

- **ptype** (integer)

Part type (PTYPE). Can be DeformableToRigid.PART or DeformableToRigid.PSET.

- **pid** (integer)

Part or Part Set ID.

- **lrb (optional)** (integer)

LRB Part ID (only for card type D2R)

Returns

No return value.

Example

To set the 3rd D2R card to ptype DeformabletoRigid.PART, pid 100 and lrb 200, for DeformableToRigid dtor:

```
dtor.SetDefToRegAutoCard(DeformabletoRigid.D2R, 2, DeformabletoRigid.PART, 100,
200);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the deformable to rigid.

Arguments

- **flag** (Flag)

Flag to set on the deformable to rigid

Returns

No return value

Example

To set flag f for deformable to rigid dtor:

```
dtor.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the deformable to rigid. The deformable to rigid will be sketched until you either call DeformableToRigid.Unsketch(), DeformableToRigid.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the deformable to rigid is sketched. If omitted redraw is true. If you want to sketch several deformable to rigids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch deformable to rigid dtor:

```
dtor.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged deformable to rigids in the model. The deformable to rigids will be sketched until you either call DeformableToRigid.Unsketch(), DeformableToRigid.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged deformable to rigids will be sketched in

- **flag** (Flag)

Flag set on the deformable to rigids that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the deformable to rigids are sketched. If omitted redraw is true. If you want to sketch flagged deformable to rigids several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all deformable to rigids flagged with flag in model m:

```
DeformableToRigid.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of deformable to rigids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing deformable to rigids should be counted. If false or omitted referenced but undefined deformable to rigids will also be included in the total.

Returns

number of deformable to rigids

Return type

Number

Example

To get the total number of deformable to rigids in model m:

```
var total = DeformableToRigid.Total(m);
```

Unblank()

Description

Unblanks the deformable to rigid

Arguments

No arguments

Returns

No return value

Example

To unblank deformable to rigid dtor:

```
dtor.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the deformable to rigids in model m:

```
DeformableToRigid.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that the flagged deformable to rigids will be unblanked in

- **flag** (Flag)

Flag set on the deformable to rigids that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the deformable to rigids in model m flagged with f:

```
DeformableToRigid.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all deformable to rigids will be unset in

- **flag** (Flag)

Flag to unset on the deformable to rigids

Returns

No return value

Example

To unset the flag f on all the deformable to rigids in model m:

```
DeformableToRigid.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the deformable to rigid.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the deformable to rigid is unsketched. If omitted redraw is true. If you want to unsketch several deformable to rigids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch deformable to rigid dtor:

```
dtor.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all deformable to rigids.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the deformable to rigids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all deformable to rigids in model m:

```
DeformableToRigid.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged deformable to rigids in the model.

Arguments

- **Model** (Model)

Model that all deformable to rigids will be unsketched in

- **flag** (Flag)

Flag set on the deformable to rigids that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the deformable to rigids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all deformable to rigids flagged with flag in model m:

```
DeformableToRigid.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DeformableToRigid object.

Return type

DeformableToRigid

Example

To check if DeformableToRigid property dtor.example is a parameter by using the DeformableToRigid.GetParameter() method:

```
if (dtor.ViewParameters().GetParameter(dtor.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for deformable to rigid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for deformable to rigid dtor:

```
dtor.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this deformable to rigid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for deformable to rigid dtor:

```
var xrefs = dtor.Xrefs();
```

---

toString()

Description

Creates a string containing the DeformableToRigid data in keyword format. Note that this contains the keyword header and the keyword cards. See also DeformableToRigid.Keyword() and DeformableToRigid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for DeformableToRigid dtor in keyword format

```
var i_str = dtor.toString();
```

Accelerometer class

The Accelerometer class gives you access to seatbelt accelerometer cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Accelerometer properties

Name	Type	Description
colour	Colour	The colour of the accelerometer
exists (read only)	logical	true if accelerometer exists, false if referred to but not defined.
igrav	integer	Gravitational acceleration due to body force loads is included in acceleration output if igrav is 0, removed if igrav is 1.
include	integer	The Include file number that the accelerometer is in.
intopt	integer	Integration option; velocities are integrated from global accelerations and transformed into local system if intopt is 0, they are integrated directly from local accelerations if intopt is 1.
label	integer	Accelerometer number. Also see the sbacid property which is an alternative name for this.
mass	real	Optional added mass for accelerometer
model (read only)	integer	The Model number that the accelerometer is in.
nid1	integer	Node number 1
nid2	integer	Node number 2
nid3	integer	Node number 3
sbacid	integer	Accelerometer number. Also see the label property which is an alternative name for this.
transparency	integer	The transparency of the accelerometer (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Accelerometer class allows you to create, modify, edit and manipulate seatbelt accelerometer cards. See the documentation below for more details.

Constructor

new Accelerometer(Model*[Model]*, sbacid*[integer]*, nid1*[integer]*, nid2*[integer]*, nid3*[integer]*, igrav (optional)*[integer]*, intopt (optional)*[integer]*, mass (optional)*[real]*)

Description

Create a new Seatbelt Accelerometer object.

Arguments

- **Model** (Model)

Model that accelerometer will be created in

- **sbacid** (integer)

Accelerometer number. Also see the label property which is an alternative name for this.

- **nid1** (integer)

Node number 1

- **nid2** (integer)

Node number 2

- **nid3** (integer)

Node number 3

- **igrav (optional)** (integer)

Gravitational acceleration due to body force loads is included in acceleration output if igrav is 0, removed if igrav is 1.

- **intopt (optional)** (integer)

Integration option; velocities are integrated from global accelerations and transformed into local system if intopt is 0, they are integrated directly from local accelerations if intopt is 1.

- **mass (optional)** (real)

Optional added mass for accelerometer

Returns

Accelerometer object

Return type

Accelerometer

Example

To create a new seatbelt accelerometer in model m with label 100, nodes 1, 2 and 3:

```
var a = new Accelerometer(m, 100, 1, 2, 3);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a accelerometer.

Arguments

- **Comment** (Comment)

Comment that will be attached to the accelerometer

Returns

No return value

Example

To associate comment c to the accelerometer a:

```
a.AssociateComment(c);
```

Blank()

Description

Blanks the accelerometer

Arguments

No arguments

Returns

No return value

Example

To blank accelerometer a:

```
a.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the accelerometers in the model.

Arguments

- **Model** (Model)

Model that all accelerometers will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the accelerometers in model m:

```
Accelerometer.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged accelerometers in the model.

Arguments

- **Model** (Model)

Model that all the flagged accelerometers will be blanked in

- **flag** (Flag)

Flag set on the accelerometers that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the accelerometers in model m flagged with f:

```
Accelerometer.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the accelerometer is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if accelerometer a is blanked:

```
if (a.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse accelerometer a:

```
a.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the accelerometer.

Arguments

- **flag** (Flag)

Flag to clear on the accelerometer

Returns

No return value

Example

To clear flag f for accelerometer a:

```
a.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the accelerometer. The target include of the copied accelerometer can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Accelerometer object

Return type

Accelerometer

Example

To copy accelerometer a into accelerometer z:

```
var z = a.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a accelerometer.

Arguments

- **Model** (Model)

Model that the accelerometer will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Accelerometer object (or null if not made)

Return type

Accelerometer

Example

To start creating an accelerometer in model m:

```
var a = Accelerometer.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a accelerometer.

Arguments

- **Comment** (Comment)

Comment that will be detached from the accelerometer

Returns

No return value

Example

To detach comment c from the accelerometer a:

```
a.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit accelerometer a:

```
a.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for accelerometer. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for accelerometer a:

```
a.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for accelerometer.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the accelerometer colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the accelerometer.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing accelerometer a:

```
var colour = a.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first accelerometer in the model.

Arguments

- **Model** (Model)

Model to get first accelerometer in

Returns

Accelerometer object (or null if there are no accelerometers in the model).

Return type

Accelerometer

Example

To get the first accelerometer in model m:

```
var a = Accelerometer.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free accelerometer label in the model. Also see Accelerometer.LastFreeLabel(), Accelerometer.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free accelerometer label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Accelerometer label.

Return type

Number

Example

To get the first free accelerometer label in model m:

```
var label = Accelerometer.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the accelerometers in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all accelerometers will be flagged in

- **flag** (Flag)

Flag to set on the accelerometers

Returns

No return value

Example

To flag all of the accelerometers with flag f in model m:

```
Accelerometer.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the accelerometer is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the accelerometer

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if accelerometer a has flag f set on it:

```
if (a.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each accelerometer in the model.
Note that ForEach has been designed to make looping over accelerometers as fast as possible and so has some limitations.
Firstly, a single temporary Accelerometer object is created and on each function call it is updated with the current accelerometer data. This means that you should not try to store the Accelerometer object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new accelerometers inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all accelerometers are in

- **func** (function)

Function to call for each accelerometer

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the accelerometers in model m:

```
Accelerometer.ForEach(m, test);
function test(a)
{
// a is Accelerometer object
}
```

To call function test for all of the accelerometers in model m with optional object:

```
var data = { x:0, y:0 };
Accelerometer.ForEach(m, test, data);
function test(a, extra)
{
// a is Accelerometer object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Accelerometer objects for all of the accelerometers in a model in PRIMER

Arguments

- **Model** (Model)

Model to get accelerometers from

Returns

Array of Accelerometer objects

Return type

Array

Example

To make an array of Accelerometer objects for all of the accelerometers in model m

```
var a = Accelerometer.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a accelerometer.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the accelerometer a:

```
var comm_array = a.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Accelerometer objects for all of the flagged accelerometers in a model in PRIMER

Arguments

- **Model** (Model)

Model to get accelerometers from

- **flag** (Flag)

Flag set on the accelerometers that you want to retrieve

Returns

Array of Accelerometer objects

Return type

Array

Example

To make an array of Accelerometer objects for all of the accelerometers in model m flagged with f

```
var a = Accelerometer.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Accelerometer object for a accelerometer ID.

Arguments

- **Model** (Model)

Model to find the accelerometer in

- **number** (integer)

number of the accelerometer you want the Accelerometer object for

Returns

Accelerometer object (or null if accelerometer does not exist).

Return type

Accelerometer

Example

To get the Accelerometer object for accelerometer 100 in model m

```
var a = Accelerometer.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Accelerometer property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Accelerometer.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

accelerometer property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Accelerometer property a.example is a parameter:

```
Options.property_parameter_names = true;
if (a.GetParameter(a.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Accelerometer property a.example is a parameter by using the GetParameter method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this accelerometer (*ELEMENT_SEATBELT_ACCELEROMETER) **Note that a carriage return is not added**. See also Accelerometer.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for accelerometer a:

```
var key = a.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the accelerometer. **Note that a carriage return is not added**. See also Accelerometer.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for accelerometer a:

```
var cards = a.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last accelerometer in the model.

Arguments

- **Model** (Model)

Model to get last accelerometer in

Returns

Accelerometer object (or null if there are no accelerometers in the model).

Return type

Accelerometer

Example

To get the last accelerometer in model m:

```
var a = Accelerometer.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free accelerometer label in the model. Also see Accelerometer.FirstFreeLabel(), Accelerometer.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free accelerometer label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Accelerometer label.

Return type

Number

Example

To get the last free accelerometer label in model m:

```
var label = Accelerometer.LastFreeLabel(m);
```

Next()

Description

Returns the next accelerometer in the model.

Arguments

No arguments

Returns

Accelerometer object (or null if there are no more accelerometers in the model).

Return type

Accelerometer

Example

To get the accelerometer in model m after accelerometer a:

```
var a = a.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) accelerometer label in the model. Also see Accelerometer.FirstFreeLabel(), Accelerometer.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free accelerometer label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Accelerometer label.

Return type

Number

Example

To get the next free accelerometer label in model m:

```
var label = Accelerometer.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a accelerometer.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only accelerometers from that model can be picked. If the argument is a Flag then only accelerometers that are flagged with *limit* can be selected. If omitted, or null, any accelerometers from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Accelerometer object (or null if not picked)

Return type

Accelerometer

Example

To pick a accelerometer from model m giving the prompt 'Pick accelerometer from screen':

```
var a = Accelerometer.Pick('Pick accelerometer from screen', m);
```

Previous()

Description

Returns the previous accelerometer in the model.

Arguments

No arguments

Returns

Accelerometer object (or null if there are no more accelerometers in the model).

Return type

Accelerometer

Example

To get the accelerometer in model m before accelerometer a:

```
var a = a.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the accelerometers in the model.

Arguments

- **Model** (Model)

Model that all accelerometers will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the accelerometers in model m, from 1000000:

```
Accelerometer.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged accelerometers in the model.

Arguments

- **Model** (Model)

Model that all the flagged accelerometers will be renumbered in

- **flag** (Flag)

Flag set on the accelerometers that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the accelerometers in model m flagged with f, from 1000000:

```
Accelerometer.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select accelerometers using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting accelerometers

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only accelerometers from that model can be selected. If the argument is a Flag then only accelerometers that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any accelerometers can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of accelerometers selected or null if menu cancelled

Return type

Number

Example

To select accelerometers from model m, flagging those selected with flag f, giving the prompt 'Select accelerometers':

```
Accelerometer.Select(f, 'Select accelerometers', m);
```

To select accelerometers, flagging those selected with flag f but limiting selection to accelerometers flagged with flag l, giving the prompt 'Select accelerometers':

```
Accelerometer.Select(f, 'Select accelerometers', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the accelerometer.

Arguments

- **flag** (Flag)

Flag to set on the accelerometer

Returns

No return value

Example

To set flag f for accelerometer a:

```
a.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the accelerometer. The accelerometer will be sketched until you either call Accelerometer.Unsketch(), Accelerometer.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the accelerometer is sketched. If omitted redraw is true. If you want to sketch several accelerometers and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch accelerometer a:

```
a.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged accelerometers in the model. The accelerometers will be sketched until you either call Accelerometer.Unsketch(), Accelerometer.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged accelerometers will be sketched in

- **flag** (Flag)

Flag set on the accelerometers that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the accelerometers are sketched. If omitted redraw is true. If you want to sketch flagged accelerometers several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all accelerometers flagged with flag in model m:

```
Accelerometer.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of accelerometers in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing accelerometers should be counted. If false or omitted referenced but undefined accelerometers will also be included in the total.

Returns

number of accelerometers

Return type

Number

Example

To get the total number of accelerometers in model m:

```
var total = Accelerometer.Total(m);
```

Unblank()

Description

Unblanks the accelerometer

Arguments

No arguments

Returns

No return value

Example

To unblank accelerometer a:

```
a.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the accelerometers in the model.

Arguments

- **Model** (Model)

Model that all accelerometers will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the accelerometers in model m:

```
Accelerometer.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged accelerometers in the model.

Arguments

- **Model** (Model)

Model that the flagged accelerometers will be unblanked in

- **flag** (Flag)

Flag set on the accelerometers that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the accelerometers in model m flagged with f:

```
Accelerometer.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the accelerometers in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all accelerometers will be unset in

- **flag** (Flag)

Flag to unset on the accelerometers

Returns

No return value

Example

To unset the flag f on all the accelerometers in model m:

```
Accelerometer.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the accelerometer.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the accelerometer is unsketched. If omitted redraw is true. If you want to unsketch several accelerometers and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch accelerometer a:

```
a.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all accelerometers.

Arguments

- **Model** (Model)

Model that all accelerometers will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the accelerometers are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all accelerometers in model m:

```
Accelerometer.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged accelerometers in the model.

Arguments

- **Model** (Model)

Model that all accelerometers will be unsketched in

- **flag** (Flag)

Flag set on the accelerometers that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the accelerometers are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all accelerometers flagged with flag in model m:

```
Accelerometer.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Accelerometer object.

Return type

Accelerometer

Example

To check if Accelerometer property a.example is a parameter by using the Accelerometer.GetParameter() method:

```
if (a.ViewParameters().GetParameter(a.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for accelerometer. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for accelerometer a:

```
a.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this accelerometer.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for accelerometer a:

```
var xrefs = a.Xrefs();
```

---

toString()

Description

Creates a string containing the accelerometer data in keyword format. Note that this contains the keyword header and the keyword cards. See also Accelerometer.Keyword() and Accelerometer.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for accelerometer a in keyword format

```
var str = a.toString();
```

Beam class

The Beam class gives you access to beam cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Beam properties

Name	Type	Description
cid	integer	Coordinate system ID (_SCALAR)
cid	integer	Coordinate system ID at node 1 (_SCALR)
colour	Colour	The colour of the beam
d1	real	Section parameter 1
d2	real	Section parameter 2
d3	real	Section parameter 3
d4	real	Section parameter 4
d5	real	Section parameter 5
d6	real	Section parameter 6
dofn1	integer	Active degree of freedom at node 1 (_SCALAR)
dofn2	integer	Active degree of freedom at node 2 (_SCALAR)
dofns	integer	Active degrees of freedom at nodes 1 and 2 (_SCALR)
eid	integer	Beam number. Also see the label property which is an alternative name for this.
elbow	logical	If ELBOW option is set. Can be true or false
exists (read only)	logical	true if beam exists, false if referred to but not defined.
include	integer	The Include file number that the beam is in.
iner	real	Mass moment of inertia for beam
label	integer	Beam number. Also see the eid property which is an alternative name for this.
local	integer	Coordinate system option
mn	integer	Middle Node for elbow beam
model (read only)	integer	The Model number that the beam is in.
n1	integer	Node number 1
n2	integer	Node number 2
n3	integer	Node number 3
nodes (read only)	integer	Number of nodes beam has
offset	real	If _OFFSET option is set. Can be true or false
orientation	real	If _ORIENTATION option is set. Can be true or false
parm1	real	Thickness parameter 1
parm2	real	Thickness parameter 2
parm3	real	Thickness parameter 3

parm4	real	Thickness parameter 4
parm5	real	Thickness parameter 5
pid	integer	Part number
pid1	integer	Part number 1 for spotweld beam
pid2	integer	Part number 2 for spotweld beam
pid_opt	logical	If _PID option is set. Can be true or false
rr1	integer	Rotational release code at node 1
rr2	integer	Rotational release code at node 2
rt1	integer	Translational release code at node 1
rt2	integer	Translational release code at node 2
scalar	logical	If _SCALAR option is set. Can be true or false
scalr	logical	If _SCALR option is set. Can be true or false
section	logical	If _SECTION option is set. Can be true or false
sn1	integer	Scalar Node number 1
sn2	integer	Scalar Node number 2
stype	string	Section type
thickness	logical	If _THICKNESS option is set. Can be true or false
transparency	integer	The transparency of the beam (0-100) 0% is opaque, 100% is transparent.
vol	real	Volume of beam
vx	real	Orientation vector X at node 1
vy	real	Orientation vector Y at node 1
vz	real	Orientation vector Z at node 1
warpage	logical	If WARPAGE option is set. Can be true or false
wx1	real	Offset vector X at node 1
wx2	real	Offset vector X at node 2
wy1	real	Offset vector Y at node 1
wy2	real	Offset vector Y at node 2
wz1	real	Offset vector Z at node 1
wz2	real	Offset vector Z at node 2

Detailed Description

The Beam class allows you to create, modify, edit and manipulate beam cards. See the documentation below for more details.

Constructor

new Beam(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2 (optional)*[integer]*, n3 (optional)*[integer]*)

Description

Create a new Beam object. Use either 1, 2 or 3 nodes when creating a new beam.

Arguments

- **Model** (Model)

Model that beam will be created in

- **eid** (integer)

Beam number

- **pid** (integer)

Part number

- **n1** (integer)

Node number 1

- **n2 (optional)** (integer)

Node number 2

- **n3 (optional)** (integer)

Node number 3

Returns

Beam object

Return type

Beam

Example

To create a new beam in model m with label 100, part 10 and nodes 1, 2, 3:

```
var b = new Beam(m, 100, 10, 1, 2, 3);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a beam.

Arguments

- **Comment** (Comment)

Comment that will be attached to the beam

Returns

No return value

Example

To associate comment c to the beam b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the beam

Arguments

No arguments

Returns

No return value

Example

To blank beam b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the beams in the model.

Arguments

- **Model** (Model)

Model that all beams will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the beams in model m:

```
Beam.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged beams in the model.

Arguments

- **Model** (Model)

Model that all the flagged beams will be blanked in

- **flag** (Flag)

Flag set on the beams that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the beams in model m flagged with f:

```
Beam.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the beam is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if beam b is blanked:

```
if (b.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse beam b:

```
b.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the beam.

Arguments

- **flag** (Flag)

Flag to clear on the beam

Returns

No return value

Example

To clear flag f for beam b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the beam. The target include of the copied beam can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Beam object

Return type

Beam

Example

To copy beam b into beam z:

```
var z = b.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a beam.

Arguments

- **Model** (Model)

Model that the beam will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Beam object (or null if not made)

Return type

Beam

Example

To start creating a beam in model m:

```
var s = Beam.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a beam.

Arguments

- **Comment** (Comment)

Comment that will be detached from the beam

Returns

No return value

Example

To detach comment c from the beam b:

```
b.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit beam b:

```
b.Edit();
```

ElemCut(Database cross section label*[integer]*)

Description

Returns coordinates of the intersections between a beam and a database cross section.
Note this function does not check that the beam is in the cross section definition (part set)

Arguments

- **Database cross section label** (integer)

The label of the database cross section.

Returns

An array containing the x,y,z coordinates of the cut point, or NULL if it does not cut

Return type

Array

Example

To get the cut line coordinates between database cross section 200 and beam b:

```
var data = b.ElemCut(200)
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for beam b:

```
b.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for beam.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the beam colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the beam.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing beam b:

```
var colour = b.ExtractColour();
```

FindBeamInBox(Model*[Model]*, xmin*[real]*, xmax*[real]*, ymin*[real]*, ymax*[real]*, zmin*[real]*, zmax*[real]*, flag (optional)*[integer]*, excl (optional)*[integer]*, vis_only (optional)*[integer]*) [static]

Description

Returns an array of Beam objects for the beams within a box. Please note this function provides a list of all beams that could potentially be in the box (using computationally cheap bounding box comparison) it is not a rigorous test of whether the beam is actually in the box. Note an extension of "spot_thickness" is applied to each beam. This may include beams that are ostensibly outside box. The user should apply their own test. (this function is intended to provide an upper bound of elems to test) Setting the "excl" flag will require that the beam is fully contained, but this may not capture all the beams you want to process.

Arguments

- **Model** (Model)

Model designated model

- **xmin** (real)

Minimum bound in global x

- **xmax** (real)

Maximum bound in global x

- **ymin** (real)

Minimum bound in global y

- **ymax** (real)

Maximum bound in global y

- **zmin** (real)

Minimum bound in global z

- **zmax** (real)

Maximum bound in global z

- **flag (optional)** (integer)

Optional flag to restrict beams considered, if 0 all beams considered

- **excl (optional)** (integer)

Optional flag (0) Apply inclusive selection (1) Apply exclusive selection inclusive selection means elements intersect box exclusive selection means elements contained in box

- **vis_only (optional)** (integer)

Optional flag to consider visible elements only (1), if (0) all elements considered

Returns

Array of Beam objects

Return type

Array

Example

To get an array of Beam objects for flagged beams within defined box (inclusive selection)

```
      var s = Beam.FindBeamInBox(m, xmin, xmax, ymin, ymax, zmin, zmax, flag, 0,
0);
      if(s.length) ...
```

FindBeamInit(Model*[Model]*, flag (optional)*[Flag]*) [static] [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Initialize setup so that all flagged beams in model can be tested to see if they are within box. In v20.0 this function is obsolete and the flagging bit (if required) should be specified in Beam.FindBeamInBox()

Arguments

- **Model** (Model)

Model in which beams have been flagged

- **flag (optional)** (Flag)

Optional flag that has been set on the beams, if 0 all beams considered

Returns

No return value

Example

To initialize find setup for flagged beams in model m:

```
Beam.FindBeamInit(m, flag);
```

First(Model*[Model]*) [static]

Description

Returns the first beam in the model.

Arguments

- **Model** (Model)

Model to get first beam in

Returns

Beam object (or null if there are no beams in the model).

Return type

Beam

Example

To get the first beam in model m:

```
var b = Beam.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free beam label in the model. Also see Beam.LastFreeLabel(), Beam.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Beam label.

Return type

Number

Example

To get the first free beam label in model m:

```
var label = Beam.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the beams in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all beams will be flagged in

- **flag** (Flag)

Flag to set on the beams

Returns

No return value

Example

To flag all of the beams with flag f in model m:

```
Beam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the beam is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the beam

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if beam b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each beam in the model.
Note that ForEach has been designed to make looping over beams as fast as possible and so has some limitations. Firstly, a single temporary Beam object is created and on each function call it is updated with the current beam data. This means that you should not try to store the Beam object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new beams inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all beams are in

- **func** (function)

Function to call for each beam

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the beams in model m:

```
Beam.ForEach(m, test);
function test(b)
{
// b is Beam object
}
```

To call function test for all of the beams in model m with optional object:

```
var data = { x:0, y:0 };
Beam.ForEach(m, test, data);
function test(b, extra)
{
// b is Beam object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Beam objects for all of the beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get beams from

Returns

Array of Beam objects

Return type

Array

Example

To make an array of Beam objects for all of the beams in model m

```
var b = Beam.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a beam.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the beam b:

```
var comm_array = b.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Beam objects for all of the flagged beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get beams from

- **flag** (Flag)

Flag set on the beams that you want to retrieve

Returns

Array of Beam objects

Return type

Array

Example

To make an array of Beam objects for all of the beams in model m flagged with f

```
var b = Beam.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Beam object for a beam ID.

Arguments

- **Model** (Model)

Model to find the beam in

- **number** (integer)

number of the beam you want the Beam object for

Returns

Beam object (or null if beam does not exist).

Return type

Beam

Example

To get the Beam object for beam 100 in model m

```
var b = Beam.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Beam property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Beam.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

beam property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Beam property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Beam property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this beam (*BEAM, *BEAM_SCALAR or *BEAM_SCALAR_VALUE). **Note that a carriage return is not added**. See also Beam.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for beam s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the beam. **Note that a carriage return is not added**. See also Beam.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for beam b:

```
var cards = b.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last beam in the model.

Arguments

- **Model** (Model)

Model to get last beam in

Returns

Beam object (or null if there are no beams in the model).

Return type

Beam

Example

To get the last beam in model m:

```
var b = Beam.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free beam label in the model. Also see Beam.FirstFreeLabel(), Beam.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Beam label.

Return type

Number

Example

To get the last free beam label in model m:

```
var label = Beam.LastFreeLabel(m);
```

Next()

Description

Returns the next beam in the model.

Arguments

No arguments

Returns

Beam object (or null if there are no more beams in the model).

Return type

Beam

Example

To get the beam in model m after beam b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) beam label in the model. Also see Beam.FirstFreeLabel(), Beam.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Beam label.

Return type

Number

Example

To get the next free beam label in model m:

```
var label = Beam.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a beam.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only beams from that model can be picked. If the argument is a Flag then only beams that are flagged with *limit* can be selected. If omitted, or null, any beams from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Beam object (or null if not picked)

Return type

Beam

Example

To pick a beam from model m giving the prompt 'Pick beam from screen':

```
var b = Beam.Pick('Pick beam from screen', m);
```

Previous()

Description

Returns the previous beam in the model.

Arguments

No arguments

Returns

Beam object (or null if there are no more beams in the model).

Return type

Beam

Example

To get the beam in model m before beam b:

```
var b = b.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the beams in the model.

Arguments

- **Model** (Model)

Model that all beams will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the beams in model m, from 1000000:

```
Beam.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged beams in the model.

Arguments

- **Model** (Model)

Model that all the flagged beams will be renumbered in

- **flag** (Flag)

Flag set on the beams that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the beams in model m flagged with f, from 1000000:

```
Beam.RenumberFlagged(m, f, 1000000);
```

SectionFacePoints(face*[integer]*)

Description

Returns the indices of the points for a faces to plot the true section of the beam. Note face numbers start at 0. Beam.SectionPoints must be called before this method.

Arguments

- **face** (integer)

Face to get indices for

Returns

Array of integers

Return type

Number

Example

To get the indices of the points for the second face on beam b:

```
var indices = b.SectionFacePoints(1);
```

SectionFaces()

Description

Returns the number of faces to plot the true section of the beam. Beam.SectionPoints must be called before this method.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the number of faces for beam b:

```
var faces = b.SectionFaces();
```

SectionPoints()

Description

Returns the point coordinates to plot the true section of the beam. They are returned in a single array of numbers.

Arguments

No arguments

Returns

Array of reals

Return type

Number

Example

To get the point coordinates for beam b:

```
var points = b.SectionPoints();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select beams using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting beams

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only beams from that model can be selected. If the argument is a Flag then only beams that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any beams can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of beams selected or null if menu cancelled

Return type

Number

Example

To select beams from model m, flagging those selected with flag f, giving the prompt 'Select beams':

```
Beam.Select(f, 'Select beams', m);
```

To select beams, flagging those selected with flag f but limiting selection to beams flagged with flag l, giving the prompt 'Select beams':

```
Beam.Select(f, 'Select beams', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the beam.

Arguments

- **flag** (Flag)

Flag to set on the beam

Returns

No return value

Example

To set flag f for beam b:

```
b.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the beam. The beam will be sketched until you either call Beam.Unsketch(), Beam.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the beam is sketched. If omitted redraw is true. If you want to sketch several beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch beam b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged beams in the model. The beams will be sketched until you either call Beam.Unsketch(), Beam.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged beams will be sketched in

- **flag** (Flag)

Flag set on the beams that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the beams are sketched. If omitted redraw is true. If you want to sketch flagged beams several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all beams flagged with flag in model m:

```
Beam.SketchFlagged(m, flag);
```

TiedNodeCheck(Contact label*[integer]*, Flag*[Flag]*, Option1*[integer]*, Option2*[integer]*)

Description

Checks if nodes of beam are tied by contact or directly attached (non-zero option1)

Arguments

- **Contact label** (integer)

The label of the tied contact. If zero the tied contact is found for the beam by reverse lookup.

- **Flag** (Flag)

flag bit

- **Option1** (integer)

Directly tied node (logical OR) 0:NONE 1:NRB/C_EXNO 2:BEAM 4:SHELL 8:SOLID 16:TSHELL

- **Option2** (integer)

0:No action 1:report error if directly attached node (acc. option1) also captured by contact

Returns

string

Return type

String

Example

To check if both nodes of beam b are tied by contact 200 or attach directly to constraint, beam or shell:

```
var message = b.TiedNodeCheck(200, flag, 1|2|4, 1)
```

Timestep()

Description

Calculates the timestep for the beam

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for beam b:

```
var timestep = b.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of beams in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing beams should be counted. If false or omitted referenced but undefined beams will also be included in the total.

Returns

number of beams

Return type

Number

Example

To get the total number of beams in model m:

```
var total = Beam.Total(m);
```

Unblank()

Description

Unblanks the beam

Arguments

No arguments

Returns

No return value

Example

To unblank beam b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the beams in the model.

Arguments

- **Model** (Model)

Model that all beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the beams in model m:

```
Beam.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged beams in the model.

Arguments

- **Model** (Model)

Model that the flagged beams will be unblanked in

- **flag** (Flag)

Flag set on the beams that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the beams in model m flagged with f:

```
Beam.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the beams in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all beams will be unset in

- **flag** (Flag)

Flag to unset on the beams

Returns

No return value

Example

To unset the flag f on all the beams in model m:

```
Beam.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the beam.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the beam is unsketched. If omitted redraw is true. If you want to unsketch several beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch beam b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all beams.

Arguments

- **Model** (Model)

Model that all beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all beams in model m:

```
Beam.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged beams in the model.

Arguments

- **Model** (Model)

Model that all beams will be unsketched in

- **flag** (Flag)

Flag set on the beams that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all beams flagged with flag in model m:

```
Beam.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Beam object.

Return type

Beam

Example

To check if Beam property b.example is a parameter by using the Beam.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for beam b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this beam.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for beam b:

```
var xrefs = b.Xrefs();
```

---

toString()

Description

Creates a string containing the beam data in keyword format. Note that this contains the keyword header and the keyword cards. See also Beam.Keyword() and Beam.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for beam b in keyword format

```
var str = b.toString();
```

Discrete class

The Discrete class gives you access to element discrete cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Discrete properties

Name	Type	Description
colour	Colour	The colour of the discrete
eid	integer	Discrete number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if discrete exists, false if referred to but not defined.
include	integer	The Include file number that the discrete is in.
label	integer	Discrete number. Also see the eid property which is an alternative name for this.
lcid	integer	Loadcurve for offset vs time
lciddr	integer	Loadcurve for offset vs time during dynamic relaxation
lco	boolean	If LCO option is set. Can be true or false
model (read only)	integer	The Model number that the discrete is in.
n1	integer	Node number 1
n2	integer	Node number 2
offset	real	Initial offset
pf	integer	Print flag. Set to write forces to the DEFORC file
pid	integer	Part number
s	real	Scale factor on forces
transparency	integer	The transparency of the discrete (0-100) 0% is opaque, 100% is transparent.
vid	integer	Orientation vector

Detailed Description

The Discrete class allows you to create, modify, edit and manipulate discrete cards. See the documentation below for more details.

Constructor

new Discrete(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*, vid (optional)*[integer]*, s (optional)*[real]*, pf (optional)*[integer]*, offset (optional)*[real]*)

Description

Create a new Discrete object.

Arguments

- **Model** (Model)

Model that discrete will be created in

- **eid** (integer)

Discrete number

- **pid** (integer)

Part number

- **n1** (integer)

Node number 1

- **n2** (integer)

Node number 2

- **vid (optional)** (integer)

Orientation vector

- **s (optional)** (real)

Scale factor on forces

- **pf (optional)** (integer)

Print flag. Set to write forces to the DEFORC file

- **offset (optional)** (real)

Initial offset

Returns

Discrete object

Return type

Discrete

Example

To create a new discrete in model m with label 200, in part 10, on nodes 1 and 2

```
var m = new Discrete(m, 200, 10, 1, 2);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a discrete.

Arguments

- **Comment** (Comment)

Comment that will be attached to the discrete

Returns

No return value

Example

To associate comment c to the discrete d:

```
d.AssociateComment(c);
```

Blank()

Description

Blanks the discrete

Arguments

No arguments

Returns

No return value

Example

To blank discrete d:

```
d.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the discretes in the model.

Arguments

- **Model** (Model)

Model that all discretes will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the discretes in model m:

```
Discrete.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged discretes in the model.

Arguments

- **Model** (Model)

Model that all the flagged discretes will be blanked in

- **flag** (Flag)

Flag set on the discretes that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the discretes in model m flagged with f:

```
Discrete.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the discrete is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if discrete d is blanked:

```
if (d.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse discrete d:

```
d.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the discrete.

Arguments

- **flag** (Flag)

Flag to clear on the discrete

Returns

No return value

Example

To clear flag f for discrete d:

```
d.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the discrete. The target include of the copied discrete can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Discrete object

Return type

Discrete

Example

To copy discrete d into discrete z:

```
var z = d.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a discrete.

Arguments

- **Model** (Model)

Model that the discrete will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Discrete object (or null if not made)

Return type

Discrete

Example

To start creating a discrete in model m:

```
var m = Discrete.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a discrete.

Arguments

- **Comment** (Comment)

Comment that will be detached from the discrete

Returns

No return value

Example

To detach comment c from the discrete d:

```
d.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit discrete d:

```
d.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for discrete. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for discrete d:

```
d.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for discrete.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the discrete colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the discrete.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing discrete d:

```
var colour = d.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first discrete in the model.

Arguments

- **Model** (Model)

Model to get first discrete in

Returns

Discrete object (or null if there are no discretes in the model).

Return type

Discrete

Example

To get the first discrete in model m:

```
var d = Discrete.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free discrete label in the model. Also see Discrete.LastFreeLabel(), Discrete.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free discrete label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Discrete label.

Return type

Number

Example

To get the first free discrete label in model m:

```
var label = Discrete.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the discretes in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all discretes will be flagged in

- **flag** (Flag)

Flag to set on the discretes

Returns

No return value

Example

To flag all of the discretes with flag f in model m:

```
Discrete.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the discrete is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the discrete

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if discrete d has flag f set on it:

```
if (d.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each discrete in the model.
Note that ForEach has been designed to make looping over discretes as fast as possible and so has some limitations.
Firstly, a single temporary Discrete object is created and on each function call it is updated with the current discrete data. This means that you should not try to store the Discrete object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new discretes inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all discretes are in

- **func** (function)

Function to call for each discrete

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the discretes in model m:

```
Discrete.ForEach(m, test);
function test(d)
{
// d is Discrete object
}
```

To call function test for all of the discretes in model m with optional object:

```
var data = { x:0, y:0 };
Discrete.ForEach(m, test, data);
function test(d, extra)
{
// d is Discrete object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Discrete objects for all of the discretes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get discretes from

Returns

Array of Discrete objects

Return type

Array

Example

To make an array of Discrete objects for all of the discretes in model m

```
var d = Discrete.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a discrete.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the discrete d:

```
var comm_array = d.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Discrete objects for all of the flagged discretes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get discretes from

- **flag** (Flag)

Flag set on the discretes that you want to retrieve

Returns

Array of Discrete objects

Return type

Array

Example

To make an array of Discrete objects for all of the discretes in model m flagged with f

```
var d = Discrete.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Discrete object for a discrete ID.

Arguments

- **Model** (Model)

Model to find the discrete in

- **number** (integer)

number of the discrete you want the Discrete object for

Returns

Discrete object (or null if discrete does not exist).

Return type

Discrete

Example

To get the Discrete object for discrete 100 in model m

```
var d = Discrete.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Discrete property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Discrete.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

discrete property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Discrete property d.example is a parameter:

```
Options.property_parameter_names = true;
if (d.GetParameter(d.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Discrete property d.example is a parameter by using the GetParameter method:

```
if (d.ViewParameters().GetParameter(d.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this discrete (*ELEMENT_DISCRETE). **Note that a carriage return is not added**. See also Discrete.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for discrete m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the discrete. **Note that a carriage return is not added**. See also Discrete.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for discrete d:

```
var cards = d.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last discrete in the model.

Arguments

- **Model** (Model)

Model to get last discrete in

Returns

Discrete object (or null if there are no discretes in the model).

Return type

Discrete

Example

To get the last discrete in model m:

```
var d = Discrete.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free discrete label in the model. Also see Discrete.FirstFreeLabel(), Discrete.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free discrete label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Discrete label.

Return type

Number

Example

To get the last free discrete label in model m:

```
var label = Discrete.LastFreeLabel(m);
```

Next()

Description

Returns the next discrete in the model.

Arguments

No arguments

Returns

Discrete object (or null if there are no more discretes in the model).

Return type

Discrete

Example

To get the discrete in model m after discrete d:

```
var d = d.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) discrete label in the model. Also see Discrete.FirstFreeLabel(), Discrete.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free discrete label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Discrete label.

Return type

Number

Example

To get the next free discrete label in model m:

```
var label = Discrete.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a discrete.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only discretes from that model can be picked. If the argument is a Flag then only discretes that are flagged with *limit* can be selected. If omitted, or null, any discretes from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Discrete object (or null if not picked)

Return type

Discrete

Example

To pick a discrete from model m giving the prompt 'Pick discrete from screen':

```
var d = Discrete.Pick('Pick discrete from screen', m);
```

Previous()

Description

Returns the previous discrete in the model.

Arguments

No arguments

Returns

Discrete object (or null if there are no more discretes in the model).

Return type

Discrete

Example

To get the discrete in model m before discrete d:

```
var d = d.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the discretes in the model.

Arguments

- **Model** (Model)

Model that all discretes will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the discretes in model m, from 1000000:

```
Discrete.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged discretes in the model.

Arguments

- **Model** (Model)

Model that all the flagged discretes will be renumbered in

- **flag** (Flag)

Flag set on the discretes that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the discretes in model m flagged with f, from 1000000:

```
Discrete.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select discretes using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting discretes

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only discretes from that model can be selected. If the argument is a Flag then only discretes that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any discretes can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of discretes selected or null if menu cancelled

Return type

Number

Example

To select discretes from model m, flagging those selected with flag f, giving the prompt 'Select discretes':

```
Discrete.Select(f, 'Select discretes', m);
```

To select discretes, flagging those selected with flag f but limiting selection to discretes flagged with flag l, giving the prompt 'Select discretes':

```
Discrete.Select(f, 'Select discretes', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the discrete.

Arguments

- **flag** (Flag)

Flag to set on the discrete

Returns

No return value

Example

To set flag f for discrete d:

```
d.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the discrete. The discrete will be sketched until you either call Discrete.Unsketch(), Discrete.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete is sketched. If omitted redraw is true. If you want to sketch several discretes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch discrete d:

```
d.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged discretes in the model. The discretes will be sketched until you either call Discrete.Unsketch(), Discrete.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged discretes will be sketched in

- **flag** (Flag)

Flag set on the discretes that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discretes are sketched. If omitted redraw is true. If you want to sketch flagged discretes several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all discretes flagged with flag in model m:

```
Discrete.SketchFlagged(m, flag);
```

Timestep()

Description

Calculates the timestep for the discrete

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for discrete d:

```
var timestep = d.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of discretes in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing discretes should be counted. If false or omitted referenced but undefined discretes will also be included in the total.

Returns

number of discretes

Return type

Number

Example

To get the total number of discretes in model m:

```
var total = Discrete.Total(m);
```

Unblank()

Description

Unblanks the discrete

Arguments

No arguments

Returns

No return value

Example

To unblank discrete d:

```
d.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the discretes in the model.

Arguments

- **Model** (Model)

Model that all discretes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the discretes in model m:

```
Discrete.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged discretes in the model.

Arguments

- **Model** (Model)

Model that the flagged discretes will be unblanked in

- **flag** (Flag)

Flag set on the discretes that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the discretes in model m flagged with f:

```
Discrete.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the discretes in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all discretes will be unset in

- **flag** (Flag)

Flag to unset on the discretes

Returns

No return value

Example

To unset the flag f on all the discretes in model m:

```
Discrete.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the discrete.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete is unsketched. If omitted redraw is true. If you want to unsketch several discretes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch discrete d:

```
d.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all discretes.

Arguments

- **Model** (Model)

Model that all discretes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discretes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all discretes in model m:

```
Discrete.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged discretes in the model.

Arguments

- **Model** (Model)

Model that all discretes will be unsketched in

- **flag** (Flag)

Flag set on the discretes that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discretes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all discretes flagged with flag in model m:

```
Discrete.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Discrete object.

Return type

Discrete

Example

To check if Discrete property d.example is a parameter by using the Discrete.GetParameter() method:

```
if (d.ViewParameters().GetParameter(d.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for discrete. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for discrete d:

```
d.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this discrete.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for discrete d:

```
var xrefs = d.Xrefs();
```

---

toString()

Description

Creates a string containing the discrete data in keyword format. Note that this contains the keyword header and the keyword cards. See also Discrete.Keyword() and Discrete.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for discrete d in keyword format

```
var s = d.toString();
```

DiscreteSphere class

The DiscreteSphere class gives you access to element discrete sphere cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

DiscreteSphere properties

Name	Type	Description
colour	Colour	The colour of the discrete sphere
exists (read only)	logical	true if discrete sphere exists, false if referred to but not defined.
include	integer	The Include file number that the discrete sphere is in.
inertia	real	Mass moment of inertia.
mass	real	Mass or volume value (depending on whether the _VOLUME option is set).
model (read only)	integer	The Model number that the discrete sphere is in.
nid	integer	Node ID.
pid	integer	Part ID to which this element belongs.
radius	real	Particle radius.
transparency	integer	The transparency of the discrete sphere (0-100) 0% is opaque, 100% is transparent.
volume	logical	Turns _VOLUME on or OFF. Note that this does NOT refer to the data field VOLUME. For the latter see the mass property.

Detailed Description

The DiscreteSphere class allows you to create, modify, edit and manipulate discrete sphere cards. See the documentation below for more details.

Constructor

new DiscreteSphere(Model*[Model]*, nid*[integer]*, pid*[integer]*, mass*[real]*, inertia*[real]*, radius*[real]*)

Description

Create a new DiscreteSphere object.

Arguments

- **Model** (Model)

Model that discrete sphere will be created in

- **nid** (integer)

Node ID and Element ID are the same for discrete spheres.

- **pid** (integer)

Part ID to which this element belongs.

- **mass** (real)

Mass or volume value.

- **inertia** (real)

Mass moment of inertia.

- **radius** (real)

Particle radius.

Returns

DiscreteSphere object

Return type

DiscreteSphere

Example

To create a new discrete sphere in model m with nid = 100, pid = 400, mass = 0.9, inertia = 2.5, radius = 2.0:

```
var dsph = new DiscreteSphere(m, 100, 400, 0.9, 2.5, 2.0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a discrete sphere.

Arguments

- **Comment** (Comment)

Comment that will be attached to the discrete sphere

Returns

No return value

Example

To associate comment c to the discrete sphere dsph:

```
dsph.AssociateComment(c);
```

Blank()

Description

Blanks the discrete sphere

Arguments

No arguments

Returns

No return value

Example

To blank discrete sphere dsph:

```
dsph.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the discrete spheres in the model.

Arguments

- **Model** (Model)

Model that all discrete spheres will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the discrete spheres in model m:

```
DiscreteSphere.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged discrete spheres in the model.

Arguments

- **Model** (Model)

Model that all the flagged discrete spheres will be blanked in

- **flag** (Flag)

Flag set on the discrete spheres that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the discrete spheres in model m flagged with f:

```
DiscreteSphere.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the discrete sphere is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if discrete sphere dsph is blanked:

```
if (dsph.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse discrete sphere dsph:

```
dsph.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the discrete sphere.

Arguments

- **flag** (Flag)

Flag to clear on the discrete sphere

Returns

No return value

Example

To clear flag f for discrete sphere dsph:

```
dsph.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the discrete sphere. The target include of the copied discrete sphere can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

DiscreteSphere object

Return type

DiscreteSphere

Example

To copy discrete sphere dsph into discrete sphere z:

```
var z = dsph.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a discrete sphere.

Arguments

- **Model** (Model)

Model that the discrete sphere will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

DiscreteSphere object (or null if not made)

Return type

DiscreteSphere

Example

To start creating a discrete sphere in model m:

```
var dsph = DiscreteSphere.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a discrete sphere.

Arguments

- **Comment** (Comment)

Comment that will be detached from the discrete sphere

Returns

No return value

Example

To detach comment c from the discrete sphere dsph:

```
dsph.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit discrete sphere dsph:

```
dsph.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for discrete sphere. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for discrete sphere dsph:

```
dsph.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for discrete sphere.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the discrete sphere colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the discrete sphere.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing discrete sphere dsph:

```
var colour = dsph.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first discrete sphere in the model.

Arguments

- **Model** (Model)

Model to get first discrete sphere in

Returns

DiscreteSphere object (or null if there are no discrete spheres in the model).

Return type

DiscreteSphere

Example

To get the first discrete sphere in model m:

```
var dsph = DiscreteSphere.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free discrete sphere label in the model. Also see DiscreteSphere.LastFreeLabel(), DiscreteSphere.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free discrete sphere label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

DiscreteSphere label.

Return type

Number

Example

To get the first free discrete sphere label in model m:

```
var label = DiscreteSphere.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the discrete spheres in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all discrete spheres will be flagged in

- **flag** (Flag)

Flag to set on the discrete spheres

Returns

No return value

Example

To flag all of the discrete spheres with flag f in model m:

```
DiscreteSphere.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the discrete sphere is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the discrete sphere

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if discrete sphere dsph has flag f set on it:

```
if (dsph.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each discrete sphere in the model.
Note that ForEach has been designed to make looping over discrete spheres as fast as possible and so has some limitations.
Firstly, a single temporary DiscreteSphere object is created and on each function call it is updated with the current discrete sphere data. This means that you should not try to store the DiscreteSphere object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new discrete spheres inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all discrete spheres are in

- **func** (function)

Function to call for each discrete sphere

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the discrete spheres in model m:

```
DiscreteSphere.ForEach(m, test);
function test(dsph)
{
// dsph is DiscreteSphere object
}
```

To call function test for all of the discrete spheres in model m with optional object:

```
var data = { x:0, y:0 };
DiscreteSphere.ForEach(m, test, data);
function test(dsph, extra)
{
// dsph is DiscreteSphere object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of DiscreteSphere objects for all of the discrete spheres in a model in PRIMER

Arguments

- **Model** (Model)

Model to get discrete spheres from

Returns

Array of DiscreteSphere objects

Return type

Array

Example

To make an array of DiscreteSphere objects for all of the discrete spheres in model m

```
var dsph = DiscreteSphere.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a discrete sphere.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the discrete sphere dsph:

```
var comm_array = dsph.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of DiscreteSphere objects for all of the flagged discrete spheres in a model in PRIMER

Arguments

- **Model** (Model)

Model to get discrete spheres from

- **flag** (Flag)

Flag set on the discrete spheres that you want to retrieve

Returns

Array of DiscreteSphere objects

Return type

Array

Example

To make an array of DiscreteSphere objects for all of the discrete spheres in model m flagged with f

```
var dsph = DiscreteSphere.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the DiscreteSphere object for a discrete sphere ID.

Arguments

- **Model** (Model)

Model to find the discrete sphere in

- **number** (integer)

number of the discrete sphere you want the DiscreteSphere object for

Returns

DiscreteSphere object (or null if discrete sphere does not exist).

Return type

DiscreteSphere

Example

To get the DiscreteSphere object for discrete sphere 100 in model m

```
var dsph = DiscreteSphere.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a DiscreteSphere property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the DiscreteSphere.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

discrete sphere property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if DiscreteSphere property dsph.example is a parameter:

```
Options.property_parameter_names = true;
if (dsph.GetParameter(dsph.example) ) do_something...
Options.property_parameter_names = false;
```

To check if DiscreteSphere property dsph.example is a parameter by using the GetParameter method:

```
if (dsph.ViewParameters().GetParameter(dsph.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this discrete sphere (*ELEMENT_DISCRETE_SPHERE or *ELEMENT_DISCRETE_SPHERE_VOLUME). **Note that a carriage return is not added**. See also DiscreteSphere.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for discrete sphere dsph:

```
var key = dsph.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the discrete sphere. **Note that a carriage return is not added**. See also DiscreteSphere.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for discrete sphere dsph:

```
var cards = dsph.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last discrete sphere in the model.

Arguments

- **Model** (Model)

Model to get last discrete sphere in

Returns

DiscreteSphere object (or null if there are no discrete spheres in the model).

Return type

DiscreteSphere

Example

To get the last discrete sphere in model m:

```
var dsph = DiscreteSphere.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free discrete sphere label in the model. Also see DiscreteSphere.FirstFreeLabel(), DiscreteSphere.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free discrete sphere label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

DiscreteSphere label.

Return type

Number

Example

To get the last free discrete sphere label in model m:

```
var label = DiscreteSphere.LastFreeLabel(m);
```

Next()

Description

Returns the next discrete sphere in the model.

Arguments

No arguments

Returns

DiscreteSphere object (or null if there are no more discrete spheres in the model).

Return type

DiscreteSphere

Example

To get the discrete sphere in model m after discrete sphere dsph:

```
var dsph = dsph.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) discrete sphere label in the model. Also see DiscreteSphere.FirstFreeLabel(), DiscreteSphere.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free discrete sphere label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

DiscreteSphere label.

Return type

Number

Example

To get the next free discrete sphere label in model m:

```
var label = DiscreteSphere.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a discrete sphere.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only discrete spheres from that model can be picked. If the argument is a Flag then only discrete spheres that are flagged with *limit* can be selected. If omitted, or null, any discrete spheres from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

DiscreteSphere object (or null if not picked)

Return type

DiscreteSphere

Example

To pick a discrete sphere from model m giving the prompt 'Pick discrete sphere from screen':

```
var dsph = DiscreteSphere.Pick('Pick discrete sphere from screen', m);
```

Previous()

Description

Returns the previous discrete sphere in the model.

Arguments

No arguments

Returns

DiscreteSphere object (or null if there are no more discrete spheres in the model).

Return type

DiscreteSphere

Example

To get the discrete sphere in model m before discrete sphere dsph:

```
var dsph = dsph.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select discrete spheres using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting discrete spheres

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only discrete spheres from that model can be selected. If the argument is a Flag then only discrete spheres that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any discrete spheres can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of discrete spheres selected or null if menu cancelled

Return type

Number

Example

To select discrete spheres from model m, flagging those selected with flag f, giving the prompt 'Select discrete spheres':

```
DiscreteSphere.Select(f, 'Select discrete spheres', m);
```

To select discrete spheres, flagging those selected with flag f but limiting selection to discrete spheres flagged with flag l, giving the prompt 'Select discrete spheres':

```
DiscreteSphere.Select(f, 'Select discrete spheres', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the discrete sphere.

Arguments

- **flag** (Flag)

Flag to set on the discrete sphere

Returns

No return value

Example

To set flag f for discrete sphere dsph:

```
dsph.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the discrete sphere. The discrete sphere will be sketched until you either call DiscreteSphere.Unsketch(), DiscreteSphere.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete sphere is sketched. If omitted redraw is true. If you want to sketch several discrete spheres and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch discrete sphere dsph:

```
dsph.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged discrete spheres in the model. The discrete spheres will be sketched until you either call DiscreteSphere.Unsketch(), DiscreteSphere.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged discrete spheres will be sketched in

- **flag** (Flag)

Flag set on the discrete spheres that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete spheres are sketched. If omitted redraw is true. If you want to sketch flagged discrete spheres several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all discrete spheres flagged with flag in model m:

```
DiscreteSphere.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of discrete spheres in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing discrete spheres should be counted. If false or omitted referenced but undefined discrete spheres will also be included in the total.

Returns

number of discrete spheres

Return type

Number

Example

To get the total number of discrete spheres in model m:

```
var total = DiscreteSphere.Total(m);
```

Unblank()

Description

Unblanks the discrete sphere

Arguments

No arguments

Returns

No return value

Example

To unblank discrete sphere dsph:

```
dsph.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the discrete spheres in the model.

Arguments

- **Model** (Model)

Model that all discrete spheres will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the discrete spheres in model m:

```
DiscreteSphere.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged discrete spheres in the model.

Arguments

- **Model** (Model)

Model that the flagged discrete spheres will be unblanked in

- **flag** (Flag)

Flag set on the discrete spheres that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the discrete spheres in model m flagged with f:

```
DiscreteSphere.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the discrete spheres in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all discrete spheres will be unset in

- **flag** (Flag)

Flag to unset on the discrete spheres

Returns

No return value

Example

To unset the flag f on all the discrete spheres in model m:

```
DiscreteSphere.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the discrete sphere.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete sphere is unsketched. If omitted redraw is true. If you want to unsketch several discrete spheres and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch discrete sphere dsph:

```
dsph.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all discrete spheres.

Arguments

- **Model** (Model)

Model that all discrete spheres will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete spheres are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all discrete spheres in model m:

```
DiscreteSphere.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged discrete spheres in the model.

Arguments

- **Model** (Model)

Model that all discrete spheres will be unsketched in

- **flag** (Flag)

Flag set on the discrete spheres that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the discrete spheres are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all discrete spheres flagged with flag in model m:

```
DiscreteSphere.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

DiscreteSphere object.

Return type

DiscreteSphere

Example

To check if DiscreteSphere property dsph.example is a parameter by using the DiscreteSphere.GetParameter() method:

```
if (dsph.ViewParameters().GetParameter(dsph.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for discrete sphere. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for discrete sphere dsph:

```
dsph.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this discrete sphere.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for discrete sphere dsph:

```
var xrefs = dsph.Xrefs();
```

---

toString()

Description

Creates a string containing the discrete sphere data in keyword format. Note that this contains the keyword header and the keyword cards. See also DiscreteSphere.Keyword() and DiscreteSphere.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for discrete sphere dsph in keyword format

```
var s = dsph.toString();
```

Mass class

The Mass class gives you access to element mass cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Mass constants

Name	Description
Mass.NODE_SET	Mass is *MASS_NODE_SET.

Mass properties

Name	Type	Description
colour	Colour	The colour of the mass
eid	integer	Mass number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if mass exists, false if referred to but not defined.
id	integer	Node id or node set id
include	integer	The Include file number that the mass is in.
label	integer	Mass number. Also see the eid property which is an alternative name for this.
mass	real	Mass value
model (read only)	integer	The Model number that the mass is in.
node_set	integer	The type of the mass. Can be false (*MASS) or Mass.NODE_SET (*MASS_NODE_SET)
pid	integer	Part ID
transparency	integer	The transparency of the mass (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Mass class allows you to create, modify, edit and manipulate mass cards. See the documentation below for more details.

Constructor

new Mass(Model*[Model]*, eid*[integer]*, id*[integer]*, mass*[real]*, node set (optional)*[integer]*)

Description

Create a new Mass object.

Arguments

- **Model** (Model)

Model that mass will be created in

- **eid** (integer)

Mass number

- **id** (integer)

Node id or node set id

- **mass** (real)

Mass value

- **node set (optional)** (integer)

Only used if a node set is used

Returns

Mass object

Return type

Mass

Example

To create a new mass in model m with label 200, on node 500, or node set 500, with a mass of 3.5, use one of the following:

```
var m = new Mass(m, 200, 500, 3.5);

var m = new Mass(m, 200, 500, 3.5, Mass.NODE_SET);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a mass.

Arguments

- **Comment** (Comment)

Comment that will be attached to the mass

Returns

No return value

Example

To associate comment c to the mass m:

```
m.AssociateComment(c);
```

Blank()

Description

Blanks the mass

Arguments

No arguments

Returns

No return value

Example

To blank mass m:

```
m.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the masss in the model.

Arguments

- **Model** (Model)

Model that all masss will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the masss in model m:

```
Mass.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged masss in the model.

Arguments

- **Model** (Model)

Model that all the flagged masss will be blanked in

- **flag** (Flag)

Flag set on the masss that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the masss in model m flagged with f:

```
Mass.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the mass is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if mass m is blanked:

```
if (m.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse mass m:

```
m.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the mass.

Arguments

- **flag** (Flag)

Flag to clear on the mass

Returns

No return value

Example

To clear flag f for mass m:

```
m.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the mass. The target include of the copied mass can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Mass object

Return type

Mass

Example

To copy mass m into mass z:

```
var z = m.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a mass.

Arguments

- **Model** (Model)

Model that the mass will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Mass object (or null if not made)

Return type

Mass

Example

To start creating a mass in model m:

```
var m = Mass.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a mass.

Arguments

- **Comment** (Comment)

Comment that will be detached from the mass

Returns

No return value

Example

To detach comment c from the mass m:

```
m.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit mass m:

```
m.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for mass. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for mass m:

```
m.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for mass.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the mass colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the mass.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing mass m:

```
var colour = m.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first mass in the model.

Arguments

- **Model** (Model)

Model to get first mass in

Returns

Mass object (or null if there are no masss in the model).

Return type

Mass

Example

To get the first mass in model m:

```
var m = Mass.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free mass label in the model. Also see Mass.LastFreeLabel(), Mass.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free mass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Mass label.

Return type

Number

Example

To get the first free mass label in model m:

```
var label = Mass.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the masss in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all masss will be flagged in

- **flag** (Flag)

Flag to set on the masss

Returns

No return value

Example

To flag all of the masss with flag f in model m:

```
Mass.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the mass is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the mass

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if mass m has flag f set on it:

```
if (m.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each mass in the model.
Note that ForEach has been designed to make looping over masss as fast as possible and so has some limitations. Firstly, a single temporary Mass object is created and on each function call it is updated with the current mass data. This means that you should not try to store the Mass object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new masss inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all masss are in

- **func** (function)

Function to call for each mass

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the masss in model m:

```
Mass.ForEach(m, test);
function test(m)
{
// m is Mass object
}
```

To call function test for all of the masss in model m with optional object:

```
var data = { x:0, y:0 };
Mass.ForEach(m, test, data);
function test(m, extra)
{
// m is Mass object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Mass objects for all of the masss in a model in PRIMER

Arguments

- **Model** (Model)

Model to get masss from

Returns

Array of Mass objects

Return type

Array

Example

To make an array of Mass objects for all of the masss in model m

```
var m = Mass.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a mass.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the mass m:

```
var comm_array = m.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Mass objects for all of the flagged masss in a model in PRIMER

Arguments

- **Model** (Model)

Model to get masss from

- **flag** (Flag)

Flag set on the masss that you want to retrieve

Returns

Array of Mass objects

Return type

Array

Example

To make an array of Mass objects for all of the masss in model m flagged with f

```
var m = Mass.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Mass object for a mass ID.

Arguments

- **Model** (Model)

Model to find the mass in

- **number** (integer)

number of the mass you want the Mass object for

Returns

Mass object (or null if mass does not exist).

Return type

Mass

Example

To get the Mass object for mass 100 in model m

```
var m = Mass.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Mass property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Mass.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

mass property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Mass property m.example is a parameter:

```
Options.property_parameter_names = true;
if (m.GetParameter(m.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Mass property m.example is a parameter by using the GetParameter method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this mass (*ELEMENT_MASS or *ELEMENT_MASS_NODE_SET). **Note that a carriage return is not added**. See also Mass.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for mass m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the mass. **Note that a carriage return is not added**. See also Mass.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for mass m:

```
var cards = m.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last mass in the model.

Arguments

- **Model** (Model)

Model to get last mass in

Returns

Mass object (or null if there are no masss in the model).

Return type

Mass

Example

To get the last mass in model m:

```
var m = Mass.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free mass label in the model. Also see Mass.FirstFreeLabel(), Mass.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free mass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Mass label.

Return type

Number

Example

To get the last free mass label in model m:

```
var label = Mass.LastFreeLabel(m);
```

Next()

Description

Returns the next mass in the model.

Arguments

No arguments

Returns

Mass object (or null if there are no more masss in the model).

Return type

Mass

Example

To get the mass in model m after mass m:

```
var m = m.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) mass label in the model. Also see Mass.FirstFreeLabel(), Mass.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free mass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Mass label.

Return type

Number

Example

To get the next free mass label in model m:

```
var label = Mass.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a mass.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only masss from that model can be picked. If the argument is a Flag then only masss that are flagged with *limit* can be selected. If omitted, or null, any masss from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Mass object (or null if not picked)

Return type

Mass

Example

To pick a mass from model m giving the prompt 'Pick mass from screen':

```
var m = Mass.Pick('Pick mass from screen', m);
```

Previous()

Description

Returns the previous mass in the model.

Arguments

No arguments

Returns

Mass object (or null if there are no more masss in the model).

Return type

Mass

Example

To get the mass in model m before mass m:

```
var m = m.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the masss in the model.

Arguments

- **Model** (Model)

Model that all masss will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the masss in model m, from 1000000:

```
Mass.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged masss in the model.

Arguments

- **Model** (Model)

Model that all the flagged masss will be renumbered in

- **flag** (Flag)

Flag set on the masss that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the masss in model m flagged with f, from 1000000:

```
Mass.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select masss using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting masss

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only masss from that model can be selected. If the argument is a Flag then only masss that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any masss can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of masss selected or null if menu cancelled

Return type

Number

Example

To select masss from model m, flagging those selected with flag f, giving the prompt 'Select masss':

```
Mass.Select(f, 'Select masss', m);
```

To select masss, flagging those selected with flag f but limiting selection to masss flagged with flag l, giving the prompt 'Select masss':

```
Mass.Select(f, 'Select masss', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the mass.

Arguments

- **flag** (Flag)

Flag to set on the mass

Returns

No return value

Example

To set flag f for mass m:

```
m.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the mass. The mass will be sketched until you either call Mass.Unsketch(), Mass.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mass is sketched. If omitted redraw is true. If you want to sketch several masss and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch mass m:

```
m.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged masss in the model. The masss will be sketched until you either call Mass.Unsketch(), Mass.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged masss will be sketched in

- **flag** (Flag)

Flag set on the masss that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the masss are sketched. If omitted redraw is true. If you want to sketch flagged masss several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all masss flagged with flag in model m:

```
Mass.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of masss in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing masss should be counted. If false or omitted referenced but undefined masss will also be included in the total.

Returns

number of masss

Return type

Number

Example

To get the total number of masss in model m:

```
var total = Mass.Total(m);
```

Unblank()

Description

Unblanks the mass

Arguments

No arguments

Returns

No return value

Example

To unblank mass m:

```
m.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the masss in the model.

Arguments

- **Model** (Model)

Model that all masss will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the masss in model m:

```
Mass.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged masss in the model.

Arguments

- **Model** (Model)

Model that the flagged masss will be unblanked in

- **flag** (Flag)

Flag set on the masss that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the masss in model m flagged with f:

```
Mass.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the masss in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all masss will be unset in

- **flag** (Flag)

Flag to unset on the masss

Returns

No return value

Example

To unset the flag f on all the masss in model m:

```
Mass.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the mass.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mass is unsketched. If omitted redraw is true. If you want to unsketch several masss and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch mass m:

```
m.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all masss.

Arguments

- **Model** (Model)

Model that all masss will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the masss are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all masss in model m:

```
Mass.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged masss in the model.

Arguments

- **Model** (Model)

Model that all masss will be unsketched in

- **flag** (Flag)

Flag set on the masss that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the masss are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all masss flagged with flag in model m:

```
Mass.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Mass object.

Return type

Mass

Example

To check if Mass property m.example is a parameter by using the Mass.GetParameter() method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for mass. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for mass m:

```
m.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this mass.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for mass m:

```
var xrefs = m.Xrefs();
```

---

toString()

Description

Creates a string containing the mass data in keyword format. Note that this contains the keyword header and the keyword cards. See also Mass.Keyword() and Mass.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for mass m in keyword format

```
var s = m.toString();
```

MassPart class

The MassPart class gives you access to element mass part cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)

MassPart constants

Name	Description
MassPart.PART	Element is *ELEMENT_MASS_PART.
MassPart.SET	Element is *ELEMENT_MASS_PART_SET.

MassPart properties

Name	Type	Description
addmass	real	Added translational mass to be distributed to the nodes of the part or part set ID.
colour	Colour	The colour of the mass part
exists (read only)	logical	true if mass part exists, false if referred to but not defined.
finmass	real	Final translational mass of the part or part set ID.
id	integer	Part or part set ID if the SET option is active.
include	integer	The Include file number that the mass part is in.
lcid	integer	Optional load curve ID to scale the added mass at time = 0.
model (read only)	integer	The Model number that the element mass part is in.
mwd	integer	Optional flag for mass-weighted distribution.
option	constant	The Element Mass Part option. Can be MassPart.PART or MassPart.SET
transparency	integer	The transparency of the mass part (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The MassPart class allows you to create, modify, edit and manipulate element mass part cards. See the documentation below for more details.

Constructor

new MassPart(Model*[Model]*, option*[constant]*, id*[integer]*, addmass (optional)*[real]*, finmass (optional)*[real]*)

Description

Create a new MassPart object.

Arguments

- **Model** (Model)

Model that mass part will be created in

- **option** (constant)

Suffix for element mass part. Can be MassPart.PART or MassPart.SET.

- **id** (integer)

Part or part set ID.

- **addmass (optional)** (real)

Added translational mass.

- **finmass (optional)** (real)

Final translational mass.

Returns

MassPart object

Return type

MassPart

Example

To create a new element mass part in model m with option _<BLANK> and part ID 10:

```
var mp = new MassPart(m, MassPart.PART, 10);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a element mass part.

Arguments

- **Comment** (Comment)

Comment that will be attached to the element mass part

Returns

No return value

Example

To associate comment c to the element mass part mp:

```
mp.AssociateComment(c);
```

Blank()

Description

Blanks the element mass part

Arguments

No arguments

Returns

No return value

Example

To blank element mass part mp:

```
mp.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the element mass parts in the model.

Arguments

- **Model** (Model)

Model that all element mass parts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the element mass parts in model m:

```
MassPart.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged element mass parts in the model.

Arguments

- **Model** (Model)

Model that all the flagged element mass parts will be blanked in

- **flag** (Flag)

Flag set on the element mass parts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the element mass parts in model m flagged with f:

```
MassPart.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the element mass part is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if element mass part mp is blanked:

```
if (mp.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse element mass part mp:

```
mp.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the element mass part.

Arguments

- **flag** (Flag)

Flag to clear on the element mass part

Returns

No return value

Example

To clear flag f for element mass part mp:

```
mp.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the element mass part. The target include of the copied element mass part can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

MassPart object

Return type

MassPart

Example

To copy element mass part mp into element mass part z:

```
var z = mp.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a mass part.

Arguments

- **Model** (Model)

Model that the mass part will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

MassPart object (or null if not made)

Return type

MassPart

Example

To start creating a mass part in model m:

```
var mp = MassPart.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a element mass part.

Arguments

- **Comment** (Comment)

Comment that will be detached from the element mass part

Returns

No return value

Example

To detach comment c from the element mass part mp:

```
mp.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit element mass part mp:

```
mp.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for element mass part. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for element mass part mp:

```
mp.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for element mass part.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the element mass part colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the element mass part.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing element mass part mp:

```
var colour = mp.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first element mass part in the model.

Arguments

- **Model** (Model)

Model to get first element mass part in

Returns

MassPart object (or null if there are no element mass parts in the model).

Return type

MassPart

Example

To get the first element mass part in model m:

```
var mp = MassPart.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the element mass parts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all element mass parts will be flagged in

- **flag** (Flag)

Flag to set on the element mass parts

Returns

No return value

Example

To flag all of the element mass parts with flag f in model m:

```
MassPart.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the element mass part is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the element mass part

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if element mass part mp has flag f set on it:

```
if (mp.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each element mass part in the model.
Note that ForEach has been designed to make looping over element mass parts as fast as possible and so has some limitations.
Firstly, a single temporary MassPart object is created and on each function call it is updated with the current element mass part data. This means that you should not try to store the MassPart object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new element mass parts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all element mass parts are in

- **func** (function)

Function to call for each element mass part

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the element mass parts in model m:

```
MassPart.ForEach(m, test);
function test(mp)
{
// mp is MassPart object
}
```

To call function test for all of the element mass parts in model m with optional object:

```
var data = { x:0, y:0 };
MassPart.ForEach(m, test, data);
function test(mp, extra)
{
// mp is MassPart object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of MassPart objects for all of the element mass parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get element mass parts from

Returns

Array of MassPart objects

Return type

Array

Example

To make an array of MassPart objects for all of the element mass parts in model m

```
var mp = MassPart.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a element mass part.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the element mass part mp:

```
var comm_array = mp.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of MassPart objects for all of the flagged element mass parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get element mass parts from

- **flag** (Flag)

Flag set on the element mass parts that you want to retrieve

Returns

Array of MassPart objects

Return type

Array

Example

To make an array of MassPart objects for all of the element mass parts in model m flagged with f

```
var mp = MassPart.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the MassPart object for a element mass part ID.

Arguments

- **Model** (Model)

Model to find the element mass part in

- **number** (integer)

number of the element mass part you want the MassPart object for

Returns

MassPart object (or null if element mass part does not exist).

Return type

MassPart

Example

To get the MassPart object for element mass part 100 in model m

```
var mp = MassPart.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a MassPart property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the MassPart.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

element mass part property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if MassPart property mp.example is a parameter:

```
Options.property_parameter_names = true;
if (mp.GetParameter(mp.example) ) do_something...
Options.property_parameter_names = false;
```

To check if MassPart property mp.example is a parameter by using the GetParameter method:

```
if (mp.ViewParameters().GetParameter(mp.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this mass part (*ELEMENT_MASS_PART) **Note that a carriage return is not added**. See also MassPart.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for mass part mp:

```
var key = mp.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the mass part. **Note that a carriage return is not added**. See also MassPart.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for mass part mp:

```
var cards = mp.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last element mass part in the model.

Arguments

- **Model** (Model)

Model to get last element mass part in

Returns

MassPart object (or null if there are no element mass parts in the model).

Return type

MassPart

Example

To get the last element mass part in model m:

```
var mp = MassPart.Last(m);
```

Next()

Description

Returns the next element mass part in the model.

Arguments

No arguments

Returns

MassPart object (or null if there are no more element mass parts in the model).

Return type

MassPart

Example

To get the element mass part in model m after element mass part mp:

```
var mp = mp.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a element mass part.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only element mass parts from that model can be picked. If the argument is a Flag then only element mass parts that are flagged with *limit* can be selected. If omitted, or null, any element mass parts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

MassPart object (or null if not picked)

Return type

MassPart

Example

To pick a element mass part from model m giving the prompt 'Pick element mass part from screen':

```
var mp = MassPart.Pick('Pick element mass part from screen', m);
```

Previous()

Description

Returns the previous element mass part in the model.

Arguments

No arguments

Returns

MassPart object (or null if there are no more element mass parts in the model).

Return type

MassPart

Example

To get the element mass part in model m before element mass part mp:

```
var mp = mp.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select element mass parts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting element mass parts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only element mass parts from that model can be selected. If the argument is a Flag then only element mass parts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any element mass parts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of element mass parts selected or null if menu cancelled

Return type

Number

Example

To select element mass parts from model m, flagging those selected with flag f, giving the prompt 'Select element mass parts':

```
MassPart.Select(f, 'Select element mass parts', m);
```

To select element mass parts, flagging those selected with flag f but limiting selection to element mass parts flagged with flag l, giving the prompt 'Select element mass parts':

```
MassPart.Select(f, 'Select element mass parts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the element mass part.

Arguments

- **flag** (Flag)

Flag to set on the element mass part

Returns

No return value

Example

To set flag f for element mass part mp:

```
mp.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the element mass part. The element mass part will be sketched until you either call MassPart.Unsketch(), MassPart.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the element mass part is sketched. If omitted redraw is true. If you want to sketch several element mass parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch element mass part mp:

```
mp.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged element mass parts in the model. The element mass parts will be sketched until you either call MassPart.Unsketch(), MassPart.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged element mass parts will be sketched in

- **flag** (Flag)

Flag set on the element mass parts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the element mass parts are sketched. If omitted redraw is true. If you want to sketch flagged element mass parts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all element mass parts flagged with flag in model m:

```
MassPart.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of element mass parts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing element mass parts should be counted. If false or omitted referenced but undefined element mass parts will also be included in the total.

Returns

number of element mass parts

Return type

Number

Example

To get the total number of element mass parts in model m:

```
var total = MassPart.Total(m);
```

Unblank()

Description

Unblanks the element mass part

Arguments

No arguments

Returns

No return value

Example

To unblank element mass part mp:

```
mp.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the element mass parts in the model.

Arguments

- **Model** (Model)

Model that all element mass parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the element mass parts in model m:

```
MassPart.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged element mass parts in the model.

Arguments

- **Model** (Model)

Model that the flagged element mass parts will be unblanked in

- **flag** (Flag)

Flag set on the element mass parts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the element mass parts in model m flagged with f:

```
MassPart.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the element mass parts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all element mass parts will be unset in

- **flag** (Flag)

Flag to unset on the element mass parts

Returns

No return value

Example

To unset the flag f on all the element mass parts in model m:

```
MassPart.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the element mass part.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the element mass part is unsketched. If omitted redraw is true. If you want to unsketch several element mass parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch element mass part mp:

```
mp.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all element mass parts.

Arguments

- **Model** (Model)

Model that all element mass parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the element mass parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all element mass parts in model m:

```
MassPart.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged element mass parts in the model.

Arguments

- **Model** (Model)

Model that all element mass parts will be unsketched in

- **flag** (Flag)

Flag set on the element mass parts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the element mass parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all element mass parts flagged with flag in model m:

```
MassPart.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

MassPart object.

Return type

MassPart

Example

To check if MassPart property mp.example is a parameter by using the MassPart.GetParameter() method:

```
if (mp.ViewParameters().GetParameter(mp.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for element mass part. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for element mass part mp:

```
mp.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this element mass part.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for element mass part mp:

```
var xrefs = mp.Xrefs();
```

---

toString()

Description

Creates a string containing the mass part data in keyword format. Note that this contains the keyword header and the keyword cards. See also MassPart.Keyword() and MassPart.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for mass part mp in keyword format

```
var str = mp.toString();
```

Pretensioner class

The Pretensioner class gives you access to seatbelt pretensioner cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model *[Model]*, redraw (optional) *[boolean]*)
- BlankFlagged(Model *[Model]*, flag *[Flag]*, redraw (optional) *[boolean]*)

Pretensioner properties

Name	Type	Description
colour	Colour	The colour of the pretensioner
exists (read only)	logical	true if pretensioner exists, false if referred to but not defined.
include	integer	The Include file number that the pretensioner is in.
label	integer	Pretensioner number. Also see the sbprid property which is an alternative name for this.
lmtfrc	real	Limiting force
model (read only)	integer	The Model number that the pretensioner is in.
ptlcid	integer	Loadcurve of pull-in vs time
sbprid	integer	Pretensioner number. Also see the label property which is an alternative name for this.
sbprty	integer	Pretensioner type.
sbrid	integer	Retractor number.
sbsid1	integer	Sensor number 1
sbsid2	integer	Sensor number 2
sbsid3	integer	Sensor number 3
sbsid4	integer	Sensor number 4
time	real	Time between sensor triggering and pretensioner acting.
transparency	integer	The transparency of the pretensioner (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Pretensioner class allows you to create, modify, edit and manipulate seatbelt pretensioner cards. See the documentation below for more details.

Constructor

new Pretensioner(Model*[Model]*, sbprid*[integer]*, sbprty*[integer]*, sbrid*[integer]*, ptlcid*[integer]*, sbsid1*[integer]*, sbsid2 (optional)*[integer]*, sbsid3 (optional)*[integer]*, sbsid4 (optional)*[integer]*, time (optional)*[real]*, lmtfrc (optional)*[real]*)

Description

Create a new Seatbelt Pretensioner object.

Arguments

- **Model** (Model)

Model that pretensioner will be created in

- **sbprid** (integer)

Pretensioner number.

- **sbprty** (integer)

Pretensioner type.

- **sbrid** (integer)

Retractor number.

- **ptlcid** (integer)

Loadcurve of pull-in vs time

- **sbsid1** (integer)

Sensor number 1

- **sbsid2 (optional)** (integer)

Sensor number 2

- **sbsid3 (optional)** (integer)

Sensor number 3

- **sbsid4 (optional)** (integer)

Sensor number 4

- **time (optional)** (real)

Time between sensor triggering and pretensioner acting.

- **lmtfrc (optional)** (real)

Limiting force

Returns

Pretensioner object

Return type

Pretensioner

Example

To create a new pyrotechnic seatbelt pretensioner in model m with label 100, Retractor 10, Loading curve 20 and Sensor 30:

```
var p = new Pretensioner(m, 100, 1, 10, 20, 30);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a pretensioner.

Arguments

- **Comment** (Comment)

Comment that will be attached to the pretensioner

Returns

No return value

Example

To associate comment c to the pretensioner p:

```
p.AssociateComment(c);
```

Blank()

Description

Blanks the pretensioner

Arguments

No arguments

Returns

No return value

Example

To blank pretensioner p:

```
p.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the pretensioners in the model.

Arguments

- **Model** (Model)

Model that all pretensioners will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the pretensioners in model m:

```
Pretensioner.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged pretensioners in the model.

Arguments

- **Model** (Model)

Model that all the flagged pretensioners will be blanked in

- **flag** (Flag)

Flag set on the pretensioners that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the pretensioners in model m flagged with f:

```
Pretensioner.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the pretensioner is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if pretensioner p is blanked:

```
if (p.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse pretensioner p:

```
p.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the pretensioner.

Arguments

- **flag** (Flag)

Flag to clear on the pretensioner

Returns

No return value

Example

To clear flag f for pretensioner p:

```
p.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the pretensioner. The target include of the copied pretensioner can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Pretensioner object

Return type

Pretensioner

Example

To copy pretensioner p into pretensioner z:

```
var z = p.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a pretensioner.

Arguments

- **Model** (Model)

Model that the pretensioner will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Pretensioner object (or null if not made)

Return type

Pretensioner

Example

To start creating an pretensioner in model m:

```
var p = Pretensioner.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a pretensioner.

Arguments

- **Comment** (Comment)

Comment that will be detached from the pretensioner

Returns

No return value

Example

To detach comment c from the pretensioner p:

```
p.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit pretensioner p:

```
p.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for pretensioner. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for pretensioner p:

```
p.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for pretensioner.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the pretensioner colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the pretensioner.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing pretensioner p:

```
var colour = p.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first pretensioner in the model.

Arguments

- **Model** (Model)

Model to get first pretensioner in

Returns

Pretensioner object (or null if there are no pretensioners in the model).

Return type

Pretensioner

Example

To get the first pretensioner in model m:

```
var p = Pretensioner.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free pretensioner label in the model. Also see Pretensioner.LastFreeLabel(), Pretensioner.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free pretensioner label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Pretensioner label.

Return type

Number

Example

To get the first free pretensioner label in model m:

```
var label = Pretensioner.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the pretensioners in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all pretensioners will be flagged in

- **flag** (Flag)

Flag to set on the pretensioners

Returns

No return value

Example

To flag all of the pretensioners with flag f in model m:

```
Pretensioner.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the pretensioner is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the pretensioner

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if pretensioner p has flag f set on it:

```
if (p.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each pretensioner in the model.
Note that ForEach has been designed to make looping over pretensioners as fast as possible and so has some limitations.
Firstly, a single temporary Pretensioner object is created and on each function call it is updated with the current pretensioner data. This means that you should not try to store the Pretensioner object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new pretensioners inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all pretensioners are in

- **func** (function)

Function to call for each pretensioner

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the pretensioners in model m:

```
Pretensioner.ForEach(m, test);
function test(p)
{
// p is Pretensioner object
}
```

To call function test for all of the pretensioners in model m with optional object:

```
var data = { x:0, y:0 };
Pretensioner.ForEach(m, test, data);
function test(p, extra)
{
// p is Pretensioner object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Pretensioner objects for all of the pretensioners in a model in PRIMER

Arguments

- **Model** (Model)

Model to get pretensioners from

Returns

Array of Pretensioner objects

Return type

Array

Example

To make an array of Pretensioner objects for all of the pretensioners in model m

```
var p = Pretensioner.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a pretensioner.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the pretensioner p:

```
var comm_array = p.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Pretensioner objects for all of the flagged pretensioners in a model in PRIMER

Arguments

- **Model** (Model)

Model to get pretensioners from

- **flag** (Flag)

Flag set on the pretensioners that you want to retrieve

Returns

Array of Pretensioner objects

Return type

Array

Example

To make an array of Pretensioner objects for all of the pretensioners in model m flagged with f

```
var p = Pretensioner.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Pretensioner object for a pretensioner ID.

Arguments

- **Model** (Model)

Model to find the pretensioner in

- **number** (integer)

number of the pretensioner you want the Pretensioner object for

Returns

Pretensioner object (or null if pretensioner does not exist).

Return type

Pretensioner

Example

To get the Pretensioner object for pretensioner 100 in model m

```
var p = Pretensioner.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Pretensioner property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Pretensioner.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

pretensioner property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Pretensioner property p.example is a parameter:

```
Options.property_parameter_names = true;
if (p.GetParameter(p.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Pretensioner property p.example is a parameter by using the GetParameter method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this pretensioner (*ELEMENT_SEATBELT_PRETEROMETER) **Note that a carriage return is not added**. See also Pretensioner.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for pretensioner p:

```
var key = p.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the pretensioner. **Note that a carriage return is not added**. See also Pretensioner.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for pretensioner a:

```
var cards = a.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last pretensioner in the model.

Arguments

- **Model** (Model)

Model to get last pretensioner in

Returns

Pretensioner object (or null if there are no pretensioners in the model).

Return type

Pretensioner

Example

To get the last pretensioner in model m:

```
var p = Pretensioner.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free pretensioner label in the model. Also see Pretensioner.FirstFreeLabel(), Pretensioner.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free pretensioner label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Pretensioner label.

Return type

Number

Example

To get the last free pretensioner label in model m:

```
var label = Pretensioner.LastFreeLabel(m);
```

Next()

Description

Returns the next pretensioner in the model.

Arguments

No arguments

Returns

Pretensioner object (or null if there are no more pretensioners in the model).

Return type

Pretensioner

Example

To get the pretensioner in model m after pretensioner p:

```
var p = p.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) pretensioner label in the model. Also see Pretensioner.FirstFreeLabel(), Pretensioner.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free pretensioner label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Pretensioner label.

Return type

Number

Example

To get the next free pretensioner label in model m:

```
var label = Pretensioner.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a pretensioner.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only pretensioners from that model can be picked. If the argument is a Flag then only pretensioners that are flagged with *limit* can be selected. If omitted, or null, any pretensioners from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Pretensioner object (or null if not picked)

Return type

Pretensioner

Example

To pick a pretensioner from model m giving the prompt 'Pick pretensioner from screen':

```
var p = Pretensioner.Pick('Pick pretensioner from screen', m);
```

Previous()

Description

Returns the previous pretensioner in the model.

Arguments

No arguments

Returns

Pretensioner object (or null if there are no more pretensioners in the model).

Return type

Pretensioner

Example

To get the pretensioner in model m before pretensioner p:

```
var p = p.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the pretensioners in the model.

Arguments

- **Model** (Model)

Model that all pretensioners will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the pretensioners in model m, from 1000000:

```
Pretensioner.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged pretensioners in the model.

Arguments

- **Model** (Model)

Model that all the flagged pretensioners will be renumbered in

- **flag** (Flag)

Flag set on the pretensioners that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the pretensioners in model m flagged with f, from 1000000:

```
Pretensioner.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select pretensioners using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting pretensioners

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only pretensioners from that model can be selected. If the argument is a Flag then only pretensioners that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any pretensioners can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of pretensioners selected or null if menu cancelled

Return type

Number

Example

To select pretensioners from model m, flagging those selected with flag f, giving the prompt 'Select pretensioners':

```
Pretensioner.Select(f, 'Select pretensioners', m);
```

To select pretensioners, flagging those selected with flag f but limiting selection to pretensioners flagged with flag l, giving the prompt 'Select pretensioners':

```
Pretensioner.Select(f, 'Select pretensioners', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the pretensioner.

Arguments

- **flag** (Flag)

Flag to set on the pretensioner

Returns

No return value

Example

To set flag f for pretensioner p:

```
p.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the pretensioner. The pretensioner will be sketched until you either call Pretensioner.Unsketch(), Pretensioner.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the pretensioner is sketched. If omitted redraw is true. If you want to sketch several pretensioners and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch pretensioner p:

```
p.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged pretensioners in the model. The pretensioners will be sketched until you either call Pretensioner.Unsketch(), Pretensioner.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged pretensioners will be sketched in

- **flag** (Flag)

Flag set on the pretensioners that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the pretensioners are sketched. If omitted redraw is true. If you want to sketch flagged pretensioners several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all pretensioners flagged with flag in model m:

```
Pretensioner.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of pretensioners in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing pretensioners should be counted. If false or omitted referenced but undefined pretensioners will also be included in the total.

Returns

number of pretensioners

Return type

Number

Example

To get the total number of pretensioners in model m:

```
var total = Pretensioner.Total(m);
```

Unblank()

Description

Unblanks the pretensioner

Arguments

No arguments

Returns

No return value

Example

To unblank pretensioner p:

```
p.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the pretensioners in the model.

Arguments

- **Model** (Model)

Model that all pretensioners will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the pretensioners in model m:

```
Pretensioner.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged pretensioners in the model.

Arguments

- **Model** (Model)

Model that the flagged pretensioners will be unblanked in

- **flag** (Flag)

Flag set on the pretensioners that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the pretensioners in model m flagged with f:

```
Pretensioner.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the pretensioners in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all pretensioners will be unset in

- **flag** (Flag)

Flag to unset on the pretensioners

Returns

No return value

Example

To unset the flag f on all the pretensioners in model m:

```
Pretensioner.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the pretensioner.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the pretensioner is unsketched. If omitted redraw is true. If you want to unsketch several pretensioners and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch pretensioner p:

```
p.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all pretensioners.

Arguments

- **Model** (Model)

Model that all pretensioners will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the pretensioners are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all pretensioners in model m:

```
Pretensioner.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged pretensioners in the model.

Arguments

- **Model** (Model)

Model that all pretensioners will be unsketched in

- **flag** (Flag)

Flag set on the pretensioners that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the pretensioners are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all pretensioners flagged with flag in model m:

```
Pretensioner.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Pretensioner object.

Return type

Pretensioner

Example

To check if Pretensioner property p.example is a parameter by using the Pretensioner.GetParameter() method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for pretensioner. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for pretensioner p:

```
p.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this pretensioner.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for pretensioner p:

```
var xrefs = p.Xrefs();
```

---

toString()

Description

Creates a string containing the pretensioner data in keyword format. Note that this contains the keyword header and the keyword cards. See also Pretensioner.Keyword() and Pretensioner.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for pretensioner p in keyword format

```
var str = p.toString();
```

Retractor class

The Retractor class gives you access to seatbelt retractor cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Retractor properties

Name	Type	Description
colour	Colour	The colour of the retractor
dsid	integer	Retractor deactivation Sensor
exists (read only)	logical	true if retractor exists, false if referred to but not defined.
include	integer	The Include file number that the retractor is in.
label	integer	Retractor number. Also see the sbrid property which is an alternative name for this.
lfed	real	Fed length
llcid	integer	Loadcurve for loading (pull-out vs force)
model (read only)	integer	The Model number that the retractor is in.
nsbi	integer	Number of elements inside the retractor
pull	real	Amount of pull out between time delay ending and retractor locking
sbid	integer	Seatbelt1D number (or Set Shell number if sbrnid is negative).
sbrid	integer	Retractor number. Also see the label property which is an alternative name for this.
sbrnid	integer	Node number (or Set Node number if negative).
shell_seatbelt (read only)	logical	true if retractor is used for shell (2D) seatbelt elements.
sid1	integer	Sensor number 1
sid2	integer	Sensor number 2
sid3	integer	Sensor number 3
sid4	integer	Sensor number 4
tdel	real	Time delay after sensor triggers
transparency	integer	The transparency of the retractor (0-100) 0% is opaque, 100% is transparent.
ulcid	integer	Loadcurve for unloading (pull-out vs force)

Detailed Description

The Retractor class allows you to create, modify, edit and manipulate seatbelt retractor cards. See the documentation below for more details.

Constructor

new Retractor(Model*[Model]*, sbrid*[integer]*, sbrnid*[integer]*, sbid*[integer]*, llcid*[integer]*, sid1*[integer]*, sid2 (optional)*[integer]*, sid3 (optional)*[integer]*, sid4 (optional)*[integer]*, tdel (optional)*[real]*, pull (optional)*[real]*, ulcid (optional)*[integer]*, lfed (optional)*[real]*)

Description

Create a new Seatbelt Retractor object.

Arguments

- **Model** (Model)

Model that retractor will be created in

- **sbrid** (integer)

Retractor number.

- **sbrnid** (integer)

Node number (or Set Node number if negative).

- **sbid** (integer)

Seatbelt number. (or Set Shell number if sbrnid is negative)

- **llcid** (integer)

Loadcurve for loading (pull-out vs force)

- **sid1** (integer)

Sensor number 1

- **sid2 (optional)** (integer)

Sensor number 2

- **sid3 (optional)** (integer)

Sensor number 3

- **sid4 (optional)** (integer)

Sensor number 4

- **tdel (optional)** (real)

Time delay after sensor triggers.

- **pull (optional)** (real)

Amount of pull out between time delay ending and retractor locking.

- **ulcid (optional)** (integer)

Loadcurve for unloading (pull-out vs force)

- **lfed (optional)** (real)

Fed length

Returns

Retractor object

Return type

Retractor

Example

To create a new seatbelt retractor in model m with label 100, retractor Node 10, Seatbelt 20, Loading curve 30 and Sensor 40:

```
var a = new Retractor(m, 100, 10, 20, 30, 40);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a retractor.

Arguments

- **Comment** (Comment)

Comment that will be attached to the retractor

Returns

No return value

Example

To associate comment c to the retractor r:

```
r.AssociateComment(c);
```

Blank()

Description

Blanks the retractor

Arguments

No arguments

Returns

No return value

Example

To blank retractor r:

```
r.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the retractors in the model.

Arguments

- **Model** (Model)

Model that all retractors will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the retractors in model m:

```
Retractor.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged retractors in the model.

Arguments

- **Model** (Model)

Model that all the flagged retractors will be blanked in

- **flag** (Flag)

Flag set on the retractors that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the retractors in model m flagged with f:

```
Retractor.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the retractor is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if retractor r is blanked:

```
if (r.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse retractor r:

```
r.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the retractor.

Arguments

- **flag** (Flag)

Flag to clear on the retractor

Returns

No return value

Example

To clear flag f for retractor r:

```
r.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the retractor. The target include of the copied retractor can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Retractor object

Return type

Retractor

Example

To copy retractor r into retractor z:

```
var z = r.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a retractor.

Arguments

- **Model** (Model)

Model that the retractor will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Retractor object (or null if not made)

Return type

Retractor

Example

To start creating an retractor in model m:

```
var r = Retractor.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a retractor.

Arguments

- **Comment** (Comment)

Comment that will be detached from the retractor

Returns

No return value

Example

To detach comment c from the retractor r:

```
r.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit retractor r:

```
r.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for retractor. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for retractor r:

```
r.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for retractor.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the retractor colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the retractor.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing retractor r:

```
var colour = r.ExtractColour();
```

First(Model[*Model*]) [static]

Description

Returns the first retractor in the model.

Arguments

- **Model** (Model)

Model to get first retractor in

Returns

Retractor object (or null if there are no retractors in the model).

Return type

Retractor

Example

To get the first retractor in model m:

```
var r = Retractor.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free retractor label in the model. Also see Retractor.LastFreeLabel(), Retractor.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free retractor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Retractor label.

Return type

Number

Example

To get the first free retractor label in model m:

```
var label = Retractor.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the retractors in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all retractors will be flagged in

- **flag** (Flag)

Flag to set on the retractors

Returns

No return value

Example

To flag all of the retractors with flag f in model m:

```
Retractor.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the retractor is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the retractor

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if retractor r has flag f set on it:

```
if (r.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each retractor in the model.
Note that ForEach has been designed to make looping over retractors as fast as possible and so has some limitations.
Firstly, a single temporary Retractor object is created and on each function call it is updated with the current retractor data. This means that you should not try to store the Retractor object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new retractors inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all retractors are in

- **func** (function)

Function to call for each retractor

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the retractors in model m:

```
Retractor.ForEach(m, test);
function test(r)
{
// r is Retractor object
}
```

To call function test for all of the retractors in model m with optional object:

```
var data = { x:0, y:0 };
Retractor.ForEach(m, test, data);
function test(r, extra)
{
// r is Retractor object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Retractor objects for all of the retractors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get retractors from

Returns

Array of Retractor objects

Return type

Array

Example

To make an array of Retractor objects for all of the retractors in model m

```
var r = Retractor.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a retractor.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the retractor r:

```
var comm_array = r.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Retractor objects for all of the flagged retractors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get retractors from

- **flag** (Flag)

Flag set on the retractors that you want to retrieve

Returns

Array of Retractor objects

Return type

Array

Example

To make an array of Retractor objects for all of the retractors in model m flagged with f

```
var r = Retractor.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Retractor object for a retractor ID.

Arguments

- **Model** (Model)

Model to find the retractor in

- **number** (integer)

number of the retractor you want the Retractor object for

Returns

Retractor object (or null if retractor does not exist).

Return type

Retractor

Example

To get the Retractor object for retractor 100 in model m

```
var r = Retractor.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Retractor property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Retractor.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

retractor property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Retractor property r.example is a parameter:

```
Options.property_parameter_names = true;
if (r.GetParameter(r.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Retractor property r.example is a parameter by using the GetParameter method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this retractor (*ELEMENT_SEATBELT_RETREROMETER) **Note that a carriage return is not added**. See also Retractor.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for retractor r:

```
var key = r.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the retractor. **Note that a carriage return is not added**. See also Retractor.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for retractor r:

```
var cards = r.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last retractor in the model.

Arguments

- **Model** (Model)

Model to get last retractor in

Returns

Retractor object (or null if there are no retractors in the model).

Return type

Retractor

Example

To get the last retractor in model m:

```
var r = Retractor.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free retractor label in the model. Also see Retractor.FirstFreeLabel(), Retractor.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free retractor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Retractor label.

Return type

Number

Example

To get the last free retractor label in model m:

```
var label = Retractor.LastFreeLabel(m);
```

Next()

Description

Returns the next retractor in the model.

Arguments

No arguments

Returns

Retractor object (or null if there are no more retractors in the model).

Return type

Retractor

Example

To get the retractor in model m after retractor r:

```
var r = r.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) retractor label in the model. Also see Retractor.FirstFreeLabel(), Retractor.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free retractor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Retractor label.

Return type

Number

Example

To get the next free retractor label in model m:

```
var label = Retractor.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a retractor.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only retractors from that model can be picked. If the argument is a Flag then only retractors that are flagged with *limit* can be selected. If omitted, or null, any retractors from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Retractor object (or null if not picked)

Return type

Retractor

Example

To pick a retractor from model m giving the prompt 'Pick retractor from screen':

```
var r = Retractor.Pick('Pick retractor from screen', m);
```

Previous()

Description

Returns the previous retractor in the model.

Arguments

No arguments

Returns

Retractor object (or null if there are no more retractors in the model).

Return type

Retractor

Example

To get the retractor in model m before retractor r:

```
var r = r.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the retractors in the model.

Arguments

- **Model** (Model)

Model that all retractors will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the retractors in model m, from 1000000:

```
Retractor.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged retractors in the model.

Arguments

- **Model** (Model)

Model that all the flagged retractors will be renumbered in

- **flag** (Flag)

Flag set on the retractors that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the retractors in model m flagged with f, from 1000000:

```
Retractor.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select retractors using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting retractors

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only retractors from that model can be selected. If the argument is a Flag then only retractors that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any retractors can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of retractors selected or null if menu cancelled

Return type

Number

Example

To select retractors from model m, flagging those selected with flag f, giving the prompt 'Select retractors':

```
Retractor.Select(f, 'Select retractors', m);
```

To select retractors, flagging those selected with flag f but limiting selection to retractors flagged with flag l, giving the prompt 'Select retractors':

```
Retractor.Select(f, 'Select retractors', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the retractor.

Arguments

- **flag** (Flag)

Flag to set on the retractor

Returns

No return value

Example

To set flag f for retractor r:

```
r.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the retractor. The retractor will be sketched until you either call Retractor.Unsketch(), Retractor.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the retractor is sketched. If omitted redraw is true. If you want to sketch several retractors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch retractor r:

```
r.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged retractors in the model. The retractors will be sketched until you either call Retractor.Unsketch(), Retractor.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged retractors will be sketched in

- **flag** (Flag)

Flag set on the retractors that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the retractors are sketched. If omitted redraw is true. If you want to sketch flagged retractors several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all retractors flagged with flag in model m:

```
Retractor.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of retractors in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing retractors should be counted. If false or omitted referenced but undefined retractors will also be included in the total.

Returns

number of retractors

Return type

Number

Example

To get the total number of retractors in model m:

```
var total = Retractor.Total(m);
```

Unblank()

Description

Unblanks the retractor

Arguments

No arguments

Returns

No return value

Example

To unblank retractor r:

```
r.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the retractors in the model.

Arguments

- **Model** (Model)

Model that all retractors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the retractors in model m:

```
Retractor.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged retractors in the model.

Arguments

- **Model** (Model)

Model that the flagged retractors will be unblanked in

- **flag** (Flag)

Flag set on the retractors that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the retractors in model m flagged with f:

```
Retractor.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the retractors in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all retractors will be unset in

- **flag** (Flag)

Flag to unset on the retractors

Returns

No return value

Example

To unset the flag f on all the retractors in model m:

```
Retractor.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the retractor.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the retractor is unsketched. If omitted redraw is true. If you want to unsketch several retractors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch retractor r:

```
r.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all retractors.

Arguments

- **Model** (Model)

Model that all retractors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the retractors are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all retractors in model m:

```
Retractor.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged retractors in the model.

Arguments

- **Model** (Model)

Model that all retractors will be unsketched in

- **flag** (Flag)

Flag set on the retractors that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the retractors are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all retractors flagged with flag in model m:

```
Retractor.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Retractor object.

Return type

Retractor

Example

To check if Retractor property r.example is a parameter by using the Retractor.GetParameter() method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for retractor. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for retractor r:

```
r.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this retractor.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for retractor r:

```
var xrefs = r.Xrefs();
```

---

toString()

Description

Creates a string containing the retractor data in keyword format. Note that this contains the keyword header and the keyword cards. See also Retractor.Keyword() and Retractor.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for retractor r in keyword format

```
var str = r.toString();
```

Seatbelt1D class

The Seatbelt1D class gives you access to 2 noded (1D) element seatbelt cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Seatbelt1D properties

Name	Type	Description
colour	Colour	The colour of the seatbelt
eid	integer	Seatbelt1D number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if seatbelt exists, false if referred to but not defined.
include	integer	The Include file number that the seatbelt is in.
label	integer	Seatbelt1D number. Also see the eid property which is an alternative name for this.
model (read only)	integer	The Model number that the seatbelt is in.
n1	integer	Node 1 ID
n2	integer	Node 2 ID
pid	integer	Part ID
sbrid	integer	Retractor ID
slen	real	Initial slack length
transparency	integer	The transparency of the seatbelt (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Seatbelt1D class allows you to create, modify, edit and manipulate 2 noded (1D) element seatbelt cards. See the documentation below for more details.

Constructor

new Seatbelt1D(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*)

Description

Create a new Seatbelt1D object.

Arguments

- **Model** (Model)

Model that seatbelt will be created in

- **eid** (integer)

Seatbelt ID.

- **pid** (integer)

Part number.

- **n1** (integer)

Node 1 ID

- **n2** (integer)

Node 2 ID

Returns

Seatbelt1D object

Return type

Seatbelt1D

Example

To create a new 2 noded element seatbelt in model m with label 100, part 10 and nodes 20, 21:

```
var a = new Seatbelt1D(m, 100, 10, 20, 21);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a seatbelt.

Arguments

- **Comment** (Comment)

Comment that will be attached to the seatbelt

Returns

No return value

Example

To associate comment c to the seatbelt s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the seatbelt

Arguments

No arguments

Returns

No return value

Example

To blank seatbelt s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the seatbelts in model m:

```
Seatbelt1D.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that all the flagged seatbelts will be blanked in

- **flag** (Flag)

Flag set on the seatbelts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the seatbelts in model m flagged with f:

```
Seatbelt1D.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the seatbelt is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if seatbelt s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse seatbelt s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the seatbelt.

Arguments

- **flag** (Flag)

Flag to clear on the seatbelt

Returns

No return value

Example

To clear flag f for seatbelt s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the seatbelt. The target include of the copied seatbelt can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Seatbelt1D object

Return type

Seatbelt1D

Example

To copy seatbelt s into seatbelt z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a 2 noded seatbelt.

Arguments

- **Model** (Model)

Model that the seatbelt will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Seatbelt1D object (or null if not made)

Return type

Seatbelt1D

Example

To start creating a seatbelt in model m:

```
var s = Seatbelt1D.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a seatbelt.

Arguments

- **Comment** (Comment)

Comment that will be detached from the seatbelt

Returns

No return value

Example

To detach comment c from the seatbelt s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit seatbelt s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for seatbelt. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for seatbelt s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for seatbelt.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the seatbelt colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the seatbelt.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing seatbelt s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first seatbelt in the model.

Arguments

- **Model** (Model)

Model to get first seatbelt in

Returns

Seatbelt1D object (or null if there are no seatbelts in the model).

Return type

Seatbelt1D

Example

To get the first seatbelt in model m:

```
var s = Seatbelt1D.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free seatbelt label in the model. Also see Seatbelt1D.LastFreeLabel(), Seatbelt1D.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Seatbelt1D label.

Return type

Number

Example

To get the first free seatbelt label in model m:

```
var label = Seatbelt1D.FirstFreeLabel(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the seatbelts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all seatbelts will be flagged in

- **flag** (Flag)

Flag to set on the seatbelts

Returns

No return value

Example

To flag all of the seatbelts with flag f in model m:

```
Seatbelt1D.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the seatbelt is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the seatbelt

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if seatbelt s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each seatbelt in the model.
Note that ForEach has been designed to make looping over seatbelts as fast as possible and so has some limitations.
Firstly, a single temporary Seatbelt1D object is created and on each function call it is updated with the current seatbelt data. This means that you should not try to store the Seatbelt1D object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new seatbelts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all seatbelts are in

- **func** (function)

Function to call for each seatbelt

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the seatbelts in model m:

```
Seatbelt1D.ForEach(m, test);
function test(s)
{
// s is Seatbelt1D object
}
```

To call function test for all of the seatbelts in model m with optional object:

```
var data = { x:0, y:0 };
Seatbelt1D.ForEach(m, test, data);
function test(s, extra)
{
// s is Seatbelt1D object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Seatbelt1D objects for all of the seatbelts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get seatbelts from

Returns

Array of Seatbelt1D objects

Return type

Array

Example

To make an array of Seatbelt1D objects for all of the seatbelts in model m

```
var s = Seatbelt1D.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a seatbelt.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the seatbelt s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Seatbelt1D objects for all of the flagged seatbelts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get seatbelts from

- **flag** (Flag)

Flag set on the seatbelts that you want to retrieve

Returns

Array of Seatbelt1D objects

Return type

Array

Example

To make an array of Seatbelt1D objects for all of the seatbelts in model m flagged with f

```
var s = Seatbelt1D.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Seatbelt1D object for a seatbelt ID.

Arguments

- **Model** (Model)

Model to find the seatbelt in

- **number** (integer)

number of the seatbelt you want the Seatbelt1D object for

Returns

Seatbelt1D object (or null if seatbelt does not exist).

Return type

Seatbelt1D

Example

To get the Seatbelt1D object for seatbelt 100 in model m

```
var s = Seatbelt1D.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Seatbelt1D property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Seatbelt1D.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

seatbelt property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Seatbelt1D property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Seatbelt1D property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this seatbelt (*ELEMENT_SEATBELT) **Note that a carriage return is not added**. See also Seatbelt1D.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for seatbelt s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the seatbelt. **Note that a carriage return is not added**. See also Seatbelt1D.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for seatbelt s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last seatbelt in the model.

Arguments

- **Model** (Model)

Model to get last seatbelt in

Returns

Seatbelt1D object (or null if there are no seatbelts in the model).

Return type

Seatbelt1D

Example

To get the last seatbelt in model m:

```
var s = Seatbelt1D.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free seatbelt label in the model. Also see Seatbelt1D.FirstFreeLabel(), Seatbelt1D.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Seatbelt1D label.

Return type

Number

Example

To get the last free seatbelt label in model m:

```
var label = Seatbelt1D.LastFreeLabel(m);
```

Next()

Description

Returns the next seatbelt in the model.

Arguments

No arguments

Returns

Seatbelt1D object (or null if there are no more seatbelts in the model).

Return type

Seatbelt1D

Example

To get the seatbelt in model m after seatbelt s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) seatbelt label in the model. Also see Seatbelt1D.FirstFreeLabel(), Seatbelt1D.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Seatbelt1D label.

Return type

Number

Example

To get the next free seatbelt label in model m:

```
var label = Seatbelt1D.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a seatbelt.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only seatbelts from that model can be picked. If the argument is a Flag then only seatbelts that are flagged with *limit* can be selected. If omitted, or null, any seatbelts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Seatbelt1D object (or null if not picked)

Return type

Seatbelt1D

Example

To pick a seatbelt from model m giving the prompt 'Pick seatbelt from screen':

```
var s = Seatbelt1D.Pick('Pick seatbelt from screen', m);
```

Previous()

Description

Returns the previous seatbelt in the model.

Arguments

No arguments

Returns

Seatbelt1D object (or null if there are no more seatbelts in the model).

Return type

Seatbelt1D

Example

To get the seatbelt in model m before seatbelt s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the seatbelts in model m, from 1000000:

```
Seatbelt1D.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that all the flagged seatbelts will be renumbered in

- **flag** (Flag)

Flag set on the seatbelts that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the seatbelts in model m flagged with f, from 1000000:

```
Seatbelt1D.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select seatbelts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting seatbelts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only seatbelts from that model can be selected. If the argument is a Flag then only seatbelts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any seatbelts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of seatbelts selected or null if menu cancelled

Return type

Number

Example

To select seatbelts from model m, flagging those selected with flag f, giving the prompt 'Select seatbelts':

```
Seatbelt1D.Select(f, 'Select seatbelts', m);
```

To select seatbelts, flagging those selected with flag f but limiting selection to seatbelts flagged with flag l, giving the prompt 'Select seatbelts':

```
Seatbelt1D.Select(f, 'Select seatbelts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the seatbelt.

Arguments

- **flag** (Flag)

Flag to set on the seatbelt

Returns

No return value

Example

To set flag f for seatbelt s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the seatbelt. The seatbelt will be sketched until you either call Seatbelt1D.Unsketch(), Seatbelt1D.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelt is sketched. If omitted redraw is true. If you want to sketch several seatbelts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch seatbelt s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged seatbelts in the model. The seatbelts will be sketched until you either call Seatbelt1D.Unsketch(), Seatbelt1D.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged seatbelts will be sketched in

- **flag** (Flag)

Flag set on the seatbelts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are sketched. If omitted redraw is true. If you want to sketch flagged seatbelts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all seatbelts flagged with flag in model m:

```
Seatbelt1D.SketchFlagged(m, flag);
```

Timestep()

Description

Calculates the timestep for the seatbelt

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for seatbelt s:

```
var timestep = s.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of seatbelts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing seatbelts should be counted. If false or omitted referenced but undefined seatbelts will also be included in the total.

Returns

number of seatbelts

Return type

Number

Example

To get the total number of seatbelts in model m:

```
var total = Seatbelt1D.Total(m);
```

Unblank()

Description

Unblanks the seatbelt

Arguments

No arguments

Returns

No return value

Example

To unblank seatbelt s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the seatbelts in model m:

```
Seatbelt1D.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that the flagged seatbelts will be unblanked in

- **flag** (Flag)

Flag set on the seatbelts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the seatbelts in model m flagged with f:

```
Seatbelt1D.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all seatbelts will be unset in

- **flag** (Flag)

Flag to unset on the seatbelts

Returns

No return value

Example

To unset the flag f on all the seatbelts in model m:

```
Seatbelt1D.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the seatbelt.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelt is unsketched. If omitted redraw is true. If you want to unsketch several seatbelts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch seatbelt s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all seatbelts.

Arguments

- **Model** (Model)

Model that all seatbelts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all seatbelts in model m:

```
Seatbelt1D.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be unsketched in

- **flag** (Flag)

Flag set on the seatbelts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all seatbelts flagged with flag in model m:

```
Seatbelt1D.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Seatbelt1D object.

Return type

Seatbelt1D

Example

To check if Seatbelt1D property s.example is a parameter by using the Seatbelt1D.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for seatbelt. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for seatbelt s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this seatbelt.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for seatbelt s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the seatbelt data in keyword format. Note that this contains the keyword header and the keyword cards. See also Seatbelt1D.Keyword() and Seatbelt1D.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for seatbelt s in keyword format

```
var str = s.toString();
```

Seatbelt2D class

The Seatbelt2D class gives you access to 4 noded (2D) element seatbelt cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Seatbelt2D properties

Name	Type	Description
colour	Colour	The colour of the seatbelt
eid	integer	Seatbelt2D number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if seatbelt exists, false if referred to but not defined.
include	integer	The Include file number that the seatbelt is in.
label	integer	Seatbelt2D number. Also see the eid property which is an alternative name for this.
model (read only)	integer	The Model number that the seatbelt is in.
n1	integer	Node 1 ID
n2	integer	Node 2 ID
n3	integer	Node 3 ID
n4	integer	Node 4 ID
pid	integer	Part ID
sbrid	integer	Retractor ID
slen	real	Initial slack length
transparency	integer	The transparency of the seatbelt (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Seatbelt2D class allows you to create, modify, edit and manipulate 4 noded element seatbelt cards. See the documentation below for more details.

Constructor

new Seatbelt2D(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*)

Description

Create a new Seatbelt2D object.

Arguments

- **Model** (Model)

Model that seatbelt will be created in

- **eid** (integer)

Seatbelt ID.

- **pid** (integer)

Part number.

- **n1** (integer)

Node 1 ID

- **n2** (integer)

Node 2 ID

- **n3** (integer)

Node 3 ID

- **n4** (integer)

Node 4 ID

Returns

Seatbelt2D object

Return type

Seatbelt2D

Example

To create a new 4 noded element seatbelt in model m with label 100, part 10 and nodes 20, 21, 22, 23:

```
var a = new Seatbelt2D(m, 100, 10, 20, 21, 22, 23);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a seatbelt.

Arguments

- **Comment** (Comment)

Comment that will be attached to the seatbelt

Returns

No return value

Example

To associate comment c to the seatbelt s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the seatbelt

Arguments

No arguments

Returns

No return value

Example

To blank seatbelt s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the seatbelts in model m:

```
Seatbelt2D.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that all the flagged seatbelts will be blanked in

- **flag** (Flag)

Flag set on the seatbelts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the seatbelts in model m flagged with f:

```
Seatbelt2D.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the seatbelt is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if seatbelt s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse seatbelt s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the seatbelt.

Arguments

- **flag** (Flag)

Flag to clear on the seatbelt

Returns

No return value

Example

To clear flag f for seatbelt s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the seatbelt. The target include of the copied seatbelt can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Seatbelt2D object

Return type

Seatbelt2D

Example

To copy seatbelt s into seatbelt z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a 2 noded seatbelt.

Arguments

- **Model** (Model)

Model that the seatbelt will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Seatbelt2D object (or null if not made)

Return type

Seatbelt2D

Example

To start creating a seatbelt in model m:

```
var s = Seatbelt2D.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a seatbelt.

Arguments

- **Comment** (Comment)

Comment that will be detached from the seatbelt

Returns

No return value

Example

To detach comment c from the seatbelt s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit seatbelt s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for seatbelt. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for seatbelt s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for seatbelt.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the seatbelt colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the seatbelt.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing seatbelt s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first seatbelt in the model.

Arguments

- **Model** (Model)

Model to get first seatbelt in

Returns

Seatbelt2D object (or null if there are no seatbelts in the model).

Return type

Seatbelt2D

Example

To get the first seatbelt in model m:

```
var s = Seatbelt2D.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free seatbelt label in the model. Also see Seatbelt2D.LastFreeLabel(), Seatbelt2D.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Seatbelt2D label.

Return type

Number

Example

To get the first free seatbelt label in model m:

```
var label = Seatbelt2D.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the seatbelts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all seatbelts will be flagged in

- **flag** (Flag)

Flag to set on the seatbelts

Returns

No return value

Example

To flag all of the seatbelts with flag f in model m:

```
Seatbelt2D.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the seatbelt is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the seatbelt

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if seatbelt s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each seatbelt in the model.
Note that ForEach has been designed to make looping over seatbelts as fast as possible and so has some limitations.
Firstly, a single temporary Seatbelt2D object is created and on each function call it is updated with the current seatbelt data. This means that you should not try to store the Seatbelt2D object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new seatbelts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all seatbelts are in

- **func** (function)

Function to call for each seatbelt

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the seatbelts in model m:

```
Seatbelt2D.ForEach(m, test);
function test(s)
{
// s is Seatbelt2D object
}
```

To call function test for all of the seatbelts in model m with optional object:

```
var data = { x:0, y:0 };
Seatbelt2D.ForEach(m, test, data);
function test(s, extra)
{
// s is Seatbelt2D object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Seatbelt2D objects for all of the seatbelts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get seatbelts from

Returns

Array of Seatbelt2D objects

Return type

Array

Example

To make an array of Seatbelt2D objects for all of the seatbelts in model m

```
var s = Seatbelt2D.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a seatbelt.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the seatbelt s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Seatbelt2D objects for all of the flagged seatbelts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get seatbelts from

- **flag** (Flag)

Flag set on the seatbelts that you want to retrieve

Returns

Array of Seatbelt2D objects

Return type

Array

Example

To make an array of Seatbelt2D objects for all of the seatbelts in model m flagged with f

```
var s = Seatbelt2D.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Seatbelt2D object for a seatbelt ID.

Arguments

- **Model** (Model)

Model to find the seatbelt in

- **number** (integer)

number of the seatbelt you want the Seatbelt2D object for

Returns

Seatbelt2D object (or null if seatbelt does not exist).

Return type

Seatbelt2D

Example

To get the Seatbelt2D object for seatbelt 100 in model m

```
var s = Seatbelt2D.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Seatbelt2D property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Seatbelt2D.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

seatbelt property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Seatbelt2D property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Seatbelt2D property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this seatbelt (*ELEMENT_SEATBELT) **Note that a carriage return is not added**. See also Seatbelt2D.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for seatbelt s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the seatbelt. **Note that a carriage return is not added**. See also Seatbelt2D.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for seatbelt s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last seatbelt in the model.

Arguments

- **Model** (Model)

Model to get last seatbelt in

Returns

Seatbelt2D object (or null if there are no seatbelts in the model).

Return type

Seatbelt2D

Example

To get the last seatbelt in model m:

```
var s = Seatbelt2D.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free seatbelt label in the model. Also see Seatbelt2D.FirstFreeLabel(), Seatbelt2D.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Seatbelt2D label.

Return type

Number

Example

To get the last free seatbelt label in model m:

```
var label = Seatbelt2D.LastFreeLabel(m);
```

Next()

Description

Returns the next seatbelt in the model.

Arguments

No arguments

Returns

Seatbelt2D object (or null if there are no more seatbelts in the model).

Return type

Seatbelt2D

Example

To get the seatbelt in model m after seatbelt s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) seatbelt label in the model. Also see Seatbelt2D.FirstFreeLabel(), Seatbelt2D.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free seatbelt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Seatbelt2D label.

Return type

Number

Example

To get the next free seatbelt label in model m:

```
var label = Seatbelt2D.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a seatbelt.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only seatbelts from that model can be picked. If the argument is a Flag then only seatbelts that are flagged with *limit* can be selected. If omitted, or null, any seatbelts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Seatbelt2D object (or null if not picked)

Return type

Seatbelt2D

Example

To pick a seatbelt from model m giving the prompt 'Pick seatbelt from screen':

```
var s = Seatbelt2D.Pick('Pick seatbelt from screen', m);
```

Previous()

Description

Returns the previous seatbelt in the model.

Arguments

No arguments

Returns

Seatbelt2D object (or null if there are no more seatbelts in the model).

Return type

Seatbelt2D

Example

To get the seatbelt in model m before seatbelt s:

```
var s = s.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select seatbelts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting seatbelts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only seatbelts from that model can be selected. If the argument is a Flag then only seatbelts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any seatbelts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of seatbelts selected or null if menu cancelled

Return type

Number

Example

To select seatbelts from model m, flagging those selected with flag f, giving the prompt 'Select seatbelts':

```
Seatbelt2D.Select(f, 'Select seatbelts', m);
```

To select seatbelts, flagging those selected with flag f but limiting selection to seatbelts flagged with flag l, giving the prompt 'Select seatbelts':

```
Seatbelt2D.Select(f, 'Select seatbelts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the seatbelt.

Arguments

- **flag** (Flag)

Flag to set on the seatbelt

Returns

No return value

Example

To set flag f for seatbelt s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the seatbelt. The seatbelt will be sketched until you either call Seatbelt2D.Unsketch(), Seatbelt2D.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelt is sketched. If omitted redraw is true. If you want to sketch several seatbelts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch seatbelt s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged seatbelts in the model. The seatbelts will be sketched until you either call Seatbelt2D.Unsketch(), Seatbelt2D.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged seatbelts will be sketched in

- **flag** (Flag)

Flag set on the seatbelts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are sketched. If omitted redraw is true. If you want to sketch flagged seatbelts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all seatbelts flagged with flag in model m:

```
Seatbelt2D.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of seatbelts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing seatbelts should be counted. If false or omitted referenced but undefined seatbelts will also be included in the total.

Returns

number of seatbelts

Return type

Number

Example

To get the total number of seatbelts in model m:

```
var total = Seatbelt2D.Total(m);
```

Unblank()

Description

Unblanks the seatbelt

Arguments

No arguments

Returns

No return value

Example

To unblank seatbelt s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the seatbelts in model m:

```
Seatbelt2D.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that the flagged seatbelts will be unblanked in

- **flag** (Flag)

Flag set on the seatbelts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the seatbelts in model m flagged with f:

```
Seatbelt2D.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the seatbelts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all seatbelts will be unset in

- **flag** (Flag)

Flag to unset on the seatbelts

Returns

No return value

Example

To unset the flag f on all the seatbelts in model m:

```
Seatbelt2D.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the seatbelt.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelt is unsketched. If omitted redraw is true. If you want to unsketch several seatbelts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch seatbelt s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all seatbelts.

Arguments

- **Model** (Model)

Model that all seatbelts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all seatbelts in model m:

```
Seatbelt2D.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged seatbelts in the model.

Arguments

- **Model** (Model)

Model that all seatbelts will be unsketched in

- **flag** (Flag)

Flag set on the seatbelts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the seatbelts are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all seatbelts flagged with flag in model m:

```
Seatbelt2D.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Seatbelt2D object.

Return type

Seatbelt2D

Example

To check if Seatbelt2D property s.example is a parameter by using the Seatbelt2D.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for seatbelt. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for seatbelt s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this seatbelt.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for seatbelt s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the seatbelt data in keyword format. Note that this contains the keyword header and the keyword cards. See also Seatbelt2D.Keyword() and Seatbelt2D.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for seatbelt s in keyword format

```
var str = s.toString();
```

Sensor class

The Sensor class gives you access to seatbelt sensor cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)

Sensor properties

Name	Type	Description
acc	real	Activating acceleration.
atime	real	Time over which acceleration must be exceeded.
colour	Colour	The colour of the sensor
dmn	real	Minimum distance
dmx	real	Maximum distance
dof	integer	Degree of freedom.
exists (read only)	logical	true if sensor exists, false if referred to but not defined.
include	integer	The Include file number that the sensor is in.
label	integer	Sensor number. Also see the sbacid property which is an alternative name for this.
model (read only)	integer	The Model number that the sensor is in.
nid	integer	Node number.
nid1	integer	Node number 1
nid2	integer	Node number 2
pulmn	real	Maximum pull-out
pulmx	real	Maximum pull-out
pulrat	real	Rate of pull-out (length/time units)
pultim	real	Time over which rate of pull#out must be exceeded
sbrid	integer	Retractor number (for sbstyp = 2 OR 5).
sbsfl	integer	Sensor flag.
sbsid	integer	Sensor number. Also see the label property which is an alternative name for this.
sbstyp	integer	Sensor type.
time	real	Time at which sensor triggers
transparency	integer	The transparency of the sensor (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Sensor class allows you to create, modify, edit and manipulate seatbelt sensor cards. See the documentation below for more details.

Constructor

new Sensor(Model*[Model]*, sbsid*[integer]*, sbstyp*[integer]*, sbsfl (optional)*[integer]*, nid (optional)*[integer]*, nid2 (optional)*[integer]*)

Description

Create a new Seatbelt Sensor object.

Arguments

- **Model** (Model)

Model that sensor will be created in

- **sbsid** (integer)

Sensor number.

- **sbstyp** (integer)

Sensor type

- **sbsfl (optional)** (integer)

Sensor flag. Default 0.

- **nid (optional)** (integer)

Optional node ID: Compulsory for types 1 and 4.

- **nid2 (optional)** (integer)

Optional node ID 2: Compulsory for type 4.

Returns

Sensor object

Return type

Sensor

Example

To create a new seatbelt sensor in model m with label 100, type 1 and node 1:

```
var s = new Sensor(m, 100, 1, 0, 1);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a sensor.

Arguments

- **Comment** (Comment)

Comment that will be attached to the sensor

Returns

No return value

Example

To associate comment c to the sensor s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the sensor

Arguments

No arguments

Returns

No return value

Example

To blank sensor s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the sensors in the model.

Arguments

- **Model** (Model)

Model that all sensors will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sensors in model m:

```
Sensor.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged sensors in the model.

Arguments

- **Model** (Model)

Model that all the flagged sensors will be blanked in

- **flag** (Flag)

Flag set on the sensors that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sensors in model m flagged with f:

```
Sensor.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the sensor is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if sensor s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse sensor s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the sensor.

Arguments

- **flag** (Flag)

Flag to clear on the sensor

Returns

No return value

Example

To clear flag f for sensor s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the sensor. The target include of the copied sensor can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Sensor object

Return type

Sensor

Example

To copy sensor s into sensor z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a sensor.

Arguments

- **Model** (Model)

Model that the sensor will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Sensor object (or null if not made)

Return type

Sensor

Example

To start creating an sensor in model m:

```
var s = Sensor.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a sensor.

Arguments

- **Comment** (Comment)

Comment that will be detached from the sensor

Returns

No return value

Example

To detach comment c from the sensor s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit sensor s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for sensor. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for sensor s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for sensor.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the sensor colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the sensor.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing sensor s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first sensor in the model.

Arguments

- **Model** (Model)

Model to get first sensor in

Returns

Sensor object (or null if there are no sensors in the model).

Return type

Sensor

Example

To get the first sensor in model m:

```
var s = Sensor.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free sensor label in the model. Also see Sensor.LastFreeLabel(), Sensor.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free sensor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Sensor label.

Return type

Number

Example

To get the first free sensor label in model m:

```
var label = Sensor.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the sensors in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all sensors will be flagged in

- **flag** (Flag)

Flag to set on the sensors

Returns

No return value

Example

To flag all of the sensors with flag f in model m:

```
Sensor.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the sensor is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the sensor

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if sensor s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each sensor in the model.
Note that ForEach has been designed to make looping over sensors as fast as possible and so has some limitations.
Firstly, a single temporary Sensor object is created and on each function call it is updated with the current sensor data. This means that you should not try to store the Sensor object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new sensors inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all sensors are in

- **func** (function)

Function to call for each sensor

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the sensors in model m:

```
Sensor.ForEach(m, test);
function test(s)
{
// s is Sensor object
}
```

To call function test for all of the sensors in model m with optional object:

```
var data = { x:0, y:0 };
Sensor.ForEach(m, test, data);
function test(s, extra)
{
// s is Sensor object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Sensor objects for all of the sensors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sensors from

Returns

Array of Sensor objects

Return type

Array

Example

To make an array of Sensor objects for all of the sensors in model m

```
var s = Sensor.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a sensor.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the sensor s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Sensor objects for all of the flagged sensors in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sensors from

- **flag** (Flag)

Flag set on the sensors that you want to retrieve

Returns

Array of Sensor objects

Return type

Array

Example

To make an array of Sensor objects for all of the sensors in model m flagged with f

```
var s = Sensor.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Sensor object for a sensor ID.

Arguments

- **Model** (Model)

Model to find the sensor in

- **number** (integer)

number of the sensor you want the Sensor object for

Returns

Sensor object (or null if sensor does not exist).

Return type

Sensor

Example

To get the Sensor object for sensor 100 in model m

```
var s = Sensor.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Sensor property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Sensor.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

sensor property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Sensor property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Sensor property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this sensor (*ELEMENT_SEATBELT_SENSEROMETER) **Note that a carriage return is not added**. See also Sensor.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for sensor s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the sensor. **Note that a carriage return is not added**. See also Sensor.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for sensor s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last sensor in the model.

Arguments

- **Model** (Model)

Model to get last sensor in

Returns

Sensor object (or null if there are no sensors in the model).

Return type

Sensor

Example

To get the last sensor in model m:

```
var s = Sensor.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free sensor label in the model. Also see Sensor.FirstFreeLabel(), Sensor.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free sensor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Sensor label.

Return type

Number

Example

To get the last free sensor label in model m:

```
var label = Sensor.LastFreeLabel(m);
```

Next()

Description

Returns the next sensor in the model.

Arguments

No arguments

Returns

Sensor object (or null if there are no more sensors in the model).

Return type

Sensor

Example

To get the sensor in model m after sensor s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) sensor label in the model. Also see Sensor.FirstFreeLabel(), Sensor.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free sensor label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Sensor label.

Return type

Number

Example

To get the next free sensor label in model m:

```
var label = Sensor.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a sensor.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sensors from that model can be picked. If the argument is a Flag then only sensors that are flagged with *limit* can be selected. If omitted, or null, any sensors from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Sensor object (or null if not picked)

Return type

Sensor

Example

To pick a sensor from model m giving the prompt 'Pick sensor from screen':

```
var s = Sensor.Pick('Pick sensor from screen', m);
```

Previous()

Description

Returns the previous sensor in the model.

Arguments

No arguments

Returns

Sensor object (or null if there are no more sensors in the model).

Return type

Sensor

Example

To get the sensor in model m before sensor s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the sensors in the model.

Arguments

- **Model** (Model)

Model that all sensors will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sensors in model m, from 1000000:

```
Sensor.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged sensors in the model.

Arguments

- **Model** (Model)

Model that all the flagged sensors will be renumbered in

- **flag** (Flag)

Flag set on the sensors that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sensors in model m flagged with f, from 1000000:

```
Sensor.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select sensors using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting sensors

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sensors from that model can be selected. If the argument is a Flag then only sensors that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any sensors can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of sensors selected or null if menu cancelled

Return type

Number

Example

To select sensors from model m, flagging those selected with flag f, giving the prompt 'Select sensors':

```
Sensor.Select(f, 'Select sensors', m);
```

To select sensors, flagging those selected with flag f but limiting selection to sensors flagged with flag l, giving the prompt 'Select sensors':

```
Sensor.Select(f, 'Select sensors', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the sensor.

Arguments

- **flag** (Flag)

Flag to set on the sensor

Returns

No return value

Example

To set flag f for sensor s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the sensor. The sensor will be sketched until you either call Sensor.Unsketch(), Sensor.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sensor is sketched. If omitted redraw is true. If you want to sketch several sensors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch sensor s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged sensors in the model. The sensors will be sketched until you either call Sensor.Unsketch(), Sensor.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged sensors will be sketched in

- **flag** (Flag)

Flag set on the sensors that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sensors are sketched. If omitted redraw is true. If you want to sketch flagged sensors several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all sensors flagged with flag in model m:

```
Sensor.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of sensors in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing sensors should be counted. If false or omitted referenced but undefined sensors will also be included in the total.

Returns

number of sensors

Return type

Number

Example

To get the total number of sensors in model m:

```
var total = Sensor.Total(m);
```

Unblank()

Description

Unblanks the sensor

Arguments

No arguments

Returns

No return value

Example

To unblank sensor s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the sensors in the model.

Arguments

- **Model** (Model)

Model that all sensors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sensors in model m:

```
Sensor.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged sensors in the model.

Arguments

- **Model** (Model)

Model that the flagged sensors will be unblanked in

- **flag** (Flag)

Flag set on the sensors that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sensors in model m flagged with f:

```
Sensor.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the sensors in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all sensors will be unset in

- **flag** (Flag)

Flag to unset on the sensors

Returns

No return value

Example

To unset the flag f on all the sensors in model m:

```
Sensor.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the sensor.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sensor is unsketched. If omitted redraw is true. If you want to unsketch several sensors and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch sensor s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all sensors.

Arguments

- **Model** (Model)

Model that all sensors will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sensors are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sensors in model m:

```
Sensor.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged sensors in the model.

Arguments

- **Model** (Model)

Model that all sensors will be unsketched in

- **flag** (Flag)

Flag set on the sensors that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sensors are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sensors flagged with flag in model m:

```
Sensor.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Sensor object.

Return type

Sensor

Example

To check if Sensor property s.example is a parameter by using the Sensor.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for sensor. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for sensor s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this sensor.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for sensor s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the sensor data in keyword format. Note that this contains the keyword header and the keyword cards. See also Sensor.Keyword() and Sensor.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for sensor s in keyword format

```
var str = s.toString();
```

Shell class

The Shell class gives you access to shell cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)
- Create(Model*[Model]*, modal (optional)*[boolean]*)

Shell constants

Name	Description
Shell.EDGE_1	Edge 1 of shell
Shell.EDGE_2	Edge 2 of shell
Shell.EDGE_3	Edge 3 of shell
Shell.EDGE_4	Edge 4 of shell

Shell properties

Name	Type	Description
beta	real	Orthotropic material base offset angle. null if the _BETA option is not set. If not null then this is the angle in degrees and the _BETA option is set. This is required to distinguish between the cases of _BETA not being used (beta === null) and _BETA being set but the angle being zero (beta === 0). Prior to version 18 _BETA was only set if beta was non-zero. This was fixed in version 18 and the test changed to beta not being null. **Note: If this option is set then mcid should be 0**
colour	Colour	The colour of the shell
composite	logical	If COMPOSITE option is set. Can be true or false
composite_long	logical	If COMPOSITE_LONG option is set. Can be true or false
dof	logical	If DOF option is set. Can be true or false

edges	constant	Bitwise code of Shell.EDGE_1, Shell.EDGE_2, Shell.EDGE_3 and Shell.EDGE_4 representing which edges of the shell are free edges
eid	integer	Shell number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if shell exists, false if referred to but not defined.
include	integer	The Include file number that the shell is in.
label	integer	Shell number. Also see the eid property which is an alternative name for this.
mcid	integer	Material coordinate system ID. If non zero then the _MCID option is assumed. **Note: If this option is set then beta should be null.**
model (read only)	integer	The Model number that the shell is in.
n1	integer	Node number 1
n2	integer	Node number 2
n3	integer	Node number 3
n4	integer	Node number 4
n5	integer	Node number 5
n6	integer	Node number 6
n7	integer	Node number 7
n8	integer	Node number 8
nip	logical	Number of integration points for composite shell
nodes (read only)	integer	Number of nodes shell has
ns1	integer	Scalar Node number 1
ns2	integer	Scalar Node number 2
ns3	integer	Scalar Node number 3
ns4	integer	Scalar Node number 4
offset	real	Offset distance. If non zero then the _OFFSET option is assumed
pid	integer	Part number
shl4_to_shl8	logical	If SHL4_TO_SHL8 option is set. Can be true or false
thic1	real	Thickness at node 1
thic2	real	Thickness at node 2
thic3	real	Thickness at node 3
thic4	real	Thickness at node 4
thic5	real	Thickness at node 5 (if 8 noded shell)
thic6	real	Thickness at node 6 (if 8 noded shell)
thic7	real	Thickness at node 7 (if 8 noded shell)
thic8	real	Thickness at node 8 (if 8 noded shell)
thickness	logical	If _THICKNESS option is set. Can be true or false
transparency	integer	The transparency of the shell (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Shell class allows you to create, modify, edit and manipulate shell cards. See the documentation below for more details.

Constructor

new Shell(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4 (optional)*[integer]*, n5 (optional)*[integer]*, n6 (optional)*[integer]*, n7 (optional)*[integer]*, n8 (optional)*[integer]*)

Description

Create a new Shell object. Use either 3, 4, 6 or 8 nodes when creating a new shell. If you are creating a 3 noded shell either only give 3 nodes or give 4 nodes but make nodes 3 and 4 the same number. Similarly, 6 noded shells can be created with 6 node arguments or with 8 nodes but nodes 3 and 4 the same number and nodes 7 and 8 the same number.

Arguments

- **Model** (Model)

Model that shell will be created in

- **eid** (integer)

Shell number

- **pid** (integer)

Part number

- **n1** (integer)

Node number 1

- **n2** (integer)

Node number 2

- **n3** (integer)

Node number 3

- **n4 (optional)** (integer)

Node number 4

- **n5 (optional)** (integer)

Node number 5

- **n6 (optional)** (integer)

Node number 6

- **n7 (optional)** (integer)

Node number 7

- **n8 (optional)** (integer)

Node number 8

Returns

Shell object

Return type

Shell

Example

To create a new shell in model m with label 100, part 10 and nodes 1, 2, 3, 4:

```
var s = new Shell(m, 100, 10, 1, 2, 3, 4);
```

Details of functions

Angles()

Description

Calculates the minimum and maximum internal angles (in degrees) for the shell

Arguments

No arguments

Returns

Array of numbers containing min and max angles

Return type

Number

Example

To calculate the maximum and minimum internal angles for shell s:

```
var angles = s.Angles();
var min = angles[0];
var max = angles[1];
```

Area()

Description

Calculates the area for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the area for shell s:

```
var area = s.Area();
```

AspectRatio()

Description

Calculates the aspect ratio for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the aspect ratio for shell s:

```
var ratio = s.AspectRatio();
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the shell

Returns

No return value

Example

To associate comment c to the shell s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the shell

Arguments

No arguments

Returns

No return value

Example

To blank shell s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the shells in the model.

Arguments

- **Model** (Model)

Model that all shells will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the shells in model m:

```
Shell.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged shells will be blanked in

- **flag** (Flag)

Flag set on the shells that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the shells in model m flagged with f:

```
Shell.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the shell is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if shell s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse shell s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the shell.

Arguments

- **flag** (Flag)

Flag to clear on the shell

Returns

No return value

Example

To clear flag f for shell s:

```
s.ClearFlag(f);
```

CoordsToIsoparametric(x*[real]*, y*[real]*, z*[real]*)

Description

Calculates the isoparametric coordinates for a point on the shell.

Arguments

- **x** (real)

X coordinate of point

- **y** (real)

Y coordinate of point

- **z** (real)

Z coordinate of point

Returns

Array containing s and t isoparametric coordinates and the distance the point is from the shell (positive in direction of shell normal). If it is not possible to calculate the isoparametric coordinates null is returned.

Return type

Array

Example

To calculate the isoparametric coordinates of point (10, 20, 30) on shell s:

```
var isocoords = s.CoordsToIsoparametric(10, 20, 30);
```

Copy(range (optional)*[boolean]*)

Description

Copies the shell. The target include of the copied shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Shell object

Return type

Shell

Example

To copy shell s into shell z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a shell.

Arguments

- **Model** (Model)

Model that the shell will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Shell object (or null if not made)

Return type

Shell

Example

To start creating a shell in model m:

```
var s = Shell.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the shell

Returns

No return value

Example

To detach comment c from the shell s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit shell s:

```
s.Edit();
```

ElemCut(Database cross section label*[integer]*)

Description

Returns coordinates of the intersections between a shell and a database cross section.

Arguments

- **Database cross section label** (integer)

The label of the database cross section.

Returns

An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line, or NULL if it does not cut. Note this function does not check that the shell is in the cross section definition (part set)

Return type

Array

Example

To get the cut line coordinates between database cross section 200 and shell s:

```
var data = s.ElemCut(200)
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for shell s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for shell.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the shell colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the shell.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing shell s:

```
var colour = s.ExtractColour();
```

FillAttachedHole(pid*[integer]*, size*[real]*)

Description

Fills in (meshes) a hole attached to the shell.

Arguments

- **pid** (integer)

The Part number that the new shells will be created in.

- **size** (real)

The size for created elements.

Returns

No return value.

Example

To fill in a hole attached to shell s, putting new shells with size 5.0 into part 100:

```
s.FillAttachedHole(100, 5.0);
```

FillHolesOnFlagged(Model*[Model]*, Flag*[Flag]*, RemeshHole*[boolean]*, pid (optional)*[integer]*, Max Hole Size (optional)*[real]*, Mesh Element size (optional)*[real]*, planarSurface (optional)*[boolean]*) [static]

Description

Fills multiple holes using flagged shells.

Arguments

- **Model** (Model)

Model that all shells are in.

- **Flag** (Flag)

flag bit

- **RemeshHole** (boolean)

TRUE if elements around the hole should be remeshed

- **pid (optional)** (integer)

Needs to be specified if RemeshHole is FALSE. Specifies the Part id where the mesh is filled

- **Max Hole Size (optional)** (real)

Maximum size of the hole which is to be filled. If omitted a default size of 20.0 will be set

- **Mesh Element size (optional)** (real)

Element size of the mesh which fills the hole. If omitted a default size of 10.0 will be set

- **planarSurface (optional)** (boolean)

Needs to be specified if RemeshHole is TRUE. TRUE if we need to Use planar surface

Returns

No return value.

Example

To fill holes on flagged shells:

```
Shell.FillHolesOnFlagged(m, flag, 1, 112, 60.5, 5.34 ,0);
```

Note: pid is required when RemeshHole is FALSE

```
Shell.FillHolesOnFlagged(m, flag, 0, 112);
```

FindShellInBox(Model*[Model]*, xmin*[real]*, xmax*[real]*, ymin*[real]*, ymax*[real]*, zmin*[real]*, zmax*[real]*, flag (optional)*[integer]*, excl (optional)*[integer]*, vis_only (optional)*[integer]*) [static]

Description

Returns an array of Shell objects for the shells within a box. Please note in (default) inclusive mode this function provides a list of all shells that could potentially be in the box (using computationally cheap bounding box comparison - local box vs main box). NOTE - it is not a rigorous test of whether the shell is actually in the box. An extension of "spot_thickness" is applied to each local shell box. By default this is 10mm. You can use "Options.connection_max_thickness = x" to reduce this value. This may return shells that are ostensibly outside box. The user should apply their own test on each shell returned. The purpose of this function is to reduce the number of shells you need to test. Setting the exclusive option will only return shells that are fully contained in the main box This may not capture all the shells you want to process so must be used with care.

Arguments

- **Model** (Model)

Model designated model

- **xmin** (real)

Minimum bound in global x

- **xmax** (real)

Maximum bound in global x

- **ymin** (real)

Minimum bound in global y

- **ymax** (real)

Maximum bound in global y

- **zmin** (real)

Minimum bound in global z

- **zmax** (real)

Maximum bound in global z

- **flag (optional)** (integer)

Optional flag to restrict shells considered, if 0 all shells considered

- **excl (optional)** (integer)

Optional flag (0) Apply inclusive selection with local box extension = "spot_thickness" (default 10) (-1) Apply inclusive selection with local box extension = 0.5*shell thickness (1) Apply exclusive selection inclusive selection means elements intersect box exclusive selection means elements contained in box

- **vis_only (optional)** (integer)

Optional flag to consider visible shells only (1), if (0) all shells considered

Returns

Array of Shell objects

Return type

Array

Example

To get an array of Shell objects for flagged shells within defined box.

```
var s = Shell.FindShellInBox(m, xmin, xmax, ymin, ymax, zmin, zmax, flag, 0, 0);
```

FindShellInit(Model*[Model]*, flag (optional)*[Flag]*) [static] [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Initialize setup so that all flagged shells in model can be tested to see if they are within box. In v20.0 this function is obsolete and the flagging bit (if required) should be specified in Shell.FindShellInBox()

Arguments

- **Model** (Model)

Model in which shells have been flagged

- **flag (optional)** (Flag)

Optional flag that has been set on the shells, if 0 all shells considered

Returns

No return value

Example

To initialize find setup for flagged shells in model m:

```
Shell.FindShellInit(m, flag);
```

First(Model*[Model]*) [static]

Description

Returns the first shell in the model.

Arguments

- **Model** (Model)

Model to get first shell in

Returns

Shell object (or null if there are no shells in the model).

Return type

Shell

Example

To get the first shell in model m:

```
var s = Shell.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free shell label in the model. Also see Shell.LastFreeLabel(), Shell.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Shell label.

Return type

Number

Example

To get the first free shell label in model m:

```
var label = Shell.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all shells will be flagged in

- **flag** (Flag)

Flag to set on the shells

Returns

No return value

Example

To flag all of the shells with flag f in model m:

```
Shell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if shell s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each shell in the model.
Note that ForEach has been designed to make looping over shells as fast as possible and so has some limitations. Firstly, a single temporary Shell object is created and on each function call it is updated with the current shell data. This means that you should not try to store the Shell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all shells are in

- **func** (function)

Function to call for each shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the shells in model m:

```
Shell.ForEach(m, test);
function test(s)
{
// s is Shell object
}
```

To call function test for all of the shells in model m with optional object:

```
var data = { x:0, y:0 };
Shell.ForEach(m, test, data);
function test(s, extra)
{
// s is Shell object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Shell objects for all of the shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get shells from

Returns

Array of Shell objects

Return type

Array

Example

To make an array of Shell objects for all of the shells in model m

```
var s = Shell.GetAll(m);
```

GetAttachedShells(tolerance (optional)*[real]*, recursive (optional)*[boolean]*)

Description

Returns the shells that are attached to the shell. **Note that 'attached' means that the shells must share 2 nodes**.

Arguments

- **tolerance (optional)** (real)

This tolerance can be used to limit the selection to shells whose normal vector is within this tolerance (in degrees) of the original shell. If omitted the tolerance is 180 degrees.

- **recursive (optional)** (boolean)

If recursive is false then only the shells actually attached to the shell will be returned (this could also be done by using the Xrefs class but this method is provided for convenience. If recursive is true then PRIMER will keep finding attached shells until no more can be found. If omitted recursive will be false.

Returns

Array of Shell objects (or null if there are no attached shells).

Return type

Array

Example

To find the shells attached to shell s with a 10 degree tolerance, growing the selection until no more shells can be found:

```
var shell_array = s.GetAttachedShells(10, true);
```

GetComments()

Description

Extracts the comments associated to a shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the shell s:

```
var comm_array = s.GetComments();
```

GetCompositeData(ipt*[integer]*)

Description

Returns the composite data for an integration point in *ELEMENT_SHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array containing the material ID, thickness and beta angle values. If the _COMPOSITE_LONG option is set, then the array returned will also contain the ply ID.

Return type

Array

Example

To get the composite data for the 3rd integration point for shell s:

```
if (s.composite && s.nip >= 3)
{
    var ipt_data = s.GetCompositeData(2);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Shell objects for all of the flagged shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get shells from

- **flag** (Flag)

Flag set on the shells that you want to retrieve

Returns

Array of Shell objects

Return type

Array

Example

To make an array of Shell objects for all of the shells in model m flagged with f

```
var s = Shell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Shell object for a shell ID.

Arguments

- **Model** (Model)

Model to find the shell in

- **number** (integer)

number of the shell you want the Shell object for

Returns

Shell object (or null if shell does not exist).

Return type

Shell

Example

To get the Shell object for shell 100 in model m

```
var s = Shell.GetFromID(m, 100);
```

GetNodeIDs()

Description

Returns the labels of the nodes on the shell as an array. See also Shell.GetNodes()

Arguments

No arguments

Returns

Array of node labels (integers)

Return type

Number

Example

To return the node labels of shell s as an array

```
var nodes = s.GetNodeIDs();
```

GetNodes()

Description

Returns the nodes on the shell as an array of Node objects. See also Shell.GetNodeIDs()

Arguments

No arguments

Returns

Array of Node objects

Return type

Array

Example

To return the nodes of shell s as an array

```
var nodes = s.GetNodes();
```

GetParameter(prop*[string]*)

Description

Checks if a Shell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Shell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Shell property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Shell property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

GetShellReferenceGeometry()

Description

Returns the airbag shell reference geometry of the shell

Arguments

No arguments

Returns

The shell reference geometry ID of the shell (or 0 if it hasn't got any)

Return type

Number

Example

To get the shell reference geometry of the shell s:

```
var a = s.GetShellReferenceGeometry();
```

IsoparametricToCoords(s*[real]*, t*[real]*)

Description

Calculates the coordinates for a point on the shell from the isoparametric coords.

Arguments

- **s** (real)

First isoparametric coordinate

- **t** (real)

Second isoparametric coordinate

Returns

Array of numbers containing x, y and z or null if not possible to calculate.

Return type

Number

Example

To calculate the coordinates of isoparametric point (0.5, -0.5) on shell s:

```
var coords = s.IsoparametricToCoords(0.5, -0.5);
```

Jacobian()

Description

Calculates the jacobian for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the jacobian for shell s:

```
var jacobian = s.Jacobian();
```

Keyword()

Description

Returns the keyword for this shell (*SHELL, *SHELL_SCALAR or *SHELL_SCALAR_VALUE). **Note that a carriage return is not added**. See also Shell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for shell s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the shell. **Note that a carriage return is not added**. See also Shell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for shell s:

```
var cards = s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last shell in the model.

Arguments

- **Model** (Model)

Model to get last shell in

Returns

Shell object (or null if there are no shells in the model).

Return type

Shell

Example

To get the last shell in model m:

```
var s = Shell.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free shell label in the model. Also see Shell.FirstFreeLabel(), Shell.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Shell label.

Return type

Number

Example

To get the last free shell label in model m:

```
var label = Shell.LastFreeLabel(m);
```

Length()

Description

Calculates the minimum length for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the minimum length for shell s:

```
var length = s.Length();
```

MakeConsistentNormalsFlagged(Model*[Model]*, Flag*[Flag]*, Shell label (optional)*[integer]*) [static]

Description

Make all the flagged SHELL normals consistent with a selected one, the Seed Element.

Arguments

- **Model** (Model)

Model that all shells are in.

- **Flag** (Flag)

flag bit

- **Shell label (optional)** (integer)

The label of the seed shell. If omitted, or null, the first flagged shell is used as the seed shell.

Returns

Array containing the labels of shells which have had normals reversed

Return type

Array

Example

To make all flagged shell normals consistent:

```
Shell.MakeConsistentNormalsFlagged(m, flag, 1001);
```

Next()

Description

Returns the next shell in the model.

Arguments

No arguments

Returns

Shell object (or null if there are no more shells in the model).

Return type

Shell

Example

To get the shell in model m after shell s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) shell label in the model. Also see Shell.FirstFreeLabel(), Shell.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Shell label.

Return type

Number

Example

To get the next free shell label in model m:

```
var label = Shell.NextFreeLabel(m);
```

NormalVector()

Description

Calculates the unit normal vector for the shell.

Arguments

No arguments

Returns

Array of numbers containing x, y and z components of unit normal vector or null if the vector cannot be calculated (for example if the shell has zero area).

Return type

Number

Example

To calculate the normal vector of shell s:

```
var nvector = s.NormalVector();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a shell.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only shells from that model can be picked. If the argument is a Flag then only shells that are flagged with *limit* can be selected. If omitted, or null, any shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Shell object (or null if not picked)

Return type

Shell

Example

To pick a shell from model m giving the prompt 'Pick shell from screen':

```
var s = Shell.Pick('Pick shell from screen', m);
```

PickIsoparametric(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a point on a shell. The isoparametric coordinates of the point picked on the shell are returned as well as the shell picked. These coordinates are suitable for using in the function Shell.IsoparametricToCoords(). See also Shell.Pick()

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only shells from that model can be picked. If the argument is a Flag then only shells that are flagged with *limit* can be selected. If omitted, or null, any shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Array containing Shell object and isoparametric coordinates (or null if not picked or the point is not on a shell)

Return type

Array

Example

To pick a point on a shell from model m giving the prompt 'Pick a point on a shell on the screen':

```
var a = Shell.PickIsoparametric('Pick a point on a shell on the screen', m);
if (a != null)
{
    Message("You picked point "+a[1]+","+a[2]+" on shell "+a[0].label);
}
```

Previous()

Description

Returns the previous shell in the model.

Arguments

No arguments

Returns

Shell object (or null if there are no more shells in the model).

Return type

Shell

Example

To get the shell in model m before shell s:

```
var s = s.Previous();
```

RemoveCompositeData(ipt*[integer]*)

Description

Removes the composite data for an integration point in *ELEMENT_SHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to remove. **Note that integration points start at 0, not 1**.

Returns

No return value.

Example

To remove the composite data for the 3rd integration point for shell s:

```
s.RemoveCompositeData(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the shells in the model.

Arguments

- **Model** (Model)

Model that all shells will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the shells in model m, from 1000000:

```
Shell.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged shells will be renumbered in

- **flag** (Flag)

Flag set on the shells that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the shells in model m flagged with f, from 1000000:

```
Shell.RenumberFlagged(m, f, 1000000);
```

ReverseNormal(redraw (optional)*[boolean]*)

Description

Reverse shell normal.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to reverse several shell normals and only redraw after the last one then use false for all redraws apart from the last one.

Returns

No return value.

Example

To Reverse shell normal for shell s:

```
s.ReverseNormal();
```

ReverseNormalsFlagged(Model*[Model]*, Flag*[Flag]*) [static]

Description

Reverse all the flagged shell normals

Arguments

- **Model** (Model)

Model that all shells are in.

- **Flag** (Flag)

flag bit

Returns

No return value.

Example

To Reverse all flagged shell normals:

```
Shell.ReverseNormalsFlagged(m, flag);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only shells from that model can be selected. If the argument is a Flag then only shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of shells selected or null if menu cancelled

Return type

Number

Example

To select shells from model m, flagging those selected with flag f, giving the prompt 'Select shells':

```
Shell.Select(f, 'Select shells', m);
```

To select shells, flagging those selected with flag f but limiting selection to shells flagged with flag l, giving the prompt 'Select shells':

```
Shell.Select(f, 'Select shells', l);
```

SetCompositeData(ipt*[integer]*, mid*[integer]*, thick*[real]*, beta*[real]*, plyid (optional)*[integer]*)

Description

Sets the composite data for an integration point in *ELEMENT_SHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to set the data for. **Note that integration points start at 0, not 1**.

- **mid** (integer)

Material ID for the integration point.

- **thick** (real)

Thickness of the integration point.

- **beta** (real)

Material angle of the integration point.

- **plyid (optional)** (integer)

Ply ID for the integration point. This should be used if the _COMPOSITE_LONG option is set for the shell.

Returns

No return value.

Example

To set the composite data for the 3rd integration point to mat 1, thickness 0.5 and angle 45, for shell s:

```
s.SetCompositeData(2, 1, 0.5, 45);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the shell.

Arguments

- **flag** (Flag)

Flag to set on the shell

Returns

No return value

Example

To set flag f for shell s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the shell. The shell will be sketched until you either call Shell.Unsketch(), Shell.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the shell is sketched. If omitted redraw is true. If you want to sketch several shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch shell s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged shells in the model. The shells will be sketched until you either call Shell.Unsketch(), Shell.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged shells will be sketched in

- **flag** (Flag)

Flag set on the shells that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the shells are sketched. If omitted redraw is true. If you want to sketch flagged shells several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all shells flagged with flag in model m:

```
Shell.SketchFlagged(m, flag);
```

Skew()

Description

Calculates the skew for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the skew for shell s:

```
var skew = s.Skew();
```

Taper()

Description

Calculates the taper for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the taper for shell s:

```
var taper = s.Taper();
```

TiedNodeCheck(Contact label*[integer]*, Flag*[Flag]*, Option1*[integer]*, Option2*[integer]*)

Description

Checks if nodes of shell are tied by contact or directly attached (non-zero option1).

Arguments

- **Contact label** (integer)

The label of the tied contact. If zero the tied contact is found for the shell by reverse lookup.

- **Flag** (Flag)

flag bit

- **Option1** (integer)

Directly tied node (logical OR) 0:NONE 1:NRB/C_EXNO 2:BEAM 4:SHELL 8:SOLID 16:TSHELL

- **Option2** (integer)

0:No action 1: report error if directly attached node (acc. option1) captured by contact

Returns

string

Return type

String

Example

To check if all nodes of shell s are tied by contact 200 or attach directly to constraint:

```
var message = s.TiedNodeCheck(200, flag, 1, 1)
```

Timestep()

Description

Calculates the timestep for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for shell s:

```
var timestep = s.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing shells should be counted. If false or omitted referenced but undefined shells will also be included in the total.

Returns

number of shells

Return type

Number

Example

To get the total number of shells in model m:

```
var total = Shell.Total(m);
```

Unblank()

Description

Unblanks the shell

Arguments

No arguments

Returns

No return value

Example

To unblank shell s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the shells in the model.

Arguments

- **Model** (Model)

Model that all shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the shells in model m:

```
Shell.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged shells in the model.

Arguments

- **Model** (Model)

Model that the flagged shells will be unblanked in

- **flag** (Flag)

Flag set on the shells that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the shells in model m flagged with f:

```
Shell.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all shells will be unset in

- **flag** (Flag)

Flag to unset on the shells

Returns

No return value

Example

To unset the flag f on all the shells in model m:

```
Shell.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the shell.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the shell is unsketched. If omitted redraw is true. If you want to unsketch several shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch shell s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all shells.

Arguments

- **Model** (Model)

Model that all shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all shells in model m:

```
Shell.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged shells in the model.

Arguments

- **Model** (Model)

Model that all shells will be unsketched in

- **flag** (Flag)

Flag set on the shells that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all shells flagged with flag in model m:

```
Shell.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Shell object.

Return type

Shell

Example

To check if Shell property s.example is a parameter by using the Shell.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for shell s:

```
s.Warning("My custom warning");
```

Warpage()

Description

Calculates the warpage for the shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the warpage for shell s:

```
var warpage = s.Warpage();
```

WeightingFactors(s*[real]*, t*[real]*)

Description

Calculates the weighting factors for a point on the shell from the isoparametric coords.

Arguments

- **s** (real)

First isoparametric coordinate

- **t** (real)

Second isoparametric coordinate

Returns

Array of numbers containing weighting factors or null if not possible to calculate.

Return type

Number

Example

To calculate the weighting factors of isoparametric point (0.5, -0.5) on shell s:

```
var weights = s.WeightingFactors(0.5, -0.5);
```

Xrefs()

Description

Returns the cross references for this shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for shell s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the shell data in keyword format. Note that this contains the keyword header and the keyword cards. See also Shell.Keyword() and Shell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for shell s in keyword format

```
var str = s.toString();
```

Slipring class

The Slipring class gives you access to seatbelt slipring cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Slipring properties

Name	Type	Description
colour	Colour	The colour of the slipring
dc	real	Optional decay constant to allow a smooth transition between the static and dynamic friction coefficients.
direct	integer	Direction of belt movement
exists (read only)	logical	true if slipring exists, false if referred to but not defined.
fc	real	Coulomb dynamic friction coefficient
fcs	real	Coulomb static friction coefficient
funcid	integer	Function ID to determine friction coefficient
include	integer	The Include file number that the slipring is in.
k	real	Optional coefficient for determining the Coulomb friction coefficient related to angle alpha
label	integer	Slipring number. Also see the sbsrid property which is an alternative name for this.
lcnffd	integer	Loadcurve for Coulomb dynamic friction
lcnffs	integer	Loadcurve for Coulomb static friction
ltime	real	Slipring lockup time
model (read only)	integer	The Model number that the slipring is in.
onid	integer	Orientation Node number
sbid1	integer	Seatbelt number 1 (or Set Shell number if sbrnid is negative).
sbid2	integer	Seatbelt number 2 (or Set Shell number if sbrnid is negative).
sbrnid	integer	Node number (or Set Node number if negative)
sbsrid	integer	Slipring number. Also see the label property which is an alternative name for this.
shell_seatbelt (read only)	logical	true if slipring is used for shell (2D) seatbelt elements.
transparency	integer	The transparency of the slipring (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Slipring class allows you to create, modify, edit and manipulate seatbelt slipring cards. See the documentation below for more details.

Constructor

new Slipring(Model*[Model]*, sbsrid*[integer]*, sbid1*[integer]*, sbid2*[integer]*, sbrnid*[integer]*)

Description

Create a new Seatbelt Slipring object.

Arguments

- **Model** (Model)

Model that slipring will be created in

- **sbsrid** (integer)

Slipring number.

- **sbid1** (integer)

Seatbelt number 1

- **sbid2** (integer)

Seatbelt number 2

- **sbrnid** (integer)

Slipring Node number

Returns

Slipring object

Return type

Slipring

Example

To create a new seatbelt slipring in model m with label 100, seatbelts 10, 11 and node 20:

```
var a = new Slipring(m, 100, 10, 11, 20);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a slipring.

Arguments

- **Comment** (Comment)

Comment that will be attached to the slipring

Returns

No return value

Example

To associate comment c to the slipring s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the slipring

Arguments

No arguments

Returns

No return value

Example

To blank slipring s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the sliprings in the model.

Arguments

- **Model** (Model)

Model that all sliprings will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sliprings in model m:

```
Slipring.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged sliprings in the model.

Arguments

- **Model** (Model)

Model that all the flagged sliprings will be blanked in

- **flag** (Flag)

Flag set on the sliprings that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sliprings in model m flagged with f:

```
Slipring.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the slipring is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if slipring s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse slipring s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the slipring.

Arguments

- **flag** (Flag)

Flag to clear on the slipring

Returns

No return value

Example

To clear flag f for slipring s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the slipring. The target include of the copied slipring can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Slipring object

Return type

Slipring

Example

To copy slipring s into slipring z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a slipring.

Arguments

- **Model** (Model)

Model that the slipring will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Slipring object (or null if not made)

Return type

Slipring

Example

To start creating an slipring in model m:

```
var s = Slipring.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a slipring.

Arguments

- **Comment** (Comment)

Comment that will be detached from the slipring

Returns

No return value

Example

To detach comment c from the slipring s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit slipring s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for slipring. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for slipring s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for slipring.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the slipring colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the slipring.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing slipring s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first slipring in the model.

Arguments

- **Model** (Model)

Model to get first slipring in

Returns

Slipring object (or null if there are no sliprings in the model).

Return type

Slipring

Example

To get the first slipring in model m:

```
var s = Slipring.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free slipring label in the model. Also see Slipring.LastFreeLabel(), Slipring.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free slipring label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Slipring label.

Return type

Number

Example

To get the first free slipring label in model m:

```
var label = Slipring.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the sliprings in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all sliprings will be flagged in

- **flag** (Flag)

Flag to set on the sliprings

Returns

No return value

Example

To flag all of the sliprings with flag f in model m:

```
Slipring.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the slipring is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the slipring

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if slipring s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each slipring in the model.
Note that ForEach has been designed to make looping over sliprings as fast as possible and so has some limitations.
Firstly, a single temporary Slipring object is created and on each function call it is updated with the current slipring data. This means that you should not try to store the Slipring object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new sliprings inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all sliprings are in

- **func** (function)

Function to call for each slipring

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the sliprings in model m:

```
Slipring.ForEach(m, test);
function test(s)
{
// s is Slipring object
}
```

To call function test for all of the sliprings in model m with optional object:

```
var data = { x:0, y:0 };
Slipring.ForEach(m, test, data);
function test(s, extra)
{
// s is Slipring object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Slipring objects for all of the sliprings in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sliprings from

Returns

Array of Slipring objects

Return type

Array

Example

To make an array of Slipring objects for all of the sliprings in model m

```
var s = Slipring.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a slipring.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the slipring s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Slipring objects for all of the flagged sliprings in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sliprings from

- **flag** (Flag)

Flag set on the sliprings that you want to retrieve

Returns

Array of Slipring objects

Return type

Array

Example

To make an array of Slipring objects for all of the sliprings in model m flagged with f

```
var s = Slipring.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Slipring object for a slipring ID.

Arguments

- **Model** (Model)

Model to find the slipring in

- **number** (integer)

number of the slipring you want the Slipring object for

Returns

Slipring object (or null if slipring does not exist).

Return type

Slipring

Example

To get the Slipring object for slipring 100 in model m

```
var s = Slipring.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Slipring property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Slipring.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

slipring property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Slipring property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Slipring property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this slipring (*ELEMENT_SEATBELT_SLIPEROMETER) **Note that a carriage return is not added**. See also Slipring.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for slipring s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the slipring. **Note that a carriage return is not added**. See also Slipring.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for slipring s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last slipring in the model.

Arguments

- **Model** (Model)

Model to get last slipring in

Returns

Slipring object (or null if there are no sliprings in the model).

Return type

Slipring

Example

To get the last slipring in model m:

```
var s = Slipring.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free slipring label in the model. Also see Slipring.FirstFreeLabel(), Slipring.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free slipring label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Slipring label.

Return type

Number

Example

To get the last free slipring label in model m:

```
var label = Slipring.LastFreeLabel(m);
```

Next()

Description

Returns the next slipring in the model.

Arguments

No arguments

Returns

Slipring object (or null if there are no more sliprings in the model).

Return type

Slipring

Example

To get the slipring in model m after slipring s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) slipring label in the model. Also see Slipring.FirstFreeLabel(), Slipring.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free slipring label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Slipring label.

Return type

Number

Example

To get the next free slipring label in model m:

```
var label = Slipring.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a slipring.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sliprings from that model can be picked. If the argument is a Flag then only sliprings that are flagged with *limit* can be selected. If omitted, or null, any sliprings from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Slipring object (or null if not picked)

Return type

Slipring

Example

To pick a slipring from model m giving the prompt 'Pick slipring from screen':

```
var s = Slipring.Pick('Pick slipring from screen', m);
```

Previous()

Description

Returns the previous slipring in the model.

Arguments

No arguments

Returns

Slipring object (or null if there are no more sliprings in the model).

Return type

Slipring

Example

To get the slipring in model m before slipring s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the sliprings in the model.

Arguments

- **Model** (Model)

Model that all sliprings will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sliprings in model m, from 1000000:

```
Slipring.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged sliprings in the model.

Arguments

- **Model** (Model)

Model that all the flagged sliprings will be renumbered in

- **flag** (Flag)

Flag set on the sliprings that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sliprings in model m flagged with f, from 1000000:

```
Slipring.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select sliprings using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting sliprings

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sliprings from that model can be selected. If the argument is a Flag then only sliprings that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any sliprings can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of sliprings selected or null if menu cancelled

Return type

Number

Example

To select sliprings from model m, flagging those selected with flag f, giving the prompt 'Select sliprings':

```
Slipring.Select(f, 'Select sliprings', m);
```

To select sliprings, flagging those selected with flag f but limiting selection to sliprings flagged with flag l, giving the prompt 'Select sliprings':

```
Slipring.Select(f, 'Select sliprings', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the slipring.

Arguments

- **flag** (Flag)

Flag to set on the slipring

Returns

No return value

Example

To set flag f for slipring s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the slipring. The slipring will be sketched until you either call Slipring.Unsketch(), Slipring.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the slipring is sketched. If omitted redraw is true. If you want to sketch several sliprings and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch slipring s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged sliprings in the model. The sliprings will be sketched until you either call Slipring.Unsketch(), Slipring.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged sliprings will be sketched in

- **flag** (Flag)

Flag set on the sliprings that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sliprings are sketched. If omitted redraw is true. If you want to sketch flagged sliprings several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all sliprings flagged with flag in model m:

```
Slipring.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of sliprings in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing sliprings should be counted. If false or omitted referenced but undefined sliprings will also be included in the total.

Returns

number of sliprings

Return type

Number

Example

To get the total number of sliprings in model m:

```
var total = Slipring.Total(m);
```

Unblank()

Description

Unblanks the slipring

Arguments

No arguments

Returns

No return value

Example

To unblank slipring s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the sliprings in the model.

Arguments

- **Model** (Model)

Model that all sliprings will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sliprings in model m:

```
Slipring.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged sliprings in the model.

Arguments

- **Model** (Model)

Model that the flagged sliprings will be unblanked in

- **flag** (Flag)

Flag set on the sliprings that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sliprings in model m flagged with f:

```
Slipring.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the sliprings in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all sliprings will be unset in

- **flag** (Flag)

Flag to unset on the sliprings

Returns

No return value

Example

To unset the flag f on all the sliprings in model m:

```
Slipring.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the slipring.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the slipring is unsketched. If omitted redraw is true. If you want to unsketch several sliprings and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch slipring s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all sliprings.

Arguments

- **Model** (Model)

Model that all sliprings will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sliprings are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sliprings in model m:

```
Slipring.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged sliprings in the model.

Arguments

- **Model** (Model)

Model that all sliprings will be unsketched in

- **flag** (Flag)

Flag set on the sliprings that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sliprings are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sliprings flagged with flag in model m:

```
Slipring.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Slipring object.

Return type

Slipring

Example

To check if Slipring property s.example is a parameter by using the Slipring.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for slipring. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for slipring s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this slipring.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for slipring s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the slipring data in keyword format. Note that this contains the keyword header and the keyword cards. See also Slipring.Keyword() and Slipring.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for slipring s in keyword format

```
var str = s.toString();
```

Solid class

The Solid class gives you access to solid cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model *[Model]*, redraw (optional) *[boolean]*)

Solid constants

Name	Description
Solid.EDGE_1	Edge 1 of solid
Solid.EDGE_10	Edge 10 of solid
Solid.EDGE_11	Edge 11 of solid
Solid.EDGE_12	Edge 12 of solid
Solid.EDGE_2	Edge 2 of solid
Solid.EDGE_3	Edge 3 of solid
Solid.EDGE_4	Edge 4 of solid
Solid.EDGE_5	Edge 5 of solid
Solid.EDGE_6	Edge 6 of solid
Solid.EDGE_7	Edge 7 of solid
Solid.EDGE_8	Edge 8 of solid
Solid.EDGE_9	Edge 9 of solid
Solid.FACE_1	Face 1 of solid
Solid.FACE_2	Face 2 of solid
Solid.FACE_3	Face 3 of solid
Solid.FACE_4	Face 4 of solid
Solid.FACE_5	Face 5 of solid
Solid.FACE_6	Face 6 of solid

Solid properties

Name	Type	Description
a1	real	x component of material direction a
a2	real	y component of material direction a
a3	real	z component of material direction a
colour	Colour	The colour of the solid
d1	real	x component of material in-plane vector
d2	real	y component of material in-plane vector

d3	real	z component of material in-plane vector
dof	logical	If DOF option is set. Can be true or false
edges	constant	Bitwise code of Solid.EDGE_1, Solid.EDGE_2, Solid.EDGE_3, Solid.EDGE_4, Solid.EDGE_5, Solid.EDGE_6, Solid.EDGE_7, Solid.EDGE_8, Solid.EDGE_9, Solid.EDGE_10, Solid.EDGE_11 and Solid.EDGE_12 representing which edges of the solid are free faces
eid	integer	Solid number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if solid exists, false if referred to but not defined.
faces	constant	Bitwise code of Solid.FACE_1, Solid.FACE_2, Solid.FACE_3, Solid.FACE_4, Solid.FACE_5 and Solid.FACE_6 representing which faces of the solid are internal faces. Note that this is calculated from the solids that are currently visible so blanking solids will affect this property once graphics have been updated.
h20	logical	If _H20 option is set. Can be true or false
h27	logical	If _H27 option is set. Can be true or false
h64	logical	If _H64 option is set. Can be true or false
h8toh20	logical	If _H8TOH20 option is set. Can be true or false
h8toh27	logical	If _H8TOH27 option is set. Can be true or false
h8toh64	logical	If _H8TOH64 option is set. Can be true or false
include	integer	The Include file number that the solid is in.
label	integer	Solid number. Also see the eid property which is an alternative name for this.
model (read only)	integer	The Model number that the solid is in.
n1	integer	Node number 1
n10	integer	Node number 10
n11	integer	Node number 11
n12	integer	Node number 12
n13	integer	Node number 13
n14	integer	Node number 14
n15	integer	Node number 15
n16	integer	Node number 16
n17	integer	Node number 17
n18	integer	Node number 18
n19	integer	Node number 19
n2	integer	Node number 2
n20	integer	Node number 20
n21	integer	Node number 21
n22	integer	Node number 22
n23	integer	Node number 23
n24	integer	Node number 24
n25	integer	Node number 25
n26	integer	Node number 26

n27	integer	Node number 27
n28	integer	Node number 28
n29	integer	Node number 29
n3	integer	Node number 3
n30	integer	Node number 30
n31	integer	Node number 31
n32	integer	Node number 32
n33	integer	Node number 33
n34	integer	Node number 34
n35	integer	Node number 35
n36	integer	Node number 36
n37	integer	Node number 37
n38	integer	Node number 38
n39	integer	Node number 39
n4	integer	Node number 4
n40	integer	Node number 40
n41	integer	Node number 41
n42	integer	Node number 42
n43	integer	Node number 43
n44	integer	Node number 44
n45	integer	Node number 45
n46	integer	Node number 46
n47	integer	Node number 47
n48	integer	Node number 48
n49	integer	Node number 49
n5	integer	Node number 5
n50	integer	Node number 50
n51	integer	Node number 51
n52	integer	Node number 52
n53	integer	Node number 53
n54	integer	Node number 54
n55	integer	Node number 55
n56	integer	Node number 56
n57	integer	Node number 57
n58	integer	Node number 58
n59	integer	Node number 59
n6	integer	Node number 6
n60	integer	Node number 60
n61	integer	Node number 61

n62	integer	Node number 62
n63	integer	Node number 63
n64	integer	Node number 64
n7	integer	Node number 7
n8	integer	Node number 8
n9	integer	Node number 9
nodes (read only)	integer	Number of nodes solid has
ns1	integer	Scalar Node number 1
ns2	integer	Scalar Node number 2
ns3	integer	Scalar Node number 3
ns4	integer	Scalar Node number 4
ns5	integer	Scalar Node number 5
ns6	integer	Scalar Node number 6
ns7	integer	Scalar Node number 7
ns8	integer	Scalar Node number 8
ortho	logical	If _ORTHO option is set. Can be true or false
p21	logical	If _P21 option is set. Can be true or false
p40	logical	If _P40 option is set. Can be true or false
pid	integer	Part number
t15	logical	If _T15 option is set. Can be true or false
t20	logical	If _T20 option is set. Can be true or false
tet4totet10	logical	If _TET4TOTET10 option is set. Can be true or false
transparency	integer	The transparency of the solid (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Solid class allows you to create, modify, edit and manipulate solid cards. See the documentation below for more details.

Constructor

new Solid(Model*[Model]*, options *[object]*)

Description

Create a new Solid object. If you are creating a 4 noded solid either only give 4 nodes or give 8 nodes but make nodes 4 to 8 the same number. If you are creating a 6 noded solid either only give 6 nodes or give 8 nodes but make nodes 5 and 6 the same number and nodes 7 and 8 the same number.

Arguments

- **Model** (Model)

Model that solid will be created in

- **options** (object)

Options for creating the solid

Object has the following properties:

Name	Type	Description
eid	integer	Solid number
nodes	array	Array of Node IDs for the solid. At least 4 nodes must be given
pid	integer	Part number

Returns

Solid object

Return type

Solid

Example

To create a new solid in model m with label 100, part 10 and nodes 1, 2, 3, 4:

```
var s = new Solid(m, {eid: 100, pid: 10, nodes: [1,2,3,4]} );
```

new Solid(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*, n5 (optional)*[integer]*, n6 (optional)*[integer]*, n7 (optional)*[integer]*, n8 (optional)*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Solid object. Use either 4, 6 or 8 nodes when creating a new solid. If you are creating a 4 noded solid either only give 4 nodes or give 8 nodes but make nodes 4 to 8 the same number. If you are creating a 6 noded solid either only give 6 nodes or give 8 nodes but make nodes 5 and 6 the same number and nodes 7 and 8 the same number.

Arguments

- **Model** (Model)

Model that solid will be created in

- **eid** (integer)

Solid number

- **pid** (integer)

Part number

- **n1** (integer)

Node number 1 or array containing all nodes (in which case other no other arguement has to be given after this)

- **n2** (integer)

Node number 2

- **n3** (integer)

Node number 3

- **n4** (integer)

Node number 4

- **n5 (optional)** (integer)

Node number 5

- **n6 (optional)** (integer)

Node number 6

- **n7 (optional)** (integer)

Node number 7

- **n8 (optional)** (integer)

Node number 8

Returns

Solid object

Return type

Solid

Example

To create a new solid in model m with label 100, part 10 and nodes 1, 2, 3, 4, 5, 6, 7, 8:

```
var s = new Solid(m, 100, 10, 1, 2, 3, 4, 5, 6, 7, 8);
```

Details of functions

AspectRatio()

Description

Calculates the aspect ratio for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the aspect ratio for solid s:

```
var ratio = s.AspectRatio();
```

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a solid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the solid

Returns

No return value

Example

To associate comment c to the solid s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the solid

Arguments

No arguments

Returns

No return value

Example

To blank solid s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the solids in the model.

Arguments

- **Model** (Model)

Model that all solids will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the solids in model m:

```
Solid.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged solids in the model.

Arguments

- **Model** (Model)

Model that all the flagged solids will be blanked in

- **flag** (Flag)

Flag set on the solids that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the solids in model m flagged with f:

```
Solid.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the solid is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if solid s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse solid s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the solid.

Arguments

- **flag** (Flag)

Flag to clear on the solid

Returns

No return value

Example

To clear flag f for solid s:

```
s.ClearFlag(f);
```

CoordsToIsoparametric(Model*[Model]*, x*[real]*, y*[real]*, z*[real]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*) [static]

Description

Calculates the isoparametric coordinates for a point on 3 or 4 noded segment

Arguments

- **Model** (Model)

Model designated model

- **x** (real)

X coordinate of point

- **y** (real)

Y coordinate of point

- **z** (real)

Z coordinate of point

- **n1** (integer)

node 1 of segment

- **n2** (integer)

node 2 of segment

- **n3** (integer)

node 3 of segment

- **n4** (integer)

node 4 of segment

Returns

Array containing s and t isoparametric coordinates and the distance the point is from the segment If it is not possible to calculate the isoparametric coordinates null is returned.

Return type

Array

Example

To calculate the isoparametric coordinates of point (100, 100, 20) on segment defined by nodes 11,12,13,14:

```
var isocoords = Solid.CoordsToIsoparametric(100, 100, 20, 11, 12, 13, 14);
```

Copy(range (optional)*[boolean]*)

Description

Copies the solid. The target include of the copied solid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Solid object

Return type

Solid

Example

To copy solid s into solid z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a solid.

Arguments

- **Model** (Model)

Model that the solid will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Solid object (or null if not made)

Return type

Solid

Example

To start creating a solid in model m:

```
var s = Solid.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a solid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the solid

Returns

No return value

Example

To detach comment c from the solid s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit solid s:

```
s.Edit();
```

ElemCut(Database cross section label*[integer]*)

Description

Returns coordinates of the intersections between a solid and a database cross section.

Arguments

- **Database cross section label** (integer)

The label of the database cross section.

Returns

Object with the following properties:

Name	Type	Description
face1	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 1. Null if no cut on this face.
face2	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 2. Null if no cut on this face.
face3	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 3. Null if no cut on this face.
face4	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 4. Null if no cut on this face.
face5	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 5. Null if no cut on this face.
face6	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 6. Null if no cut on this face.

Return type

object

Example

To see if the database cross section 200 cuts solid s and at which points it cuts face 3 of the solid:

```
var data = s.ElemCut(200);
var face = data.face3;
if(face)
{
   var point1_x = face[0];
   var point1_y = face[1];
   var point1_z = face[2];
   var point2_x = face[3];
   var point2_y = face[4];
   var point2_z = face[5];
}
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for solid s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for solid.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the solid colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the solid.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing solid s:

```
var colour = s.ExtractColour();
```

FindSolidInBox(Model*[Model]*, xmin*[real]*, xmax*[real]*, ymin*[real]*, ymax*[real]*, zmin*[real]*, zmax*[real]*, flag (optional)*[integer]*, excl (optional)*[integer]*, vis_only (optional)*[integer]*) [static]

Description

Returns an array of Solid objects for the solids within a box. Please note this function provides a list of all solids that could potentially be in the box (using computationally cheap bounding box comparison) it is not a rigorous test of whether the solid is actually in the box. This may include solids that are ostensibly outside box. The user should apply their own test. (this function is intended to provide an upper bound of elems to test) Setting the "excl" flag will require that the solid is fully contained but this may not capture all the solids you want to process.

Arguments

- **Model** (Model)

Model designated model

- **xmin** (real)

Minimum bound in global x

- **xmax** (real)

Maximum bound in global x

- **ymin** (real)

Minimum bound in global y

- **ymax** (real)

Maximum bound in global y

- **zmin** (real)

Minimum bound in global z

- **zmax** (real)

Maximum bound in global z

- **flag (optional)** (integer)

Optional flag to restrict solids considered, if 0 all solids considered

- **excl (optional)** (integer)

Optional flag (0) Apply inclusive selection (1) Apply exclusive selection inclusive selection means elements intersect box exclusive selection means elements contained in box

- **vis_only (optional)** (integer)

Optional flag to consider visible elements only (1), if (0) all elements considered

Returns

Array of Solid objects

Return type

Array

Example

To get an array of Solid objects for flagged solids within defined box (inclusive selection)

```
var s = Solid.FindSolidInBox(m, xmin, xmax, ymin, ymax, zmin, zmax, flag, 0, 0);
```

FindSolidInit(Model*[Model]*, flag (optional)*[Flag]*) [static] [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Initialize setup so that all flagged solids in model can be tested to see if they are within box. In v20.0 this function is obsolete and the flagging bit (if required) should be specified in Solid.FindSolidInBox()

Arguments

- **Model** (Model)

Model in which shells have been flagged

- **flag (optional)** (Flag)

Optional flag that has been set on the solids, if 0 all solids considered

Returns

No return value

Example

To initialize find setup for flagged solids in model m:

```
Solid.FindSolidInit(m, flag);
```

First(Model*[Model]*) [static]

Description

Returns the first solid in the model.

Arguments

- **Model** (Model)

Model to get first solid in

Returns

Solid object (or null if there are no solids in the model).

Return type

Solid

Example

To get the first solid in model m:

```
var s = Solid.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free solid label in the model. Also see Solid.LastFreeLabel(), Solid.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free solid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Solid label.

Return type

Number

Example

To get the first free solid label in model m:

```
var label = Solid.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the solids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all solids will be flagged in

- **flag** (Flag)

Flag to set on the solids

Returns

No return value

Example

To flag all of the solids with flag f in model m:

```
Solid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the solid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the solid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if solid s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each solid in the model.
Note that ForEach has been designed to make looping over solids as fast as possible and so has some limitations. Firstly, a single temporary Solid object is created and on each function call it is updated with the current solid data. This means that you should not try to store the Solid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new solids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all solids are in

- **func** (function)

Function to call for each solid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the solids in model m:

```
Solid.ForEach(m, test);
function test(s)
{
// s is Solid object
}
```

To call function test for all of the solids in model m with optional object:

```
var data = { x:0, y:0 };
Solid.ForEach(m, test, data);
function test(s, extra)
{
// s is Solid object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Solid objects for all of the solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get solids from

Returns

Array of Solid objects

Return type

Array

Example

To make an array of Solid objects for all of the solids in model m

```
var s = Solid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a solid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the solid s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Solid objects for all of the flagged solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get solids from

- **flag** (Flag)

Flag set on the solids that you want to retrieve

Returns

Array of Solid objects

Return type

Array

Example

To make an array of Solid objects for all of the solids in model m flagged with f

```
var s = Solid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Solid object for a solid ID.

Arguments

- **Model** (Model)

Model to find the solid in

- **number** (integer)

number of the solid you want the Solid object for

Returns

Solid object (or null if solid does not exist).

Return type

Solid

Example

To get the Solid object for solid 100 in model m

```
var s = Solid.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Solid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Solid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

solid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Solid property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Solid property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Jacobian()

Description

Calculates the jacobian for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the jacobian for solid s:

```
var jacobian = s.Jacobian();
```

Keyword()

Description

Returns the keyword for this solid (*SOLID, *SOLID_SCALAR or *SOLID_SCALAR_VALUE). **Note that a carriage return is not added**. See also Solid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for solid s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the solid. **Note that a carriage return is not added**. See also Solid.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for solid s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last solid in the model.

Arguments

- **Model** (Model)

Model to get last solid in

Returns

Solid object (or null if there are no solids in the model).

Return type

Solid

Example

To get the last solid in model m:

```
var s = Solid.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free solid label in the model. Also see Solid.FirstFreeLabel(), Solid.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free solid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Solid label.

Return type

Number

Example

To get the last free solid label in model m:

```
var label = Solid.LastFreeLabel(m);
```

Next()

Description

Returns the next solid in the model.

Arguments

No arguments

Returns

Solid object (or null if there are no more solids in the model).

Return type

Solid

Example

To get the solid in model m after solid s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) solid label in the model. Also see Solid.FirstFreeLabel(), Solid.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free solid label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Solid label.

Return type

Number

Example

To get the next free solid label in model m:

```
var label = Solid.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a solid.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only solids from that model can be picked. If the argument is a Flag then only solids that are flagged with *limit* can be selected. If omitted, or null, any solids from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Solid object (or null if not picked)

Return type

Solid

Example

To pick a solid from model m giving the prompt 'Pick solid from screen':

```
var s = Solid.Pick('Pick solid from screen', m);
```

Previous()

Description

Returns the previous solid in the model.

Arguments

No arguments

Returns

Solid object (or null if there are no more solids in the model).

Return type

Solid

Example

To get the solid in model m before solid s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the solids in the model.

Arguments

- **Model** (Model)

Model that all solids will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the solids in model m, from 1000000:

```
Solid.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged solids in the model.

Arguments

- **Model** (Model)

Model that all the flagged solids will be renumbered in

- **flag** (Flag)

Flag set on the solids that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the solids in model m flagged with f, from 1000000:

```
Solid.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select solids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting solids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only solids from that model can be selected. If the argument is a Flag then only solids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any solids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of solids selected or null if menu cancelled

Return type

Number

Example

To select solids from model m, flagging those selected with flag f, giving the prompt 'Select solids':

```
Solid.Select(f, 'Select solids', m);
```

To select solids, flagging those selected with flag f but limiting selection to solids flagged with flag l, giving the prompt 'Select solids':

```
Solid.Select(f, 'Select solids', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the solid.

Arguments

- **flag** (Flag)

Flag to set on the solid

Returns

No return value

Example

To set flag f for solid s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the solid. The solid will be sketched until you either call Solid.Unsketch(), Solid.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the solid is sketched. If omitted redraw is true. If you want to sketch several solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch solid s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged solids in the model. The solids will be sketched until you either call Solid.Unsketch(), Solid.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged solids will be sketched in

- **flag** (Flag)

Flag set on the solids that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the solids are sketched. If omitted redraw is true. If you want to sketch flagged solids several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all solids flagged with flag in model m:

```
Solid.SketchFlagged(m, flag);
```

TetCollapse()

Description

Calculates the tetrahedral collapse for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the tet collapse for solid s:

```
var tet collapse = s.TetCollapse();
```

TiedNodeCheck(Contact label*[integer]*, Flag*[Flag]*, Option1*[integer]*, Option2*[integer]*)

Description

Checks if nodes of solid are tied by contact or directly attached (non-zero option1).

Arguments

- **Contact label** (integer)

The label of the tied contact. If zero the tied contact is found for the solid by reverse lookup.

- **Flag** (Flag)

flag bit

- **Option1** (integer)

Directly tied node (logical OR) 0:NONE 1:NRB/C_EXNO 2:BEAM 4:SHELL 8:SOLID 16:TSHELL

- **Option2** (integer)

0:No action 1:report error if directly attached node (acc. option1) also captured by contact

Returns

string

Return type

String

Example

To check if all nodes of solid h are tied by contact 200 or attach directly to constraint or shell:

```
var message = h.TiedNodeCheck(200, flag, 1|4, 1)
```

Timestep()

Description

Calculates the timestep for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for solid s:

```
var timestep = s.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of solids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing solids should be counted. If false or omitted referenced but undefined solids will also be included in the total.

Returns

number of solids

Return type

Number

Example

To get the total number of solids in model m:

```
var total = Solid.Total(m);
```

Unblank()

Description

Unblanks the solid

Arguments

No arguments

Returns

No return value

Example

To unblank solid s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the solids in the model.

Arguments

- **Model** (Model)

Model that all solids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the solids in model m:

```
Solid.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged solids in the model.

Arguments

- **Model** (Model)

Model that the flagged solids will be unblanked in

- **flag** (Flag)

Flag set on the solids that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the solids in model m flagged with f:

```
Solid.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the solids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all solids will be unset in

- **flag** (Flag)

Flag to unset on the solids

Returns

No return value

Example

To unset the flag f on all the solids in model m:

```
Solid.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the solid.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the solid is unsketched. If omitted redraw is true. If you want to unsketch several solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch solid s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all solids.

Arguments

- **Model** (Model)

Model that all solids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all solids in model m:

```
Solid.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged solids in the model.

Arguments

- **Model** (Model)

Model that all solids will be unsketched in

- **flag** (Flag)

Flag set on the solids that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all solids flagged with flag in model m:

```
Solid.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Solid object.

Return type

Solid

Example

To check if Solid property s.example is a parameter by using the Solid.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Volume()

Description

Calculates the volume for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the volume for solid s:

```
var volume = s.Volume();
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for solid s:

```
s.Warning("My custom warning");
```

Warpage()

Description

Calculates the warpage for the solid

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the warpage for solid s:

```
var warpage = s.Warpage();
```

Xrefs()

Description

Returns the cross references for this solid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for solid s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the solid data in keyword format. Note that this contains the keyword header and the keyword cards. See also Solid.Keyword() and Solid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for solid s in keyword format

```
var str = s.toString();
```

Sph class

The Sph class gives you access to Element SPH cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Sph properties

Name	Type	Description
colour	Colour	The colour of the sph element.
exists (read only)	logical	true if sph exists, false if referred to but not defined.
include	integer	The Include file number that the sph is in.
mass	real	Mass value.
model (read only)	integer	The Model number that the sph is in.
nid	integer	Node ID.
pid	integer	Part ID to which this element belongs.
transparency	integer	The transparency of the sph (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Sph class allows you to create, modify, edit and manipulate SPH cards. See the documentation below for more details.

Constructor

new Sph(Model*[Model]*, nid*[integer]*, pid*[integer]*, mass*[real]*)

Description

Create a new object.

Arguments

- **Model** (Model)

Model that sph will be created in

- **nid** (integer)

Node ID and Element ID are the same for the SPH option.

- **pid** (integer)

Part ID to which this element belongs.

- **mass** (real)

Mass value.

Returns

Sph object

Return type

Sph

Example

To create a new sph element in model m with nid = 100, pid = 400, mass = 0.9:

```
var s = new Sph(m, 100, 400, 0.9);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a sph.

Arguments

- **Comment** (Comment)

Comment that will be attached to the sph

Returns

No return value

Example

To associate comment c to the sph s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the sph

Arguments

No arguments

Returns

No return value

Example

To blank sph s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the sphs in the model.

Arguments

- **Model** (Model)

Model that all sphs will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sphs in model m:

```
Sph.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged sphs in the model.

Arguments

- **Model** (Model)

Model that all the flagged sphs will be blanked in

- **flag** (Flag)

Flag set on the sphs that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sphs in model m flagged with f:

```
Sph.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the sph is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if sph s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse sph s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the sph.

Arguments

- **flag** (Flag)

Flag to clear on the sph

Returns

No return value

Example

To clear flag f for sph s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the sph. The target include of the copied sph can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Sph object

Return type

Sph

Example

To copy sph s into sph z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an sph.

Arguments

- **Model** (Model)

Model that the sph will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Sph object (or null if not made)

Return type

Sph

Example

To start creating an sph in model m:

```
var s = Sph.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a sph.

Arguments

- **Comment** (Comment)

Comment that will be detached from the sph

Returns

No return value

Example

To detach comment c from the sph s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit sph s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for sph. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for sph s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for sph.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the sph colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the sph.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing sph s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first sph in the model.

Arguments

- **Model** (Model)

Model to get first sph in

Returns

Sph object (or null if there are no sphs in the model).

Return type

Sph

Example

To get the first sph in model m:

```
var s = Sph.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free sph label in the model. Also see Sph.LastFreeLabel(), Sph.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free sph label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Sph label.

Return type

Number

Example

To get the first free sph label in model m:

```
var label = Sph.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the sphs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all sphs will be flagged in

- **flag** (Flag)

Flag to set on the sphs

Returns

No return value

Example

To flag all of the sphs with flag f in model m:

```
Sph.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the sph is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the sph

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if sph s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each sph in the model.
Note that ForEach has been designed to make looping over sphs as fast as possible and so has some limitations. Firstly, a single temporary Sph object is created and on each function call it is updated with the current sph data. This means that you should not try to store the Sph object for later use (e.g. in an array) as it is temporary. Secondly, you cannot create new sphs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all sphs are in

- **func** (function)

Function to call for each sph

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the sphs in model m:

```
Sph.ForEach(m, test);
function test(s)
{
// s is Sph object
}
```

To call function test for all of the sphs in model m with optional object:

```
var data = { x:0, y:0 };
Sph.ForEach(m, test, data);
function test(s, extra)
{
// s is Sph object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Sph objects for all of the sphs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sphs from

Returns

Array of Sph objects

Return type

Array

Example

To make an array of Sph objects for all of the sphs in model m

```
var s = Sph.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a sph.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the sph s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Sph objects for all of the flagged sphs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sphs from

- **flag** (Flag)

Flag set on the sphs that you want to retrieve

Returns

Array of Sph objects

Return type

Array

Example

To make an array of Sph objects for all of the sphs in model m flagged with f

```
var s = Sph.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Sph object for a sph ID.

Arguments

- **Model** (Model)

Model to find the sph in

- **number** (integer)

number of the sph you want the Sph object for

Returns

Sph object (or null if sph does not exist).

Return type

Sph

Example

To get the Sph object for sph 100 in model m

```
var s = Sph.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Sph property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Sph.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

sph property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Sph property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Sph property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this sph (*ELEMENT_SPH) **Note that a carriage return is not added**. See also Sph.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for sph s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the sph. **Note that a carriage return is not added**. See also Sph.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for sph s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last sph in the model.

Arguments

- **Model** (Model)

Model to get last sph in

Returns

Sph object (or null if there are no sphs in the model).

Return type

Sph

Example

To get the last sph in model m:

```
var s = Sph.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free sph label in the model. Also see Sph.FirstFreeLabel(), Sph.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free sph label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Sph label.

Return type

Number

Example

To get the last free sph label in model m:

```
var label = Sph.LastFreeLabel(m);
```

Next()

Description

Returns the next sph in the model.

Arguments

No arguments

Returns

Sph object (or null if there are no more sphs in the model).

Return type

Sph

Example

To get the sph in model m after sph s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) sph label in the model. Also see Sph.FirstFreeLabel(), Sph.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free sph label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Sph label.

Return type

Number

Example

To get the next free sph label in model m:

```
var label = Sph.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a sph.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sphs from that model can be picked. If the argument is a Flag then only sphs that are flagged with *limit* can be selected. If omitted, or null, any sphs from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Sph object (or null if not picked)

Return type

Sph

Example

To pick a sph from model m giving the prompt 'Pick sph from screen':

```
var s = Sph.Pick('Pick sph from screen', m);
```

Previous()

Description

Returns the previous sph in the model.

Arguments

No arguments

Returns

Sph object (or null if there are no more sphs in the model).

Return type

Sph

Example

To get the sph in model m before sph s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the sphs in the model.

Arguments

- **Model** (Model)

Model that all sphs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sphs in model m, from 1000000:

```
Sph.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged sphs in the model.

Arguments

- **Model** (Model)

Model that all the flagged sphs will be renumbered in

- **flag** (Flag)

Flag set on the sphs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sphs in model m flagged with f, from 1000000:

```
Sph.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select sphs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting sphs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sphs from that model can be selected. If the argument is a Flag then only sphs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any sphs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of sphs selected or null if menu cancelled

Return type

Number

Example

To select sphs from model m, flagging those selected with flag f, giving the prompt 'Select sphs':

```
Sph.Select(f, 'Select sphs', m);
```

To select sphs, flagging those selected with flag f but limiting selection to sphs flagged with flag l, giving the prompt 'Select sphs':

```
Sph.Select(f, 'Select sphs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the sph.

Arguments

- **flag** (Flag)

Flag to set on the sph

Returns

No return value

Example

To set flag f for sph s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the sph. The sph will be sketched until you either call Sph.Unsketch(), Sph.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sph is sketched. If omitted redraw is true. If you want to sketch several sphs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch sph s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged sphs in the model. The sphs will be sketched until you either call Sph.Unsketch(), Sph.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged sphs will be sketched in

- **flag** (Flag)

Flag set on the sphs that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sphs are sketched. If omitted redraw is true. If you want to sketch flagged sphs several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all sphs flagged with flag in model m:

```
Sph.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of sphs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing sphs should be counted. If false or omitted referenced but undefined sphs will also be included in the total.

Returns

number of sphs

Return type

Number

Example

To get the total number of sphs in model m:

```
var total = Sph.Total(m);
```

Unblank()

Description

Unblanks the sph

Arguments

No arguments

Returns

No return value

Example

To unblank sph s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the sphs in the model.

Arguments

- **Model** (Model)

Model that all sphs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sphs in model m:

```
Sph.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged sphs in the model.

Arguments

- **Model** (Model)

Model that the flagged sphs will be unblanked in

- **flag** (Flag)

Flag set on the sphs that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sphs in model m flagged with f:

```
Sph.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the sphs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all sphs will be unset in

- **flag** (Flag)

Flag to unset on the sphs

Returns

No return value

Example

To unset the flag f on all the sphs in model m:

```
Sph.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the sph.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sph is unsketched. If omitted redraw is true. If you want to unsketch several sphs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch sph s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all sphs.

Arguments

- **Model** (Model)

Model that all sphs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sphs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sphs in model m:

```
Sph.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged sphs in the model.

Arguments

- **Model** (Model)

Model that all sphs will be unsketched in

- **flag** (Flag)

Flag set on the sphs that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sphs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sphs flagged with flag in model m:

```
Sph.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Sph object.

Return type

Sph

Example

To check if Sph property s.example is a parameter by using the Sph.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for sph. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for sph s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this sph.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for sph s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the sph data in keyword format. Note that this contains the keyword header and the keyword cards. See also Sph.Keyword() and Sph.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for sph s in keyword format

```
var str = s.toString();
```

Tshell class

The Tshell class gives you access to thick shell cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)

Tshell properties

Name	Type	Description
beta	logical	If BETA option is set.
beta_angle	real	Angle for BETA option.
colour	Colour	The colour of the thick shell
composite	logical	If COMPOSITE option is set. Can be true or false
eid	integer	Tshell number. Also see the label property which is an alternative name for this.
exists (read only)	logical	true if thick shell exists, false if referred to but not defined.
include	integer	The Include file number that the thick shell is in.
label	integer	Tshell number. Also see the eid property which is an alternative name for this.
model (read only)	integer	The Model number that the thick shell is in.
n1	integer	Node number 1
n2	integer	Node number 2
n3	integer	Node number 3
n4	integer	Node number 4
n5	integer	Node number 5
n6	integer	Node number 6
n7	integer	Node number 7
n8	integer	Node number 8
nip	logical	Number of integration points for composite thick shell
nodes (read only)	integer	Number of nodes thick shell has
pid	integer	Part number
transparency	integer	The transparency of the thick shell (0-100) 0% is opaque, 100% is transparent.

Detailed Description

The Tshell class allows you to create, modify, edit and manipulate thich shell cards. See the documentation below for more details.

Constructor

new Tshell(Model*[Model]*, eid*[integer]*, pid*[integer]*, n1*[integer]*, n2*[integer]*, n3*[integer]*, n4*[integer]*, n5*[integer]*, n6*[integer]*, n7 (optional)*[integer]*, n8 (optional)*[integer]*)

Description

Create a new Tshell object. Use either 6 or 8 nodes when creating a new thick shell.

Arguments

- **Model** (Model)

Model that thick shell will be created in

- **eid** (integer)

Tshell number

- **pid** (integer)

Part number

- **n1** (integer)

Node number 1

- **n2** (integer)

Node number 2

- **n3** (integer)

Node number 3

- **n4** (integer)

Node number 4

- **n5** (integer)

Node number 5

- **n6** (integer)

Node number 6

- **n7 (optional)** (integer)

Node number 7

- **n8 (optional)** (integer)

Node number 8

Returns

Tshell object

Return type

Tshell

Example

To create a new thick shell in model m with label 100, part 10 and nodes 1, 2, 3, 4, 5, 6, 7, 8:

```
var t = new Tshell(m, 100, 10, 1, 2, 3, 4, 5, 6, 7, 8);
```

Details of functions

AspectRatio()

Description

Calculates the aspect ratio for the thick shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the aspect ratio for thick shell t:

```
var ratio = t.AspectRatio();
```

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a thick shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the thick shell

Returns

No return value

Example

To associate comment c to the thick shell t:

```
t.AssociateComment(c);
```

Blank()

Description

Blanks the thick shell

Arguments

No arguments

Returns

No return value

Example

To blank thick shell t:

```
t.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the thick shells in the model.

Arguments

- **Model** (Model)

Model that all thick shells will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the thick shells in model m:

```
Tshell.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged thick shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged thick shells will be blanked in

- **flag** (Flag)

Flag set on the thick shells that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the thick shells in model m flagged with f:

```
Tshell.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the thick shell is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if thick shell t is blanked:

```
if (t.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse thick shell t:

```
t.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the thick shell.

Arguments

- **flag** (Flag)

Flag to clear on the thick shell

Returns

No return value

Example

To clear flag f for thick shell t:

```
t.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the thick shell. The target include of the copied thick shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Tshell object

Return type

Tshell

Example

To copy thick shell t into thick shell z:

```
var z = t.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a thick shell.

Arguments

- **Model** (Model)

Model that the thick shell will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Tshell object (or null if not made)

Return type

Tshell

Example

To start creating a thick shell in model m:

```
var t = Tshell.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a thick shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the thick shell

Returns

No return value

Example

To detach comment c from the thick shell t:

```
t.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit thick shell t:

```
t.Edit();
```

ElemCut(Database cross section label*[integer]*)

Description

Returns coordinates of the intersections between a thick shell and a database cross section.

Arguments

- **Database cross section label** (integer)

The label of the database cross section.

Returns

Object with the following properties:

Name	Type	Description
face1	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 1. Null if no cut on this face.

face2	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 2. Null if no cut on this face.
face3	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 3. Null if no cut on this face.
face4	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 4. Null if no cut on this face.
face5	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 5. Null if no cut on this face.
face6	Array of reals	An array containing the x1,y1,z1,x2,y2,z2 coordinates of the cut line on the face 6. Null if no cut on this face.

Return type

object

Example

To see if the database cross section 200 cuts thick shell s and at which points it cuts face 3 of the thick shell:

```
var data = s.ElemCut(200);
var face = data.face3;
if(face)
{
    var point1_x = face[0];
    var point1_y = face[1];
    var point1_z = face[2];
    var point2_x = face[3];
    var point2_y = face[4];
    var point2_z = face[5];
}
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for thick shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for thick shell t:

```
t.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for thick shell.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the thick shell colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the thick shell.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing thick shell t:

```
var colour = t.ExtractColour();
```

FindTshellInBox(Model*[Model]*, xmin*[real]*, xmax*[real]*, ymin*[real]*, ymax*[real]*, zmin*[real]*, zmax*[real]*, flag (optional)*[integer]*, excl (optional)*[integer]*, vis_only (optional)*[integer]*) [static]

Description

Returns an array of Tshell objects for the thick shells within a box. Please note this function provides a list of all thick shells that could potentially be in the box (using computationally cheap bounding box comparison) it is not a rigorous test of whether the thick shellis actually in the box. This may include tshells that are ostensibly outside box. The user should apply their own test. (this function is intended to provide an upper bound of elems to test) Setting the "excl" flag will require that the tshell is fully contained. but this may not capture all the tshells you want to process.

Arguments

- **Model** (Model)

Model designated model

- **xmin** (real)

Minimum bound in global x

- **xmax** (real)

Maximum bound in global x

- **ymin** (real)

Minimum bound in global y

- **ymax** (real)

Maximum bound in global y

- **zmin** (real)

Minimum bound in global z

- **zmax** (real)

Maximum bound in global z

- **flag (optional)** (integer)

Optional flag to restrict thick shells considered, if 0 all tshells considered

- **excl (optional)** (integer)

Optional flag (0) Apply inclusive selection (1) Apply exclusive selection inclusive selection means elements intersect box exclusive selection means elements contained in box

- **vis_only (optional)** (integer)

Optional flag to consider visible elements only (1), if (0) all elements considered

Returns

Array of Tshell objects

Return type

Array

Example

To get an array of Tshell objects for flagged thick shells within defined box (inclusive selection)

```
var s = Tshell.FindTshellInBox(m, xmin, xmax, ymin, ymax, zmin, zmax, flag, 0,
0);
```

First(Model*[Model]*) [static]

Description

Returns the first thick shell in the model.

Arguments

- **Model** (Model)

Model to get first thick shell in

Returns

Tshell object (or null if there are no thick shells in the model).

Return type

Tshell

Example

To get the first thick shell in model m:

```
var t = Tshell.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free thick shell label in the model. Also see Tshell.LastFreeLabel(), Tshell.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free thick shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Tshell label.

Return type

Number

Example

To get the first free thick shell label in model m:

```
var label = Tshell.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the thick shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all thick shells will be flagged in

- **flag** (Flag)

Flag to set on the thick shells

Returns

No return value

Example

To flag all of the thick shells with flag f in model m:

```
Tshell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the thick shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the thick shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if thick shell t has flag f set on it:

```
if (t.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each thick shell in the model.
Note that ForEach has been designed to make looping over thick shells as fast as possible and so has some limitations.
Firstly, a single temporary Tshell object is created and on each function call it is updated with the current thick shell data. This means that you should not try to store the Tshell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new thick shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all thick shells are in

- **func** (function)

Function to call for each thick shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the thick shells in model m:

```
Tshell.ForEach(m, test);
function test(t)
{
// t is Tshell object
}
```

To call function test for all of the thick shells in model m with optional object:

```
var data = { x:0, y:0 };
Tshell.ForEach(m, test, data);
function test(t, extra)
{
// t is Tshell object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Tshell objects for all of the thick shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get thick shells from

Returns

Array of Tshell objects

Return type

Array

Example

To make an array of Tshell objects for all of the thick shells in model m

```
var t = Tshell.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a thick shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the thick shell t:

```
var comm_array = t.GetComments();
```

GetCompositeData(ipt*[integer]*)

Description

Returns the composite data for an integration point in *ELEMENT_TSHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array of numbers containing the material id, thickness and beta angle.

Return type

Number

Example

To get the composite data for the 3rd integration point for thick shell t:

```
if (t.composite && s.nip >= 3)
{
    var ipt_data = t.GetCompositeData(2);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Tshell objects for all of the flagged thick shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get thick shells from

- **flag** (Flag)

Flag set on the thick shells that you want to retrieve

Returns

Array of Tshell objects

Return type

Array

Example

To make an array of Tshell objects for all of the thick shells in model m flagged with f

```
var t = Tshell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Tshell object for a thick shell ID.

Arguments

- **Model** (Model)

Model to find the thick shell in

- **number** (integer)

number of the thick shell you want the Tshell object for

Returns

Tshell object (or null if thick shell does not exist).

Return type

Tshell

Example

To get the Tshell object for thick shell 100 in model m

```
var t = Tshell.GetFromID(m, 100);
```

GetNodeIDs()

Description

Returns the labels of the nodes on the thick shell as an array. See also Tshell.GetNodes()

Arguments

No arguments

Returns

Array of node labels (integers)

Return type

Number

Example

To return the node labels of thick shell t as an array

```
var nodes = t.GetNodeIDs();
```

GetNodes()

Description

Returns the nodes on the thick shell as an array of Node objects. See also Tshell.GetNodeIDs()

Arguments

No arguments

Returns

Array of Node objects

Return type

Array

Example

To return the nodes of thick shell t as an array

```
var nodes = t.GetNodes();
```

GetParameter(prop*[string]*)

Description

Checks if a Tshell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Tshell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

thick shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Tshell property t.example is a parameter:

```
Options.property_parameter_names = true;
if (t.GetParameter(t.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Tshell property t.example is a parameter by using the GetParameter method:

```
if (t.ViewParameters().GetParameter(t.example) ) do_something...
```

Jacobian()

Description

Calculates the jacobian for the thick shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the jacobian for thick shell t:

```
var jacobian = s.Jacobian();
```

Keyword()

Description

Returns the keyword for this thick shell (*ELEMENT_TSHELL or *ELEMENT_TSHELL_COMPOSITE). **Note that a carriage return is not added**. See also Tshell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for thick shell t:

```
var key = t.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the thick shell. **Note that a carriage return is not added**. See also Tshell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for thick shell t:

```
var cards = t.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last thick shell in the model.

Arguments

- **Model** (Model)

Model to get last thick shell in

Returns

Tshell object (or null if there are no thick shells in the model).

Return type

Tshell

Example

To get the last thick shell in model m:

```
var t = Tshell.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free thick shell label in the model. Also see Tshell.FirstFreeLabel(), Tshell.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free thick shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Tshell label.

Return type

Number

Example

To get the last free thick shell label in model m:

```
var label = Tshell.LastFreeLabel(m);
```

Next()

Description

Returns the next thick shell in the model.

Arguments

No arguments

Returns

Tshell object (or null if there are no more thick shells in the model).

Return type

Tshell

Example

To get the thick shell in model m after thick shell t:

```
var t = t.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) thick shell label in the model. Also see Tshell.FirstFreeLabel(), Tshell.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free thick shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Tshell label.

Return type

Number

Example

To get the next free thick shell label in model m:

```
var label = Tshell.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a thick shell.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only thick shells from that model can be picked. If the argument is a Flag then only thick shells that are flagged with *limit* can be selected. If omitted, or null, any thick shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Tshell object (or null if not picked)

Return type

Tshell

Example

To pick a thick shell from model m giving the prompt 'Pick thick shell from screen':

```
var t = Tshell.Pick('Pick thick shell from screen', m);
```

Previous()

Description

Returns the previous thick shell in the model.

Arguments

No arguments

Returns

Tshell object (or null if there are no more thick shells in the model).

Return type

Tshell

Example

To get the thick shell in model m before thick shell t:

```
var t = t.Previous();
```

RemoveCompositeData(ipt*[integer]*)

Description

Removes the composite data for an integration point in *ELEMENT_TSHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to remove. **Note that integration points start at 0, not 1**.

Returns

No return value.

Example

To remove the composite data for the 3rd integration point for thick shell t:

```
t.RemoveCompositeData(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the thick shells in the model.

Arguments

- **Model** (Model)

Model that all thick shells will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the thick shells in model m, from 1000000:

```
Tshell.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged thick shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged thick shells will be renumbered in

- **flag** (Flag)

Flag set on the thick shells that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the thick shells in model m flagged with f, from 1000000:

```
Tshell.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select thick shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting thick shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only thick shells from that model can be selected. If the argument is a Flag then only thick shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any thick shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of thick shells selected or null if menu cancelled

Return type

Number

Example

To select thick shells from model m, flagging those selected with flag f, giving the prompt ’Select thick shells’:

```
Tshell.Select(f, ’Select thick shells’, m);
```

To select thick shells, flagging those selected with flag f but limiting selection to thick shells flagged with flag l, giving the prompt ’Select thick shells’:

```
Tshell.Select(f, ’Select thick shells’, l);
```

SetCompositeData(ipt*[integer]*, mid*[integer]*, thick*[real]*, beta*[real]*)

Description

Sets the composite data for an integration point in *ELEMENT_TSHELL_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to set the data for. **Note that integration points start at 0, not 1**.

- **mid** (integer)

Material ID for the integration point.

- **thick** (real)

Thickness of the integration point.

- **beta** (real)

Material angle of the integration point.

Returns

No return value.

Example

To set the composite data for the 3rd integration point to mat 1, thickness 0.5 and angle 45, for thick shell t:

```
t.SetCompositeData(2, 1, 0.5, 45);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the thick shell.

Arguments

- **flag** (Flag)

Flag to set on the thick shell

Returns

No return value

Example

To set flag f for thick shell t:

```
t.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the thick shell. The thick shell will be sketched until you either call Tshell.Unsketch(), Tshell.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the thick shell is sketched. If omitted redraw is true. If you want to sketch several thick shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch thick shell t:

```
t.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged thick shells in the model. The thick shells will be sketched until you either call Tshell.Unsketch(), Tshell.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged thick shells will be sketched in

- **flag** (Flag)

Flag set on the thick shells that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the thick shells are sketched. If omitted redraw is true. If you want to sketch flagged thick shells several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all thick shells flagged with flag in model m:

```
Tshell.SketchFlagged(m, flag);
```

Timestep()

Description

Calculates the timestep for the thick shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the timestep for thick shell t:

```
var timestep = t.Timestep();
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of thick shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing thick shells should be counted. If false or omitted referenced but undefined thick shells will also be included in the total.

Returns

number of thick shells

Return type

Number

Example

To get the total number of thick shells in model m:

```
var total = Tshell.Total(m);
```

Unblank()

Description

Unblanks the thick shell

Arguments

No arguments

Returns

No return value

Example

To unblank thick shell t:

```
t.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the thick shells in the model.

Arguments

- **Model** (Model)

Model that all thick shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the thick shells in model m:

```
Tshell.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged thick shells in the model.

Arguments

- **Model** (Model)

Model that the flagged thick shells will be unblanked in

- **flag** (Flag)

Flag set on the thick shells that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the thick shells in model m flagged with f:

```
Tshell.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the thick shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all thick shells will be unset in

- **flag** (Flag)

Flag to unset on the thick shells

Returns

No return value

Example

To unset the flag f on all the thick shells in model m:

```
Tshell.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the thick shell.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the thick shell is unsketched. If omitted redraw is true. If you want to unsketch several thick shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch thick shell t:

```
t.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all thick shells.

Arguments

- **Model** (Model)

Model that all thick shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the thick shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all thick shells in model m:

```
Tshell.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged thick shells in the model.

Arguments

- **Model** (Model)

Model that all thick shells will be unsketched in

- **flag** (Flag)

Flag set on the thick shells that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the thick shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all thick shells flagged with flag in model m:

```
Tshell.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Tshell object.

Return type

Tshell

Example

To check if Tshell property t.example is a parameter by using the Tshell.GetParameter() method:

```
if (t.ViewParameters().GetParameter(t.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for thick shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for thick shell t:

```
t.Warning("My custom warning");
```

Warpage()

Description

Calculates the warpage for the thick shell

Arguments

No arguments

Returns

real

Return type

Number

Example

To calculate the warpage for thick shell t:

```
var warpage = s.Warpage();
```

Xrefs()

Description

Returns the cross references for this thick shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for thick shell t:

```
var xrefs = t.Xrefs();
```

---

toString()

Description

Creates a string containing the thick shell data in keyword format. Note that this contains the keyword header and the keyword cards. See also Tshell.Keyword() and Tshell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for thick shell t in keyword format

```
var str = t.toString();
```

FreqFRF class

The FreqFRF class gives you access to *FREQUENCY_DOMAIN_FRF keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

FreqFRF constants

Constants for ID type for n1/ n2

Name	Description
FreqFRF.NODE	Property n1typ/ n2typ value EQ.0.0: n1/ n2 is Node ID (default).
FreqFRF.NODE_SET	Property n1typ/ n2typ value EQ.1.0: n1/ n2 is Node Set ID.
FreqFRF.SEGMENT_SET	Property n1typ/ n2typ value EQ.2.0: n1/ n2 is Segment Set ID.

FreqFRF properties

Name	Type	Description
dampf	real	Modal damping coefficient.
dmpmas	real	Mass proportional damping constant in Rayleigh damping.
dmpstf	real	Stiffness proportional damping constant in Rayleigh damping.
dof1	integer	Applicable degrees-of-freedom for excitation input (ignored if vad1 = 4).
dof2	integer	Applicable degrees-of-freedom for response output.
exists (read only)	logical	true if *FREQUENCY_DOMAIN_FRF exists, false if referred to but not defined.
fmax	real	Maximum frequency for FRF output (cycles/time).
fmin	real	Minimum frequency for FRF output (cycles/time).
fnmax	real	Optional maximum natural frequency employed in FRF computation.
fspace	integer	Frequency spacing option for FRF output.
include	integer	The Include file number that the *FREQUENCY_DOMAIN_FRF is in.
label (read only)	integer	The label the *FREQUENCY_DOMAIN_FRF has in PRIMER.
lcdam	integer	Load Curve ID defining mode dependent modal damping coefficient.
lcfreq	integer	Load Curve ID defining the frequencies for FRF output.
lctyp	integer	Type of load curve defining modal damping coefficient.
mdmax	integer	The last mode employed in FRF computation (optional).
mdmin	integer	The first mode employed in FRF computation (optional).
model (read only)	integer	The Model number that the *FREQUENCY_DOMAIN_FRF is in.
n1	integer	Node/ Node Set/ Segment Set ID for excitation input.
n1typ	integer	Type of n1. Values can be FreqFRF.NODE, FreqFRF.NODE_SET or FreqFRF.SEGMENT_SET.
n2	integer	Node/ Node Set/ Segment Set ID for response output.
n2typ	integer	Type of n2. Values can be FreqFRF.NODE, FreqFRF.NODE_SET or FreqFRF.SEGMENT_SET.
nfreq	integer	Number of frequencies for FRF output.
output	integer	Output option.
relatv	integer	Flag for displacement, velocity and acceleration results.
restrt	integer	Restart option.
vad1	integer	Excitation input type.
vad2	integer	Response output type.
vid1	integer	Vector ID (for dof1 = 0) for excitation input.
vid2	integer	Vector ID (for dof2 = 0) for response direction.

Detailed Description

The FreqFRF class allows you to create, modify, edit and manipulate *FREQUENCY_DOMAIN_FRF. See the documentation below for more details.

Constructor

new FreqFRF(Model*[Model]*, n1*[integer]*, n1typ*[integer]*, n2*[integer]*, n2typ*[integer]*)

Description

Create a new FreqFRF object.

Arguments

- **Model** (Model)

Model that *FREQUENCY_DOMAIN_FRF will be created in.

- **n1** (integer)

Node/ Node Set/ Segment Set ID for excitation input.

- **n1typ** (integer)

Type of n1. Values can be FreqFRF.NODE, FreqFRF.NODE_SET or FreqFRF.SEGMENT_SET.

- **n2** (integer)

Node/ Node Set/ Segment Set ID for response output.

- **n2typ** (integer)

Type of n2. Values can be FreqFRF.NODE, FreqFRF.NODE_SET or FreqFRF.SEGMENT_SET.

Returns

FreqFRF object

Return type

FreqFRF

Example

To create a new *FREQUENCY_DOMAIN_FRF in model m with node 10 for excitation output and node set 2 for response output

```
var f = new FreqFRF(m, 10, FreqFRF.NODE, 2, FreqFRF.NODE_SET);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *FREQUENCY_DOMAIN_FRF.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *FREQUENCY_DOMAIN_FRF

Returns

No return value

Example

To associate comment c to the *FREQUENCY_DOMAIN_FRF f:

```
f.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *FREQUENCY_DOMAIN_FRF f:

```
f.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *FREQUENCY_DOMAIN_FRF.

Arguments

- **flag** (Flag)

Flag to clear on the *FREQUENCY_DOMAIN_FRF

Returns

No return value

Example

To clear flag f for *FREQUENCY_DOMAIN_FRF f:

```
f.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *FREQUENCY_DOMAIN_FRF. The target include of the copied *FREQUENCY_DOMAIN_FRF can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

FreqFRF object

Return type

FreqFRF

Example

To copy *FREQUENCY_DOMAIN_FRF f into *FREQUENCY_DOMAIN_FRF z:

```
var z = f.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *FREQUENCY_DOMAIN_FRF.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *FREQUENCY_DOMAIN_FRF

Returns

No return value

Example

To detach comment c from the *FREQUENCY_DOMAIN_FRF f:

```
f.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *FREQUENCY_DOMAIN_FRF f:

```
f.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *FREQUENCY_DOMAIN_FRF. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *FREQUENCY_DOMAIN_FRF f:

```
f.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *FREQUENCY_DOMAIN_FRF in the model.

Arguments

- **Model** (Model)

Model to get first *FREQUENCY_DOMAIN_FRF in

Returns

FreqFRF object (or null if there are no *FREQUENCY_DOMAIN_FRFs in the model).

Return type

FreqFRF

Example

To get the first *FREQUENCY_DOMAIN_FRF in model m:

```
var f = FreqFRF.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *FREQUENCY_DOMAIN_FRFs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_FRFs will be flagged in

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_FRFs

Returns

No return value

Example

To flag all of the *FREQUENCY_DOMAIN_FRFs with flag f in model m:

```
FreqFRF.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *FREQUENCY_DOMAIN_FRF is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *FREQUENCY_DOMAIN_FRF

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *FREQUENCY_DOMAIN_FRF f has flag f set on it:

```
if (f.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *FREQUENCY_DOMAIN_FRF in the model.
Note that ForEach has been designed to make looping over *FREQUENCY_DOMAIN_FRFs as fast as possible and so has some limitations.
Firstly, a single temporary FreqFRF object is created and on each function call it is updated with the current *FREQUENCY_DOMAIN_FRF data. This means that you should not try to store the FreqFRF object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *FREQUENCY_DOMAIN_FRFs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_FRFs are in

- **func** (function)

Function to call for each *FREQUENCY_DOMAIN_FRF

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *FREQUENCY_DOMAIN_FRFs in model m:

```
FreqFRF.ForEach(m, test);
function test(f)
{
// f is FreqFRF object
}
```

To call function test for all of the *FREQUENCY_DOMAIN_FRFs in model m with optional object:

```
var data = { x:0, y:0 };
FreqFRF.ForEach(m, test, data);
function test(f, extra)
{
// f is FreqFRF object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of FreqFRF objects for all of the *FREQUENCY_DOMAIN_FRFs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_FRFs from

Returns

Array of FreqFRF objects

Return type

Array

Example

To make an array of FreqFRF objects for all of the *FREQUENCY_DOMAIN_FRFs in model m

```
var f = FreqFRF.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *FREQUENCY_DOMAIN_FRF.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *FREQUENCY_DOMAIN_FRF f:

```
var comm_array = f.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of FreqFRF objects for all of the flagged *FREQUENCY_DOMAIN_FRFs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_FRFs from

- **flag** (Flag)

Flag set on the *FREQUENCY_DOMAIN_FRFs that you want to retrieve

Returns

Array of FreqFRF objects

Return type

Array

Example

To make an array of FreqFRF objects for all of the *FREQUENCY_DOMAIN_FRFs in model m flagged with f

```
var f = FreqFRF.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the FreqFRF object for a *FREQUENCY_DOMAIN_FRF ID.

Arguments

- **Model** (Model)

Model to find the *FREQUENCY_DOMAIN_FRF in

- **number** (integer)

number of the *FREQUENCY_DOMAIN_FRF you want the FreqFRF object for

Returns

FreqFRF object (or null if *FREQUENCY_DOMAIN_FRF does not exist).

Return type

FreqFRF

Example

To get the FreqFRF object for *FREQUENCY_DOMAIN_FRF 100 in model m

```
var f = FreqFRF.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a FreqFRF property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the FreqFRF.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*FREQUENCY_DOMAIN_FRF property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if FreqFRF property f.example is a parameter:

```
Options.property_parameter_names = true;
if (f.GetParameter(f.example) ) do_something...
Options.property_parameter_names = false;
```

To check if FreqFRF property f.example is a parameter by using the GetParameter method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this *FREQUENCY_DOMAIN_FRF **Note that a carriage return is not added**. See also FreqFRF.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for *FREQUENCY_DOMAIN_FRF f:

```
var key = f.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *FREQUENCY_DOMAIN_FRF. **Note that a carriage return is not added**. See also FreqFRF.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for *FREQUENCY_DOMAIN_FRF f:

```
var cards = f.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *FREQUENCY_DOMAIN_FRF in the model.

Arguments

- **Model** (Model)

Model to get last *FREQUENCY_DOMAIN_FRF in

Returns

FreqFRF object (or null if there are no *FREQUENCY_DOMAIN_FRFs in the model).

Return type

FreqFRF

Example

To get the last *FREQUENCY_DOMAIN_FRF in model m:

```
var f = FreqFRF.Last(m);
```

Next()

Description

Returns the next *FREQUENCY_DOMAIN_FRF in the model.

Arguments

No arguments

Returns

FreqFRF object (or null if there are no more *FREQUENCY_DOMAIN_FRFs in the model).

Return type

FreqFRF

Example

To get the *FREQUENCY_DOMAIN_FRF in model m after *FREQUENCY_DOMAIN_FRF f:

```
var f = f.Next();
```

Previous()

Description

Returns the previous *FREQUENCY_DOMAIN_FRF in the model.

Arguments

No arguments

Returns

FreqFRF object (or null if there are no more *FREQUENCY_DOMAIN_FRFs in the model).

Return type

FreqFRF

Example

To get the *FREQUENCY_DOMAIN_FRF in model m before *FREQUENCY_DOMAIN_FRF f:

```
var f = f.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *FREQUENCY_DOMAIN_FRFs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *FREQUENCY_DOMAIN_FRFs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *FREQUENCY_DOMAIN_FRFs from that model can be selected. If the argument is a Flag then only *FREQUENCY_DOMAIN_FRFs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *FREQUENCY_DOMAIN_FRFs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *FREQUENCY_DOMAIN_FRFs selected or null if menu cancelled

Return type

Number

Example

To select *FREQUENCY_DOMAIN_FRFs from model m, flagging those selected with flag f, giving the prompt 'Select *FREQUENCY_DOMAIN_FRFs':

```
FreqFRF.Select(f, 'Select *FREQUENCY_DOMAIN_FRFs', m);
```

To select *FREQUENCY_DOMAIN_FRFs, flagging those selected with flag f but limiting selection to *FREQUENCY_DOMAIN_FRFs flagged with flag l, giving the prompt 'Select *FREQUENCY_DOMAIN_FRFs':

```
FreqFRF.Select(f, 'Select *FREQUENCY_DOMAIN_FRFs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *FREQUENCY_DOMAIN_FRF.

Arguments

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_FRF

Returns

No return value

Example

To set flag f for *FREQUENCY_DOMAIN_FRF f:

```
f.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *FREQUENCY_DOMAIN_FRFs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *FREQUENCY_DOMAIN_FRFs should be counted. If false or omitted referenced but undefined *FREQUENCY_DOMAIN_FRFs will also be included in the total.

Returns

number of *FREQUENCY_DOMAIN_FRFs

Return type

Number

Example

To get the total number of *FREQUENCY_DOMAIN_FRFs in model m:

```
var total = FreqFRF.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *FREQUENCY_DOMAIN_FRFs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *FREQUENCY_DOMAIN_FRFs will be unset in

- **flag** (Flag)

Flag to unset on the *FREQUENCY_DOMAIN_FRFs

Returns

No return value

Example

To unset the flag f on all the *FREQUENCY_DOMAIN_FRFs in model m:

```
FreqFRF.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

FreqFRF object.

Return type

FreqFRF

Example

To check if FreqFRF property f.example is a parameter by using the FreqFRF.GetParameter() method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *FREQUENCY_DOMAIN_FRF. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *FREQUENCY_DOMAIN_FRF f:

```
f.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *FREQUENCY_DOMAIN_FRF.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *FREQUENCY_DOMAIN_FRF f:

```
var xrefs = f.Xrefs();
```

---

toString()

Description

Creates a string containing the *FREQUENCY_DOMAIN_FRF data in keyword format. Note that this contains the keyword header and the keyword cards. See also FreqFRF.Keyword() and FreqFRF.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for *FREQUENCY_DOMAIN_FRF f in keyword format

```
var str = f.toString();
```

FreqSSD class

The FreqSSD class gives you access to *FREQUENCY_DOMAIN_SSD keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

FreqSSD constants

Name	Description
FreqSSD.DIRECT	FreqSSD option for *FREQUENCY_DOMAIN_SSD_DIRECT.

FreqSSD.DIRECT_FD	FreqSSD option for *FREQUENCY_DOMAIN_SSD_DIRECT_FREQUENCY_DEPENDENT.
FreqSSD.ERP	FreqSSD option for *FREQUENCY_DOMAIN_SSD_ERP.
FreqSSD.FATIGUE	FreqSSD option for *FREQUENCY_DOMAIN_SSD_FATIGUE.
FreqSSD.FRF	FreqSSD option for *FREQUENCY_DOMAIN_SSD_FRF.
FreqSSD.SUBCASE	FreqSSD option for *FREQUENCY_DOMAIN_SSD_SUBCASE.

FreqSSD properties

Name	Type	Description
c	real	Sound speed of the fluid (for option FreqSSD.ERP only).
dampf	real	Modal damping coefficient.
dmpflg	integer	Damping flag.
dmpmas	real	Mass proportional damping constant in Rayleigh damping.
dmpstf	real	Stiffness proportional damping constant in Rayleigh damping.
erpref	real	ERP reference value (for option FreqSSD.ERP only).
erprlf	real	ERP radiation loss factor (for option FreqSSD.ERP only).
exists (read only)	logical	true if *FREQUENCY_DOMAIN_SSD exists, false if referred to but not defined.
fnmax	real	The maximum natural frequency in modal superposition method (optional).
fnmin	real	The minimum natural frequency in modal superposition method (optional).
include	integer	The Include file number that the *FREQUENCY_DOMAIN_SSD is in.
istress	integer	Stress computation flag (for option FreqSSD.DIRECT only).
label (read only)	integer	The label the *FREQUENCY_DOMAIN_SSD has in PRIMER.
lcdam	integer	Load Curve ID defining mode dependent modal damping coefficient.
lcflag	integer	Load curve definition flag.
lcftg	integer	Load Curve ID defining duration of excitation for each frequency (for option FreqSSD.FATIGUE only).
lctyp	integer	Type of load curve defining modal damping coefficient.
mdmax	integer	The last mode in modal superposition method (optional).
mdmin	integer	The first mode in modal superposition method (optional).
memory	integer	Memory flag.
model (read only)	integer	The Model number that the *FREQUENCY_DOMAIN_SSD is in.
nerp	integer	Number of ERP panels.
notyp	integer	Type of NOUT.
nout	integer	Part, part set, segment set, or node set ID for response output.
nova	integer	Response output type.
option	constant	The *FREQUENCY_DOMAIN_SSD option. Can be FreqSSD.DIRECT, FreqSSD.DIRECT_FD, FreqSSD.FATIGUE, FreqSSD.FRF, FreqSSD.ERP or FreqSSD.SUBCASE.
radeff	integer	Radiation efficiency computation flag (for option FreqSSD.ERP only).

relatv	integer	Flag for displacement, velocity and acceleration results.
restdp	integer	Restart option.
restmd	integer	Restart option.
ro	real	Fluid density (for option FreqSSD.ERP only).
strtyp	integer	Stress used in fatigue analysis.

Detailed Description

The FreqSSD class allows you to create, modify, edit and manipulate *FREQUENCY_DOMAIN_SSD. See the documentation below for more details.

Constructor

new FreqSSD(Model*[Model]*, option*[constant]*)

Description

Create a new FreqSSD object.

Arguments

- **Model** (Model)

Model that *FREQUENCY_DOMAIN_SSD will be created in.

- **option** (constant)

Specify the type of *FREQUENCY_DOMAIN_SSD. Can be FreqSSD.DIRECT, FreqSSD.DIRECT_FD, FreqSSD.FATIGUE, FreqSSD.FRF, FreqSSD.ERP or FreqSSD.SUBCASE.

Returns

FreqSSD object

Return type

FreqSSD

Example

To create a new *FREQUENCY_DOMAIN_SSD in model m, of type FATIGUE

```
var f = new FreqSSD(m, FreqSSD.FATIGUE);
```

Details of functions

AddLoadData()

Description

Allows user to add a new load card in *FREQUENCY_DOMAIN_SSD. This method is only applicable when option is not FreqSSD.SUBCASE.

The new card has uninitialised fields and should be updated by FreqSSD.SetLoadData().

Arguments

No arguments

Returns

Index of the new load

Return type

integer

Example

To add a new load data card in *FREQUENCY_DOMAIN_SSD f:

```
f.AddLoadData();
```

AddSubcaseData()

Description

Allows user to add new subcase cards in *FREQUENCY_DOMAIN_SSD. This method is only applicable when option is FreqSSD.SUBCASE.

The new cards have uninitialised fields and should be updated by FreqSSD.SetSubcaseData().

Arguments

No arguments

Returns

Index of the new subcase

Return type

integer

Example

To add a new load data card in *FREQUENCY_DOMAIN_SSD f:

```
f.AddSubcaseData();
```

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a *FREQUENCY_DOMAIN_SSD.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *FREQUENCY_DOMAIN_SSD

Returns

No return value

Example

To associate comment c to the *FREQUENCY_DOMAIN_SSD f:

```
f.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *FREQUENCY_DOMAIN_SSD f:

```
f.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *FREQUENCY_DOMAIN_SSD.

Arguments

- **flag** (Flag)

Flag to clear on the *FREQUENCY_DOMAIN_SSD

Returns

No return value

Example

To clear flag f for *FREQUENCY_DOMAIN_SSD f:

```
f.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *FREQUENCY_DOMAIN_SSD. The target include of the copied *FREQUENCY_DOMAIN_SSD can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

FreqSSD object

Return type

FreqSSD

Example

To copy *FREQUENCY_DOMAIN_SSD f into *FREQUENCY_DOMAIN_SSD z:

```
var z = f.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *FREQUENCY_DOMAIN_SSD card.

Arguments

- **Model** (Model)

Model that the *FREQUENCY_DOMAIN_SSD card will be created in.

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

FreqSSD object (or null if not made)

Return type

FreqSSD

Example

To start creating a *FREQUENCY_DOMAIN_SSD card in model m:

```
var f = FreqSSD.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *FREQUENCY_DOMAIN_SSD.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *FREQUENCY_DOMAIN_SSD

Returns

No return value

Example

To detach comment c from the *FREQUENCY_DOMAIN_SSD f:

```
f.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *FREQUENCY_DOMAIN_SSD f:

```
f.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *FREQUENCY_DOMAIN_SSD. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *FREQUENCY_DOMAIN_SSD f:

```
f.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *FREQUENCY_DOMAIN_SSD in the model.

Arguments

- **Model** (Model)

Model to get first *FREQUENCY_DOMAIN_SSD in

Returns

FreqSSD object (or null if there are no *FREQUENCY_DOMAIN_SSDs in the model).

Return type

FreqSSD

Example

To get the first *FREQUENCY_DOMAIN_SSD in model m:

```
var f = FreqSSD.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *FREQUENCY_DOMAIN_SSDs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_SSDs will be flagged in

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_SSDs

Returns

No return value

Example

To flag all of the *FREQUENCY_DOMAIN_SSDs with flag f in model m:

```
FreqSSD.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *FREQUENCY_DOMAIN_SSD is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *FREQUENCY_DOMAIN_SSD

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *FREQUENCY_DOMAIN_SSD f has flag f set on it:

```
if (f.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *FREQUENCY_DOMAIN_SSD in the model.
Note that ForEach has been designed to make looping over *FREQUENCY_DOMAIN_SSDs as fast as possible and so has some limitations.
Firstly, a single temporary FreqSSD object is created and on each function call it is updated with the current *FREQUENCY_DOMAIN_SSD data. This means that you should not try to store the FreqSSD object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *FREQUENCY_DOMAIN_SSDs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_SSDs are in

- **func** (function)

Function to call for each *FREQUENCY_DOMAIN_SSD

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *FREQUENCY_DOMAIN_SSDs in model m:

```
FreqSSD.ForEach(m, test);
function test(f)
{
// f is FreqSSD object
}
```

To call function test for all of the *FREQUENCY_DOMAIN_SSDs in model m with optional object:

```
var data = { x:0, y:0 };
FreqSSD.ForEach(m, test, data);
function test(f, extra)
{
// f is FreqSSD object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of FreqSSD objects for all of the *FREQUENCY_DOMAIN_SSDs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_SSDs from

Returns

Array of FreqSSD objects

Return type

Array

Example

To make an array of FreqSSD objects for all of the *FREQUENCY_DOMAIN_SSDs in model m

```
var f = FreqSSD.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *FREQUENCY_DOMAIN_SSD.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *FREQUENCY_DOMAIN_SSD f:

```
var comm_array = f.GetComments();
```

GetErpData(index*[integer]*)

Description

Returns the ERP data for a specific ERP part as an array. For each ERP part there will be 2 values. There are nerp ERP parts.

This method is only applicable when option is FreqSSD.ERP.

Arguments

- **index** (integer)

Index you want the ERP data for. **Note that indices start at 0**.

Returns

An array containing the ERP data (values: pid[integer], ptyp[integer]). The array length will be 2.

Return type

Number

Example

To get the data for the 3rd ERP part for *FREQUENCY_DOMAIN_SSD f:

```
var edata = f.GetErpData(2);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of FreqSSD objects for all of the flagged *FREQUENCY_DOMAIN_SSDs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_SSDs from

- **flag** (Flag)

Flag set on the *FREQUENCY_DOMAIN_SSDs that you want to retrieve

Returns

Array of FreqSSD objects

Return type

Array

Example

To make an array of FreqSSD objects for all of the *FREQUENCY_DOMAIN_SSDs in model m flagged with f

```
var f = FreqSSD.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the FreqSSD object for a *FREQUENCY_DOMAIN_SSD ID.

Arguments

- **Model** (Model)

Model to find the *FREQUENCY_DOMAIN_SSD in

- **number** (integer)

number of the *FREQUENCY_DOMAIN_SSD you want the FreqSSD object for

Returns

FreqSSD object (or null if *FREQUENCY_DOMAIN_SSD does not exist).

Return type

FreqSSD

Example

To get the FreqSSD object for *FREQUENCY_DOMAIN_SSD 100 in model m

```
var f = FreqSSD.GetFromID(m, 100);
```

GetLoadData(index*[integer]*)

Description

Returns the data for a specific excitation load as an array. For each load there will be 8 values. There can be as many loads as needed.

This method is only applicable when option is not FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index you want the load data for. **Note that indices start at 0**.

Returns

An array containing the load data (values: nid[integer], ntyp[integer], dof[integer], vad[integer], lc1[integer], lc2[integer], sf[real], vid[integer]).

The array length will be 8.

Return type

Number

Example

To get the data for the 4th load for *FREQUENCY_DOMAIN_SSD f:

```
var ldata = f.GetLoadData(3);
```

GetParameter(prop*[string]*)

Description

Checks if a FreqSSD property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the FreqSSD.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*FREQUENCY_DOMAIN_SSD property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if FreqSSD property f.example is a parameter:

```
Options.property_parameter_names = true;
if (f.GetParameter(f.example) ) do_something...
Options.property_parameter_names = false;
```

To check if FreqSSD property f.example is a parameter by using the GetParameter method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

GetSubcaseData(index*[integer]*)

Description

Returns the data for a specific subcase as an array. For each subcase there will be 3 + 8 x nload values. There can be as many subcases as needed.

This method is only applicable when option is FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index you want the subcase data for. **Note that indices start at 0**.

Returns

An array containing the subcase data (values: caseid[string], title[string], nload[integer], nid[integer], ntyp[integer], dof[integer], vad[integer], lc1[integer], lc2[integer], sf[real], vid[integer], ...)

Where values nid to vid are repeated nload times in the array. The array length will be 3 + 8 x nload.

Return type

Number

Example

To get the data for the 2nd subcase for *FREQUENCY_DOMAIN_SSD f:

```
var sdata = f.GetSubcaseData(1);
```

Keyword()

Description

Returns the keyword for this *FREQUENCY_DOMAIN_SSD. **Note that a carriage return is not added**. See also FreqSSD.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for *FREQUENCY_DOMAIN_SSD f:

```
var key = f.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *FREQUENCY_DOMAIN_SSD. **Note that a carriage return is not added**. See also FreqSSD.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for *FREQUENCY_DOMAIN_SSD f:

```
var cards = f.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *FREQUENCY_DOMAIN_SSD in the model.

Arguments

- **Model** (Model)

Model to get last *FREQUENCY_DOMAIN_SSD in

Returns

FreqSSD object (or null if there are no *FREQUENCY_DOMAIN_SSDs in the model).

Return type

FreqSSD

Example

To get the last *FREQUENCY_DOMAIN_SSD in model m:

```
var f = FreqSSD.Last(m);
```

Next()

Description

Returns the next *FREQUENCY_DOMAIN_SSD in the model.

Arguments

No arguments

Returns

FreqSSD object (or null if there are no more *FREQUENCY_DOMAIN_SSDs in the model).

Return type

FreqSSD

Example

To get the *FREQUENCY_DOMAIN_SSD in model m after *FREQUENCY_DOMAIN_SSD f:

```
var f = f.Next();
```

Previous()

Description

Returns the previous *FREQUENCY_DOMAIN_SSD in the model.

Arguments

No arguments

Returns

FreqSSD object (or null if there are no more *FREQUENCY_DOMAIN_SSDs in the model).

Return type

FreqSSD

Example

To get the *FREQUENCY_DOMAIN_SSD in model m before *FREQUENCY_DOMAIN_SSD f:

```
var f = f.Previous();
```

RemoveLoadData(index*[integer]*)

Description

Allows user to remove a specified load card in *FREQUENCY_DOMAIN_SSD.

This method is only applicable when option is not FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index of the load card you want to remove. **Note that indices start at 0**.

Returns

No return value

Example

To remove first load card in *FREQUENCY_DOMAIN_SSD f:

```
f.RemoveLoadData(0);
```

RemoveSubcaseData(index*[integer]*)

Description

Allows user to remove cards for a specified subcase in *FREQUENCY_DOMAIN_SSD.

This method is only applicable when option is FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index of the subcase you want to remove cards for. **Note that indices start at 0**.

Returns

No return value

Example

To remove cards corresponding to the second subcase in *FREQUENCY_DOMAIN_SSD f:

```
f.RemoveSubcaseData(1);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *FREQUENCY_DOMAIN_SSDs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *FREQUENCY_DOMAIN_SSDs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *FREQUENCY_DOMAIN_SSDs from that model can be selected. If the argument is a Flag then only *FREQUENCY_DOMAIN_SSDs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *FREQUENCY_DOMAIN_SSDs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *FREQUENCY_DOMAIN_SSDs selected or null if menu cancelled

Return type

Number

Example

To select *FREQUENCY_DOMAIN_SSDs from model m, flagging those selected with flag f, giving the prompt 'Select *FREQUENCY_DOMAIN_SSDs':

```
FreqSSD.Select(f, 'Select *FREQUENCY_DOMAIN_SSDs', m);
```

To select *FREQUENCY_DOMAIN_SSDs, flagging those selected with flag f but limiting selection to *FREQUENCY_DOMAIN_SSDs flagged with flag l, giving the prompt 'Select *FREQUENCY_DOMAIN_SSDs':

```
FreqSSD.Select(f, 'Select *FREQUENCY_DOMAIN_SSDs', l);
```

SetErpData(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific ERP part. For each ERP part there will be 2 values. There are nerp ERP parts.

This method is only applicable when option is FreqSSD.ERP.

Arguments

- **index** (integer)

Index you want to set ERP data for. **Note that indices start at 0**.

- **data** (Array of data)

An array containing the ERP data (values: pid[integer], ptyp[integer]). The array length should be 2.

Returns

No return value.

Example

To set the 3rd ERP part data for *FREQUENCY_DOMAIN_SSD f to the values in array edata:

```
f.SetErpData(2, edata);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *FREQUENCY_DOMAIN_SSD.

Arguments

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_SSD

Returns

No return value

Example

To set flag f for *FREQUENCY_DOMAIN_SSD f:

```
f.SetFlag(f);
```

SetLoadData(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific excitation load. For each load there will be 8 values. There can be as many loads as needed.

This method is only applicable when option is not FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index you want to set load data for. **Note that indices start at 0**.

- **data** (Array of data)

An array containing the load data (values: nid[integer], ntyp[integer], dof[integer], vad[integer], lc1[integer], lc2[integer], sf[real], vid[integer]).

The array length should be 8.

Returns

No return value.

Example

To set the 4th load data for *FREQUENCY_DOMAIN_SSD f to the values in array ldata:

```
f.SetLoadData(3, ldata);
```

SetSubcaseData(index*[integer]*, caseid*[string]*, title*[string]*, nload*[integer]*, data*[Array of data]*)

Description

Set the data for a specific subcase. For each subcase, data will have 8 x nload values. There can be as many subcases as needed.

This method is only applicable when option is FreqSSD.SUBCASE.

Arguments

- **index** (integer)

Index you want to set subcase data for. **Note that indices start at 0**.

- **caseid** (string)

Identification string to be used as the case ID (must include at least one letter).

- **title** (string)

A description of the current loading case (can be blank).

- **nload** (integer)

Number of loads for this loading case.

- **data** (Array of data)

An array containing the subcase load data (values: nid[integer], ntyp[integer], dof[integer], vad[integer], lc1[integer], lc2[integer], sf[real], vid[integer], ...)

Where values nid to vid are repeated nload times in the array. The array length should be 8 x nload.

Returns

No return value.

Example

To set the 2nd subcase data for *FREQUENCY_DOMAIN_SSD f to have caseid "ID2", no title, 2 load cards and load data of ldata:

```
f.SetSubcaseData(1, "ID2", "", 2, ldata);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *FREQUENCY_DOMAIN_SSDs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *FREQUENCY_DOMAIN_SSDs should be counted. If false or omitted referenced but undefined *FREQUENCY_DOMAIN_SSDs will also be included in the total.

Returns

number of *FREQUENCY_DOMAIN_SSDs

Return type

Number

Example

To get the total number of *FREQUENCY_DOMAIN_SSDs in model m:

```
var total = FreqSSD.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *FREQUENCY_DOMAIN_SSDs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *FREQUENCY_DOMAIN_SSDs will be unset in

- **flag** (Flag)

Flag to unset on the *FREQUENCY_DOMAIN_SSDs

Returns

No return value

Example

To unset the flag f on all the *FREQUENCY_DOMAIN_SSDs in model m:

```
FreqSSD.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

FreqSSD object.

Return type

FreqSSD

Example

To check if FreqSSD property f.example is a parameter by using the FreqSSD.GetParameter() method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *FREQUENCY_DOMAIN_SSD. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *FREQUENCY_DOMAIN_SSD f:

```
f.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *FREQUENCY_DOMAIN_SSD.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *FREQUENCY_DOMAIN_SSD f:

```
var xrefs = f.Xrefs();
```

---

toString()

Description

Creates a string containing the *FREQUENCY_DOMAIN_SSD data in keyword format. Note that this contains the keyword header and the keyword cards. See also FreqSSD.Keyword() and FreqSSD.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for *FREQUENCY_DOMAIN_SSD f in keyword format

```
var s = f.toString();
```

FreqVibration class

The FreqVibration class gives you access to *FREQUENCY_DOMAIN_RANDOM_VIBRATION keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example
