FreqVibration constants

Name	Description
FreqVibration.FATIGUE	FreqVibration option for *FREQUENCY_DOMAIN_RANDOM_VIBRATION_FATIGUE.
FreqVibration.VIBRATION	FreqVibration option for *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

FreqVibration properties

Name	Type	Description
dampf	real	Modal damping coefficient.
dmpmas	real	Mass proportional damping constant in Rayleigh damping.
dmpstf	real	Stiffness proportional damping constant in Rayleigh damping.
dmptyp	integer	Tytpe of Damping.
exists (read only)	logical	true if *FREQUENCY_DOMAIN_RANDOM_VIBRATION exists, false if referred to but not defined.
fnmax	real	The maximum natural frequency in modal superposition method (optional).
fnmin	real	The minimum natural frequency in modal superposition method (optional).
icoarse	integer	Option for PSD curve coarsening.
include	integer	The Include file number that the *FREQUENCY_DOMAIN_RANDOM_VIBRATION is in.
inftg	integer	Flag for including initial damage ratio.
ipanelu	integer	Number of strips in U-direction (used only for vaflag = 5,6,7).
ipanelv	integer	Number of strips in V-direction (used only for vaflag = 5,6,7).
label (read only)	integer	The label the *FREQUENCY_DOMAIN_RANDOM_VIBRATION has in PRIMER.
lcdam	integer	Load Curve ID defining mode dependent modal damping coefficient.
lctyp	integer	Type of load curve defining modal damping coefficient.
ldflag	integer	Type of loading curves.
ldtyp	Integer	Excitation load type.
mdmax	integer	The last mode in modal superposition method (optional).
mdmin	integer	The first mode in modal superposition method (optional).
method	integer	Method for modal response analysis.
mftg	integer	Method for random fatigue analysis.
model (read only)	integer	The Model number that the *FREQUENCY_DOMAIN_RANDOM_VIBRATION is in.
napsd	integer	Number of auto PSD load definition.
ncpsd	integer	Number of cross PSD load definition.
nftg	integer	Field specifying the number of S-N curves to be defined.
option	constant	The *FREQUENCY_DOMAIN_RANDOM_VIBRATION option. Can be FreqVibration.VIBRATION, FreqVibration.FATIGUE.
pref	real	Reference pressure

restrm	integer	Restart option.
restrt	integer	Restart option.
strsf	real	Stress scale factor to accommodate different ordinates in S-N curve (not used if nftg = -999).
strtyp	integer	Stress type of S-N curve in fatigue analysis.
tcoarse	real	Tolerance for slope change percentage for removing intermediate points from PSD curve for icoarse = 2.
temper	real	Temperature.
texpos	real	Exposure time.
umlt	real	Multiplier for converting g to [length unit]/[time unit]^2 (used only for UNIT = -1).
unit	integer	Flag for acceleration unit conversion.
vaflag	integer	Loading type.
vapsd	integer	Flag for PSD output.
varms	integer	Flag for RMS output.

Detailed Description

The FreqVibration class allows you to create, modify, edit and manipulate *FREQUENCY_DOMAIN_RANDOM_VIBRATION. See the documentation below for more details.

Constructor

new FreqVibration(Model*[Model]*, option*[constant]*)

Description

Create a new FreqVibration object.

Arguments

- **Model** (Model)

Model that *FREQUENCY_DOMAIN_RANDOM_VIBRATION will be created in.

- **option** (constant)

Specify the type of *FREQUENCY_DOMAIN_RANDOM_VIBRATION. Can be FreqVibration.VIBRATION, FreqVibration.FATIGUE.

Returns

FreqVibration object

Return type

FreqVibration

Example

To create a new *FREQUENCY_DOMAIN_RANDOM_VIBRATION in model m, of type FATIGUE

```
var f = new FreqVibration(m, FreqVibration.FATIGUE);
```

Details of functions

AddAutoPsdLoadData()

Description

Allows user to add a new Auto PSD load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

The new card has uninitialised fields and should be updated by FreqVibration.SetAutoPsdLoadData().

Arguments

No arguments

Returns

Index of the new auto PSD load

Return type

integer

Example

To add a new auto PSD load data card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.AddAutoPsdLoadData();
```

AddCrossPsdLoadData()

Description

Allows user to add a new Cross PSD load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

The new card has uninitialised fields and should be updated by FreqVibration.SetCrossPsdLoadData().

Arguments

No arguments

Returns

Index of the new cross PSD load

Return type

integer

Example

To add a new cross PSD load data card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.AddCrossPsdLoadData();
```

AddInftgData()

Description

Allows user to add new Initial Damage cards in *FREQUENCY_DOMAIN_RANDOM_VIBRATION. This method is only applicable when option is FreqVibration.FATIGUE.

The new cards have uninitialised fields and should be updated by FreqVibration.SetInftgData().

Arguments

No arguments

Returns

Index of the new initial damage card

Return type

integer

Example

To add a new initial damage card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.AddInftgData();
```

AddSNCurveData()

Description

Allows user to add new S-N curve cards in *FREQUENCY_DOMAIN_RANDOM_VIBRATION. This method is only applicable when option is FreqVibration.FATIGUE.

The new cards have uninitialised fields and should be updated by FreqVibration.SetSNCurveData().

Arguments

No arguments

Returns

Index of the new S-N curve card

Return type

integer

Example

To add a new S-N curve card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.AddSNCurveData();
```

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *FREQUENCY_DOMAIN_RANDOM_VIBRATION

Returns

No return value

Example

To associate comment c to the *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **flag** (Flag)

Flag to clear on the *FREQUENCY_DOMAIN_RANDOM_VIBRATION

Returns

No return value

Example

To clear flag f for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *FREQUENCY_DOMAIN_RANDOM_VIBRATION. The target include of the copied *FREQUENCY_DOMAIN_RANDOM_VIBRATION can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

FreqVibration object

Return type

FreqVibration

Example

To copy *FREQUENCY_DOMAIN_RANDOM_VIBRATION f into *FREQUENCY_DOMAIN_RANDOM_VIBRATION z:

```
var z = f.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *FREQUENCY_DOMAIN_RANDOM_VIBRATION card.

Arguments

- **Model** (Model)

Model that the *FREQUENCY_DOMAIN_RANDOM_VIBRATION card will be created in.

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

FreqVibration object (or null if not made)

Return type

FreqVibration

Example

To start creating a *FREQUENCY_DOMAIN_RANDOM_VIBRATION card in model m:

```
var f = FreqVibration.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *FREQUENCY_DOMAIN_RANDOM_VIBRATION

Returns

No return value

Example

To detach comment c from the *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *FREQUENCY_DOMAIN_RANDOM_VIBRATION. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *FREQUENCY_DOMAIN_RANDOM_VIBRATION in the model.

Arguments

- **Model** (Model)

Model to get first *FREQUENCY_DOMAIN_RANDOM_VIBRATION in

Returns

FreqVibration object (or null if there are no *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model).

Return type

FreqVibration

Example

To get the first *FREQUENCY_DOMAIN_RANDOM_VIBRATION in model m:

```
var f = FreqVibration.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs will be flagged in

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs

Returns

No return value

Example

To flag all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs with flag f in model m:

```
FreqVibration.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *FREQUENCY_DOMAIN_RANDOM_VIBRATION is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *FREQUENCY_DOMAIN_RANDOM_VIBRATION

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *FREQUENCY_DOMAIN_RANDOM_VIBRATION f has flag f set on it:

```
if (f.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *FREQUENCY_DOMAIN_RANDOM_VIBRATION in the model.

Note that ForEach has been designed to make looping over *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs as fast as possible and so has some limitations.
Firstly, a single temporary FreqVibration object is created and on each function call it is updated with the current *FREQUENCY_DOMAIN_RANDOM_VIBRATION data. This means that you should not try to store the FreqVibration object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs are in

- **func** (function)

Function to call for each *FREQUENCY_DOMAIN_RANDOM_VIBRATION

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m:

```
FreqVibration.ForEach(m, test);
function test(f)
{
// f is FreqVibration object
}
```

To call function test for all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m with optional object:

```
var data = { x:0, y:0 };
FreqVibration.ForEach(m, test, data);
function test(f, extra)
{
// f is FreqVibration object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of FreqVibration objects for all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs from

Returns

Array of FreqVibration objects

Return type

Array

Example

To make an array of FreqVibration objects for all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m

```
var f = FreqVibration.GetAll(m);
```

GetAutoPsdLoadData(index*[integer]*) [static]

Description

Returns the Auto PSD load data for a specific Auto PSD Load definition as an array. For each Auto PSD load definition there will be 8 values. There are napsd Auto PSD load definitions.

Arguments

- **index** (integer)

Index you want the Auto PSD load data for. **Note that indices start at 0**.

Returns

An array containing the Auto PSD load data (values: sid[integer], stype[integer], dof[integer], ldpsd[integer], ldvel[integer], ldflw[integer], ldspn[integer], cid[integer]). The array length will be 8.

Return type

Number

Example

To get the data for the 3rd Auto PSD load data for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var apsd_data = f.GetAutoPsdLoadData(2);
```

GetComments()

Description

Extracts the comments associated to a *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var comm_array = f.GetComments();
```

GetCrossPsdLoadData(index*[integer]*) [static]

Description

Returns the Cross PSD load data for a specific Cross PSD Load definition as an array. For each Cross PSD load definition there will be 5 values. There are ncpsd Cross PSD load definitions.

Arguments

- **index** (integer)

Index you want the Cross PSD load data for. **Note that indices start at 0**.

Returns

An array containing the Cross PSD load data (values: load_i[integer], load_j[integer], lctyp2[integer], ldpsd1[integer], ldpsd2[integer]). The array length will be 5.

Return type

Number

Example

To get the data for the 3rd Cross PSD load data for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var cpsd_data = f.GetCrossPsdLoadData(2);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of FreqVibration objects for all of the flagged *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs from

- **flag** (Flag)

Flag set on the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs that you want to retrieve

Returns

Array of FreqVibration objects

Return type

Array

Example

To make an array of FreqVibration objects for all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m flagged with f

```
var f = FreqVibration.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the FreqVibration object for a *FREQUENCY_DOMAIN_RANDOM_VIBRATION ID.

Arguments

- **Model** (Model)

Model to find the *FREQUENCY_DOMAIN_RANDOM_VIBRATION in

- **number** (integer)

number of the *FREQUENCY_DOMAIN_RANDOM_VIBRATION you want the FreqVibration object for

Returns

FreqVibration object (or null if *FREQUENCY_DOMAIN_RANDOM_VIBRATION does not exist).

Return type

FreqVibration

Example

To get the FreqVibration object for *FREQUENCY_DOMAIN_RANDOM_VIBRATION 100 in model m

```
var f = FreqVibration.GetFromID(m, 100);
```

GetInftgData(index*[integer]*) [static]

Description

Returns the path and filename of a binary database for fatigue information from a specific initial damage card. There are inftg filenames.

This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index of an initial damage card that you want the filename from. **Note that indices start at 0**.

Returns

Return value from an initial damage card (values: filename[string])

Return type

String

Example

To get the filename from the 2nd initial damage card for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var fdata = f.GetInftgData(1);
```

GetParameter(prop*[string]*)

Description

Checks if a FreqVibration property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the FreqVibration.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*FREQUENCY_DOMAIN_RANDOM_VIBRATION property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if FreqVibration property f.example is a parameter:

```
Options.property_parameter_names = true;
if (f.GetParameter(f.example) ) do_something...
Options.property_parameter_names = false;
```

To check if FreqVibration property f.example is a parameter by using the GetParameter method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

GetSNCurveData(index*[integer]*) [static]

Description

Returns the data of a specific zone for fatigue analysis as an array. For each zone there will be 8 values. There are nftg zone definitions for fatigue analysis.

This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index you want the zone data for. **Note that indices start at 0**.

Returns

An array containing the zone data (values: pid[integer], lcid[integer], ptype[integer], ltype[integer], a[real], b[real], sthres[real], snlimt[integer]).

The array length will be 8.

Return type

Number

Example

To get the data for the 4th zone for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var sndata = f.GetSNCurveData(3);
```

Keyword()

Description

Returns the keyword for this *FREQUENCY_DOMAIN_RANDOM_VIBRATION. **Note that a carriage return is not added**. See also FreqVibration.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var key = f.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *FREQUENCY_DOMAIN_RANDOM_VIBRATION. **Note that a carriage return is not added**. See also FreqVibration.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var cards = f.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *FREQUENCY_DOMAIN_RANDOM_VIBRATION in the model.

Arguments

- **Model** (Model)

Model to get last *FREQUENCY_DOMAIN_RANDOM_VIBRATION in

Returns

FreqVibration object (or null if there are no *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model).

Return type

FreqVibration

Example

To get the last *FREQUENCY_DOMAIN_RANDOM_VIBRATION in model m:

```
var f = FreqVibration.Last(m);
```

Next()

Description

Returns the next *FREQUENCY_DOMAIN_RANDOM_VIBRATION in the model.

Arguments

No arguments

Returns

FreqVibration object (or null if there are no more *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model).

Return type

FreqVibration

Example

To get the *FREQUENCY_DOMAIN_RANDOM_VIBRATION in model m after *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var f = f.Next();
```

Previous()

Description

Returns the previous *FREQUENCY_DOMAIN_RANDOM_VIBRATION in the model.

Arguments

No arguments

Returns

FreqVibration object (or null if there are no more *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model).

Return type

FreqVibration

Example

To get the *FREQUENCY_DOMAIN_RANDOM_VIBRATION in model m before *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var f = f.Previous();
```

RemoveAutoPsdLoadData(index*[integer]*)

Description

Allows user to remove a specified Auto PSD load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **index** (integer)

Index of the auto PSD load card you want to remove. **Note that indices start at 0**.

Returns

No return value

Example

To remove first load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.RemoveAutoPsdLoadData(0);
```

RemoveCrossPsdLoadData(index*[integer]*)

Description

Allows user to remove a specified Cross PSD load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **index** (integer)

Index of the cross PSD load card you want to remove. **Note that indices start at 0**.

Returns

No return value

Example

To remove third load card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.RemoveCrossPsdLoadData(2);
```

RemoveInftgData(index*[integer]*)

Description

Allows user to remove a specified Initial Damage card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.
This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index of the Initrial Damage card you want to remove. **Note that indices start at 0**.

Returns

No return value

Example

To remove second Initial Damage card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.RemoveInftgData(1);
```

RemoveSNCurveData(index*[integer]*)

Description

Allows user to remove a specified S-N curve card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION.
This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index of the S-N curve card you want to remove. **Note that indices start at 0**.

Returns

No return value

Example

To remove second S-N curve card in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.RemoveSNCurveData(1);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs from that model can be selected. If the argument is a Flag then only *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs selected or null if menu cancelled

Return type

Number

Example

To select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs from model m, flagging those selected with flag f, giving the prompt 'Select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs':

```
FreqVibration.Select(f, 'Select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs', m);
```

To select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs, flagging those selected with flag f but limiting selection to *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs flagged with flag l, giving the prompt 'Select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs':

```
FreqVibration.Select(f, 'Select *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs', l);
```

SetAutoPsdLoadData(index*[integer]*, data*[Array of data]*) [static]

Description

Set the data for a specific Auto PSD load card. For each Auto PSD load card there will be 8 values. There are napsd Auto PSD load cards.

Arguments

- **index** (integer)

Index you want to set Auto PSD load data for. **Note that indices start at 0**.

- **data** (Array of data)

An array containing the Auto PSD load data (values: sid[integer], stype[integer], dof[integer], ldpsd[integer], ldvel[integer], ldflw[integer], ldspn[integer], cid[integer]). The array length should be 8.

Returns

No return value.

Example

To set the 3rd Auto PSD load data for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f to the values in array adata:

```
f.SetAutoPsdLoadData(2, adata);
```

SetCrossPsdLoadData(index*[integer]*, data*[Array of data]*) [static]

Description

Set the data for a specific Cross PSD load card. For each Cross PSD load card there will be 5 values. There are ncpsd Cross PSD load cards.

Arguments

- **index** (integer)

Index you want to set Cross PSD load data for. **Note that indices start at 0**.

- **data** (Array of data)

An array containing the Cross PSD load data (values: load_i[integer], load_j[integer], lctyp2[integer], ldpsd1[integer], ldpsd2[integer]). The array length should be 5.

Returns

No return value.

Example

To set the 4th Cross PSD load data for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f to the values in array cdata:

```
f.SetCrossPsdLoadData(2, cdata);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

- **flag** (Flag)

Flag to set on the *FREQUENCY_DOMAIN_RANDOM_VIBRATION

Returns

No return value

Example

To set flag f for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.SetFlag(f);
```

SetInftgData(index*[integer]*, filename*[string]*) [static]

Description

Set the filename data for an existing binary database for fatigue infromation for a specific initial damage card. There are inftg filenames.

This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index of an initial damage card that you want the filename for. **Note that indices start at 0**.

- **filename** (string)

Path and name of existing binary database fro fatigue information.

Returns

No return value.

Example

To set the file name for the 2nd initial damage card of *FREQUENCY_DOMAIN_RANDOM_VIBRATION f to have filename "d3ftg":

```
f.SetInftgData(1, "d3ftg");
```

SetSNCurveData(index*[integer]*, data*[Array of data]*) [static]

Description

Set the data for a specific zone for fatigue analysis. For each zone there will be 8 values. There are nftg zone definitions for fatigue analysis. This method is only applicable when option is FreqVibration.FATIGUE.

Arguments

- **index** (integer)

Index you want to set the fatigue analysis zone data for. **Note that indices start at 0**.

- **data** (Array of data)

An array containing the zone data (values: pid[integer], lcid[integer], ptype[integer], ltype[integer], a[float], b[float], sthres[float], snlimt[integer]). The array length will be 8.

Returns

No return value.

Example

To set the data for 4th fatigue analysis zone in *FREQUENCY_DOMAIN_RANDOM_VIBRATION f to the values in array sndata:

```
f.SetSNCurveData(3, sndata);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs should be counted. If false or omitted referenced but undefined *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs will also be included in the total.

Returns

number of *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs

Return type

Number

Example

To get the total number of *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m:

```
var total = FreqVibration.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs will be unset in

- **flag** (Flag)

Flag to unset on the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs

Returns

No return value

Example

To unset the flag f on all the *FREQUENCY_DOMAIN_RANDOM_VIBRATIONs in model m:

```
FreqVibration.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

FreqVibration object.

Return type

FreqVibration

Example

To check if FreqVibration property f.example is a parameter by using the FreqVibration.GetParameter() method:

```
if (f.ViewParameters().GetParameter(f.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *FREQUENCY_DOMAIN_RANDOM_VIBRATION. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
f.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *FREQUENCY_DOMAIN_RANDOM_VIBRATION.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f:

```
var xrefs = f.Xrefs();
```

---

toString()

Description

Creates a string containing the *FREQUENCY_DOMAIN_RANDOM_VIBRATION data in keyword format. Note that this contains the keyword header and the keyword cards. See also FreqVibration.Keyword() and FreqVibration.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for *FREQUENCY_DOMAIN_RANDOM_VIBRATION f in keyword format

```
var s = f.toString();
```

Hourglass class

The Hourglass class gives you access to hourglass cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Create(Model*[Model]*, modal (optional)*[boolean]*)

- Xrefs()
- toString()

Hourglass properties

Name	Type	Description
exists (read only)	logical	true if hourglass exists, false if referred to but not defined.
hgid	integer or string	Hourglass number or character label. Also see the label property which is an alternative name for this.
ibq	integer	Bulk viscosity type

ihq	integer	Hourglass control type
include	integer	The Include file number that the hourglass is in.
label	integer or string	Hourglass number or character label. Also see the hgid property which is an alternative name for this.
model (read only)	integer	The Model number that the hourglass is in.
q1	real	Quadratic bulk viscosity coefficient
q2	real	Linear bulk viscosity coefficient
qb	real	Coefficient for shell bending
qm	real	Hourglass coefficient
qw	real	Coefficient for shell warping
title	string	Title for hourglass
vdc	real	Viscous damping coefficient

Detailed Description

The Hourglass class allows you to create, modify, edit and manipulate hourglass cards. See the documentation below for more details.

Constructor

new Hourglass(Model*[Model]*, hgid*[integer or string]*, title (optional)*[string]*)

Description

Create a new Hourglass object.

Arguments

- **Model** (Model)

Model that hourglass will be created in

- **hgid** (integer or string)

Hourglass number or character label

- **title (optional)** (string)

Title for the hourglass

Returns

Hourglass object

Return type

Hourglass

Example

To create a new hourglass in model m with label 100:

```
var h = new Hourglass(m, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a hourglass.

Arguments

- **Comment** (Comment)

Comment that will be attached to the hourglass

Returns

No return value

Example

To associate comment c to the hourglass n:

```
n.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse hourglass n:

```
n.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the hourglass.

Arguments

- **flag** (Flag)

Flag to clear on the hourglass

Returns

No return value

Example

To clear flag f for hourglass n:

```
n.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the hourglass. The target include of the copied hourglass can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Hourglass object

Return type

Hourglass

Example

To copy hourglass n into hourglass z:

```
var z = n.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a hourglass.

Arguments

- **Model** (Model)

Model that the hourglass will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Hourglass object (or null if not made)

Return type

Hourglass

Example

To start creating a hourglass in model m:

```
var h = Hourglass.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a hourglass.

Arguments

- **Comment** (Comment)

Comment that will be detached from the hourglass

Returns

No return value

Example

To detach comment c from the hourglass n:

```
n.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit hourglass n:

```
n.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for hourglass. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for hourglass n:

```
n.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first hourglass in the model.

Arguments

- **Model** (Model)

Model to get first hourglass in

Returns

Hourglass object (or null if there are no hourglasses in the model).

Return type

Hourglass

Example

To get the first hourglass in model m:

```
var n = Hourglass.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free hourglass label in the model. Also see Hourglass.LastFreeLabel(), Hourglass.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free hourglass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Hourglass label.

Return type

Number

Example

To get the first free hourglass label in model m:

```
var label = Hourglass.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the hourglasses in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all hourglasses will be flagged in

- **flag** (Flag)

Flag to set on the hourglasses

Returns

No return value

Example

To flag all of the hourglasses with flag f in model m:

```
Hourglass.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the hourglass is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the hourglass

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if hourglass n has flag f set on it:

```
if (n.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each hourglass in the model.
Note that ForEach has been designed to make looping over hourglasses as fast as possible and so has some limitations.
Firstly, a single temporary Hourglass object is created and on each function call it is updated with the current hourglass data. This means that you should not try to store the Hourglass object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new hourglasses inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all hourglasses are in

- **func** (function)

Function to call for each hourglass

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the hourglasses in model m:

```
Hourglass.ForEach(m, test);
function test(n)
{
// n is Hourglass object
}
```

To call function test for all of the hourglasses in model m with optional object:

```
var data = { x:0, y:0 };
Hourglass.ForEach(m, test, data);
function test(n, extra)
{
// n is Hourglass object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Hourglass objects for all of the hourglasses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get hourglasses from

Returns

Array of Hourglass objects

Return type

Array

Example

To make an array of Hourglass objects for all of the hourglasses in model m

```
var n = Hourglass.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a hourglass.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the hourglass n:

```
var comm_array = n.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Hourglass objects for all of the flagged hourglasses in a model in PRIMER

Arguments

- **Model** (Model)

Model to get hourglasses from

- **flag** (Flag)

Flag set on the hourglasses that you want to retrieve

Returns

Array of Hourglass objects

Return type

Array

Example

To make an array of Hourglass objects for all of the hourglasses in model m flagged with f

```
var n = Hourglass.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Hourglass object for a hourglass ID.

Arguments

- **Model** (Model)

Model to find the hourglass in

- **number** (integer)

number of the hourglass you want the Hourglass object for

Returns

Hourglass object (or null if hourglass does not exist).

Return type

Hourglass

Example

To get the Hourglass object for hourglass 100 in model m

```
var n = Hourglass.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Hourglass property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Hourglass.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

hourglass property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Hourglass property n.example is a parameter:

```
Options.property_parameter_names = true;
if (n.GetParameter(n.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Hourglass property n.example is a parameter by using the GetParameter method:

```
if (n.ViewParameters().GetParameter(n.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this hourglass (*HOURGLASS). **Note that a carriage return is not added**. See also Hourglass.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for hourglass h:

```
var key = h.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the hourglass. **Note that a carriage return is not added**. See also Hourglass.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for hourglass h:

```
var cards = h.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last hourglass in the model.

Arguments

- **Model** (Model)

Model to get last hourglass in

Returns

Hourglass object (or null if there are no hourglasses in the model).

Return type

Hourglass

Example

To get the last hourglass in model m:

```
var n = Hourglass.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free hourglass label in the model. Also see Hourglass.FirstFreeLabel(), Hourglass.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free hourglass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Hourglass label.

Return type

Number

Example

To get the last free hourglass label in model m:

```
var label = Hourglass.LastFreeLabel(m);
```

Next()

Description

Returns the next hourglass in the model.

Arguments

No arguments

Returns

Hourglass object (or null if there are no more hourglasses in the model).

Return type

Hourglass

Example

To get the hourglass in model m after hourglass n:

```
var n = n.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) hourglass label in the model. Also see Hourglass.FirstFreeLabel(), Hourglass.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free hourglass label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Hourglass label.

Return type

Number

Example

To get the next free hourglass label in model m:

```
var label = Hourglass.NextFreeLabel(m);
```

Previous()

Description

Returns the previous hourglass in the model.

Arguments

No arguments

Returns

Hourglass object (or null if there are no more hourglasses in the model).

Return type

Hourglass

Example

To get the hourglass in model m before hourglass n:

```
var n = n.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the hourglasses in the model.

Arguments

- **Model** (Model)

Model that all hourglasses will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the hourglasses in model m, from 1000000:

```
Hourglass.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged hourglasses in the model.

Arguments

- **Model** (Model)

Model that all the flagged hourglasses will be renumbered in

- **flag** (Flag)

Flag set on the hourglasses that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the hourglasses in model m flagged with f, from 1000000:

```
Hourglass.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select hourglasses using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting hourglasses

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only hourglasses from that model can be selected. If the argument is a Flag then only hourglasses that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any hourglasses can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of hourglasses selected or null if menu cancelled

Return type

Number

Example

To select hourglasses from model m, flagging those selected with flag f, giving the prompt 'Select hourglasses':

```
Hourglass.Select(f, 'Select hourglasses', m);
```

To select hourglasses, flagging those selected with flag f but limiting selection to hourglasses flagged with flag l, giving the prompt 'Select hourglasses':

```
Hourglass.Select(f, 'Select hourglasses', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the hourglass.

Arguments

- **flag** (Flag)

Flag to set on the hourglass

Returns

No return value

Example

To set flag f for hourglass n:

```
n.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of hourglasses in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing hourglasses should be counted. If false or omitted referenced but undefined hourglasses will also be included in the total.

Returns

number of hourglasses

Return type

Number

Example

To get the total number of hourglasses in model m:

```
var total = Hourglass.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the hourglasses in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all hourglasses will be unset in

- **flag** (Flag)

Flag to unset on the hourglasses

Returns

No return value

Example

To unset the flag f on all the hourglasses in model m:

```
Hourglass.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Hourglass object.

Return type

Hourglass

Example

To check if Hourglass property n.example is a parameter by using the Hourglass.GetParameter() method:

```
if (n.ViewParameters().GetParameter(n.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for hourglass. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for hourglass n:

```
n.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this hourglass.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for hourglass n:

```
var xrefs = n.Xrefs();
```

---

toString()

Description

Creates a string containing the hourglass data in keyword format. Note that this contains the keyword header and the keyword cards. See also Hourglass.Keyword() and Hourglass.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for hourglass h in keyword format

```
var s = h.toString();
```

Include class

The Include class allows you to access the include files in a model. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Warning(message*[string]*, details (optional)*[string]*)
- Write(filename*[string]*, options (optional)*[object]*)
- Write(filename*[string]*, path (optional)*[constant]*, separator (optional)*[constant]*, version (optional)*[string]*, large (optional)*[boolean]*) [deprecated]
- toString()

Include constants

Name	Description
Include.COPY_INTO_CURRENT	Copied elements are put into the current layer. See also Options.copy_target_include
Include.COPY_INTO_SOURCE	Copied elements are put into the include of the original element. See also Options.copy_target_include

Include.MASTER_ONLY	Only write the master file. See also Model.Write()
Include.MERGE	Merge include files into the master file. See also Model.Write()
Include.NOT_WRITTEN	Prevent include files from being written. See also Model.Write()
Include.SAME_DIR	Write master and include files into the same directory. See also Model.Write()
Include.SELECT	Select include files to be written out. See also Model.Write()
Include.SUBDIR	Write include files to subdirectory. See also Model.Write()

Constants for Directory separators

Name	Description
Include.NATIVE	Use directory separators native to this machine when writing directory names. See also Model.Write()
Include.UNIX	Use unix directory separators when writing directory names. See also Model.Write()
Include.WINDOWS	Use windows directory separators when writing directory names. See also Model.Write()

Constants for Pathnames

Name	Description
Include.ABSOLUTE	Write include file with absolute pathname. See also Model.Write()
Include.RELATIVE	Write include file with relative pathname. See also Model.Write()

Constants for Transformation offsets

Name	Description
Include.ENDOFF	Offset applied to PRIMER post end keywords (Dummy, Mechanism etc.)
Include.IDDOFF	Offset to define ID (used in Include.SetTransformOffset())
Include.IDEOFF	Offset to element ID (used in Include.SetTransformOffset())
Include.IDFOFF	Offset to function and table ID (used in Include.SetTransformOffset())
Include.IDMOFF	Offset to material ID (used in Include.SetTransformOffset())
Include.IDNOFF	Offset to node ID (used in Include.SetTransformOffset())
Include.IDPOFF	Offset to part ID (used in Include.SetTransformOffset())
Include.IDROFF	Offset to other ID (used in Include.SetTransformOffset())
Include.IDSOFF	Offset to set ID (used in Include.SetTransformOffset())

Constants for compress mode

Name	Description
Include.INDIVIDUAL_GZIP	Each file ’name.key’ is ’gzipped’ to become the individual file ’name.key.gz’
Include.INDIVIDUAL_ZIP	Each file ’name.key’ is ’zipped’ to become the individual file ’name.key.zip’
Include.KEEP_ORIGINAL	Each file ’name.key’ is written using its original compression: uncompressed, ’.gz. or ’.zip’ format

Include properties

Name	Type	Description
comments	string	Comments stored at the top of the include file. Note that this property is not supported for master include file.
fctchg	real	Electric charge transformation factor. Note that this property is not supported for master include file.
fctlen	real	Length transformation factor. Note that this property is not supported for master include file.
fctmas	real	Mass transformation factor. Note that this property is not supported for master include file.
fcttem	string	Temperature transformation factor. Note that this property is not supported for master include file.
fcttim	real	Time transformation factor. Note that this property is not supported for master include file.
file	string	The absolute filename for this include file.Note that this property is not supported for master include file. Also see the name and path properties.
genmax	integer	Include maximum label range value for general items
genmin	integer	Include minimum label range value for general items
iddoff (read only)	integer	Offset to define ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
ideoff (read only)	integer	Offset to element ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idfoff (read only)	integer	Offset to function and table ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idmoff (read only)	integer	Offset to material and equation of state ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idnoff (read only)	integer	Offset to node ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idpoff (read only)	integer	Offset to part, nodal rigid body and constrained node set ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idroff (read only)	integer	Offset to other ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
idsoff (read only)	integer	Offset to set ID. To set property use Include.SetTransformOffset(). Note that this property is not supported for master include file.
incout	integer	Create file containing transformed data. Note that this property is not supported for master include file.
label (read only)	integer	Include number. This number is used to identify the include file. A number is required as it is possible (with include transforms) to have multiple include files with the same name so they cannot be identified by name. The master file is include file number 0. Also see the parent property.
model	integer	The Model number that the include is in.
n_locked_range	integer	Number of locked label ranges. Note that this does not include label ranges locked model-wide (ALL includes).
name	string	The filename for this include file excluding any path. Note that this property is not supported for master include file. Also see the file and path properties.
nelmax	integer	Include maximum label range value for nodes/elements/nrbc/const. spotwelds/define HWA items
nelmin	integer	Include minimum label range value for nodes/elements/nrbc/const. spotwelds/define HWA items
parent	integer	Include number for the parent include file of this include. This number is used to identify the parent include file. A number is required as it is possible (with include transforms) to have multiple include files with the same name so they cannot be identified by name. The master file is include file number 0. Also see the label property. Note that this property is not supported for master include file.

path	string	The path for this include file. Note that this property is not supported for master include file. Also see the file and name properties.
suppressed	logical	If keyout of Include file has been suppressed. Note that this property is not supported for master include file.
tranid	integer	Define transformation number. Note that this property is not supported for master include file.
transform	logical	true if this include file is an *INCLUDE_TRANSFORM, false otherwise. Note that this property is not supported for master include file.

Detailed Description

The Include class allows to create and query include files in a model. See the documentation below for more details.

Constructor

new Include(Model*[Model]*, name*[string]*, parent (optional)*[integer]*)

Description

Create a new Include object.

Arguments

- **Model** (Model)

Model that include will be created in

- **name** (string)

Include filename

- **parent (optional)** (integer)

Parent include file number. If omitted parent will be 0 (main file).

Returns

Include object

Return type

Include

Example

To create a new include file /path/to/include.key in model m

```
var i = new Include(m, "/path/to/include.key");
```

Details of functions

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*, masterInclude (optional)*[boolean]*) [static]

Description

Blanks all of the includes in the model.

Arguments

- **Model** (Model)

Model that all includes will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

- **masterInclude (optional)** (boolean)

If masterInclude file should be blanked or not. If omitted masterInclude is false. The master file is include file number 0.

Returns

No return value

Example

To blank all of the includes in model m:

```
Include.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged include files in the model.

Arguments

- **Model** (Model)

Model that all the flagged includes will be blanked in

- **flag** (Flag)

Flag set on the includes that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the include files in model m flagged with f:

```
Include.BlankFlagged(m, f);
```

ClearFlag(flag*[Flag]*, clear contents (optional)*[boolean]*)

Description

Clears a flag on the include.

Arguments

- **flag** (Flag)

Flag to clear on the include

- **clear contents (optional)** (boolean)

If true then the items in the include file will also have flag cleared. If false (default) then the include file contents are not cleared.

Returns

Number of item flags cleared

Return type

Number

Example

To clear flag f for include i:

```
i.ClearFlag(f);
```

To clear flag f for include i and all of the items inside the include file, returning the number of item flags cleared in the include file:

```
var ncleared = i.ClearFlag(f, true);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for an include file. For more details on checking see the Check class. Note that this function is not supported for the master include file.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for include i:

```
i.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first include file in the model.

Arguments

- **Model** (Model)

Model to get first include in

Returns

Include object (or null if there are no includes in the model).

Return type

Include

Example

To get the first include in model m:

```
var i = Include.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*, masterInclude (optional)*[boolean]*) [static]

Description

Flags all of the includes in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all includes will be flagged in

- **flag** (Flag)

Flag to set on the includes

- **masterInclude (optional)** (boolean)

If masterInclude file should be flagged or not. If omitted masterInclude is false. The master file is include file number 0.

Returns

No return value

Example

To flag all of the includes with flag f in model m:

```
Include.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the include is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the include

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if include i has flag f set on it:

```
if (i.Flagged(f) ) do_something...
```

GetAll(Model*[Model]*, masterInclude (optional)*[boolean]*) [static]

Description

Returns an array of Include objects for all of the includes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get includes from

- **masterInclude (optional)** (boolean)

If masterInclude file should be included or not. If omitted masterInclude is false. The master file is include file number

0.

Returns

Array of Include objects

Return type

Array

Example

To make an array of Include objects for all of the includes in model m

```
var i = Include.GetAll(m);
```

GetDetailedRange(type argument*[string]*)

Description

Gets detailed min and max label ranges for specified type from the include.

Arguments

- **type argument** (string)

Entity type for which ranges are returned

Returns

An array containing the min and max label ranges for the specified type or null if no range defined for this type.

Return type

Array

Example

To get node ranges for include i:

```
var ranges = i.GetDetailedRange("NODE");
var min = ranges[0];
var max = ranges[1];
```

GetFromID(Model*[Model]*, include number*[integer]*) [static]

Description

Returns the Include object for an include label.
Note that items that are in the main keyword file will have a layer value of 0 which can be used as the *include number* argument to this function to return master include file.

Arguments

- **Model** (Model)

Model to find the include in

- **include number** (integer)

number of the include you want the Include object for

Returns

Include object (or null if include does not exist).

Return type

Include

Example

To get the Include object for include 10 in model m

```
var i = Include.GetFromID(m, 10);
```

GetLockedLabelData(rangenum*[integer]*)

Description

Returns the locked label data for include files. Also see the n_locked_range property

Arguments

- **rangenum** (integer)

The range number you want the data for; includes can have multiple ranges. **Note that range numbers start at 0, not 1**.

Returns

An array containing the include name (string can also be "ALL" if range is applicable model-wide), start (min) label (integer), end (max) label (integer), safe range (0 or 1 for false or true), and entity type (string).

Return type

Number

Example

To get the locked label data for the 3rd range for include i:

```
if (i.n_locked_range >= 3)
{
    var locked_label_data = i.GetLockedLabelData(2);
}
```

IsEmpty()

Description

Returns true if include is Empty (contains no INSTALLED static/sort/kid/include items).

Arguments

No arguments

Returns

logical

Return type

Boolean

Example

To see if include inc is empty

```
if(inc.Empty())
```

Keyword()

Description

Returns the keyword for this include (*INCLUDE, *INCLUDE_TRANSFORM). **Note that a carriage return is not added**. See also Include.KeywordCards(). This function is not supported for the master include file.

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for include i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the include. **Note that a carriage return is not added**. See also Include.Keyword(). Also note that this function is not supported for the master include file.

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for include i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last include file in the model.

Arguments

- **Model** (Model)

Model to get last include in

Returns

Include object (or null if there are no includes in the model).

Return type

Include

Example

To get the last include in model m:

```
var i = Include.Last(m);
```

MakeCurrentLayer()

Description

Sets this include file to be the current layer so that any newly created items are put in this include file. Also see the Model.layer property.

Arguments

No arguments

Returns

No return value

Example

To make include i the current layer:

```
i.MakeCurrentLayer();
```

Modified(listing*[boolean]*)

Description

Returns true if include has been modified.

Arguments

- **listing** (boolean)

false for no listing output, true for listing output

Returns

logical

Return type

Boolean

Example

To see if include inc is modified

```
if(inc.Modified(false)) ... (no listing output)
```

Next()

Description

Returns the next include in the model. Note that this function is not supported for the master include file.

Arguments

No arguments

Returns

Include object (or null if there are no more includes in the model).

Return type

Include

Example

To get the include in model m after include i:

```
var i = i.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick an include.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only includes from that model can be picked. If the argument is a Flag then only includes that are flagged with *limit* can be selected. If omitted, or null, any includes from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Include object (or null if not picked)

Return type

Include

Example

To pick an includee from model m giving the prompt 'Pick include from screen':

```
var i = Include.Pick('Pick include from screen', m);
```

Previous()

Description

Returns the previous include in the model. Note that this function is not supported for the master include file.

Arguments

No arguments

Returns

Include object (or null if there are no more includes in the model).

Return type

Include

Example

To get the include in model m before include i:

```
var i = i.Previous();
```

RemoveLockedLabelData(rangenum*[integer]*)

Description

Removes the locked label data for a range in include files. Also see the n_locked_range property

Arguments

- **rangenum** (integer)

The locked label range you want to remove. **Note that range numbers start at 0, not 1**.

Returns

No return value.

Example

To remove the locked labels for the 3rd range for include i:

```
i.RemoveLockedLabelData(2);
```

Select(flag*[Flag]*, prompt*[string]*, Model (optional)*[Model]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select includes using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting includes

- **prompt** (string)

Text to display as a prompt to the user

- **Model (optional)** (Model)

Model to select from

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of items selected or null if menu cancelled

Return type

Number

Example

To select an include from model m, flagging those selected with flag f, giving the prompt 'Select include':

```
Include.Select(f, 'Select include', m);
```

SetDetailedRange(type argument*[string]*, min label*[integer]*, max label*[integer]*)

Description

Sets detailed min and max label ranges for specified type on the include.

Arguments

- **type argument** (string)

Entity type for which ranges are to be defined

- **min label** (integer)

Defines the smallest label for entities of this type

- **max label** (integer)

Defines the largest label for entities of this type

Returns

No return value

Example

To set node ranges for include i:

```
i.SetDetailedRange("NODE", 50000, 60000);
```

SetFlag(flag*[Flag]*, flag contents (optional)*[boolean]*)

Description

Sets a flag on the include.

Arguments

- **flag** (Flag)

Flag to set on the include

- **flag contents (optional)** (boolean)

If true then the items in the include file will also be flagged. If false (default) then the include file contents are not flagged.

Returns

Number of items flagged

Return type

Number

Example

To set flag f for include i:

```
i.SetFlag(f);
```

To set flag f for include i and all of the items inside the include file, returning the number of items flagged in the include file:

```
var nflagged = i.SetFlag(f, true);
```

SetLockedLabelData(rangenum*[integer]*, min*[integer]*, max*[integer]*, type*[string]*, safe (optional)*[boolean]*, all_includes (optional)*[boolean]*)

Description

Sets the locked label data for a particular range for an include file. Also see the n_locked_range property

Arguments

- **rangenum** (integer)

The range you want to set the data for. **Note that range numbers start at 0, not 1**.

- **min** (integer)

Start (min) label for a locked range.

- **max** (integer)

End (max) label for a locked range.

- **type** (string)

Entity type code - "NODE", "SHELL" etc. Can also be "ALL" (for a list of types see Appendix I of the PRIMER manual).

- **safe (optional)** (boolean)

Determines whether a locked range is safe (protected).

- **all_includes (optional)** (boolean)

Specified range will be set model-wide (all includes). Only useful when working with the 'master' include.

Returns

No return value.

Example

To set the locked label data for the 3rd range with min 99, max 199, for nodes for include i:

```
i.SetLockedLabelData(3, 99, 199, "NODE");
```

SetTransformOffset(offset*[constant]*, value*[integer]*, check_only (optional)*[boolean]*)

Description

Sets offset values for include transform. This function is required to change the offset values rather than changing the properties directly so that the include can be checked to ensure that the new value does not cause any label clashes with existing items or any negative labels when the transform is unapplied when writing the include. Note that this function is not supported for the master include file.

Arguments

- **offset** (constant)

The include transform offset type to change. Can be Include.IDNOFF, Include.IDEOFF, Include.IDPOFF, Include.IDMOFF, Include.IDSOFF, Include.IDFOFF, Include.IDDOFF or Include.IDROFF.

- **value** (integer)

The value to change the offset to

- **check_only (optional)** (boolean)

Sometimes it may be necessary to check if changing an offset for an include will cause an error or label clash rather than actually changing it. If check only is true then PRIMER will just check to see if the new value for the offset will cause any label clashes or negative labels **and not change the offset value or any item labels**. If false or omitted then the offset and labels will be updated if there are no errors.

Returns

logical, true if change successful. false if the change would cause a clash of labels or negative labels, in which case the value is not changed.

Return type

Boolean

Example

To set idpoff for include i to 1000, checking that the change is successful:

```
var success = i.SetTransformOffset(Include.IDPOFF, 1000);
```

Total(Model*[Model]*) [static]

Description

Returns the total number of include files in the model.

Arguments

- **Model** (Model)

Model to get include total from

Returns

integer

Return type

Number

Example

To get the number of include files in model m:

```
var t = Include.Total(m);
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the includes in the model.

Arguments

- **Model** (Model)

Model that all includes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the includes in model m:

```
Include.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged include files in the model.

Arguments

- **Model** (Model)

Model that all the flagged includes will be unblanked in

- **flag** (Flag)

Flag set on the includes that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the include files in model m flagged with f:

```
Include.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the includes in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all includes will be unset in

- **flag** (Flag)

Flag to unset on the includes

Returns

No return value

Example

To unset the flag f on all of the includes in model m:

```
Include.UnflagAll(m, f);
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for an include file. For more details on checking see the Check class. Note that this function is not supported for the master include file.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add a warning message "My custom warning" for include i:

```
i.Warning("My custom warning");
```

Write(filename*[string]*, options (optional)*[object]*)

Description

Writes an include file. Note that this function is not supported for the master include file.

Arguments

- **filename** (string)

Filename of the LS-Dyna keyword file you want to write

- **options (optional)** (object)

Options specifying how the file should be written out. If omitted the default values below will be used. The properties available are:

Object has the following properties:

Name	Type	Description
binary (optional)	boolean	If true then the output file will be written out in binary. If false (default) then an ascii file will be written.
compress (optional)	boolean	If true then the output file will be compressed. If false (default) then an uncompressed file will be written.
compressLevel (optional)	integer	Compression level for .gz and .zip files. Must be in the range 1 to 9 with 1 being the least compression (fastest speed) to 9 being the greatest compression (slowest speed)

compressMode (optional)	integer	This option can be used to specify the mode of compression. Can be Include.KEEP_ORIGINAL or Include.INDIVIDUAL_GZIP or Include.INDIVIDUAL_ZIP
fileStartAscii (optional)	boolean	If true then the begining of the file (*CONTROL etc) file is written out in ascii. If false (default) then the entire file is converted to binary.
i10 (optional)	boolean	If true then i10 format will be used to write the file. If false (default) then the normal LS-DYNA format will be used.
large (optional)	boolean	If true then large format will be used to write the file. If false (default) then the normal LS-DYNA format will be used. Note that large format is only available from version R7.1 and above.
path (optional)	integer	The method used to write include paths. Can be Include.ABSOLUTE (default) or Include.RELATIVE
separator (optional)	integer	The directory separator used when writing include files. Can be Include.NATIVE (default), Include.UNIX or Include.WINDOWS
version (optional)	string	The LS-DYNA version used to write the file. Can be "971R5", "971R4", "971R3", "970v6763" etc (see the version popup in Model->Write '>>> LS-Dyna output options' for a full list). See also Options.dyna_version

Returns

No return value

Example

To Write include i to file /data/test/file.key as a compressed gzip in version R10.0

```
var output_obj = new Object();
output_obj.version = "R10.0";
output_obj.compress = true;
output_obj.compressMode = Include.INDIVIDUAL_GZIP;
i.Write("/data/test/file.key", output_obj);
```

Write(filename*[string]*, path (optional)*[constant]*, separator (optional)*[constant]*, version (optional)*[string]*, large (optional)*[boolean]*) [deprecated]

This function is deprecated in version 15.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Writes an include file. Note that this function is not supported for the master include file.

Arguments

- **filename** (string)

Filename of the LS-Dyna keyword file you want to write

- **path (optional)** (constant)

The method used to write include paths. Can be Include.ABSOLUTE (default) or Include.RELATIVE

- **separator (optional)** (constant)

The directory separator used when writing include files. Can be Include.NATIVE (default), Include.UNIX or Include.WINDOWS

- **version (optional)** (string)

The LS-DYNA version used to write the file. Can be "971R5", "971R4", "971R3", "970v6763" etc. (see the version popup in Model->Write '>>> LS-Dyna output options' for a full list). See also Options.dyna_version

- **large (optional)** (boolean)

If true then large format will be used to write the file. If false (default) then the normal LS-DYNA format will be used. Note that large format is only available from version R7.1 and above.

Returns

No return value

Example

To write include file i to file /data/test/file.key

```
i.Write("/data/test/file.key");
```

---

toString()

Description

Creates a string containing the include data in keyword format. Note that this contains the keyword header and the keyword cards. See also Include.Keyword() and Include.KeywordCards(). Also note that this function is not supported for the master include file.

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for include i in keyword format

```
var s = i.toString();
```

AxialForceBeam class

The AxialForceBeam class gives you access to initial axial force beam cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

AxialForceBeam properties

Name	Type	Description
bsid	integer	Beam set ID.
exists (read only)	logical	true if axial force beam exists, false if referred to but not defined.
id (read only)	integer	ID of the axial force beam. Only used in PRIMER.
include	integer	The Include file number that the axial force beam is in.
kbend	integer	Bending stiffness flag.

lcid	integer	Loadcurve ID.
model (read only)	integer	The Model number that the axial force beam is in.
scale	real	Scale factor on loadcurve.

Detailed Description

The AxialForceBeam class allows you to create, modify, edit and manipulate initial axial force beam cards. See the documentation below for more details.

Constructor

new AxialForceBeam(Model*[Model]*, bsid*[integer]*, lcid*[integer]*, scale (optional)*[real]*)

Description

Create a new AxialForceBeam object.

Arguments

- **Model** (Model)

Model that axial force beam will be created in

- **bsid** (integer)

BeamSet ID.

- **lcid** (integer)

Loadcurve ID defining preload versus time.

- **scale (optional)** (real)

Scale factor on curve

Returns

AxialForceBeam object

Return type

AxialForceBeam

Example

To create a new axial force beam in model m using beam set 10, load curve 100:

```
var afb = new AxialForceBeam(m, 10, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a axial force beam.

Arguments

- **Comment** (Comment)

Comment that will be attached to the axial force beam

Returns

No return value

Example

To associate comment c to the axial force beam afb:

```
afb.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the axial force beam.

Arguments

- **flag** (Flag)

Flag to clear on the axial force beam

Returns

No return value

Example

To clear flag f for axial force beam afb:

```
afb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the axial force beam. The target include of the copied axial force beam can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

AxialForceBeam object

Return type

AxialForceBeam

Example

To copy axial force beam afb into axial force beam z:

```
var z = afb.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a axial force beam.

Arguments

- **Comment** (Comment)

Comment that will be detached from the axial force beam

Returns

No return value

Example

To detach comment c from the axial force beam afb:

```
afb.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for axial force beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for axial force beam afb:

```
afb.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first axial force beam in the model.

Arguments

- **Model** (Model)

Model to get first axial force beam in

Returns

AxialForceBeam object (or null if there are no axial force beams in the model).

Return type

AxialForceBeam

Example

To get the first axial force beam in model m:

```
var afb = AxialForceBeam.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the axial force beams in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all axial force beams will be flagged in

- **flag** (Flag)

Flag to set on the axial force beams

Returns

No return value

Example

To flag all of the axial force beams with flag f in model m:

```
AxialForceBeam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the axial force beam is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the axial force beam

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if axial force beam afb has flag f set on it:

```
if (afb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each axial force beam in the model.
Note that ForEach has been designed to make looping over axial force beams as fast as possible and so has some limitations.
Firstly, a single temporary AxialForceBeam object is created and on each function call it is updated with the current axial force beam data. This means that you should not try to store the AxialForceBeam object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new axial force beams inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all axial force beams are in

- **func** (function)

Function to call for each axial force beam

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the axial force beams in model m:

```
AxialForceBeam.ForEach(m, test);
function test(afb)
{
// afb is AxialForceBeam object
}
```

To call function test for all of the axial force beams in model m with optional object:

```
var data = { x:0, y:0 };
AxialForceBeam.ForEach(m, test, data);
function test(afb, extra)
{
// afb is AxialForceBeam object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of AxialForceBeam objects for all of the axial force beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get axial force beams from

Returns

Array of AxialForceBeam objects

Return type

Array

Example

To make an array of AxialForceBeam objects for all of the axial force beams in model m

```
var afb = AxialForceBeam.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a axial force beam.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the axial force beam afb:

```
var comm_array = afb.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of AxialForceBeam objects for all of the flagged axial force beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get axial force beams from

- **flag** (Flag)

Flag set on the axial force beams that you want to retrieve

Returns

Array of AxialForceBeam objects

Return type

Array

Example

To make an array of AxialForceBeam objects for all of the axial force beams in model m flagged with f

```
var afb = AxialForceBeam.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the AxialForceBeam object for a axial force beam ID.

Arguments

- **Model** (Model)

Model to find the axial force beam in

- **number** (integer)

number of the axial force beam you want the AxialForceBeam object for

Returns

AxialForceBeam object (or null if axial force beam does not exist).

Return type

AxialForceBeam

Example

To get the AxialForceBeam object for axial force beam 100 in model m

```
var afb = AxialForceBeam.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a AxialForceBeam property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the AxialForceBeam.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

axial force beam property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if AxialForceBeam property afb.example is a parameter:

```
Options.property_parameter_names = true;
if (afb.GetParameter(afb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if AxialForceBeam property afb.example is a parameter by using the GetParameter method:

```
if (afb.ViewParameters().GetParameter(afb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this axial force beam (*INITIAL_AXIAL_FORCE_BEAM). **Note that a carriage return is not added**. See also AxialForceBeam.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for axial force beam afb:

```
var key = afb.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the axial force beam. **Note that a carriage return is not added**. See also AxialForceBeam.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for axial force beam afb:

```
var cards = afb.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last axial force beam in the model.

Arguments

- **Model** (Model)

Model to get last axial force beam in

Returns

AxialForceBeam object (or null if there are no axial force beams in the model).

Return type

AxialForceBeam

Example

To get the last axial force beam in model m:

```
var afb = AxialForceBeam.Last(m);
```

Next()

Description

Returns the next axial force beam in the model.

Arguments

No arguments

Returns

AxialForceBeam object (or null if there are no more axial force beams in the model).

Return type

AxialForceBeam

Example

To get the axial force beam in model m after axial force beam afb:

```
var afb = afb.Next();
```

Previous()

Description

Returns the previous axial force beam in the model.

Arguments

No arguments

Returns

AxialForceBeam object (or null if there are no more axial force beams in the model).

Return type

AxialForceBeam

Example

To get the axial force beam in model m before axial force beam afb:

```
var afb = afb.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select axial force beams using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting axial force beams

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only axial force beams from that model can be selected. If the argument is a Flag then only axial force beams that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any axial force beams can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of axial force beams selected or null if menu cancelled

Return type

Number

Example

To select axial force beams from model m, flagging those selected with flag f, giving the prompt 'Select axial force beams':

```
AxialForceBeam.Select(f, 'Select axial force beams', m);
```

To select axial force beams, flagging those selected with flag f but limiting selection to axial force beams flagged with flag l, giving the prompt 'Select axial force beams':

```
AxialForceBeam.Select(f, 'Select axial force beams', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the axial force beam.

Arguments

- **flag** (Flag)

Flag to set on the axial force beam

Returns

No return value

Example

To set flag f for axial force beam afb:

```
afb.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the axial force beam. The axial force beam will be sketched until you either call AxialForceBeam.Unsketch(), AxialForceBeam.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the axial force beam is sketched. If omitted redraw is true. If you want to sketch several axial force beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch axial force beam afb:

```
afb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged axial force beams in the model. The axial force beams will be sketched until you either call AxialForceBeam.Unsketch(), AxialForceBeam.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged axial force beams will be sketched in

- **flag** (Flag)

Flag set on the axial force beams that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the axial force beams are sketched. If omitted redraw is true. If you want to sketch flagged axial force beams several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all axial force beams flagged with flag in model m:

```
AxialForceBeam.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of axial force beams in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing axial force beams should be counted. If false or omitted referenced but undefined axial force beams will also be included in the total.

Returns

number of axial force beams

Return type

Number

Example

To get the total number of axial force beams in model m:

```
var total = AxialForceBeam.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the axial force beams in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all axial force beams will be unset in

- **flag** (Flag)

Flag to unset on the axial force beams

Returns

No return value

Example

To unset the flag f on all the axial force beams in model m:

```
AxialForceBeam.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the axial force beam.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the axial force beam is unsketched. If omitted redraw is true. If you want to unsketch several axial force beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch axial force beam afb:

```
afb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all axial force beams.

Arguments

- **Model** (Model)

Model that all axial force beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the axial force beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all axial force beams in model m:

```
AxialForceBeam.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged axial force beams in the model.

Arguments

- **Model** (Model)

Model that all axial force beams will be unsketched in

- **flag** (Flag)

Flag set on the axial force beams that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the axial force beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all axial force beams flagged with flag in model m:

```
AxialForceBeam.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

AxialForceBeam object.

Return type

AxialForceBeam

Example

To check if AxialForceBeam property afb.example is a parameter by using the AxialForceBeam.GetParameter() method:

```
if (afb.ViewParameters().GetParameter(afb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for axial force beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for axial force beam afb:

```
afb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this axial force beam.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for axial force beam afb:

```
var xrefs = afb.Xrefs();
```

---

toString()

Description

Creates a string containing the axial force data in keyword format. Note that this contains the keyword header and the keyword cards. See also AxialForceBeam.Keyword() and AxialForceBeam.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for axial force beam afb in keyword format

```
var s = afb.toString();
```

StrainShell class

The StrainShell class gives you access to define initial strain shell cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StrainShell constants

Name	Description
StrainShell.SET	Initial is *INITIAL_STRAIN_SHELL_SET.
StrainShell.SHELL	Initial is *INITIAL_STRAIN_SHELL.

StrainShell properties

Name	Type	Description
eid	integer	Shell Element ID or shell set ID
exists (read only)	logical	true if strain_shell exists, false if referred to but not defined.
ilocal	integer	Flag for coordinate system of strain components
include	integer	The Include file number that the initial strain shell is in.
large	logical	true if large format, false otherwise
model (read only)	integer	The Model number that the initial strain shell is in.
nplane	integer	Number of in plane integration points being output (not read when the SET option is used)
nthick	integer	Number of integration points through the thickness (not read when the SET option is used)
type	constant	The Intial strain shell type. Can be StrainShell.SHELL or StrainShell.SET.

Detailed Description

The StrainShell class allows you to create, modify, edit and manipulate strain_shell cards. See the documentation below for more details.

Constructor

new StrainShell(Model*[Model]*, type*[constant]*, eid*[integer]*, nplane*[integer]*, nthick*[integer]*, large*[integer]*, ilocal*[integer]*)

Description

Create a new StrainShell object.

Arguments

- **Model** (Model)

Model that strain_shell will be created in

- **type** (constant)

Specify the type of initial strain shell (Can be StrainShell.SHELL or StrainShell.SET)

- **eid** (integer)

Shell Element ID or shell set ID

- **nplane** (integer)

Number of in plane integration points being output

- **nthick** (integer)

Number of integration points through the thickness

- **large** (integer)

Large format flag, set 0 to turn it off or 1 to enable it. It is optional and set to 0 by default.

- **ilocal** (integer)

Flag for coordinate system of strain components. Set to 0 for global or 1 to enable local. It is optional and set to 0 by default

Returns

StrainShell object

Return type

StrainShell

Example

To create a new strain_shell in model m, of type SET

```
var s = new StrainShell(m, StrainShell.SET, 1, 2, 2);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial strain shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial strain shell

Returns

No return value

Example

To associate comment c to the initial strain shell iss:

```
iss.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial strain shell.

Arguments

- **flag** (Flag)

Flag to clear on the initial strain shell

Returns

No return value

Example

To clear flag f for initial strain shell iss:

```
iss.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial strain shell. The target include of the copied initial strain shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StrainShell object

Return type

StrainShell

Example

To copy initial strain shell iss into initial strain shell z:

```
var z = iss.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial strain shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial strain shell

Returns

No return value

Example

To detach comment c from the initial strain shell iss:

```
iss.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial strain shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial strain shell iss:

```
iss.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial strain shell in the model.

Arguments

- **Model** (Model)

Model to get first initial strain shell in

Returns

StrainShell object (or null if there are no initial strain shells in the model).

Return type

StrainShell

Example

To get the first initial strain shell in model m:

```
var iss = StrainShell.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial strain shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial strain shells will be flagged in

- **flag** (Flag)

Flag to set on the initial strain shells

Returns

No return value

Example

To flag all of the initial strain shells with flag f in model m:

```
StrainShell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial strain shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial strain shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial strain shell iss has flag f set on it:

```
if (iss.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial strain shell in the model.
Note that ForEach has been designed to make looping over initial strain shells as fast as possible and so has some limitations.
Firstly, a single temporary StrainShell object is created and on each function call it is updated with the current initial strain shell data. This means that you should not try to store the StrainShell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial strain shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial strain shells are in

- **func** (function)

Function to call for each initial strain shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial strain shells in model m:

```
StrainShell.ForEach(m, test);
function test(iss)
{
// iss is StrainShell object
}
```

To call function test for all of the initial strain shells in model m with optional object:

```
var data = { x:0, y:0 };
StrainShell.ForEach(m, test, data);
function test(iss, extra)
{
// iss is StrainShell object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StrainShell objects for all of the initial strain shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial strain shells from

Returns

Array of StrainShell objects

Return type

Array

Example

To make an array of StrainShell objects for all of the initial strain shells in model m

```
var iss = StrainShell.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial strain shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial strain shell iss:

```
var comm_array = iss.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StrainShell objects for all of the flagged initial strain shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial strain shells from

- **flag** (Flag)

Flag set on the initial strain shells that you want to retrieve

Returns

Array of StrainShell objects

Return type

Array

Example

To make an array of StrainShell objects for all of the initial strain shells in model m flagged with f

```
var iss = StrainShell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StrainShell object for a initial strain shell ID.

Arguments

- **Model** (Model)

Model to find the initial strain shell in

- **number** (integer)

number of the initial strain shell you want the StrainShell object for

Returns

StrainShell object (or null if initial strain shell does not exist).

Return type

StrainShell

Example

To get the StrainShell object for initial strain shell 100 in model m

```
var iss = StrainShell.GetFromID(m, 100);
```

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for a specific integration point as an array. For each integration point there will be 7 strain component values. There are nplane x nthick integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for initial strain shell iss:

```
var data = iss.GetIntegrationPoint(2);
```

GetParameter(prop*[string]*)

Description

Checks if a StrainShell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StrainShell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial strain shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StrainShell property iss.example is a parameter:

```
Options.property_parameter_names = true;
if (iss.GetParameter(iss.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StrainShell property iss.example is a parameter by using the GetParameter method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this initial strain shell (*INITIAL_STRAIN_SHELL). **Note that a carriage return is not added**. See also StrainShell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for strain_shell i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial strain shell. **Note that a carriage return is not added**. See also StrainShell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for strain_shell i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial strain shell in the model.

Arguments

- **Model** (Model)

Model to get last initial strain shell in

Returns

StrainShell object (or null if there are no initial strain shells in the model).

Return type

StrainShell

Example

To get the last initial strain shell in model m:

```
var iss = StrainShell.Last(m);
```

Next()

Description

Returns the next initial strain shell in the model.

Arguments

No arguments

Returns

StrainShell object (or null if there are no more initial strain shells in the model).

Return type

StrainShell

Example

To get the initial strain shell in model m after initial strain shell iss:

```
var iss = iss.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial strain shell.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial strain shells from that model can be picked. If the argument is a Flag then only initial strain shells that are flagged with *limit* can be selected. If omitted, or null, any initial strain shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StrainShell object (or null if not picked)

Return type

StrainShell

Example

To pick a initial strain shell from model m giving the prompt 'Pick initial strain shell from screen':

```
var iss = StrainShell.Pick('Pick initial strain shell from screen', m);
```

Previous()

Description

Returns the previous initial strain shell in the model.

Arguments

No arguments

Returns

StrainShell object (or null if there are no more initial strain shells in the model).

Return type

StrainShell

Example

To get the initial strain shell in model m before initial strain shell iss:

```
var iss = iss.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial strain shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial strain shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial strain shells from that model can be selected. If the argument is a Flag then only initial strain shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial strain shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial strain shells selected or null if menu cancelled

Return type

Number

Example

To select initial strain shells from model m, flagging those selected with flag f, giving the prompt 'Select initial strain shells':

```
StrainShell.Select(f, 'Select initial strain shells', m);
```

To select initial strain shells, flagging those selected with flag f but limiting selection to initial strain shells flagged with flag l, giving the prompt 'Select initial strain shells':

```
StrainShell.Select(f, 'Select initial strain shells', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial strain shell.

Arguments

- **flag** (Flag)

Flag to set on the initial strain shell

Returns

No return value

Example

To set flag f for initial strain shell iss:

```
iss.SetFlag(f);
```

SetIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific integration point. For each integration point there will be 7 strain component values. There are nplane x nthick integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the integration point data. The array length should be 7.

Returns

No return value.

Example

To set the 3rd integration point data for initial strain shell iss to the values in array adata:

```
iss.SetIntegrationPoint(2, adata);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial strain shell. The initial strain shell will be sketched until you either call StrainShell.Unsketch(), StrainShell.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain shell is sketched. If omitted redraw is true. If you want to sketch several initial strain shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial strain shell iss:

```
iss.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial strain shells in the model. The initial strain shells will be sketched until you either call StrainShell.Unsketch(), StrainShell.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial strain shells will be sketched in

- **flag** (Flag)

Flag set on the initial strain shells that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain shells are sketched. If omitted redraw is true. If you want to sketch flagged initial strain shells several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial strain shells flagged with flag in model m:

```
StrainShell.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial strain shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial strain shells should be counted. If false or omitted referenced but undefined initial strain shells will also be included in the total.

Returns

number of initial strain shells

Return type

Number

Example

To get the total number of initial strain shells in model m:

```
var total = StrainShell.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial strain shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial strain shells will be unset in

- **flag** (Flag)

Flag to unset on the initial strain shells

Returns

No return value

Example

To unset the flag f on all the initial strain shells in model m:

```
StrainShell.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial strain shell.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain shell is unsketched. If omitted redraw is true. If you want to unsketch several initial strain shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial strain shell iss:

```
iss.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial strain shells.

Arguments

- **Model** (Model)

Model that all initial strain shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial strain shells in model m:

```
StrainShell.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial strain shells in the model.

Arguments

- **Model** (Model)

Model that all initial strain shells will be unsketched in

- **flag** (Flag)

Flag set on the initial strain shells that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial strain shells flagged with flag in model m:

```
StrainShell.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StrainShell object.

Return type

StrainShell

Example

To check if StrainShell property iss.example is a parameter by using the StrainShell.GetParameter() method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial strain shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial strain shell iss:

```
iss.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial strain shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial strain shell iss:

```
var xrefs = iss.Xrefs();
```

---

toString()

Description

Creates a string containing the initial strain shell data in keyword format. Note that this contains the keyword header and the keyword cards. See also StrainShell.Keyword() and StrainShell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for strain_shell i in keyword format

```
var s = i.toString();
```

StrainSolid class

The StrainSolid class gives you access to define initial strain solid cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StrainSolid constants

Name	Description
StrainSolid.SET	Initial is *INITIAL_STRESS_SOLID_SET.
StrainSolid.SOLID	Initial is *INITIAL_STRESS_SOLID.

StrainSolid properties

Name	Type	Description

eid	integer	Solid Element ID or solid set ID
epsxx	real	Define the xxth strain component in the global cartesian system.
epsxy	real	Define the xyth strain component in the global cartesian system.
epsyy	real	Define the yyth strain component in the global cartesian system.
epsyz	real	Define the yzth strain component in the global cartesian system.
epszx	real	Define the zxth strain component in the global cartesian system.
epszz	real	Define the zzth strain component in the global cartesian system.
exists (read only)	logical	true if strain_solid exists, false if referred to but not defined.
include	integer	The Include file number that the initial strain solid is in.
model (read only)	integer	The Model number that the initial strain solid is in.
type	constant	The Intial strain solid type. Can be StrainSolid.SOLID or StrainSolid.SET.

Detailed Description

The StrainSolid class allows you to create, modify, edit and manipulate *INITIAL_STRESS_SOLID cards. See the documentation below for more details.

Constructor

new StrainSolid(Model*[Model]*, type*[constant]*, eid*[integer]*, epsxx*[real]*, epsyy*[real]*, epszz*[real]*, epsxy*[real]*, epsyz*[real]*, epszx*[real]*)

Description

Create a new StrainSolid object.

Arguments

- **Model** (Model)

Model that strain_solid will be created in

- **type** (constant)

Specify the type of initial strain solid (Can be StrainSolid.SOLID or StrainSolid.SET)

- **eid** (integer)

Solid Element ID or solid set ID

- **epsxx** (real)

The xxth strain component in the global cartesian system.

- **epsyy** (real)

The yyth strain component in the global cartesian system.

- **epszz** (real)

The zzth strain component in the global cartesian system.

- **epsxy** (real)

The xyth strain component in the global cartesian system.

- **epsyz** (real)

The yzth strain component in the global cartesian system.

- **epszx** (real)

The zxth strain component in the global cartesian system.

Returns

StrainSolid object

Return type

StrainSolid

Example

To create a new strain_solid in model m, of type SET with SOLID_SET id as 1, strain components as 10, 20, 30, 40, 50, 60.

```
var s = new StrainSolid(m, StrainSolid.SET, 1, 10, 20, 30, 40, 50, 60);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial strain solid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial strain solid

Returns

No return value

Example

To associate comment c to the initial strain solid iso:

```
iso.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial strain solid.

Arguments

- **flag** (Flag)

Flag to clear on the initial strain solid

Returns

No return value

Example

To clear flag f for initial strain solid iso:

```
iso.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial strain solid. The target include of the copied initial strain solid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StrainSolid object

Return type

StrainSolid

Example

To copy initial strain solid iso into initial strain solid z:

```
var z = iso.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial strain solid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial strain solid

Returns

No return value

Example

To detach comment c from the initial strain solid iso:

```
iso.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial strain solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial strain solid iso:

```
iso.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial strain solid in the model.

Arguments

- **Model** (Model)

Model to get first initial strain solid in

Returns

StrainSolid object (or null if there are no initial strain solids in the model).

Return type

StrainSolid

Example

To get the first initial strain solid in model m:

```
var iso = StrainSolid.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial strain solids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial strain solids will be flagged in

- **flag** (Flag)

Flag to set on the initial strain solids

Returns

No return value

Example

To flag all of the initial strain solids with flag f in model m:

```
StrainSolid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial strain solid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial strain solid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial strain solid iso has flag f set on it:

```
if (iso.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial strain solid in the model.
Note that ForEach has been designed to make looping over initial strain solids as fast as possible and so has some limitations.
Firstly, a single temporary StrainSolid object is created and on each function call it is updated with the current initial strain solid data. This means that you should not try to store the StrainSolid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial strain solids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial strain solids are in

- **func** (function)

Function to call for each initial strain solid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial strain solids in model m:

```
StrainSolid.ForEach(m, test);
function test(iso)
{
// iso is StrainSolid object
}
```

To call function test for all of the initial strain solids in model m with optional object:

```
var data = { x:0, y:0 };
StrainSolid.ForEach(m, test, data);
function test(iso, extra)
{
// iso is StrainSolid object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StrainSolid objects for all of the initial strain solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial strain solids from

Returns

Array of StrainSolid objects

Return type

Array

Example

To make an array of StrainSolid objects for all of the initial strain solids in model m

```
var iso = StrainSolid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial strain solid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial strain solid iso:

```
var comm_array = iso.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StrainSolid objects for all of the flagged initial strain solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial strain solids from

- **flag** (Flag)

Flag set on the initial strain solids that you want to retrieve

Returns

Array of StrainSolid objects

Return type

Array

Example

To make an array of StrainSolid objects for all of the initial strain solids in model m flagged with f

```
var iso = StrainSolid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StrainSolid object for a initial strain solid ID.

Arguments

- **Model** (Model)

Model to find the initial strain solid in

- **number** (integer)

number of the initial strain solid you want the StrainSolid object for

Returns

StrainSolid object (or null if initial strain solid does not exist).

Return type

StrainSolid

Example

To get the StrainSolid object for initial strain solid 100 in model m

```
var iso = StrainSolid.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a StrainSolid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StrainSolid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial strain solid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StrainSolid property iso.example is a parameter:

```
Options.property_parameter_names = true;
if (iso.GetParameter(iso.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StrainSolid property iso.example is a parameter by using the GetParameter method:

```
if (iso.ViewParameters().GetParameter(iso.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this initial strain solid (*INITIAL_STRESS_SOLID). **Note that a carriage return is not added**. See also StrainSolid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for strain_solid i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial strain solid. **Note that a carriage return is not added**. See also StrainSolid.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for strain_solid i:

```
var cards = i.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last initial strain solid in the model.

Arguments

- **Model** (Model)

Model to get last initial strain solid in

Returns

StrainSolid object (or null if there are no initial strain solids in the model).

Return type

StrainSolid

Example

To get the last initial strain solid in model m:

```
var iso = StrainSolid.Last(m);
```

Next()

Description

Returns the next initial strain solid in the model.

Arguments

No arguments

Returns

StrainSolid object (or null if there are no more initial strain solids in the model).

Return type

StrainSolid

Example

To get the initial strain solid in model m after initial strain solid iso:

```
var iso = iso.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial strain solid.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial strain solids from that model can be picked. If the argument is a Flag then only initial strain solids that are flagged with *limit* can be selected. If omitted, or null, any initial strain solids from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StrainSolid object (or null if not picked)

Return type

StrainSolid

Example

To pick a initial strain solid from model m giving the prompt 'Pick initial strain solid from screen':

```
var iso = StrainSolid.Pick('Pick initial strain solid from screen', m);
```

Previous()

Description

Returns the previous initial strain solid in the model.

Arguments

No arguments

Returns

StrainSolid object (or null if there are no more initial strain solids in the model).

Return type

StrainSolid

Example

To get the initial strain solid in model m before initial strain solid iso:

```
var iso = iso.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial strain solids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial strain solids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial strain solids from that model can be selected. If the argument is a Flag then only initial strain solids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial strain solids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial strain solids selected or null if menu cancelled

Return type

Number

Example

To select initial strain solids from model m, flagging those selected with flag f, giving the prompt 'Select initial strain solids':

```
StrainSolid.Select(f, 'Select initial strain solids', m);
```

To select initial strain solids, flagging those selected with flag f but limiting selection to initial strain solids flagged with flag l, giving the prompt 'Select initial strain solids':

```
StrainSolid.Select(f, 'Select initial strain solids', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial strain solid.

Arguments

- **flag** (Flag)

Flag to set on the initial strain solid

Returns

No return value

Example

To set flag f for initial strain solid iso:

```
iso.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial strain solid. The initial strain solid will be sketched until you either call StrainSolid.Unsketch(), StrainSolid.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain solid is sketched. If omitted redraw is true. If you want to sketch several initial strain solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial strain solid iso:

```
iso.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial strain solids in the model. The initial strain solids will be sketched until you either call StrainSolid.Unsketch(), StrainSolid.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial strain solids will be sketched in

- **flag** (Flag)

Flag set on the initial strain solids that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain solids are sketched. If omitted redraw is true. If you want to sketch flagged initial strain solids several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial strain solids flagged with flag in model m:

```
StrainSolid.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial strain solids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial strain solids should be counted. If false or omitted referenced but undefined initial strain solids will also be included in the total.

Returns

number of initial strain solids

Return type

Number

Example

To get the total number of initial strain solids in model m:

```
var total = StrainSolid.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial strain solids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial strain solids will be unset in

- **flag** (Flag)

Flag to unset on the initial strain solids

Returns

No return value

Example

To unset the flag f on all the initial strain solids in model m:

```
StrainSolid.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial strain solid.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain solid is unsketched. If omitted redraw is true. If you want to unsketch several initial strain solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial strain solid iso:

```
iso.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial strain solids.

Arguments

- **Model** (Model)

Model that all initial strain solids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial strain solids in model m:

```
StrainSolid.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial strain solids in the model.

Arguments

- **Model** (Model)

Model that all initial strain solids will be unsketched in

- **flag** (Flag)

Flag set on the initial strain solids that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial strain solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial strain solids flagged with flag in model m:

```
StrainSolid.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StrainSolid object.

Return type

StrainSolid

Example

To check if StrainSolid property iso.example is a parameter by using the StrainSolid.GetParameter() method:

```
if (iso.ViewParameters().GetParameter(iso.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial strain solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial strain solid iso:

```
iso.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial strain solid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial strain solid iso:

```
var xrefs = iso.Xrefs();
```

---

toString()

Description

Creates a string containing the initial strain solid data in keyword format. Note that this contains the keyword header and the keyword cards. See also StrainSolid.Keyword() and StrainSolid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for strain_solid i in keyword format

```
var s = i.toString();
```

StressBeam class

The StressBeam class gives you access to define initial stress beam cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StressBeam constants

Constants for Coordinate system for stresses

Name	Description
StressBeam.GLOBAL_CSYS	Stress components are defined in the global coordinate system.

StressBeam.LOCAL_CSYS	Stress components are defined in the local beam system.

Constants for Number of Axes

Name	Description
StressBeam.NAXES_0	Number of variables giving beam local axes is zero.
StressBeam.NAXES_12	Number of variables giving beam local axes is 12.

Constants for Types of Rule

Name	Description
StressBeam.RULE_GUASS_QUADRATURE_NPTS_1	Type of Rule is 1 x 1 Gauss quadrature. Rule value is 1. Also sets npts to 1.
StressBeam.RULE_GUASS_QUADRATURE_NPTS_16	Type of Rule is 4 x 4 Gauss quadrature. Rule value is 5. Also sets npts to 16.
StressBeam.RULE_GUASS_QUADRATURE_NPTS_4	Type of Rule is 2 x 2 Gauss quadrature. Rule value is 2. Also sets npts to 4.
StressBeam.RULE_GUASS_QUADRATURE_NPTS_9	Type of Rule is 3 x 3 Gauss quadrature. Rule value is 3. Also sets npts to 9.
StressBeam.RULE_LOBATTO_QUADRATURE_NPTS_9	Type of Rule is 3 x 3 Lobatto quadrature. Rule value is 4. Also sets npts to 9.

StressBeam properties

Name	Type	Description
eid	integer	Beam Element ID
exists (read only)	logical	true if stress_beam exists, false if referred to but not defined.
include	integer	The Include file number that the initial stress beam is in.
large	logical	true if large format, false otherwise.
local	constant	Coordinate system for stresses. Valid values are: StressBeam.GLOBAL_CSYS or StressBeam.LOCAL_CSYS.
model (read only)	integer	The Model number that the initial stress beam is in.
naxes	constant	Number of variables giving beam local axes. Valid values are: StressBeam.NAXES_0 or StressBeam.NAXES_12.
nhisv	integer	Number of additional history variables (only used if large is TRUE).
npts	integer	Number of integration points. The property value is set automatically if the rule is NOT set to a IntegrationBeam label.
rule	integer	Integration rule type number. Valid values are: StressBeam.RULE_GUASS_QUADRATURE_NPTS_1, StressBeam.RULE_GUASS_QUADRATURE_NPTS_4, StressBeam.RULE_GUASS_QUADRATURE_NPTS_9, StressBeam.RULE_LOBATTO_QUADRATURE_NPTS_9, StressBeam.RULE_GUASS_QUADRATURE_NPTS_16 or a IntegrationBeam label as a negative value.

Detailed Description

The StressBeam class allows you to create, modify, edit and manipulate *INITIAL_STRESS_BEAM cards. See the documentation below for more details.

Constructor

new StressBeam(Model*[Model]*, eid*[integer]*, rule*[integer]*, large (optional)*[boolean]*, nhisv (optional)*[integer]*, local (optional)*[constant]*, naxes (optional)*[constant]*)

Description

Create a new StressBeam object.

Arguments

- **Model** (Model)

Model that stress_beam will be created in

- **eid** (integer)

Beam Element ID

- **rule** (integer)

Integration rule type number. Valid values are: StressBeam.RULE_GUASS_QUADRATURE_NPTS_1, StressBeam.RULE_GUASS_QUADRATURE_NPTS_4, StressBeam.RULE_GUASS_QUADRATURE_NPTS_9, StressBeam.RULE_LOBATTO_QUADRATURE_NPTS_9, StressBeam.RULE_GUASS_QUADRATURE_NPTS_16 or a IntegrationBeam label as a negative value.

- **large (optional)** (boolean)

true if large format, false otherwise.

- **nhisv (optional)** (integer)

Number of additional history variables (only used if large is TRUE).

- **local (optional)** (constant)

Coordinate system for stresses. Valid values are: StressBeam.GLOBAL_CSYS or StressBeam.LOCAL_CSYS.

- **naxes (optional)** (constant)

Number of variables giving beam local axes. Valid values are: StressBeam.NAXES_0 or StressBeam.NAXES_12.

Returns

StressBeam object

Return type

StressBeam

Example

To create a new stress_beam in model m, for beam element id 100 with 4 number of integration points and number of history variables as 4:

```
var s = new StressBeam(m, 100, StressBeam.RULE_GUASS_QUADRATURE_NPTS_4, true,
4);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial stress beam.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial stress beam

Returns

No return value

Example

To associate comment c to the initial stress beam isb:

```
isb.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial stress beam.

Arguments

- **flag** (Flag)

Flag to clear on the initial stress beam

Returns

No return value

Example

To clear flag f for initial stress beam isb:

```
isb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial stress beam. The target include of the copied initial stress beam can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StressBeam object

Return type

StressBeam

Example

To copy initial stress beam isb into initial stress beam z:

```
var z = isb.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial stress beam.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial stress beam

Returns

No return value

Example

To detach comment c from the initial stress beam isb:

```
isb.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial stress beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial stress beam isb:

```
isb.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial stress beam in the model.

Arguments

- **Model** (Model)

Model to get first initial stress beam in

Returns

StressBeam object (or null if there are no initial stress beams in the model).

Return type

StressBeam

Example

To get the first initial stress beam in model m:

```
var isb = StressBeam.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial stress beams in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial stress beams will be flagged in

- **flag** (Flag)

Flag to set on the initial stress beams

Returns

No return value

Example

To flag all of the initial stress beams with flag f in model m:

```
StressBeam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial stress beam is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial stress beam

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial stress beam isb has flag f set on it:

```
if (isb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial stress beam in the model.
Note that ForEach has been designed to make looping over initial stress beams as fast as possible and so has some limitations.
Firstly, a single temporary StressBeam object is created and on each function call it is updated with the current initial stress beam data. This means that you should not try to store the StressBeam object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial stress beams inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial stress beams are in

- **func** (function)

Function to call for each initial stress beam

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial stress beams in model m:

```
StressBeam.ForEach(m, test);
function test(isb)
{
// isb is StressBeam object
}
```

To call function test for all of the initial stress beams in model m with optional object:

```
var data = { x:0, y:0 };
StressBeam.ForEach(m, test, data);
function test(isb, extra)
{
// isb is StressBeam object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StressBeam objects for all of the initial stress beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress beams from

Returns

Array of StressBeam objects

Return type

Array

Example

To make an array of StressBeam objects for all of the initial stress beams in model m

```
var isb = StressBeam.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial stress beam.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial stress beam isb:

```
var comm_array = isb.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StressBeam objects for all of the flagged initial stress beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress beams from

- **flag** (Flag)

Flag set on the initial stress beams that you want to retrieve

Returns

Array of StressBeam objects

Return type

Array

Example

To make an array of StressBeam objects for all of the initial stress beams in model m flagged with f

```
var isb = StressBeam.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StressBeam object for a initial stress beam ID.

Arguments

- **Model** (Model)

Model to find the initial stress beam in

- **number** (integer)

number of the initial stress beam you want the StressBeam object for

Returns

StressBeam object (or null if initial stress beam does not exist).

Return type

StressBeam

Example

To get the StressBeam object for initial stress beam 100 in model m

```
var isb = StressBeam.GetFromID(m, 100);
```

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for a specific integration point as an array. For each integration point there will be 7 values if large is FALSE. For each integration point there will be (7 + nhisv) values if large is TRUE. There are npts integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for initial stress beam isb:

```
var data = isb.GetIntegrationPoint(2);
```

GetLocalAxesValues()

Description

Returns the 12 axes values as an array. The axes values are valid only if the naxes is set to StressBeam.NAXES_12.

Arguments

No arguments

Returns

An array containing the axes values.

Return type

Array

Example

To get the data for the axes values for initial stress beam isb:

```
var data = isb.GetLocalAxesValues();
```

GetParameter(prop*[string]*)

Description

Checks if a StressBeam property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StressBeam.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial stress beam property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StressBeam property isb.example is a parameter:

```
Options.property_parameter_names = true;
if (isb.GetParameter(isb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StressBeam property isb.example is a parameter by using the GetParameter method:

```
if (isb.ViewParameters().GetParameter(isb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this initial stress beam (*INITIAL_STRESS_BEAM). **Note that a carriage return is not added**. See also StressBeam.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for stress_beam i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial stress beam. **Note that a carriage return is not added**. See also StressBeam.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for stress_beam i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial stress beam in the model.

Arguments

- **Model** (Model)

Model to get last initial stress beam in

Returns

StressBeam object (or null if there are no initial stress beams in the model).

Return type

StressBeam

Example

To get the last initial stress beam in model m:

```
var isb = StressBeam.Last(m);
```

Next()

Description

Returns the next initial stress beam in the model.

Arguments

No arguments

Returns

StressBeam object (or null if there are no more initial stress beams in the model).

Return type

StressBeam

Example

To get the initial stress beam in model m after initial stress beam isb:

```
var isb = isb.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial stress beam.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress beams from that model can be picked. If the argument is a Flag then only initial stress beams that are flagged with *limit* can be selected. If omitted, or null, any initial stress beams from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StressBeam object (or null if not picked)

Return type

StressBeam

Example

To pick a initial stress beam from model m giving the prompt 'Pick initial stress beam from screen':

```
var isb = StressBeam.Pick('Pick initial stress beam from screen', m);
```

Previous()

Description

Returns the previous initial stress beam in the model.

Arguments

No arguments

Returns

StressBeam object (or null if there are no more initial stress beams in the model).

Return type

StressBeam

Example

To get the initial stress beam in model m before initial stress beam isb:

```
var isb = isb.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial stress beams using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial stress beams

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress beams from that model can be selected. If the argument is a Flag then only initial stress beams that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial stress beams can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial stress beams selected or null if menu cancelled

Return type

Number

Example

To select initial stress beams from model m, flagging those selected with flag f, giving the prompt 'Select initial stress beams':

```
StressBeam.Select(f, 'Select initial stress beams', m);
```

To select initial stress beams, flagging those selected with flag f but limiting selection to initial stress beams flagged with flag l, giving the prompt 'Select initial stress beams':

```
StressBeam.Select(f, 'Select initial stress beams', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial stress beam.

Arguments

- **flag** (Flag)

Flag to set on the initial stress beam

Returns

No return value

Example

To set flag f for initial stress beam isb:

```
isb.SetFlag(f);
```

SetIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific integration point. For each integration point there will be 7 values if large is FALSE. For each integration point there will be (7 + nhisv) values if large is TRUE. There are npts integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the integration point data. The array length should be 7 if large is FALSE. The array length should be (7 + nhisv) if large is TRUE.

Returns

No return value.

Example

To set the 3rd integration point data for initial stress beam isb to the values in array adata:

```
isb.SetIntegrationPoint(2, adata);
```

SetLocalAxesValues(data*[Array of data]*)

Description

Sets the 12 axes values as an array. The axes values are set only if the naxes is set to StressBeam.NAXES_12.

Arguments

- **data** (Array of data)

Array containing the axes values data. The array length should be 12.

Returns

No return value

Example

To set the data for the axes values for initial stress beam isb:

```
var data = isb.SetLocalAxesValues(data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial stress beam. The initial stress beam will be sketched until you either call StressBeam.Unsketch(), StressBeam.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress beam is sketched. If omitted redraw is true. If you want to sketch several initial stress beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial stress beam isb:

```
isb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial stress beams in the model. The initial stress beams will be sketched until you either call StressBeam.Unsketch(), StressBeam.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial stress beams will be sketched in

- **flag** (Flag)

Flag set on the initial stress beams that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress beams are sketched. If omitted redraw is true. If you want to sketch flagged initial stress beams several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial stress beams flagged with flag in model m:

```
StressBeam.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial stress beams in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial stress beams should be counted. If false or omitted referenced but undefined initial stress beams will also be included in the total.

Returns

number of initial stress beams

Return type

Number

Example

To get the total number of initial stress beams in model m:

```
var total = StressBeam.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial stress beams in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial stress beams will be unset in

- **flag** (Flag)

Flag to unset on the initial stress beams

Returns

No return value

Example

To unset the flag f on all the initial stress beams in model m:

```
StressBeam.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial stress beam.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress beam is unsketched. If omitted redraw is true. If you want to unsketch several initial stress beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial stress beam isb:

```
isb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial stress beams.

Arguments

- **Model** (Model)

Model that all initial stress beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress beams in model m:

```
StressBeam.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial stress beams in the model.

Arguments

- **Model** (Model)

Model that all initial stress beams will be unsketched in

- **flag** (Flag)

Flag set on the initial stress beams that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress beams flagged with flag in model m:

```
StressBeam.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StressBeam object.

Return type

StressBeam

Example

To check if StressBeam property isb.example is a parameter by using the StressBeam.GetParameter() method:

```
if (isb.ViewParameters().GetParameter(isb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial stress beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial stress beam isb:

```
isb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial stress beam.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial stress beam isb:

```
var xrefs = isb.Xrefs();
```

---

toString()

Description

Creates a string containing the initial stress beam data in keyword format. Note that this contains the keyword header and the keyword cards. See also StressBeam.Keyword() and StressBeam.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for stress_beam i in keyword format

```
var s = i.toString();
```

StressSection class

The StressSection class gives you access to define *INITIAL_STRESS_SECTION cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StressSection properties

Name	Type	Description
csid	integer	Cross section ID.
exists (read only)	logical	true if stress section exists, false if referred to but not defined.
include	integer	The Include file number that the stress section is in.
issid	integer	StressSection number. Also see the label property which is an alternative name for this.
istiff	integer	Load curve ID defining the artificial stress fraction versus time.
izshear	integer	Shear stress flag.
label	integer	StressSection number. Also see the issid property which is an alternative name for this.
lcid	integer	Load curve ID defining preload stress versus time.
model (read only)	integer	The Model number that the stress section is in.
psid	integer	Part set ID.
vid	integer	Vector ID defining the direction normal to the cross section.

Detailed Description

The StressSection class allows you to create, modify, edit and manipulate initial stress section cards. See the documentation below for more details.

Constructor

new StressSection(Model*[Model]*, issid*[integer]*, csid*[integer]*, lcid*[integer]*, psid*[integer]*, vid*[integer]*, izshear*[integer]*, istiff (optional)*[integer]*)

Description

Create a new StressSection object.

Arguments

- **Model** (Model)

Model that stress section will be created in

- **issid** (integer)

StressSection number.

- **csid** (integer)

Cross section ID.

- **lcid** (integer)

Load curve ID defining preload stress versus time.

- **psid** (integer)

Part set ID.

- **vid** (integer)

Vector ID.

- **izshear** (integer)

Shear stress flag.

- **istiff (optional)** (integer)

Load curve ID defining artificial stress fraction versus time.

Returns

StressSection object

Return type

StressSection

Example

To create a new stress section in model m with label 11, cross section 12, load curve 13, part set 14, vector 15 and shear stress flag 16:

```
var iss = new StressSection(m, 11, 12, 13, 14, 15, 16);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a stress section.

Arguments

- **Comment** (Comment)

Comment that will be attached to the stress section

Returns

No return value

Example

To associate comment c to the stress section iss:

```
iss.AssociateComment(c);
```

Blank()

Description

Blanks the stress section

Arguments

No arguments

Returns

No return value

Example

To blank stress section iss:

```
iss.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the stress sections in the model.

Arguments

- **Model** (Model)

Model that all stress sections will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the stress sections in model m:

```
StressSection.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged stress sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged stress sections will be blanked in

- **flag** (Flag)

Flag set on the stress sections that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the stress sections in model m flagged with f:

```
StressSection.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the stress section is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if stress section iss is blanked:

```
if (iss.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse stress section iss:

```
iss.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the stress section.

Arguments

- **flag** (Flag)

Flag to clear on the stress section

Returns

No return value

Example

To clear flag f for stress section iss:

```
iss.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the stress section. The target include of the copied stress section can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StressSection object

Return type

StressSection

Example

To copy stress section iss into stress section z:

```
var z = iss.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a initial stress section definition.

Arguments

- **Model** (Model)

Model that the stress section will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

StressSection object (or null if not made)

Return type

StressSection

Example

To start creating a initial stress section definition in model m:

```
var iss = StressSection.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a stress section.

Arguments

- **Comment** (Comment)

Comment that will be detached from the stress section

Returns

No return value

Example

To detach comment c from the stress section iss:

```
iss.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit stress section iss:

```
iss.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for stress section. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for stress section iss:

```
iss.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first stress section in the model.

Arguments

- **Model** (Model)

Model to get first stress section in

Returns

StressSection object (or null if there are no stress sections in the model).

Return type

StressSection

Example

To get the first stress section in model m:

```
var iss = StressSection.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free stress section label in the model. Also see StressSection.LastFreeLabel(), StressSection.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free stress section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

StressSection label.

Return type

Number

Example

To get the first free stress section label in model m:

```
var label = StressSection.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the stress sections in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all stress sections will be flagged in

- **flag** (Flag)

Flag to set on the stress sections

Returns

No return value

Example

To flag all of the stress sections with flag f in model m:

```
StressSection.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the stress section is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the stress section

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if stress section iss has flag f set on it:

```
if (iss.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each stress section in the model.
Note that ForEach has been designed to make looping over stress sections as fast as possible and so has some limitations.
Firstly, a single temporary StressSection object is created and on each function call it is updated with the current stress section data. This means that you should not try to store the StressSection object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new stress sections inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all stress sections are in

- **func** (function)

Function to call for each stress section

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the stress sections in model m:

```
StressSection.ForEach(m, test);
function test(iss)
{
// iss is StressSection object
}
```

To call function test for all of the stress sections in model m with optional object:

```
var data = { x:0, y:0 };
StressSection.ForEach(m, test, data);
function test(iss, extra)
{
// iss is StressSection object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of StressSection objects for all of the stress sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get stress sections from

Returns

Array of StressSection objects

Return type

Array

Example

To make an array of StressSection objects for all of the stress sections in model m

```
var iss = StressSection.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a stress section.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the stress section iss:

```
var comm_array = iss.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StressSection objects for all of the flagged stress sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get stress sections from

- **flag** (Flag)

Flag set on the stress sections that you want to retrieve

Returns

Array of StressSection objects

Return type

Array

Example

To make an array of StressSection objects for all of the stress sections in model m flagged with f

```
var iss = StressSection.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StressSection object for a stress section ID.

Arguments

- **Model** (Model)

Model to find the stress section in

- **number** (integer)

number of the stress section you want the StressSection object for

Returns

StressSection object (or null if stress section does not exist).

Return type

StressSection

Example

To get the StressSection object for stress section 100 in model m

```
var iss = StressSection.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a StressSection property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StressSection.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

stress section property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StressSection property iss.example is a parameter:

```
Options.property_parameter_names = true;
if (iss.GetParameter(iss.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StressSection property iss.example is a parameter by using the GetParameter method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this stress section. **Note that a carriage return is not added**. See also StressSection.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for stress section iss:

```
var key = iss.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the stress section. **Note that a carriage return is not added**. See also StressSection.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for stress section iss:

```
var cards = iss.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last stress section in the model.

Arguments

- **Model** (Model)

Model to get last stress section in

Returns

StressSection object (or null if there are no stress sections in the model).

Return type

StressSection

Example

To get the last stress section in model m:

```
var iss = StressSection.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free stress section label in the model. Also see StressSection.FirstFreeLabel(), StressSection.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free stress section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

StressSection label.

Return type

Number

Example

To get the last free stress section label in model m:

```
var label = StressSection.LastFreeLabel(m);
```

Next()

Description

Returns the next stress section in the model.

Arguments

No arguments

Returns

StressSection object (or null if there are no more stress sections in the model).

Return type

StressSection

Example

To get the stress section in model m after stress section iss:

```
var iss = iss.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) stress section label in the model. Also see StressSection.FirstFreeLabel(), StressSection.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free stress section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

StressSection label.

Return type

Number

Example

To get the next free stress section label in model m:

```
var label = StressSection.NextFreeLabel(m);
```

Previous()

Description

Returns the previous stress section in the model.

Arguments

No arguments

Returns

StressSection object (or null if there are no more stress sections in the model).

Return type

StressSection

Example

To get the stress section in model m before stress section iss:

```
var iss = iss.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the stress sections in the model.

Arguments

- **Model** (Model)

Model that all stress sections will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the stress sections in model m, from 1000000:

```
StressSection.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged stress sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged stress sections will be renumbered in

- **flag** (Flag)

Flag set on the stress sections that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the stress sections in model m flagged with f, from 1000000:

```
StressSection.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select stress sections using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting stress sections

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only stress sections from that model can be selected. If the argument is a Flag then only stress sections that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any stress sections can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of stress sections selected or null if menu cancelled

Return type

Number

Example

To select stress sections from model m, flagging those selected with flag f, giving the prompt 'Select stress sections':

```
StressSection.Select(f, 'Select stress sections', m);
```

To select stress sections, flagging those selected with flag f but limiting selection to stress sections flagged with flag l, giving the prompt 'Select stress sections':

```
StressSection.Select(f, 'Select stress sections', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the stress section.

Arguments

- **flag** (Flag)

Flag to set on the stress section

Returns

No return value

Example

To set flag f for stress section iss:

```
iss.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the stress section. The stress section will be sketched until you either call StressSection.Unsketch(), StressSection.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the stress section is sketched. If omitted redraw is true. If you want to sketch several stress sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch stress section iss:

```
iss.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged stress sections in the model. The stress sections will be sketched until you either call StressSection.Unsketch(), StressSection.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged stress sections will be sketched in

- **flag** (Flag)

Flag set on the stress sections that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the stress sections are sketched. If omitted redraw is true. If you want to sketch flagged stress sections several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all stress sections flagged with flag in model m:

```
StressSection.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of stress sections in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing stress sections should be counted. If false or omitted referenced but undefined stress sections will also be included in the total.

Returns

number of stress sections

Return type

Number

Example

To get the total number of stress sections in model m:

```
var total = StressSection.Total(m);
```

Unblank()

Description

Unblanks the stress section

Arguments

No arguments

Returns

No return value

Example

To unblank stress section iss:

```
iss.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the stress sections in the model.

Arguments

- **Model** (Model)

Model that all stress sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the stress sections in model m:

```
StressSection.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged stress sections in the model.

Arguments

- **Model** (Model)

Model that the flagged stress sections will be unblanked in

- **flag** (Flag)

Flag set on the stress sections that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the stress sections in model m flagged with f:

```
StressSection.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the stress sections in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all stress sections will be unset in

- **flag** (Flag)

Flag to unset on the stress sections

Returns

No return value

Example

To unset the flag f on all the stress sections in model m:

```
StressSection.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the stress section.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the stress section is unsketched. If omitted redraw is true. If you want to unsketch several stress sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch stress section iss:

```
iss.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all stress sections.

Arguments

- **Model** (Model)

Model that all stress sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the stress sections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all stress sections in model m:

```
StressSection.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged stress sections in the model.

Arguments

- **Model** (Model)

Model that all stress sections will be unsketched in

- **flag** (Flag)

Flag set on the stress sections that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the stress sections are unsketched. If omitted redraw is true. If you want to

unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all stress sections flagged with flag in model m:

```
StressSection.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StressSection object.

Return type

StressSection

Example

To check if StressSection property iss.example is a parameter by using the StressSection.GetParameter() method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for stress section. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for stress section iss:

```
iss.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this stress section.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for stress section iss:

```
var xrefs = iss.Xrefs();
```

---

toString()

Description

Creates a string containing the stress section data in keyword format. Note that this contains the keyword header and the keyword cards. See also StressSection.Keyword() and StressSection.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for stress section iss in keyword format

```
var s = iss.toString();
```

StressShell class

The StressShell class gives you access to define initial stress shell cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

StressShell constants

Name	Description
StressShell.SET	Initial is *INITIAL_STRESS_SHELL_SET.
StressShell.SHELL	Initial is *INITIAL_STRESS_SHELL.

StressShell properties

Name	Type	Description
eid	integer	Shell Element ID or shell set ID
exists (read only)	logical	true if stress_shell exists, false if referred to but not defined.
include	integer	The Include file number that the initial stress shell is in.
large	logical	true if large format, false otherwise
model (read only)	integer	The Model number that the initial stress shell is in.
nhisv	integer	Number of additional history variables
nplane	integer	Number of in plane integration points being output
ntensr	integer	Number of components of tensor data taken from the element history variables stored
nthhsv	integer	Number of thermal history variables per thermal integration point
nthick	integer	Number of integration points through the thickness
nthint	integer	Number of thermal integration points
type	constant	The Intial stress shell type. Can be StressShell.SHELL or StressShell.SET.

Detailed Description

The StressShell class allows you to create, modify, edit and manipulate stress_shell cards. See the documentation below for more details.

Constructor

new StressShell(Model*[Model]*, type*[constant]*, eid*[integer]*, nplane*[integer]*, nthick*[integer]*, nhisv*[integer]*, ntensr*[integer]*)

Description

Create a new StressShell object.

Arguments

- **Model** (Model)

Model that stress_shell will be created in

- **type** (constant)

Specify the type of initial stress shell (Can be StressShell.SHELL or StressShell.SET)

- **eid** (integer)

Shell Element ID or shell set ID

- **nplane** (integer)

Number of in plane integration points being output

- **nthick** (integer)

Number of integration points through the thickness

- **nhisv** (integer)

Number of additional history variables

- **ntensr** (integer)

Number of components of tensor data taken from the element history variables stored

Returns

StressShell object

Return type

StressShell

Example

To create a new stress_shell in model m, of type SET

```
var s = new StressShell(m, StressShell.SET, 1, 3, 0, 0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial stress shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial stress shell

Returns

No return value

Example

To associate comment c to the initial stress shell iss:

```
iss.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial stress shell.

Arguments

- **flag** (Flag)

Flag to clear on the initial stress shell

Returns

No return value

Example

To clear flag f for initial stress shell iss:

```
iss.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial stress shell. The target include of the copied initial stress shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StressShell object

Return type

StressShell

Example

To copy initial stress shell iss into initial stress shell z:

```
var z = iss.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial stress shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial stress shell

Returns

No return value

Example

To detach comment c from the initial stress shell iss:

```
iss.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial stress shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial stress shell iss:

```
iss.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial stress shell in the model.

Arguments

- **Model** (Model)

Model to get first initial stress shell in

Returns

StressShell object (or null if there are no initial stress shells in the model).

Return type

StressShell

Example

To get the first initial stress shell in model m:

```
var iss = StressShell.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial stress shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial stress shells will be flagged in

- **flag** (Flag)

Flag to set on the initial stress shells

Returns

No return value

Example

To flag all of the initial stress shells with flag f in model m:

```
StressShell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial stress shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial stress shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial stress shell iss has flag f set on it:

```
if (iss.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial stress shell in the model.
Note that ForEach has been designed to make looping over initial stress shells as fast as possible and so has some limitations.
Firstly, a single temporary StressShell object is created and on each function call it is updated with the current initial stress shell data. This means that you should not try to store the StressShell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial stress shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial stress shells are in

- **func** (function)

Function to call for each initial stress shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial stress shells in model m:

```
StressShell.ForEach(m, test);
function test(iss)
{
// iss is StressShell object
}
```

To call function test for all of the initial stress shells in model m with optional object:

```
var data = { x:0, y:0 };
StressShell.ForEach(m, test, data);
function test(iss, extra)
{
// iss is StressShell object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StressShell objects for all of the initial stress shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress shells from

Returns

Array of StressShell objects

Return type

Array

Example

To make an array of StressShell objects for all of the initial stress shells in model m

```
var iss = StressShell.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial stress shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial stress shell iss:

```
var comm_array = iss.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StressShell objects for all of the flagged initial stress shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress shells from

- **flag** (Flag)

Flag set on the initial stress shells that you want to retrieve

Returns

Array of StressShell objects

Return type

Array

Example

To make an array of StressShell objects for all of the initial stress shells in model m flagged with f

```
var iss = StressShell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StressShell object for a initial stress shell ID.

Arguments

- **Model** (Model)

Model to find the initial stress shell in

- **number** (integer)

number of the initial stress shell you want the StressShell object for

Returns

StressShell object (or null if initial stress shell does not exist).

Return type

StressShell

Example

To get the StressShell object for initial stress shell 100 in model m

```
var iss = StressShell.GetFromID(m, 100);
```

GetHisvData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.GetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for a specific integration point as an array. For each integration point there will be 8 + nhisv + (6 x ntensr) values. There are nplane x nthick integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for initial stress shell iss:

```
var data = iss.GetIntegrationPoint(2);
```

GetParameter(prop*[string]*)

Description

Checks if a StressShell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StressShell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial stress shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StressShell property iss.example is a parameter:

```
Options.property_parameter_names = true;
if (iss.GetParameter(iss.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StressShell property iss.example is a parameter by using the GetParameter method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

GetStressData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.GetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

GetTensrData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.GetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

GetThermalIntegrationPoint(index*[integer]*)

Description

Returns the thermal data for a specific integration point as an array. For each integration point there will be nthhsv values. There are nthint integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd thermal integration point for initial stress shell iss:

```
var data = iss.GetThermalIntegrationPoint(2);
```

Keyword()

Description

Returns the keyword for this initial stress shell (*INITIAL_STRESS_SHELL). **Note that a carriage return is not added**. See also StressShell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for stress_shell i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial stress shell. **Note that a carriage return is not added**. See also StressShell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for stress_shell i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial stress shell in the model.

Arguments

- **Model** (Model)

Model to get last initial stress shell in

Returns

StressShell object (or null if there are no initial stress shells in the model).

Return type

StressShell

Example

To get the last initial stress shell in model m:

```
var iss = StressShell.Last(m);
```

Next()

Description

Returns the next initial stress shell in the model.

Arguments

No arguments

Returns

StressShell object (or null if there are no more initial stress shells in the model).

Return type

StressShell

Example

To get the initial stress shell in model m after initial stress shell iss:

```
var iss = iss.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial stress shell.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress shells from that model can be picked. If the argument is a Flag then only initial stress shells that are flagged with *limit* can be selected. If omitted, or null, any initial stress shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StressShell object (or null if not picked)

Return type

StressShell

Example

To pick a initial stress shell from model m giving the prompt 'Pick initial stress shell from screen':

```
var iss = StressShell.Pick('Pick initial stress shell from screen', m);
```

Previous()

Description

Returns the previous initial stress shell in the model.

Arguments

No arguments

Returns

StressShell object (or null if there are no more initial stress shells in the model).

Return type

StressShell

Example

To get the initial stress shell in model m before initial stress shell iss:

```
var iss = iss.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial stress shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial stress shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress shells from that model can be selected. If the argument is a Flag then only initial stress shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial stress shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial stress shells selected or null if menu cancelled

Return type

Number

Example

To select initial stress shells from model m, flagging those selected with flag f, giving the prompt 'Select initial stress shells':

```
StressShell.Select(f, 'Select initial stress shells', m);
```

To select initial stress shells, flagging those selected with flag f but limiting selection to initial stress shells flagged with flag l, giving the prompt 'Select initial stress shells':

```
StressShell.Select(f, 'Select initial stress shells', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial stress shell.

Arguments

- **flag** (Flag)

Flag to set on the initial stress shell

Returns

No return value

Example

To set flag f for initial stress shell iss:

```
iss.SetFlag(f);
```

SetHisvData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.SetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

SetIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific integration point. For each integration point there will be 8 + nhisv + (6 x ntensr) values. There are nplane x nthick integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the integration point data. The array length should be 8 + nhisv + (6 x ntensr).

Returns

No return value.

Example

To set the 3rd integration point data for initial stress shell iss to the values in array adata:

```
iss.SetIntegrationPoint(2, adata);
```

SetStressData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.SetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

SetTensrData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use StressShell.SetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

SetThermalIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the thermal data for a specific integration point. For each integration point there will be nthhsv values. There are nthint thermal integration points.

Arguments

- **index** (integer)

Index you want the thermal integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the thermal integration point data. The array length should be nthhsv.

Returns

No return value.

Example

To set the 3rd thermal integration point data for initial stress shell iss to the values in array adata:

```
iss.SetThermalIntegrationPoint(2, adata);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial stress shell. The initial stress shell will be sketched until you either call StressShell.Unsketch(), StressShell.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress shell is sketched. If omitted redraw is true. If you want to sketch several initial stress shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial stress shell iss:

```
iss.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial stress shells in the model. The initial stress shells will be sketched until you either call StressShell.Unsketch(), StressShell.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial stress shells will be sketched in

- **flag** (Flag)

Flag set on the initial stress shells that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress shells are sketched. If omitted redraw is true. If you want to sketch flagged initial stress shells several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial stress shells flagged with flag in model m:

```
StressShell.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial stress shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial stress shells should be counted. If false or omitted referenced but undefined initial stress shells will also be included in the total.

Returns

number of initial stress shells

Return type

Number

Example

To get the total number of initial stress shells in model m:

```
var total = StressShell.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial stress shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial stress shells will be unset in

- **flag** (Flag)

Flag to unset on the initial stress shells

Returns

No return value

Example

To unset the flag f on all the initial stress shells in model m:

```
StressShell.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial stress shell.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress shell is unsketched. If omitted redraw is true. If you want to unsketch several initial stress shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial stress shell iss:

```
iss.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial stress shells.

Arguments

- **Model** (Model)

Model that all initial stress shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress shells in model m:

```
StressShell.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial stress shells in the model.

Arguments

- **Model** (Model)

Model that all initial stress shells will be unsketched in

- **flag** (Flag)

Flag set on the initial stress shells that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress shells flagged with flag in model m:

```
StressShell.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StressShell object.

Return type

StressShell

Example

To check if StressShell property iss.example is a parameter by using the StressShell.GetParameter() method:

```
if (iss.ViewParameters().GetParameter(iss.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial stress shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial stress shell iss:

```
iss.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial stress shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial stress shell iss:

```
var xrefs = iss.Xrefs();
```

---

toString()

Description

Creates a string containing the initial stress shell data in keyword format. Note that this contains the keyword header and the keyword cards. See also StressShell.Keyword() and StressShell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for stress_shell i in keyword format

```
var s = i.toString();
```

StressSolid class

The StressSolid class gives you access to define initial stress solid cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(Model*[Model]*)
- FlagAll(Model*[Model]*, flag*[Flag]*)

StressSolid constants

Name	Description
StressSolid.SET	Initial is *INITIAL_STRESS_SOLID_SET.
StressSolid.SOLID	Initial is *INITIAL_STRESS_SOLID.

StressSolid properties

Name	Type	Description
eid	integer	Solid Element ID or solid set ID
exists (read only)	logical	true if stress_solid exists, false if referred to but not defined.
ialegp	integer	*ALE_MULTI-MATERIAL_GROUP or *ALE_STRUCTURED_MULTI-MATERIAL_GROUP id.
include	integer	The Include file number that the initial stress solid is in.
iveflg	integer	Initial volume energy flag (only used if large is TRUE). Valid values are 0, 1 and 2 only.
large	logical	true if large format, false otherwise.
model (read only)	integer	The Model number that the initial stress solid is in.
nhisv	integer	Number of additional history variables (only used if large is TRUE).
nint	integer	Number of integration points (should correspond to the solid element formulation). Valid values for hexadral solid elements are 1, 8 or 14. Valid values for tetrahedral elements are 1, 4 or 5. Valid values for pentraderal elements are 1 or 2.
nthhsv	integer	Number of thermal history variables per thermal integration point (only used if large is TRUE).
nthint	integer	Number of thermal integration points (only used if large is TRUE).
type	constant	The Intial stress solid type. Can be StressSolid.SOLID or StressSolid.SET.

Detailed Description

The StressSolid class allows you to create, modify, edit and manipulate *INITIAL_STRESS_SOLID cards. See the documentation below for more details.

Constructor

new StressSolid(Model*[Model]*, type*[constant]*, eid*[integer]*, nint*[integer]*, nhisv*[integer]*, large*[boolean]*, iveflg*[integer]*)

Description

Create a new StressSolid object.

Arguments

- **Model** (Model)

Model that stress_solid will be created in

- **type** (constant)

Specify the type of initial stress solid (Can be StressSolid.SOLID or StressSolid.SET)

- **eid** (integer)

Solid Element ID or solid set ID

- **nint** (integer)

Number of integration points (should correspond to the solid element formulation). Valid values for hexadral solid elements are 1, 8 or 14. Valid values for tetrahedral elements are 1, 4 or 5. Valid values for pentraderal elements are 1 or 2.

- **nhisv** (integer)

Number of additional history variables (only used if large is TRUE).

- **large** (boolean)

true if large format, false otherwise.

- **iveflg** (integer)

Initial volume energy flag (only used if large is TRUE). Valid values are 0, 1 and 2 only.

Returns

StressSolid object

Return type

StressSolid

Example

To create a new stress_solid in model m, of type SET with SOLID_SET id as 1, number of integration points as 3 and number of history variables as 4.

```
var s = new StressSolid(m, StressSolid.SET, 1, 3, 4, true);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial stress solid.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial stress solid

Returns

No return value

Example

To associate comment c to the initial stress solid iso:

```
iso.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial stress solid.

Arguments

- **flag** (Flag)

Flag to clear on the initial stress solid

Returns

No return value

Example

To clear flag f for initial stress solid iso:

```
iso.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial stress solid. The target include of the copied initial stress solid can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

StressSolid object

Return type

StressSolid

Example

To copy initial stress solid iso into initial stress solid z:

```
var z = iso.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial stress solid.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial stress solid

Returns

No return value

Example

To detach comment c from the initial stress solid iso:

```
iso.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial stress solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial stress solid iso:

```
iso.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial stress solid in the model.

Arguments

- **Model** (Model)

Model to get first initial stress solid in

Returns

StressSolid object (or null if there are no initial stress solids in the model).

Return type

StressSolid

Example

To get the first initial stress solid in model m:

```
var iso = StressSolid.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial stress solids in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial stress solids will be flagged in

- **flag** (Flag)

Flag to set on the initial stress solids

Returns

No return value

Example

To flag all of the initial stress solids with flag f in model m:

```
StressSolid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial stress solid is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial stress solid

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial stress solid iso has flag f set on it:

```
if (iso.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial stress solid in the model.
Note that ForEach has been designed to make looping over initial stress solids as fast as possible and so has some limitations.
Firstly, a single temporary StressSolid object is created and on each function call it is updated with the current initial stress solid data. This means that you should not try to store the StressSolid object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial stress solids inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial stress solids are in

- **func** (function)

Function to call for each initial stress solid

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial stress solids in model m:

```
StressSolid.ForEach(m, test);
function test(iso)
{
// iso is StressSolid object
}
```

To call function test for all of the initial stress solids in model m with optional object:

```
var data = { x:0, y:0 };
StressSolid.ForEach(m, test, data);
function test(iso, extra)
{
// iso is StressSolid object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of StressSolid objects for all of the initial stress solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress solids from

Returns

Array of StressSolid objects

Return type

Array

Example

To make an array of StressSolid objects for all of the initial stress solids in model m

```
var iso = StressSolid.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial stress solid.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial stress solid iso:

```
var comm_array = iso.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of StressSolid objects for all of the flagged initial stress solids in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial stress solids from

- **flag** (Flag)

Flag set on the initial stress solids that you want to retrieve

Returns

Array of StressSolid objects

Return type

Array

Example

To make an array of StressSolid objects for all of the initial stress solids in model m flagged with f

```
var iso = StressSolid.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the StressSolid object for a initial stress solid ID.

Arguments

- **Model** (Model)

Model to find the initial stress solid in

- **number** (integer)

number of the initial stress solid you want the StressSolid object for

Returns

StressSolid object (or null if initial stress solid does not exist).

Return type

StressSolid

Example

To get the StressSolid object for initial stress solid 100 in model m

```
var iso = StressSolid.GetFromID(m, 100);
```

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for a specific integration point as an array. For each integration point there will be 7 values if large is FALSE. For each integration point there will be (7 + nhisv) values if large is TRUE. There are nint integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for initial stress solid iso:

```
var data = iso.GetIntegrationPoint(2);
```

GetParameter(prop*[string]*)

Description

Checks if a StressSolid property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the StressSolid.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial stress solid property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if StressSolid property iso.example is a parameter:

```
Options.property_parameter_names = true;
if (iso.GetParameter(iso.example) ) do_something...
Options.property_parameter_names = false;
```

To check if StressSolid property iso.example is a parameter by using the GetParameter method:

```
if (iso.ViewParameters().GetParameter(iso.example) ) do_something...
```

GetThermalIntegrationPoint(index*[integer]*)

Description

Returns the thermal data for a specific integration point as an array. For each integration point there will be nthhsv values. There are nthint integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd thermal integration point for initial stress solid iso:

```
var data = iso.GetThermalIntegrationPoint(2);
```

Keyword()

Description

Returns the keyword for this initial stress solid (*INITIAL_STRESS_SOLID). **Note that a carriage return is not added**. See also StressSolid.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for stress_solid i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial stress solid. **Note that a carriage return is not added**. See also StressSolid.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for stress_solid i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial stress solid in the model.

Arguments

- **Model** (Model)

Model to get last initial stress solid in

Returns

StressSolid object (or null if there are no initial stress solids in the model).

Return type

StressSolid

Example

To get the last initial stress solid in model m:

```
var iso = StressSolid.Last(m);
```

Next()

Description

Returns the next initial stress solid in the model.

Arguments

No arguments

Returns

StressSolid object (or null if there are no more initial stress solids in the model).

Return type

StressSolid

Example

To get the initial stress solid in model m after initial stress solid iso:

```
var iso = iso.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial stress solid.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress solids from that model can be picked. If the argument is a Flag then only initial stress solids that are flagged with *limit* can be selected. If omitted, or null, any initial stress solids from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

StressSolid object (or null if not picked)

Return type

StressSolid

Example

To pick a initial stress solid from model m giving the prompt 'Pick initial stress solid from screen':

```
var iso = StressSolid.Pick('Pick initial stress solid from screen', m);
```

Previous()

Description

Returns the previous initial stress solid in the model.

Arguments

No arguments

Returns

StressSolid object (or null if there are no more initial stress solids in the model).

Return type

StressSolid

Example

To get the initial stress solid in model m before initial stress solid iso:

```
var iso = iso.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial stress solids using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial stress solids

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial stress solids from that model can be selected. If the argument is a Flag then only initial stress solids that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial stress solids can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial stress solids selected or null if menu cancelled

Return type

Number

Example

To select initial stress solids from model m, flagging those selected with flag f, giving the prompt 'Select initial stress solids':

```
StressSolid.Select(f, 'Select initial stress solids', m);
```

To select initial stress solids, flagging those selected with flag f but limiting selection to initial stress solids flagged with flag l, giving the prompt 'Select initial stress solids':

```
StressSolid.Select(f, 'Select initial stress solids', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial stress solid.

Arguments

- **flag** (Flag)

Flag to set on the initial stress solid

Returns

No return value

Example

To set flag f for initial stress solid iso:

```
iso.SetFlag(f);
```

SetIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the data for a specific integration point. For each integration point there will be 7 values if large is FALSE. For each integration point there will be (7 + nhisv) values if large is TRUE. There are nint integration points.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the integration point data. The array length should be 7 if large is FALSE. The array length should be (7 + nhisv) if large is TRUE.

Returns

No return value.

Example

To set the 3rd integration point data for initial stress solid iso to the values in array adata:

```
iso.SetIntegrationPoint(2, adata);
```

SetThermalIntegrationPoint(index*[integer]*, data*[Array of data]*)

Description

Set the thermal data for a specific integration point. For each integration point there will be nthhsv values. There are nthint thermal integration points.

Arguments

- **index** (integer)

Index you want the thermal integration point data for. **Note that indices start at 0**.

- **data** (Array of data)

Array containing the thermal integration point data. The array length should be nthhsv.

Returns

No return value.

Example

To set the 3rd thermal integration point data for initial stress solid iso to the values in array adata:

```
iso.SetThermalIntegrationPoint(2, adata);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial stress solid. The initial stress solid will be sketched until you either call StressSolid.Unsketch(), StressSolid.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress solid is sketched. If omitted redraw is true. If you want to sketch several initial stress solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial stress solid iso:

```
iso.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial stress solids in the model. The initial stress solids will be sketched until you either call StressSolid.Unsketch(), StressSolid.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial stress solids will be sketched in

- **flag** (Flag)

Flag set on the initial stress solids that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress solids are sketched. If omitted redraw is true. If you want to sketch flagged initial stress solids several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial stress solids flagged with flag in model m:

```
StressSolid.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial stress solids in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial stress solids should be counted. If false or omitted referenced but undefined initial stress solids will also be included in the total.

Returns

number of initial stress solids

Return type

Number

Example

To get the total number of initial stress solids in model m:

```
var total = StressSolid.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial stress solids in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial stress solids will be unset in

- **flag** (Flag)

Flag to unset on the initial stress solids

Returns

No return value

Example

To unset the flag f on all the initial stress solids in model m:

```
StressSolid.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial stress solid.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress solid is unsketched. If omitted redraw is true. If you want to unsketch several initial stress solids and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial stress solid iso:

```
iso.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial stress solids.

Arguments

- **Model** (Model)

Model that all initial stress solids will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress solids in model m:

```
StressSolid.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial stress solids in the model.

Arguments

- **Model** (Model)

Model that all initial stress solids will be unsketched in

- **flag** (Flag)

Flag set on the initial stress solids that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial stress solids are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial stress solids flagged with flag in model m:

```
StressSolid.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

StressSolid object.

Return type

StressSolid

Example

To check if StressSolid property iso.example is a parameter by using the StressSolid.GetParameter() method:

```
if (iso.ViewParameters().GetParameter(iso.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial stress solid. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial stress solid iso:

```
iso.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial stress solid.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial stress solid iso:

```
var xrefs = iso.Xrefs();
```

---

toString()

Description

Creates a string containing the initial stress solid data in keyword format. Note that this contains the keyword header and the keyword cards. See also StressSolid.Keyword() and StressSolid.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for stress_solid i in keyword format

```
var s = i.toString();
```

Velocity class

The Velocity class gives you access to define initial velocity cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Velocity properties

Name	Type	Description
boxid	integer	Define box containing nodes

exists (read only)	logical	true if velocity exists, false if referred to but not defined.
icid	integer	Local coordinate system
include	integer	The Include file number that the initial velocity is in.
irigid	integer	IRIGID flag
model (read only)	integer	The Model number that the initial velocity is in.
nsid	integer	Set Node set ID
nsidex	integer	Set Exempted Node set ID
vx	real	Initial velocity in X direction
vxe	real	Initial velocity in X direction of exempted nodes
vxr	real	Initial rotational velocity about X axis
vxre	real	Initial rotational velocity about X axis of exempted nodes
vy	real	Initial velocity in Y direction
vye	real	Initial velocity in Y direction of exempted nodes
vyr	real	Initial rotational velocity about Y axis
vyre	real	Initial rotational velocity about Y axis of exempted nodes
vz	real	Initial velocity in Z direction
vze	real	Initial velocity in Z direction of exempted nodes
vzr	real	Initial rotational velocity about Z axis
vzre	real	Initial rotational velocity about Z axis of exempted nodes

Detailed Description

The Velocity class allows you to create, modify, edit and manipulate velocity cards. See the documentation below for more details.

Constructor

new Velocity(Model*[Model]*, nsid*[integer]*, vx*[real]*, vy*[real]*, vz*[real]*, vxr*[real]*, vyr*[real]*, vzr*[real]*, boxid (optional)*[integer]*, irigid (optional)*[integer]*, nsidex (optional)*[integer]*, vxe (optional)*[real]*, vye (optional)*[real]*, vze (optional)*[real]*, vxre (optional)*[real]*, vyre (optional)*[real]*, vzre (optional)*[real]*, icid (optional)*[real]*)

Description

Create a new Velocity object.

Arguments

- **Model** (Model)

Model that velocity will be created in

- **nsid** (integer)

Set Node set ID

- **vx** (real)

Initial velocity in X direction

- **vy** (real)

Initial velocity in Y direction

- **vz** (real)

Initial velocity in Z direction

- **vxr** (real)

Initial rotational velocity about X axis

- **vyr** (real)

Initial rotational velocity about Y axis

- **vzr** (real)

Initial rotational velocity about Z axis

- **boxid (optional)** (integer)

Define box containing nodes

- **irigid (optional)** (integer)

IRIGID flag

- **nsidex (optional)** (integer)

Set Exempted Node set ID

- **vxe (optional)** (real)

Initial velocity in X direction of exempted nodes

- **vye (optional)** (real)

Initial velocity in Y direction of exempted nodes

- **vze (optional)** (real)

Initial velocity in Z direction of exempted nodes

- **vxre (optional)** (real)

Initial rotational velocity about X axis of exempted nodes

- **vyre (optional)** (real)

Initial rotational velocity about Y axis of exempted nodes

- **vzre (optional)** (real)

Initial rotational velocity about Z axis of exempted nodes

- **icid (optional)** (real)

Local coordinate system nodes

Returns

Velocity object

Return type

Velocity

Example

To create a new velocity in model m

```
var s = new Velocity(m, 1, 2.4, 3.7, 7.9, 0.0, 0.0, 0.0);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a initial velocity.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial velocity

Returns

No return value

Example

To associate comment c to the initial velocity v:

```
v.AssociateComment(c);
```

Blank()

Description

Blanks the initial velocity

Arguments

No arguments

Returns

No return value

Example

To blank initial velocity v:

```
v.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the initial velocities in the model.

Arguments

- **Model** (Model)

Model that all initial velocities will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the initial velocities in model m:

```
Velocity.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged initial velocities in the model.

Arguments

- **Model** (Model)

Model that all the flagged initial velocities will be blanked in

- **flag** (Flag)

Flag set on the initial velocities that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the initial velocities in model m flagged with f:

```
Velocity.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the initial velocity is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if initial velocity v is blanked:

```
if (v.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial velocity.

Arguments

- **flag** (Flag)

Flag to clear on the initial velocity

Returns

No return value

Example

To clear flag f for initial velocity v:

```
v.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial velocity. The target include of the copied initial velocity can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Velocity object

Return type

Velocity

Example

To copy initial velocity v into initial velocity z:

```
var z = v.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial velocity.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial velocity

Returns

No return value

Example

To detach comment c from the initial velocity v:

```
v.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial velocity. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial velocity v:

```
v.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial velocity in the model.

Arguments

- **Model** (Model)

Model to get first initial velocity in

Returns

Velocity object (or null if there are no initial velocities in the model).

Return type

Velocity

Example

To get the first initial velocity in model m:

```
var v = Velocity.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial velocities in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial velocities will be flagged in

- **flag** (Flag)

Flag to set on the initial velocities

Returns

No return value

Example

To flag all of the initial velocities with flag f in model m:

```
Velocity.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial velocity is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial velocity

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial velocity v has flag f set on it:

```
if (v.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial velocity in the model.
Note that ForEach has been designed to make looping over initial velocities as fast as possible and so has some limitations.
Firstly, a single temporary Velocity object is created and on each function call it is updated with the current initial velocity data. This means that you should not try to store the Velocity object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial velocities inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial velocities are in

- **func** (function)

Function to call for each initial velocity

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial velocities in model m:

```
Velocity.ForEach(m, test);
function test(v)
{
// v is Velocity object
}
```

To call function test for all of the initial velocities in model m with optional object:

```
var data = { x:0, y:0 };
Velocity.ForEach(m, test, data);
function test(v, extra)
{
// v is Velocity object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Velocity objects for all of the initial velocities in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial velocities from

Returns

Array of Velocity objects

Return type

Array

Example

To make an array of Velocity objects for all of the initial velocities in model m

```
var v = Velocity.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial velocity.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial velocity v:

```
var comm_array = v.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Velocity objects for all of the flagged initial velocities in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial velocities from

- **flag** (Flag)

Flag set on the initial velocities that you want to retrieve

Returns

Array of Velocity objects

Return type

Array

Example

To make an array of Velocity objects for all of the initial velocities in model m flagged with f

```
var v = Velocity.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Velocity object for a initial velocity ID.

Arguments

- **Model** (Model)

Model to find the initial velocity in

- **number** (integer)

number of the initial velocity you want the Velocity object for

Returns

Velocity object (or null if initial velocity does not exist).

Return type

Velocity

Example

To get the Velocity object for initial velocity 100 in model m

```
var v = Velocity.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Velocity property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Velocity.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial velocity property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Velocity property v.example is a parameter:

```
Options.property_parameter_names = true;
if (v.GetParameter(v.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Velocity property v.example is a parameter by using the GetParameter method:

```
if (v.ViewParameters().GetParameter(v.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this initial velocity (*INITIAL_VELOCITY). **Note that a carriage return is not added**. See also Velocity.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for velocity i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial velocity. **Note that a carriage return is not added**. See also Velocity.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for velocity i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial velocity in the model.

Arguments

- **Model** (Model)

Model to get last initial velocity in

Returns

Velocity object (or null if there are no initial velocities in the model).

Return type

Velocity

Example

To get the last initial velocity in model m:

```
var v = Velocity.Last(m);
```

Next()

Description

Returns the next initial velocity in the model.

Arguments

No arguments

Returns

Velocity object (or null if there are no more initial velocities in the model).

Return type

Velocity

Example

To get the initial velocity in model m after initial velocity v:

```
var v = v.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial velocity.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial velocities from that model can be picked. If the argument is a Flag then only initial velocities that are flagged with *limit* can be selected. If omitted, or null, any initial velocities from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Velocity object (or null if not picked)

Return type

Velocity

Example

To pick a initial velocity from model m giving the prompt 'Pick initial velocity from screen':

```
var v = Velocity.Pick('Pick initial velocity from screen', m);
```

Previous()

Description

Returns the previous initial velocity in the model.

Arguments

No arguments

Returns

Velocity object (or null if there are no more initial velocities in the model).

Return type

Velocity

Example

To get the initial velocity in model m before initial velocity v:

```
var v = v.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial velocities using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial velocities

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial velocities from that model can be selected. If the argument is a Flag then only initial velocities that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial velocities can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial velocities selected or null if menu cancelled

Return type

Number

Example

To select initial velocities from model m, flagging those selected with flag f, giving the prompt 'Select initial velocities':

```
Velocity.Select(f, 'Select initial velocities', m);
```

To select initial velocities, flagging those selected with flag f but limiting selection to initial velocities flagged with flag l, giving the prompt 'Select initial velocities':

```
Velocity.Select(f, 'Select initial velocities', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial velocity.

Arguments

- **flag** (Flag)

Flag to set on the initial velocity

Returns

No return value

Example

To set flag f for initial velocity v:

```
v.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial velocity. The initial velocity will be sketched until you either call Velocity.Unsketch(), Velocity.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity is sketched. If omitted redraw is true. If you want to sketch several initial velocities and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial velocity v:

```
v.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial velocities in the model. The initial velocities will be sketched until you either call Velocity.Unsketch(), Velocity.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial velocities will be sketched in

- **flag** (Flag)

Flag set on the initial velocities that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocities are sketched. If omitted redraw is true. If you want to sketch flagged initial velocities several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial velocities flagged with flag in model m:

```
Velocity.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial velocities in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial velocities should be counted. If false or omitted referenced but undefined initial velocities will also be included in the total.

Returns

number of initial velocities

Return type

Number

Example

To get the total number of initial velocities in model m:

```
var total = Velocity.Total(m);
```

Unblank()

Description

Unblanks the initial velocity

Arguments

No arguments

Returns

No return value

Example

To unblank initial velocity v:

```
v.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the initial velocities in the model.

Arguments

- **Model** (Model)

Model that all initial velocities will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the initial velocities in model m:

```
Velocity.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged initial velocities in the model.

Arguments

- **Model** (Model)

Model that the flagged initial velocities will be unblanked in

- **flag** (Flag)

Flag set on the initial velocities that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the initial velocities in model m flagged with f:

```
Velocity.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial velocities in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial velocities will be unset in

- **flag** (Flag)

Flag to unset on the initial velocities

Returns

No return value

Example

To unset the flag f on all the initial velocities in model m:

```
Velocity.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial velocity.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity is unsketched. If omitted redraw is true. If you want to unsketch several initial velocities and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial velocity v:

```
v.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial velocities.

Arguments

- **Model** (Model)

Model that all initial velocities will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocities are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial velocities in model m:

```
Velocity.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial velocities in the model.

Arguments

- **Model** (Model)

Model that all initial velocities will be unsketched in

- **flag** (Flag)

Flag set on the initial velocities that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocities are unsketched. If omitted redraw is true. If you want to

unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial velocities flagged with flag in model m:

```
Velocity.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Velocity object.

Return type

Velocity

Example

To check if Velocity property v.example is a parameter by using the Velocity.GetParameter() method:

```
if (v.ViewParameters().GetParameter(v.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial velocity. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial velocity v:

```
v.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial velocity.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial velocity v:

```
var xrefs = v.Xrefs();
```

---

toString()

Description

Creates a string containing the initial velocity data in keyword format. Note that this contains the keyword header and the keyword cards. See also Velocity.Keyword() and Velocity.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for velocity i in keyword format

```
var s = i.toString();
```

VelocityGeneration class

The VelocityGeneration class gives you access to define initial velocity generation cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

VelocityGeneration constants

Name	Description
VelocityGeneration.NODE_SET	ID is a NODE_SET
VelocityGeneration.PART	ID is a PART
VelocityGeneration.PART_SET	ID is a PART_SET

VelocityGeneration properties

Name	Type	Description
exists (read only)	logical	true if velocity exists, false if referred to but not defined.
icid	integer	Local coordinate system
id	integer	Set Part ID, Part set ID or Node set ID
include	integer	The Include file number that the initial velocity is in.
irigid	integer	Overide part inertia flag
ivatn	integer	Tracked parts flag
model (read only)	integer	The Model number that the initial velocity generation is in.
nx	real	x-direction cosine
ny	real	y-direction cosine
nz	real	z-direction cosine
omega	real	Angular velocity about the rotational axis
phase	integer	Dynamic relaxation flag
type	constant	Specify the type of Velocity generation (Can be VelocityGeneration.PART_SET or VelocityGeneration.PART or VelocityGeneration.NODE_SET)
vx	real	Initial translational velocity in X direction
vy	real	Initial translational velocity in Y direction
vz	real	Initial translational velocity in Z direction
xc	real	x-coordinate on rotational axis
yc	real	y-coordinate on rotational axis
zc	real	z-coordinate on rotational axis

Detailed Description

The VelocityGeneration class allows you to create, modify, edit and manipulate velocity cards. See the documentation below for more details.

Constructor

new VelocityGeneration(Model*[Model]*, type*[constant]*, id*[integer]*, omega*[real]*, vx*[real]*, vy*[real]*, vz*[real]*, ivatn*[integer]*, xc*[real]*, yc*[real]*, zc*[real]*, nx*[real]*, ny*[real]*, nz*[real]*, phase*[integer]*, irigid*[integer]*, icid*[integer]*)

Description

Create a new VelocityGeneration object.

Arguments

- **Model** (Model)

Model that velocity will be created in

- **type** (constant)

Specify the type of Velocity generation (Can be VelocityGeneration.PART_SET or VelocityGeneration.PART or VelocityGeneration.NODE_SET)

- **id** (integer)

Set Part ID, Part set ID or Node set ID

- **omega** (real)

Angular velocity about the rotational axis

- **vx** (real)

Initial translational velocity in X direction

- **vy** (real)

Initial translational velocity in Y direction

- **vz** (real)

Initial translational velocity in Z direction

- **ivatn** (integer)

Tracked parts flag

- **xc** (real)

x-coordinate on rotational axis

- **yc** (real)

y-coordinate on rotational axis

- **zc** (real)

z-coordinate on rotational axis

- **nx** (real)

x-direction cosine

- **ny** (real)

y-direction cosine

- **nz** (real)

z-direction cosine

- **phase** (integer)

Dynamic relaxation flag

- **irigid** (integer)

Overide part inertia flag

- **icid** (integer)

Local coordinate system

Returns

VelocityGeneration object

Return type

VelocityGeneration

Example

To create a new velocity in model m

```
var s = new VelocityGeneration(m, VelocityGeneration.PART, 500, 3.4, 2.4, 3.7,
7.9, 0, 0.0, 0.0, 0.0, 0.0, 0.0, 1.0, 1, 0);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a initial velocity generation.

Arguments

- **Comment** (Comment)

Comment that will be attached to the initial velocity generation

Returns

No return value

Example

To associate comment c to the initial velocity generation ivg:

```
ivg.AssociateComment(c);
```

Blank()

Description

Blanks the initial velocity generation

Arguments

No arguments

Returns

No return value

Example

To blank initial velocity generation ivg:

```
ivg.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that all initial velocity generations will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the initial velocity generations in model m:

```
VelocityGeneration.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that all the flagged initial velocity generations will be blanked in

- **flag** (Flag)

Flag set on the initial velocity generations that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the initial velocity generations in model m flagged with f:

```
VelocityGeneration.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the initial velocity generation is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if initial velocity generation ivg is blanked:

```
if (ivg.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse initial velocity generation ivg:

```
ivg.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the initial velocity generation.

Arguments

- **flag** (Flag)

Flag to clear on the initial velocity generation

Returns

No return value

Example

To clear flag f for initial velocity generation ivg:

```
ivg.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the initial velocity generation. The target include of the copied initial velocity generation can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

VelocityGeneration object

Return type

VelocityGeneration

Example

To copy initial velocity generation ivg into initial velocity generation z:

```
var z = ivg.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an initial velocity generation definition.

Arguments

- **Model** (Model)

Model that the initial velocity generation definition will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

VelocityGeneration object (or null if not made)

Return type

VelocityGeneration

Example

To start creating an initial velocity generation definition in model m:

```
var v = VelocityGeneration.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a initial velocity generation.

Arguments

- **Comment** (Comment)

Comment that will be detached from the initial velocity generation

Returns

No return value

Example

To detach comment c from the initial velocity generation ivg:

```
ivg.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit initial velocity generation ivg:

```
ivg.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for initial velocity generation. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for initial velocity generation ivg:

```
ivg.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first initial velocity generation in the model.

Arguments

- **Model** (Model)

Model to get first initial velocity generation in

Returns

VelocityGeneration object (or null if there are no initial velocity generations in the model).

Return type

VelocityGeneration

Example

To get the first initial velocity generation in model m:

```
var ivg = VelocityGeneration.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the initial velocity generations in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all initial velocity generations will be flagged in

- **flag** (Flag)

Flag to set on the initial velocity generations

Returns

No return value

Example

To flag all of the initial velocity generations with flag f in model m:

```
VelocityGeneration.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the initial velocity generation is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the initial velocity generation

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if initial velocity generation ivg has flag f set on it:

```
if (ivg.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each initial velocity generation in the model.
Note that ForEach has been designed to make looping over initial velocity generations as fast as possible and so has some limitations.
Firstly, a single temporary VelocityGeneration object is created and on each function call it is updated with the current initial velocity generation data. This means that you should not try to store the VelocityGeneration object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new initial velocity generations inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all initial velocity generations are in

- **func** (function)

Function to call for each initial velocity generation

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the initial velocity generations in model m:

```
VelocityGeneration.ForEach(m, test);
function test(ivg)
{
// ivg is VelocityGeneration object
}
```

To call function test for all of the initial velocity generations in model m with optional object:

```
var data = { x:0, y:0 };
VelocityGeneration.ForEach(m, test, data);
function test(ivg, extra)
{
// ivg is VelocityGeneration object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of VelocityGeneration objects for all of the initial velocity generations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial velocity generations from

Returns

Array of VelocityGeneration objects

Return type

Array

Example

To make an array of VelocityGeneration objects for all of the initial velocity generations in model m

```
var ivg = VelocityGeneration.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a initial velocity generation.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the initial velocity generation ivg:

```
var comm_array = ivg.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of VelocityGeneration objects for all of the flagged initial velocity generations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get initial velocity generations from

- **flag** (Flag)

Flag set on the initial velocity generations that you want to retrieve

Returns

Array of VelocityGeneration objects

Return type

Array

Example

To make an array of VelocityGeneration objects for all of the initial velocity generations in model m flagged with f

```
var ivg = VelocityGeneration.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the VelocityGeneration object for a initial velocity generation ID.

Arguments

- **Model** (Model)

Model to find the initial velocity generation in

- **number** (integer)

number of the initial velocity generation you want the VelocityGeneration object for

Returns

VelocityGeneration object (or null if initial velocity generation does not exist).

Return type

VelocityGeneration

Example

To get the VelocityGeneration object for initial velocity generation 100 in model m

```
var ivg = VelocityGeneration.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a VelocityGeneration property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the VelocityGeneration.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

initial velocity generation property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if VelocityGeneration property ivg.example is a parameter:

```
Options.property_parameter_names = true;
if (ivg.GetParameter(ivg.example) ) do_something...
Options.property_parameter_names = false;
```

To check if VelocityGeneration property ivg.example is a parameter by using the GetParameter method:

```
if (ivg.ViewParameters().GetParameter(ivg.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this initial velocity (*INITIAL_VELOCITY_GENERATION). **Note that a carriage return is not added**. See also VelocityGeneration.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for velocity i:

```
var key = i.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the initial velocity_generation. **Note that a carriage return is not added**. See also VelocityGeneration.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for velocity i:

```
var cards = i.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last initial velocity generation in the model.

Arguments

- **Model** (Model)

Model to get last initial velocity generation in

Returns

VelocityGeneration object (or null if there are no initial velocity generations in the model).

Return type

VelocityGeneration

Example

To get the last initial velocity generation in model m:

```
var ivg = VelocityGeneration.Last(m);
```

Next()

Description

Returns the next initial velocity generation in the model.

Arguments

No arguments

Returns

VelocityGeneration object (or null if there are no more initial velocity generations in the model).

Return type

VelocityGeneration

Example

To get the initial velocity generation in model m after initial velocity generation ivg:

```
var ivg = ivg.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a initial velocity generation.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial velocity generations from that model can be picked. If the argument is a Flag then only initial velocity generations that are flagged with *limit* can be selected. If omitted, or null, any initial velocity generations from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

VelocityGeneration object (or null if not picked)

Return type

VelocityGeneration

Example

To pick a initial velocity generation from model m giving the prompt 'Pick initial velocity generation from screen':

```
var ivg = VelocityGeneration.Pick('Pick initial velocity generation from
screen', m);
```

Previous()

Description

Returns the previous initial velocity generation in the model.

Arguments

No arguments

Returns

VelocityGeneration object (or null if there are no more initial velocity generations in the model).

Return type

VelocityGeneration

Example

To get the initial velocity generation in model m before initial velocity generation ivg:

```
var ivg = ivg.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select initial velocity generations using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting initial velocity generations

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only initial velocity generations from that model can be selected. If the argument is a Flag then only initial velocity generations that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any initial velocity generations can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of initial velocity generations selected or null if menu cancelled

Return type

Number

Example

To select initial velocity generations from model m, flagging those selected with flag f, giving the prompt ’Select initial velocity generations’:

```
VelocityGeneration.Select(f, ’Select initial velocity generations’, m);
```

To select initial velocity generations, flagging those selected with flag f but limiting selection to initial velocity generations flagged with flag l, giving the prompt ’Select initial velocity generations’:

```
VelocityGeneration.Select(f, ’Select initial velocity generations’, l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the initial velocity generation.

Arguments

- **flag** (Flag)

Flag to set on the initial velocity generation

Returns

No return value

Example

To set flag f for initial velocity generation ivg:

```
ivg.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the initial velocity generation. The initial velocity generation will be sketched until you either call VelocityGeneration.Unsketch(), VelocityGeneration.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity generation is sketched. If omitted redraw is true. If you want to sketch several initial velocity generations and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch initial velocity generation ivg:

```
ivg.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged initial velocity generations in the model. The initial velocity generations will be sketched until you either call VelocityGeneration.Unsketch(), VelocityGeneration.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged initial velocity generations will be sketched in

- **flag** (Flag)

Flag set on the initial velocity generations that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity generations are sketched. If omitted redraw is true. If you want to sketch flagged initial velocity generations several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all initial velocity generations flagged with flag in model m:

```
VelocityGeneration.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of initial velocity generations in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing initial velocity generations should be counted. If false or omitted referenced but undefined initial velocity generations will also be included in the total.

Returns

number of initial velocity generations

Return type

Number

Example

To get the total number of initial velocity generations in model m:

```
var total = VelocityGeneration.Total(m);
```

Unblank()

Description

Unblanks the initial velocity generation

Arguments

No arguments

Returns

No return value

Example

To unblank initial velocity generation ivg:

```
ivg.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that all initial velocity generations will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the initial velocity generations in model m:

```
VelocityGeneration.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that the flagged initial velocity generations will be unblanked in

- **flag** (Flag)

Flag set on the initial velocity generations that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the initial velocity generations in model m flagged with f:

```
VelocityGeneration.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all initial velocity generations will be unset in

- **flag** (Flag)

Flag to unset on the initial velocity generations

Returns

No return value

Example

To unset the flag f on all the initial velocity generations in model m:

```
VelocityGeneration.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the initial velocity generation.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity generation is unsketched. If omitted redraw is true. If you want to unsketch several initial velocity generations and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch initial velocity generation ivg:

```
ivg.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all initial velocity generations.

Arguments

- **Model** (Model)

Model that all initial velocity generations will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity generations are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial velocity generations in model m:

```
VelocityGeneration.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged initial velocity generations in the model.

Arguments

- **Model** (Model)

Model that all initial velocity generations will be unsketched in

- **flag** (Flag)

Flag set on the initial velocity generations that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the initial velocity generations are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all initial velocity generations flagged with flag in model m:

```
VelocityGeneration.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

VelocityGeneration object.

Return type

VelocityGeneration

Example

To check if VelocityGeneration property ivg.example is a parameter by using the VelocityGeneration.GetParameter() method:

```
if (ivg.ViewParameters().GetParameter(ivg.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for initial velocity generation. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for initial velocity generation ivg:

```
ivg.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this initial velocity generation.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for initial velocity generation ivg:

```
var xrefs = ivg.Xrefs();
```

---

toString()

Description

Creates a string containing the initial velocity data in keyword format. Note that this contains the keyword header and the keyword cards. See also VelocityGeneration.Keyword() and VelocityGeneration.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for velocity i in keyword format

```
var s = i.toString();
```

IntegrationBeam (IntB) class

The IntegrationBeam class gives you access to integration beam cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

IntegrationBeam properties

Name	Type	Description
d1	real	Cross-section dimension.

d2	real	Cross-section dimension.
d3	real	Cross-section dimension.
d4	real	Cross-section dimension.
d5	real	Cross-section dimension.
d6	real	Cross-section dimension.
exists (read only)	logical	true if intb exists, false if referred to but not defined.
icst	integer	Standard cross section type. If icst is non-zero, nip should be zero and vice-versa.
include	integer	The Include file number that the intb is in.
irid	integer	Integration rule id.
k	integer	Integration refinement parameter for standard cross section types.
model (read only)	integer	The Model number that the integration beam is in.
nip	integer	Number of integration points. If nip is non-zero, icst should be zero and vice-versa.
pid	Part	Optional part ID if different from the PID specified on the element card.
ra	real	Relative area of cross section.
s	real	Normalized s coordinate of integration point.
sref	real	Location of reference surface normal to s, for the Hughes-Liu beam only.
t	real	Normalized t coordinate of integration point.
tref	real	Location of reference surface normal to t, for the Hughes-Liu beam only.
wf	real	Weighting factor (area associated with integration point divided by actual cross sectional area).

Detailed Description

The IntegrationBeam class allows you to create, modify, edit and manipulate integration beam cards. See the documentation below for more details.

For convenience "IntB" can also be used as the class name instead of "IntegrationBeam".

Constructor

new IntegrationBeam(Model*[Model]*, irid*[integer]*, nip (optional)*[integer]*, ra (optional)*[real]*, icst (optional)*[integer]*, k (optional)*[integer]*)

Description

Create a new IntegrationBeam object.

Arguments

- **Model** (Model)

Model that intb will be created in.

- **irid** (integer)

Integration_Beam ID.

- **nip (optional)** (integer)

Number of integration points. If omitted nip will be 0. If nip is non-zero, icst should be zero and vice-versa.

- **ra (optional)** (real)

Relative area of cross section. If omitted ra will be 0.

- **icst (optional)** (integer)

Standard cross section type. If omitted icst will be 0. If icst is non-zero, nip should be zero and vice-versa.

- **k (optional)** (integer)

Integration refinement parameter for standard cross section types. If omitted k will be 0.

Returns

IntegrationBeam object

Return type

IntegrationBeam

Example

To create a new intgb 1000 in model m with the following specifiction: irid, nip, ra, icst, k are 1000, 2, 0.1, 3, 5 respectively

```
var w = new IntegrationBeam(m, 1000, 2, 0.1, 3, 5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a integration beam.

Arguments

- **Comment** (Comment)

Comment that will be attached to the integration beam

Returns

No return value

Example

To associate comment c to the integration beam ib:

```
ib.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse integration beam ib:

```
ib.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the integration beam.

Arguments

- **flag** (Flag)

Flag to clear on the integration beam

Returns

No return value

Example

To clear flag f for integration beam ib:

```
ib.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the integration beam. The target include of the copied integration beam can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

IntegrationBeam object

Return type

IntegrationBeam

Example

To copy integration beam ib into integration beam z:

```
var z = ib.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a intb.

Arguments

- **Model** (Model)

Model that the intb will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

IntegrationBeam object (or null if not made)

Return type

IntegrationBeam

Example

To start creating a intb n in model m:

```
var n = IntegrationBeam.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a integration beam.

Arguments

- **Comment** (Comment)

Comment that will be detached from the integration beam

Returns

No return value

Example

To detach comment c from the integration beam ib:

```
ib.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit integration beam ib:

```
ib.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for integration beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for integration beam ib:

```
ib.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first integration beam in the model.

Arguments

- **Model** (Model)

Model to get first integration beam in

Returns

IntegrationBeam object (or null if there are no integration beams in the model).

Return type

IntegrationBeam

Example

To get the first integration beam in model m:

```
var ib = IntegrationBeam.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free integration beam label in the model. Also see IntegrationBeam.LastFreeLabel(), IntegrationBeam.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free integration beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

IntegrationBeam label.

Return type

Number

Example

To get the first free integration beam label in model m:

```
var label = IntegrationBeam.FirstFreeLabel(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the integration beams in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all integration beams will be flagged in

- **flag** (Flag)

Flag to set on the integration beams

Returns

No return value

Example

To flag all of the integration beams with flag f in model m:

```
IntegrationBeam.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the integration beam is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the integration beam

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if integration beam ib has flag f set on it:

```
if (ib.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each integration beam in the model.
Note that ForEach has been designed to make looping over integration beams as fast as possible and so has some limitations.
Firstly, a single temporary IntegrationBeam object is created and on each function call it is updated with the current integration beam data. This means that you should not try to store the IntegrationBeam object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new integration beams inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all integration beams are in

- **func** (function)

Function to call for each integration beam

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the integration beams in model m:

```
IntegrationBeam.ForEach(m, test);
function test(ib)
{
// ib is IntegrationBeam object
}
```

To call function test for all of the integration beams in model m with optional object:

```
var data = { x:0, y:0 };
IntegrationBeam.ForEach(m, test, data);
function test(ib, extra)
{
// ib is IntegrationBeam object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of IntegrationBeam objects for all of the integration beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get integration beams from

Returns

Array of IntegrationBeam objects

Return type

Array

Example

To make an array of IntegrationBeam objects for all of the integration beams in model m

```
var ib = IntegrationBeam.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a integration beam.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the integration beam ib:

```
var comm_array = ib.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of IntegrationBeam objects for all of the flagged integration beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get integration beams from

- **flag** (Flag)

Flag set on the integration beams that you want to retrieve

Returns

Array of IntegrationBeam objects

Return type

Array

Example

To make an array of IntegrationBeam objects for all of the integration beams in model m flagged with f

```
var ib = IntegrationBeam.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the IntegrationBeam object for a integration beam ID.

Arguments

- **Model** (Model)

Model to find the integration beam in

- **number** (integer)

number of the integration beam you want the IntegrationBeam object for

Returns

IntegrationBeam object (or null if integration beam does not exist).

Return type

IntegrationBeam

Example

To get the IntegrationBeam object for integration beam 100 in model m

```
var ib = IntegrationBeam.GetFromID(m, 100);
```

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for an integration point in *INTEGRATION_BEAM.**Note data is only available when NIP>0**.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for integration beam ib:

```
var data = ib.GetIntegrationPoint(2);
```

GetNipCard() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use IntegrationBeam.GetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

GetParameter(prop*[string]*)

Description

Checks if a IntegrationBeam property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the IntegrationBeam.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

integration beam property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if IntegrationBeam property ib.example is a parameter:

```
Options.property_parameter_names = true;
if (ib.GetParameter(ib.example) ) do_something...
Options.property_parameter_names = false;
```

To check if IntegrationBeam property ib.example is a parameter by using the GetParameter method:

```
if (ib.ViewParameters().GetParameter(ib.example) ) do_something...
```

GetSectionData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use properties d1, d2, sref etc to get the section data.

Arguments

No arguments

Returns

No return value

Keyword()

Description

Returns the keyword for this intb (*INTEGRATION_BEAM). **Note that a carriage return is not added**. See also IntegrationBeam.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for intb n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the intb. **Note that a carriage return is not added**. See also IntegrationBeam.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for intb n:

```
var cards = n.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last integration beam in the model.

Arguments

- **Model** (Model)

Model to get last integration beam in

Returns

IntegrationBeam object (or null if there are no integration beams in the model).

Return type

IntegrationBeam

Example

To get the last integration beam in model m:

```
var ib = IntegrationBeam.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free integration beam label in the model. Also see IntegrationBeam.FirstFreeLabel(), IntegrationBeam.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free integration beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

IntegrationBeam label.

Return type

Number

Example

To get the last free integration beam label in model m:

```
var label = IntegrationBeam.LastFreeLabel(m);
```

Next()

Description

Returns the next integration beam in the model.

Arguments

No arguments

Returns

IntegrationBeam object (or null if there are no more integration beams in the model).

Return type

IntegrationBeam

Example

To get the integration beam in model m after integration beam ib:

```
var ib = ib.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) integration beam label in the model. Also see IntegrationBeam.FirstFreeLabel(), IntegrationBeam.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free integration beam label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

IntegrationBeam label.

Return type

Number

Example

To get the next free integration beam label in model m:

```
var label = IntegrationBeam.NextFreeLabel(m);
```

Previous()

Description

Returns the previous integration beam in the model.

Arguments

No arguments

Returns

IntegrationBeam object (or null if there are no more integration beams in the model).

Return type

IntegrationBeam

Example

To get the integration beam in model m before integration beam ib:

```
var ib = ib.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the integration beams in the model.

Arguments

- **Model** (Model)

Model that all integration beams will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the integration beams in model m, from 1000000:

```
IntegrationBeam.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged integration beams in the model.

Arguments

- **Model** (Model)

Model that all the flagged integration beams will be renumbered in

- **flag** (Flag)

Flag set on the integration beams that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the integration beams in model m flagged with f, from 1000000:

```
IntegrationBeam.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select integration beams using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting integration beams

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only integration beams from that model can be selected. If the argument is a Flag then only integration beams that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any integration beams can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of integration beams selected or null if menu cancelled

Return type

Number

Example

To select integration beams from model m, flagging those selected with flag f, giving the prompt ’Select integration beams’:

```
IntegrationBeam.Select(f, ’Select integration beams’, m);
```

To select integration beams, flagging those selected with flag f but limiting selection to integration beams flagged with flag l, giving the prompt ’Select integration beams’:

```
IntegrationBeam.Select(f, ’Select integration beams’, l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the integration beam.

Arguments

- **flag** (Flag)

Flag to set on the integration beam

Returns

No return value

Example

To set flag f for integration beam ib:

```
ib.SetFlag(f);
```

SetIntegrationPoint(index*[integer]*, s*[real]*, t*[real]*, wf*[real]*, pid(optional)*[integer]*)

Description

Sets the integration point data for an *INTEGRATION_BEAM.

Arguments

- **index** (integer)

Index you want to set the integration point data for. **Note that indices start at 0**.

- **s** (real)

s coordinate of integration point in range -1 to 1.

- **t** (real)

s coordinate of integration point in range -1 to 1.

- **wf** (real)

Weighting factor, area associated with the integration point divided by actual beam cross sectional area.

- **pid(optional)** (integer)

Optional part ID if different from the PID specified on the element card.

Returns

No return value.

Example

To set the 4th integration point for *INTEGRATION_BEAM ib to the following specifiction: s, t, wf, pid are 0.1, 0.2, 0.3, 1 respectively

```
ib.SetIntegrationPoint(3, 0.1, 0.2, 0.3, 1);
```

SetNipCard() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use IntegrationBeam.SetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

SetSectionData() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use properties d1, d2, sref etc to set the section data.

Arguments

No arguments

Returns

No return value

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of integration beams in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing integration beams should be counted. If false or omitted referenced but undefined integration beams will also be included in the total.

Returns

number of integration beams

Return type

Number

Example

To get the total number of integration beams in model m:

```
var total = IntegrationBeam.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the integration beams in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all integration beams will be unset in

- **flag** (Flag)

Flag to unset on the integration beams

Returns

No return value

Example

To unset the flag f on all the integration beams in model m:

```
IntegrationBeam.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

IntegrationBeam object.

Return type

IntegrationBeam

Example

To check if IntegrationBeam property ib.example is a parameter by using the IntegrationBeam.GetParameter() method:

```
if (ib.ViewParameters().GetParameter(ib.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for integration beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for integration beam ib:

```
ib.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this integration beam.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for integration beam ib:

```
var xrefs = ib.Xrefs();
```

---

toString()

Description

Creates a string containing the intb data in keyword format. Note that this contains the keyword header and the keyword cards. See also IntegrationBeam.Keyword() and IntegrationBeam.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for intb n in keyword format

```
var s = n.toString();
```

IntegrationShell (IntS) class

The IntegrationShell class gives you access to integration shell cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

IntegrationShell properties

Name	Type	Description
esop	integer	Equal spacing of integration points option.
exists (read only)	logical	true if ints exists, false if referred to but not defined.

failopt	integer	Treatment of failure when mixing different constitutive types.
include	integer	The Include file number that the ints is in.
irid	integer	Integration rule id.
model (read only)	integer	The Model number that the integration shell is in.
nip	integer	Number of integration points.
pid	Part	Optional part ID if different from the PID specified on the element card.
s	real	Coordinate of integration point in range -1 to 1.
wf	real	Weighting factor (thickness associated with integration point divided by actual shell thickness).

Detailed Description

The IntegrationShell class allows you to create, modify, edit and manipulate integration shell cards. See the documentation below for more details.

For convenience "IntS" can also be used as the class name instead of "IntegrationShell".

Constructor

new IntegrationShell(Model*[Model]*, irid*[integer]*, nip*[integer]*, esop (optional)*[integer]*, failopt (optional)*[integer]*)

Description

Create a new IntegrationShell object.

Arguments

- **Model** (Model)

Model that ints will be created in.

- **irid** (integer)

Integration_Beam ID.

- **nip** (integer)

Number of integration points.

- **esop (optional)** (integer)

Equal spacing of integration points option. If omitted esop will be 0.

- **failopt (optional)** (integer)

Treatment of failure when mixing different constitutive types. If omitted failopt will be 0.

Returns

IntegrationShell object

Return type

IntegrationShell

Example

To create a new ints 1000 in model m with the following specifiction: irid, nip, esop, failopt are 1000, 2, 0, 1 respectively

```
var w = new IntegrationBeam(m, 1000, 2, 0, 1);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a integration shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the integration shell

Returns

No return value

Example

To associate comment c to the integration shell is:

```
is.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse integration shell is:

```
is.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the integration shell.

Arguments

- **flag** (Flag)

Flag to clear on the integration shell

Returns

No return value

Example

To clear flag f for integration shell is:

```
is.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the integration shell. The target include of the copied integration shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

IntegrationShell object

Return type

IntegrationShell

Example

To copy integration shell is into integration shell z:

```
var z = is.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a ints.

Arguments

- **Model** (Model)

Model that the ints will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

IntegrationShell object (or null if not made)

Return type

IntegrationShell

Example

To start creating an integration shell is in model m:

```
var is = IntegrationShell.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a integration shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the integration shell

Returns

No return value

Example

To detach comment c from the integration shell is:

```
is.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit integration shell is:

```
is.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for integration shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for integration shell is:

```
is.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first integration shell in the model.

Arguments

- **Model** (Model)

Model to get first integration shell in

Returns

IntegrationShell object (or null if there are no integration shells in the model).

Return type

IntegrationShell

Example

To get the first integration shell in model m:

```
var is = IntegrationShell.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free integration shell label in the model. Also see IntegrationShell.LastFreeLabel(), IntegrationShell.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free integration shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

IntegrationShell label.

Return type

Number

Example

To get the first free integration shell label in model m:

```
var label = IntegrationShell.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the integration shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all integration shells will be flagged in

- **flag** (Flag)

Flag to set on the integration shells

Returns

No return value

Example

To flag all of the integration shells with flag f in model m:

```
IntegrationShell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the integration shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the integration shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if integration shell is has flag f set on it:

```
if (is.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each integration shell in the model.
Note that ForEach has been designed to make looping over integration shells as fast as possible and so has some limitations.
Firstly, a single temporary IntegrationShell object is created and on each function call it is updated with the current integration shell data. This means that you should not try to store the IntegrationShell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new integration shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all integration shells are in

- **func** (function)

Function to call for each integration shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the integration shells in model m:

```
IntegrationShell.ForEach(m, test);
function test(is)
{
// is is IntegrationShell object
}
```

To call function test for all of the integration shells in model m with optional object:

```
var data = { x:0, y:0 };
IntegrationShell.ForEach(m, test, data);
function test(is, extra)
{
// is is IntegrationShell object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of IntegrationShell objects for all of the integration shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get integration shells from

Returns

Array of IntegrationShell objects

Return type

Array

Example

To make an array of IntegrationShell objects for all of the integration shells in model m

```
var is = IntegrationShell.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a integration shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the integration shell is:

```
var comm_array = is.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of IntegrationShell objects for all of the flagged integration shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get integration shells from

- **flag** (Flag)

Flag set on the integration shells that you want to retrieve

Returns

Array of IntegrationShell objects

Return type

Array

Example

To make an array of IntegrationShell objects for all of the integration shells in model m flagged with f

```
var is = IntegrationShell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the IntegrationShell object for a integration shell ID.

Arguments

- **Model** (Model)

Model to find the integration shell in

- **number** (integer)

number of the integration shell you want the IntegrationShell object for

Returns

IntegrationShell object (or null if integration shell does not exist).

Return type

IntegrationShell

Example

To get the IntegrationShell object for integration shell 100 in model m

```
var is = IntegrationShell.GetFromID(m, 100);
```

GetIntegrationPoint(index*[integer]*)

Description

Returns the data for an integration point in *INTEGRATION_SHELL.**Note data is only available when NIP>0 and ESOP=0**.

Arguments

- **index** (integer)

Index you want the integration point data for. **Note that indices start at 0**.

Returns

An array containing the integration point data.

Return type

Array

Example

To get the data for the 3rd integration point for integration shell:

```
var data = is.GetIntegrationPoint(2);
```

GetNipCard() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use IntegrationShell.GetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

GetParameter(prop*[string]*)

Description

Checks if a IntegrationShell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the IntegrationShell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

integration shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if IntegrationShell property is.example is a parameter:

```
Options.property_parameter_names = true;
if (is.GetParameter(is.example) ) do_something...
Options.property_parameter_names = false;
```

To check if IntegrationShell property is.example is a parameter by using the GetParameter method:

```
if (is.ViewParameters().GetParameter(is.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this ints (*INTEGRATION_SHELL). **Note that a carriage return is not added**. See also IntegrationShell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for ints n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the ints. **Note that a carriage return is not added**. See also IntegrationShell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for integration shell is:

```
var cards = is.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last integration shell in the model.

Arguments

- **Model** (Model)

Model to get last integration shell in

Returns

IntegrationShell object (or null if there are no integration shells in the model).

Return type

IntegrationShell

Example

To get the last integration shell in model m:

```
var is = IntegrationShell.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free integration shell label in the model. Also see IntegrationShell.FirstFreeLabel(), IntegrationShell.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free integration shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

IntegrationShell label.

Return type

Number

Example

To get the last free integration shell label in model m:

```
var label = IntegrationShell.LastFreeLabel(m);
```

Next()

Description

Returns the next integration shell in the model.

Arguments

No arguments

Returns

IntegrationShell object (or null if there are no more integration shells in the model).

Return type

IntegrationShell

Example

To get the integration shell in model m after integration shell is:

```
var is = is.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) integration shell label in the model. Also see IntegrationShell.FirstFreeLabel(), IntegrationShell.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free integration shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

IntegrationShell label.

Return type

Number

Example

To get the next free integration shell label in model m:

```
var label = IntegrationShell.NextFreeLabel(m);
```

Previous()

Description

Returns the previous integration shell in the model.

Arguments

No arguments

Returns

IntegrationShell object (or null if there are no more integration shells in the model).

Return type

IntegrationShell

Example

To get the integration shell in model m before integration shell is:

```
var is = is.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the integration shells in the model.

Arguments

- **Model** (Model)

Model that all integration shells will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the integration shells in model m, from 1000000:

```
IntegrationShell.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged integration shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged integration shells will be renumbered in

- **flag** (Flag)

Flag set on the integration shells that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the integration shells in model m flagged with f, from 1000000:

```
IntegrationShell.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select integration shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting integration shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only integration shells from that model can be selected. If the argument is a Flag then only integration shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any integration shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of integration shells selected or null if menu cancelled

Return type

Number

Example

To select integration shells from model m, flagging those selected with flag f, giving the prompt 'Select integration shells':

```
IntegrationShell.Select(f, 'Select integration shells', m);
```

To select integration shells, flagging those selected with flag f but limiting selection to integration shells flagged with flag l, giving the prompt 'Select integration shells':

```
IntegrationShell.Select(f, 'Select integration shells', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the integration shell.

Arguments

- **flag** (Flag)

Flag to set on the integration shell

Returns

No return value

Example

To set flag f for integration shell is:

```
is.SetFlag(f);
```

SetIntegrationPoint(index*[integer]*, s*[real]*, wf*[real]*, pid(optional)*[integer]*)

Description

Sets the integration point data for an *INTEGRATION_SHELL.

Arguments

- **index** (integer)

Index you want to set the integration point data for. **Note that indices start at 0**.

- **s** (real)

Coordinate of integration point in range -1 to 1.

- **wf** (real)

Weighting factor, thickness associated with the integration point divided by actual shell thickness.

- **pid(optional)** (integer)

Optional part ID if different from the PID specified on the element card.

Returns

No return value.

Example

To set the 4th integration point for *INTEGRATION_SHELL is to the following specifiction: s, wf, pid are 0.1, 0.2, 1 respectively

```
is.SetIntegrationPoint(3, 0.1, 0.2, 1);
```

SetNipCard() [deprecated]

This function is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use IntegrationShell.SetIntegrationPoint() instead.

Arguments

No arguments

Returns

No return value

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of integration shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing integration shells should be counted. If false or omitted referenced but undefined integration shells will also be included in the total.

Returns

number of integration shells

Return type

Number

Example

To get the total number of integration shells in model m:

```
var total = IntegrationShell.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the integration shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all integration shells will be unset in

- **flag** (Flag)

Flag to unset on the integration shells

Returns

No return value

Example

To unset the flag f on all the integration shells in model m:

```
IntegrationShell.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

IntegrationShell object.

Return type

IntegrationShell

Example

To check if IntegrationShell property is.example is a parameter by using the IntegrationShell.GetParameter() method:

```
if (is.ViewParameters().GetParameter(is.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for integration shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for integration shell is:

```
is.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this integration shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for integration shell is:

```
var xrefs = is.Xrefs();
```

---

toString()

Description

Creates a string containing the ints data in keyword format. Note that this contains the keyword header and the keyword cards. See also IntegrationShell.Keyword() and IntegrationShell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for integration shell is in keyword format

```
var s = is.toString();
```

InterfaceComponent class

The InterfaceComponent class gives you access to interface component cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

InterfaceComponent constants

Name	Description
InterfaceComponent.NODE	Node option
InterfaceComponent.SEGMENT	Segment option

InterfaceComponent properties

Name	Type	Description
cid	integer	Coordinate system ID.
exists (read only)	logical	true if interface component exists, false if referred to but not defined.
include	integer	The Include file number that the interface component is in.
model (read only)	integer	The Model number that the interface component is in.
nid	integer	Node ID.
nsid	integer	Element ID or element set ID. The ssid property is an alternative name for this.
option	constant	InterfaceComponent option. Can be InterfaceComponent.NODE, InterfaceComponent.SEGMENT,
ssid	integer	Element ID or element set ID. The nsid property is an alternative name for this.
title	string	InterfaceComponent title

Detailed Description

The InterfaceComponent class allows you to create, modify, edit and manipulate interface component cards. See the documentation below for more details.

Constructor

new InterfaceComponent(Model*[Model]*, type*[constant]*, snid/ssid*[integer]*, cid*[integer]*, nid*[integer]*, label (optional)*[integer]*, title (optional)*[string]*)

Description

Create a new InterfaceComponent object.

Arguments

- **Model** (Model)

Model that InterfaceComponent will be created in

- **type** (constant)

InterfaceComponent type. Can be InterfaceComponent.NODE, InterfaceComponent.SEGMENT,

- **snid/ssid** (integer)

Set node or set segment ID

- **cid** (integer)

Coordinate system ID

- **nid** (integer)

Node ID

- **label (optional)** (integer)

InterfaceComponent number

- **title (optional)** (string)

Title for this interface

Returns

InterfaceComponent object

Return type

InterfaceComponent

Example

To create a new Interface Component in model m with option: NODE, nsid: 100, cyd: 200, nid: 300, ID: 1, title: "MyInterfaceComponent"

```
var i_c = new InterfaceComponent(m, InterfaceComponent.NODE, 100, 200, 300, 1,
MyInterfaceComponent);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a interface component.

Arguments

- **Comment** (Comment)

Comment that will be attached to the interface component

Returns

No return value

Example

To associate comment c to the interface component i_c:

```
i_c.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse interface component i_c:

```
i_c.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the interface component.

Arguments

- **flag** (Flag)

Flag to clear on the interface component

Returns

No return value

Example

To clear flag f for interface component i_c:

```
i_c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the interface component. The target include of the copied interface component can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

InterfaceComponent object

Return type

InterfaceComponent

Example

To copy interface component i_c into interface component z:

```
var z = i_c.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an InterfaceComponent.

Arguments

- **Model** (Model)

Model that the InterfaceComponent will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

InterfaceComponent object (or null if not made)

Return type

InterfaceComponent

Example

To start creating an InterfaceComponent in model m:

```
var ed = InterfaceComponent.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a interface component.

Arguments

- **Comment** (Comment)

Comment that will be detached from the interface component

Returns

No return value

Example

To detach comment c from the interface component i_c:

```
i_c.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit interface component i_c:

```
i_c.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for interface component. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for interface component i_c:

```
i_c.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first interface component in the model.

Arguments

- **Model** (Model)

Model to get first interface component in

Returns

InterfaceComponent object (or null if there are no interface components in the model).

Return type

InterfaceComponent

Example

To get the first interface component in model m:

```
var i_c = InterfaceComponent.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free interface component label in the model. Also see InterfaceComponent.LastFreeLabel(), InterfaceComponent.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free interface component label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

InterfaceComponent label.

Return type

Number

Example

To get the first free interface component label in model m:

```
var label = InterfaceComponent.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the interface components in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all interface components will be flagged in

- **flag** (Flag)

Flag to set on the interface components

Returns

No return value

Example

To flag all of the interface components with flag f in model m:

```
InterfaceComponent.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the interface component is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the interface component

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if interface component i_c has flag f set on it:

```
if (i_c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each interface component in the model.
Note that ForEach has been designed to make looping over interface components as fast as possible and so has some limitations.
Firstly, a single temporary InterfaceComponent object is created and on each function call it is updated with the current interface component data. This means that you should not try to store the InterfaceComponent object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new interface components inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all interface components are in

- **func** (function)

Function to call for each interface component

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the interface components in model m:

```
InterfaceComponent.ForEach(m, test);
function test(i_c)
{
// i_c is InterfaceComponent object
}
```

To call function test for all of the interface components in model m with optional object:

```
var data = { x:0, y:0 };
InterfaceComponent.ForEach(m, test, data);
function test(i_c, extra)
{
// i_c is InterfaceComponent object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of InterfaceComponent objects for all of the interface components in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interface components from

Returns

Array of InterfaceComponent objects

Return type

Array

Example

To make an array of InterfaceComponent objects for all of the interface components in model m

```
var i_c = InterfaceComponent.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a interface component.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the interface component i_c:

```
var comm_array = i_c.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of InterfaceComponent objects for all of the flagged interface components in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interface components from

- **flag** (Flag)

Flag set on the interface components that you want to retrieve

Returns

Array of InterfaceComponent objects

Return type

Array

Example

To make an array of InterfaceComponent objects for all of the interface components in model m flagged with f

```
var i_c = InterfaceComponent.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the InterfaceComponent object for a interface component ID.

Arguments

- **Model** (Model)

Model to find the interface component in

- **number** (integer)

number of the interface component you want the InterfaceComponent object for

Returns

InterfaceComponent object (or null if interface component does not exist).

Return type

InterfaceComponent

Example

To get the InterfaceComponent object for interface component 100 in model m

```
var i_c = InterfaceComponent.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a InterfaceComponent property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the InterfaceComponent.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

interface component property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if InterfaceComponent property i_c.example is a parameter:

```
Options.property_parameter_names = true;
if (i_c.GetParameter(i_c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if InterfaceComponent property i_c.example is a parameter by using the GetParameter method:

```
if (i_c.ViewParameters().GetParameter(i_c.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this InterfaceComponent (*INTERFACE_COMPONENT). **Note that a carriage return is not added**. See also InterfaceComponent.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for InterfaceComponent ed:

```
var key = ed.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the InterfaceComponent. **Note that a carriage return is not added**. See also InterfaceComponent.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for InterfaceComponent ed:

```
var cards = ed.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last interface component in the model.

Arguments

- **Model** (Model)

Model to get last interface component in

Returns

InterfaceComponent object (or null if there are no interface components in the model).

Return type

InterfaceComponent

Example

To get the last interface component in model m:

```
var i_c = InterfaceComponent.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free interface component label in the model. Also see InterfaceComponent.FirstFreeLabel(), InterfaceComponent.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free interface component label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

InterfaceComponent label.

Return type

Number

Example

To get the last free interface component label in model m:

```
var label = InterfaceComponent.LastFreeLabel(m);
```

Next()

Description

Returns the next interface component in the model.

Arguments

No arguments

Returns

InterfaceComponent object (or null if there are no more interface components in the model).

Return type

InterfaceComponent

Example

To get the interface component in model m after interface component i_c:

```
var i_c = i_c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) interface component label in the model. Also see InterfaceComponent.FirstFreeLabel(), InterfaceComponent.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free interface component label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

InterfaceComponent label.

Return type

Number

Example

To get the next free interface component label in model m:

```
var label = InterfaceComponent.NextFreeLabel(m);
```

Previous()

Description

Returns the previous interface component in the model.

Arguments

No arguments

Returns

InterfaceComponent object (or null if there are no more interface components in the model).

Return type

InterfaceComponent

Example

To get the interface component in model m before interface component i_c:

```
var i_c = i_c.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the interface components in the model.

Arguments

- **Model** (Model)

Model that all interface components will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the interface components in model m, from 1000000:

```
InterfaceComponent.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged interface components in the model.

Arguments

- **Model** (Model)

Model that all the flagged interface components will be renumbered in

- **flag** (Flag)

Flag set on the interface components that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the interface components in model m flagged with f, from 1000000:

```
InterfaceComponent.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select interface components using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting interface components

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only interface components from that model can be selected. If the argument is a Flag then only interface components that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any interface components can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of interface components selected or null if menu cancelled

Return type

Number

Example

To select interface components from model m, flagging those selected with flag f, giving the prompt 'Select interface components':

```
InterfaceComponent.Select(f, 'Select interface components', m);
```

To select interface components, flagging those selected with flag f but limiting selection to interface components flagged with flag l, giving the prompt 'Select interface components':

```
InterfaceComponent.Select(f, 'Select interface components', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the interface component.

Arguments

- **flag** (Flag)

Flag to set on the interface component

Returns

No return value

Example

To set flag f for interface component i_c:

```
i_c.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of interface components in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing interface components should be counted. If false or omitted referenced but undefined interface components will also be included in the total.

Returns

number of interface components

Return type

Number

Example

To get the total number of interface components in model m:

```
var total = InterfaceComponent.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the interface components in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all interface components will be unset in

- **flag** (Flag)

Flag to unset on the interface components

Returns

No return value

Example

To unset the flag f on all the interface components in model m:

```
InterfaceComponent.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

InterfaceComponent object.

Return type

InterfaceComponent

Example

To check if InterfaceComponent property i_c.example is a parameter by using the InterfaceComponent.GetParameter() method:

```
if (i_c.ViewParameters().GetParameter(i_c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for interface component. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for interface component i_c:

```
i_c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this interface component.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for interface component i_c:

```
var xrefs = i_c.Xrefs();
```

---

toString()

Description

Creates a string containing the InterfaceComponent data in keyword format. Note that this contains the keyword header and the keyword cards. See also InterfaceComponent.Keyword() and InterfaceComponent.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for InterfaceComponent ed in keyword format

```
var s = ed.toString();
```

InterfaceLinkingEdge class

The InterfaceLinkingEdge class gives you access to define Interface Linking Edge cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

InterfaceLinkingEdge properties

Name	Type	Description
exists (read only)	logical	true if Interface Linking Edge exists, false if referred to but not defined.
ifid	integer	Interface ID.
include	integer	The Include file number that the Interface Linking Edge is in.
model (read only)	integer	The Model number that the Interface Linking Edge is in.
nsid	integer	Node set ID

Detailed Description

The InterfaceLinkingEdge class allows you to create, modify, edit and manipulate Interface Linking Edge cards. See the documentation below for more details.

Constructor

new InterfaceLinkingEdge(Model*[Model]*, nsid*[integer]*, ifid*[integer]*)

Description

Create a new InterfaceLinkingEdge object.

Arguments

- **Model** (Model)

Model that Interface Linking Edge will be created in

- **nsid** (integer)

Node set ID

- **ifid** (integer)

Interface ID

Returns

InterfaceLinkingEdge object

Return type

InterfaceLinkingEdge

Example

To create a new Interface Linking Edge in model m with NSID 900 and IFID 2

```
var b = new InterfaceLinkingEdge(m, 900, 2);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a Interface Linking Edge.

Arguments

- **Comment** (Comment)

Comment that will be attached to the Interface Linking Edge

Returns

No return value

Example

To associate comment c to the Interface Linking Edge I_LE:

```
I_LE.AssociateComment(c);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the Interface Linking Edge.

Arguments

- **flag** (Flag)

Flag to clear on the Interface Linking Edge

Returns

No return value

Example

To clear flag f for Interface Linking Edge I_LE:

```
I_LE.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the Interface Linking Edge. The target include of the copied Interface Linking Edge can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

InterfaceLinkingEdge object

Return type

InterfaceLinkingEdge

Example

To copy Interface Linking Edge I_LE into Interface Linking Edge z:

```
var z = I_LE.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a Interface Linking Edge.

Arguments

- **Comment** (Comment)

Comment that will be detached from the Interface Linking Edge

Returns

No return value

Example

To detach comment c from the Interface Linking Edge I_LE:

```
I_LE.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for Interface Linking Edge. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for Interface Linking Edge I_LE:

```
I_LE.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first Interface Linking Edge in the model.

Arguments

- **Model** (Model)

Model to get first Interface Linking Edge in

Returns

InterfaceLinkingEdge object (or null if there are no Interface Linking Edges in the model).

Return type

InterfaceLinkingEdge

Example

To get the first Interface Linking Edge in model m:

```
var I_LE = InterfaceLinkingEdge.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the Interface Linking Edges in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all Interface Linking Edges will be flagged in

- **flag** (Flag)

Flag to set on the Interface Linking Edges

Returns

No return value

Example

To flag all of the Interface Linking Edges with flag f in model m:

```
InterfaceLinkingEdge.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the Interface Linking Edge is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the Interface Linking Edge

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if Interface Linking Edge I_LE has flag f set on it:

```
if (I_LE.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each Interface Linking Edge in the model.
Note that ForEach has been designed to make looping over Interface Linking Edges as fast as possible and so has some limitations.
Firstly, a single temporary InterfaceLinkingEdge object is created and on each function call it is updated with the current Interface Linking Edge data. This means that you should not try to store the InterfaceLinkingEdge object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new Interface Linking Edges inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all Interface Linking Edges are in

- **func** (function)

Function to call for each Interface Linking Edge

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the Interface Linking Edges in model m:

```
InterfaceLinkingEdge.ForEach(m, test);
function test(I_LE)
{
// I_LE is InterfaceLinkingEdge object
}
```

To call function test for all of the Interface Linking Edges in model m with optional object:

```
var data = { x:0, y:0 };
InterfaceLinkingEdge.ForEach(m, test, data);
function test(I_LE, extra)
{
// I_LE is InterfaceLinkingEdge object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of InterfaceLinkingEdge objects for all of the Interface Linking Edges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get Interface Linking Edges from

Returns

Array of InterfaceLinkingEdge objects

Return type

Array

Example

To make an array of InterfaceLinkingEdge objects for all of the Interface Linking Edges in model m

```
var I_LE = InterfaceLinkingEdge.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a Interface Linking Edge.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the Interface Linking Edge I_LE:

```
var comm_array = I_LE.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of InterfaceLinkingEdge objects for all of the flagged Interface Linking Edges in a model in PRIMER

Arguments

- **Model** (Model)

Model to get Interface Linking Edges from

- **flag** (Flag)

Flag set on the Interface Linking Edges that you want to retrieve

Returns

Array of InterfaceLinkingEdge objects

Return type

Array

Example

To make an array of InterfaceLinkingEdge objects for all of the Interface Linking Edges in model m flagged with f

```
var I_LE = InterfaceLinkingEdge.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the InterfaceLinkingEdge object for a Interface Linking Edge ID.

Arguments

- **Model** (Model)

Model to find the Interface Linking Edge in

- **number** (integer)

number of the Interface Linking Edge you want the InterfaceLinkingEdge object for

Returns

InterfaceLinkingEdge object (or null if Interface Linking Edge does not exist).

Return type

InterfaceLinkingEdge

Example

To get the InterfaceLinkingEdge object for Interface Linking Edge 100 in model m

```
var I_LE = InterfaceLinkingEdge.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a InterfaceLinkingEdge property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the InterfaceLinkingEdge.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

Interface Linking Edge property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if InterfaceLinkingEdge property I_LE.example is a parameter:

```
Options.property_parameter_names = true;
if (I_LE.GetParameter(I_LE.example) ) do_something...
Options.property_parameter_names = false;
```

To check if InterfaceLinkingEdge property I_LE.example is a parameter by using the GetParameter method:

```
if (I_LE.ViewParameters().GetParameter(I_LE.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this Interface Linking Edge (*INTERFACE_LINKING_EDGE). **Note that a carriage return is not added**. See also InterfaceLinkingEdge.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Interface Linking Edge m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Interface Linking Edge. **Note that a carriage return is not added**. See also InterfaceLinkingEdge.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Interface Linking Edge l:

```
var cards = l.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last Interface Linking Edge in the model.

Arguments

- **Model** (Model)

Model to get last Interface Linking Edge in

Returns

InterfaceLinkingEdge object (or null if there are no Interface Linking Edges in the model).

Return type

InterfaceLinkingEdge

Example

To get the last Interface Linking Edge in model m:

```
var I_LE = InterfaceLinkingEdge.Last(m);
```

Next()

Description

Returns the next Interface Linking Edge in the model.

Arguments

No arguments

Returns

InterfaceLinkingEdge object (or null if there are no more Interface Linking Edges in the model).

Return type

InterfaceLinkingEdge

Example

To get the Interface Linking Edge in model m after Interface Linking Edge I_LE:

```
var I_LE = I_LE.Next();
```

Previous()

Description

Returns the previous Interface Linking Edge in the model.

Arguments

No arguments

Returns

InterfaceLinkingEdge object (or null if there are no more Interface Linking Edges in the model).

Return type

InterfaceLinkingEdge

Example

To get the Interface Linking Edge in model m before Interface Linking Edge I_LE:

```
var I_LE = I_LE.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select Interface Linking Edges using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting Interface Linking Edges

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only Interface Linking Edges from that model can be selected. If the argument is a Flag then only Interface Linking Edges that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any Interface Linking Edges can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of Interface Linking Edges selected or null if menu cancelled

Return type

Number

Example

To select Interface Linking Edges from model m, flagging those selected with flag f, giving the prompt 'Select Interface Linking Edges':

```
InterfaceLinkingEdge.Select(f, 'Select Interface Linking Edges', m);
```

To select Interface Linking Edges, flagging those selected with flag f but limiting selection to Interface Linking Edges flagged with flag l, giving the prompt 'Select Interface Linking Edges':

```
InterfaceLinkingEdge.Select(f, 'Select Interface Linking Edges', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the Interface Linking Edge.

Arguments

- **flag** (Flag)

Flag to set on the Interface Linking Edge

Returns

No return value

Example

To set flag f for Interface Linking Edge I_LE:

```
I_LE.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of Interface Linking Edges in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing Interface Linking Edges should be counted. If false or omitted referenced but undefined Interface Linking Edges will also be included in the total.

Returns

number of Interface Linking Edges

Return type

Number

Example

To get the total number of Interface Linking Edges in model m:

```
var total = InterfaceLinkingEdge.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the Interface Linking Edges in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all Interface Linking Edges will be unset in

- **flag** (Flag)

Flag to unset on the Interface Linking Edges

Returns

No return value

Example

To unset the flag f on all the Interface Linking Edges in model m:

```
InterfaceLinkingEdge.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

InterfaceLinkingEdge object.

Return type

InterfaceLinkingEdge

Example

To check if InterfaceLinkingEdge property I_LE.example is a parameter by using the InterfaceLinkingEdge.GetParameter() method:

```
if (I_LE.ViewParameters().GetParameter(I_LE.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for Interface Linking Edge. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for Interface Linking Edge I_LE:

```
I_LE.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this Interface Linking Edge.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for Interface Linking Edge I_LE:

```
var xrefs = I_LE.Xrefs();
```

---

toString()

Description

Creates a string containing the Interface Linking Edge data in keyword format. Note that this contains the keyword header and the keyword cards. See also InterfaceLinkingEdge.Keyword() and InterfaceLinkingEdge.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Interface Linking Edge l in keyword format

```
var s = l.toString();
```

InterfaceSpringback class

The InterfaceSpringback class gives you access to interface springback cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

InterfaceSpringback constants

Constants for Types of Keyword

Name	Description
InterfaceSpringback.EXCLUDE	INTERFACE is *INTERFACE_SPRINGBACK_EXCLUDE.
InterfaceSpringback.LSDYNA	INTERFACE is *INTERFACE_SPRINGBACK_LSDYNA.

InterfaceSpringback.NASTRAN	INTERFACE is *INTERFACE_SPRINGBACK_NASTRAN.
InterfaceSpringback.NIKE3D	INTERFACE is *INTERFACE_SPRINGBACK_NIKE3D.
InterfaceSpringback.SEAMLESS	INTERFACE is *INTERFACE_SPRINGBACK_SEAMLESS.

InterfaceSpringback properties

Name	Type	Description
cflag	integer	Output contact state.
exists (read only)	logical	true if interface springback exists, false if referred to but not defined.
fsplit	integer	Flag for splitting of the dynain file (0 - One file, 1 - Two files.). Used for OPTCARD field.
ftensr	integer	Flag for dumping tensor data from the element history variables into the dynain file (0/1).
ftype	integer	Filetype (0-3, 10-12).
include	integer	The Include file number that the interface springback is in.
intstrn	integer	Output of strains at all integration points of shell element is requested.
model (read only)	integer	The Model number that the interface springback is in.
ncyc	integer	Number of process cycles. Used for OPTCARD field.
ndflag	integer	Flag to dump nodes into dynain file.
nexclude	integer	gives the number of excluded keywords. Needed only for InterfaceSpringback.EXCLUDE.
nnodes	integer	gives the number of nodal points constrained for this keyword. (read_only)
nothickness	logical	true if _NOTHICKNESS (option2) is set. _NOTHICKNESS can be used only for InterfaceSpringback.LSDYNA or InterfaceSpringback.NASTRAN.
nshv	integer	Num additional Shell/Solid history variables number.
nthhsv	integer	Number of thermal history variables.
optcard	logical	Whether to have a OPTCARD. Can be true or false.
psid	integer	Part set ID for springback.
sldo	integer	Output of solid element data as 0 - *ELEMENT_SOLID, 1- *ELEM_SOLID_ORTHO. Used for OPTCARD field.
type (read only)	integer	gives the type of InterfaceSpringback object.

Detailed Description

The InterfaceSpringback class allows you to create, modify, edit and manipulate interface springback cards. See the documentation below for more details.

Constructor

new InterfaceSpringback(Model*[Model]*, options *[object]*)

Description

Create a new InterfaceSpringback object.

Arguments

- **Model** (Model)

Model that interface springback will be created in

- **options** (object)

Options for creating the interface springback

Object has the following properties:

Name	Type	Description
cflag (optional)	integer	Output contact state.
fsplit (optional)	integer	Flag for splitting of the dynain file (0 - One file, 1 - Two files.). Used only for optional card.
ftensr (optional)	integer	Flag for dumping tensor data from the element history variables into the dynain file (0/1).
ftype (optional)	integer	Filetype (0-3, 10-12).
intstrn (optional)	integer	Output of strains at all integration points of shell element is requested.
keylist (optional)	Array of strings	List of keywords to be excluded.(ONLY for EXCLUDE)
ncyc (optional)	integer	Number of process cycles. Used only for optional card.
ndflag (optional)	integer	Flag to dump nodes into dynain file.
nshv (optional)	integer	Num additional Shell/Solid history variables number.
nthhsv (optional)	integer	Number of thermal history variables.
optcard (optional)	logical	Whether to have an optional card. Can be true or false.
psid (optional)	integer	Part set ID for springback.(NOT for _EXCLUDE)
sldo (optional)	integer	Output of solid element data as 0 - *ELEMENT_SOLID, 1- *ELEM_SOLID_ORTHO. Used only for optional card.
type	constant	Specify the type of InterfaceSpringback (Can be InterfaceSpringback.NIKE3D or InterfaceSpringback.LSDYNA or InterfaceSpringback.NASTRAN or InterfaceSpringback.SEAMLESS)

Returns

InterfaceSpringback object

Return type

InterfaceSpringback

Example

To create a new interface springback in model m, type LSDYNA, part set id 100:

```
var i_s = new InterfaceSpringback(m, InterfaceSpringback.LSDYNA, 100);
```

new InterfaceSpringback(Model*[Model]*, Type*[constant]*, psid (optional) *[integer]*, nshv (optional)*[integer]*, ftype (optional)*[integer]*, ftensr (optional)*[integer]*, nthhsv (optional)*[integer]*, intstrn (optional)*[integer]*, optcard (optional)*[boolean]*, sldo (optional)*[integer]*, ncyc (optional)*[integer]*, fsplit (optional)*[integer]*, ndflag (optional)*[integer]*, cflag (optional)*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new InterfaceSpringback object.

Arguments

- **Model** (Model)

Model that interface springback will be created in

- **Type** (constant)

Specify the type of InterfaceSpringback (Can be InterfaceSpringback.NIKE3D or InterfaceSpringback.LSDYNA or InterfaceSpringback.NASTRAN or InterfaceSpringback.SEAMLESS)

- **psid (optional)** (integer)

Part set ID for springback.

- **nshv (optional)** (integer)

Num additional Shell/Solid history variables number.

- **ftype (optional)** (integer)

Filetype (0-3, 10-12).

- **ftensr (optional)** (integer)

Flag for dumping tensor data from the element history variables into the dynain file (0/1).

- **nthhsv (optional)** (integer)

Number of thermal history variables.

- **intstrn (optional)** (integer)

Output of strains at all integration points of shell element is requested.

- **optcard (optional)** (boolean)

Whether to have an optional card. Can be true or false.

- **sldo (optional)** (integer)

Output of solid element data as 0 - *ELEMENT_SOLID, 1- *ELEM_SOLID_ORTHO. Used only for optional card.

- **ncyc (optional)** (integer)

Number of process cycles. Used only for optional card.

- **fsplit (optional)** (integer)

Flag for splitting of the dynain file (0 - One file, 1 - Two files.). Used only for optional card.

- **ndflag (optional)** (integer)

Flag to dump nodes into dynain file.

- **cflag (optional)** (integer)

Output contact state.

Returns

InterfaceSpringback object

Return type

InterfaceSpringback

Example

To create a new interface springback in model m, type LSDYNA, part set id 100:

```
var i_s = new InterfaceSpringback(m, InterfaceSpringback.LSDYNA, 100);
```

new InterfaceSpringback(Model*[Model]*, Type*[constant]*, keylist (optional)*[Array of strings]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new InterfaceSpringback object with InterfaceSpringback.EXCLUDE option.

Arguments

- **Model** (Model)

Model that interface springback will be created in

- **Type** (constant)

Specify the type of InterfaceSpringback (Should be InterfaceSpringback.EXCLUDE)

- **keylist (optional)** (Array of strings)

List of keywords to be excluded.

Returns

InterfaceSpringback object with InterfaceSpringback.EXCLUDE option.

Return type

InterfaceSpringback

Example

To create a new interface springback in model m, type EXCLUDE and keylist array keys:

```
var i_s = new InterfaceSpringback(m, InterfaceSpringback.EXCLUDE, keys);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a interface springback.

Arguments

- **Comment** (Comment)

Comment that will be attached to the interface springback

Returns

No return value

Example

To associate comment c to the interface springback i_s:

```
i_s.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse interface springback i_s:

```
i_s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the interface springback.

Arguments

- **flag** (Flag)

Flag to clear on the interface springback

Returns

No return value

Example

To clear flag f for interface springback i_s:

```
i_s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the interface springback. The target include of the copied interface springback can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

InterfaceSpringback object

Return type

InterfaceSpringback

Example

To copy interface springback i_s into interface springback z:

```
var z = i_s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an InterfaceSpringback definition.

Arguments

- **Model** (Model)

Model that the InterfaceSpringback will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

InterfaceSpringback object (or null if not made)

Return type

InterfaceSpringback

Example

To start creating an ifce_sbak in model m:

```
var i_s = InterfaceSpringback.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a interface springback.

Arguments

- **Comment** (Comment)

Comment that will be detached from the interface springback

Returns

No return value

Example

To detach comment c from the interface springback i_s:

```
i_s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit interface springback i_s:

```
i_s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for interface springback. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for interface springback i_s:

```
i_s.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first interface springback in the model.

Arguments

- **Model** (Model)

Model to get first interface springback in

Returns

InterfaceSpringback object (or null if there are no interface springbacks in the model).

Return type

InterfaceSpringback

Example

To get the first interface springback in model m:

```
var i_s = InterfaceSpringback.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the interface springbacks in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all interface springbacks will be flagged in

- **flag** (Flag)

Flag to set on the interface springbacks

Returns

No return value

Example

To flag all of the interface springbacks with flag f in model m:

```
InterfaceSpringback.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the interface springback is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the interface springback

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if interface springback i_s has flag f set on it:

```
if (i_s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each interface springback in the model.
Note that ForEach has been designed to make looping over interface springbacks as fast as possible and so has some limitations.
Firstly, a single temporary InterfaceSpringback object is created and on each function call it is updated with the current interface springback data. This means that you should not try to store the InterfaceSpringback object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new interface springbacks inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all interface springbacks are in

- **func** (function)

Function to call for each interface springback

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the interface springbacks in model m:

```
InterfaceSpringback.ForEach(m, test);
function test(i_s)
{
// i_s is InterfaceSpringback object
}
```

To call function test for all of the interface springbacks in model m with optional object:

```
var data = { x:0, y:0 };
InterfaceSpringback.ForEach(m, test, data);
function test(i_s, extra)
{
// i_s is InterfaceSpringback object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of InterfaceSpringback objects for all of the interface springbacks in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interface springbacks from

Returns

Array of InterfaceSpringback objects

Return type

Array

Example

To make an array of InterfaceSpringback objects for all of the interface springbacks in model m

```
var i_s = InterfaceSpringback.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a interface springback.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the interface springback i_s:

```
var comm_array = i_s.GetComments();
```

GetExcludeKeyword(idx*[integer]*)

Description

Returns the keyword string excluded at given index in Keyword list. Needed only for InterfaceSpringback.EXCLUDE.

Arguments

- **idx** (integer)

The index in Keyword list you want the Keyword string for. **Note that indices start at 0, not 1**.

Returns

A Keyword string at index "idx" from excluded keyword list .

Return type

String

Example

To get the 3rd Keyword string in Interface Springback i_s:

```
if (i_s.nexclude >= 3)
{
    var keyword = i_s.GetExcludeKeyword(2);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of InterfaceSpringback objects for all of the flagged interface springbacks in a model in PRIMER

Arguments

- **Model** (Model)

Model to get interface springbacks from

- **flag** (Flag)

Flag set on the interface springbacks that you want to retrieve

Returns

Array of InterfaceSpringback objects

Return type

Array

Example

To make an array of InterfaceSpringback objects for all of the interface springbacks in model m flagged with f

```
var i_s = InterfaceSpringback.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the InterfaceSpringback object for a interface springback ID.

Arguments

- **Model** (Model)

Model to find the interface springback in

- **number** (integer)

number of the interface springback you want the InterfaceSpringback object for

Returns

InterfaceSpringback object (or null if interface springback does not exist).

Return type

InterfaceSpringback

Example

To get the InterfaceSpringback object for interface springback 100 in model m

```
var i_s = InterfaceSpringback.GetFromID(m, 100);
```

GetNodalPoint(npt*[integer]*)

Description

Returns the data for nodal point constrained for *INTERFACE_SPRINGBACK.

Arguments

- **npt** (integer)

The nodal point you want the data for. **Note that nodal points start at 0, not 1**.

Returns

An array containing the Node id, translational constraint (TC) and rotational constraint (RC) constants.

Return type

Array

Example

To get the nodal point data for the 3rd nodal constraint for Interface Springback i_s:

```
if (i_s.nnodes >= 3)
{
    var npt_data = i_s.GetNodalPoint(2);
}
```

GetParameter(prop*[string]*)

Description

Checks if a InterfaceSpringback property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the InterfaceSpringback.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

interface springback property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if InterfaceSpringback property i_s.example is a parameter:

```
Options.property_parameter_names = true;
if (i_s.GetParameter(i_s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if InterfaceSpringback property i_s.example is a parameter by using the GetParameter method:

```
if (i_s.ViewParameters().GetParameter(i_s.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this Interface Springback (*INTERFACE_SPRINGBACK_xxxx_xxxx) **Note that a carriage return is not added**. See also InterfaceSpringback.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for InterfaceSpringback i_s:

```
var key = i_s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the InterfaceSpringback. **Note that a carriage return is not added**. See also InterfaceSpringback.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for InterfaceSpringback i_s:

```
var cards = i_s.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last interface springback in the model.

Arguments

- **Model** (Model)

Model to get last interface springback in

Returns

InterfaceSpringback object (or null if there are no interface springbacks in the model).

Return type

InterfaceSpringback

Example

To get the last interface springback in model m:

```
var i_s = InterfaceSpringback.Last(m);
```

Next()

Description

Returns the next interface springback in the model.

Arguments

No arguments

Returns

InterfaceSpringback object (or null if there are no more interface springbacks in the model).

Return type

InterfaceSpringback

Example

To get the interface springback in model m after interface springback i_s:

```
var i_s = i_s.Next();
```

Previous()

Description

Returns the previous interface springback in the model.

Arguments

No arguments

Returns

InterfaceSpringback object (or null if there are no more interface springbacks in the model).

Return type

InterfaceSpringback

Example

To get the interface springback in model m before interface springback i_s:

```
var i_s = i_s.Previous();
```

RemoveExcludeKeyword(idx*[integer]*)

Description

Removes the keyword string excluded at given index in Keyword list. Needed only for InterfaceSpringback.EXCLUDE

Arguments

- **idx** (integer)

The index in Keyword list you removed. **Note that indices start at 0, not 1**.

Returns

No return value.

Example

To remove the 3rd Keyword string in Interface Springback i_s:

```
if (i_s.nexclude >= 3)
{
    var keyword = i_s.RemoveExcludeKeyword(2);
}
```

RemoveNodalPoint(npt*[integer]*)

Description

Removes the nodal point for constrained node for *INTERFACE_SPRINGBACK.

Arguments

- **npt** (integer)

The nodal point you want to remove. **Note that nodal points start at 0, not 1**.

Returns

No return value.

Example

To remove the nodal point for the 3rd node for InterfaceSpringback i_s:

```
i_s.RemoveNodalPoint(2);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select interface springbacks using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting interface springbacks

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only interface springbacks from that model can be selected. If the argument is a Flag then only interface springbacks that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any interface springbacks can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of interface springbacks selected or null if menu cancelled

Return type

Number

Example

To select interface springbacks from model m, flagging those selected with flag f, giving the prompt ’Select interface springbacks’:

```
InterfaceSpringback.Select(f, ’Select interface springbacks’, m);
```

To select interface springbacks, flagging those selected with flag f but limiting selection to interface springbacks flagged with flag l, giving the prompt ’Select interface springbacks’:

```
InterfaceSpringback.Select(f, ’Select interface springbacks’, l);
```

SetExcludeKeyword(keystr*[string]*, index (optional)*[integer]*)

Description

Sets a keyword string to be excluded. Adds a new keyword if index value is not given, else replaces the keyword string at given index. **Note that indices start at 0, not 1**. Needed only for InterfaceSpringback.EXCLUDE

Arguments

- **keystr** (string)

The keyword string you want to be excluded.

- **index (optional)** (integer)

The index at which keyword string should be set.

Returns

No return value.

Example

To set a keyword string at index 3 to be excluded for InterfaceSpringback i_s:

```
if(i_s.nexclude >= 4)
    i_s.SetExcludeKeyword("ELEMENT_SHELL", 3);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the interface springback.

Arguments

- **flag** (Flag)

Flag to set on the interface springback

Returns

No return value

Example

To set flag f for interface springback i_s:

```
i_s.SetFlag(f);
```

SetNodalPoint(npt*[integer]*, nid*[integer]*, tc*[real]*, rc*[real]*)

Description

Sets the nodal point data for a node in *INTERFACE_SPRINGBACK.

Arguments

- **npt** (integer)

The nodal point you want to set the data for. **Note that nodal points start at 0, not 1**.

- **nid** (integer)

Node ID for the nodal point.

- **tc** (real)

Translational constraint constant of the nodal point. (0-7)

- **rc** (real)

Rotational constraint constant of the nodal point. (0-7)

Returns

No return value.

Example

To set the nodal data for the 3rd nodal point to node 1, tc 2 and rc 4, for InterfaceSpringback i_s:

```
i_s.SetNodalPoint(2, 1, 2, 4);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of interface springbacks in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing interface springbacks should be counted. If false or omitted referenced but undefined interface springbacks will also be included in the total.

Returns

number of interface springbacks

Return type

Number

Example

To get the total number of interface springbacks in model m:

```
var total = InterfaceSpringback.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the interface springbacks in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all interface springbacks will be unset in

- **flag** (Flag)

Flag to unset on the interface springbacks

Returns

No return value

Example

To unset the flag f on all the interface springbacks in model m:

```
InterfaceSpringback.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

InterfaceSpringback object.

Return type

InterfaceSpringback

Example

To check if InterfaceSpringback property i_s.example is a parameter by using the InterfaceSpringback.GetParameter() method:

```
if (i_s.ViewParameters().GetParameter(i_s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for interface springback. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for interface springback i_s:

```
i_s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this interface springback.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for interface springback i_s:

```
var xrefs = i_s.Xrefs();
```

---

toString()

Description

Creates a string containing the InterfaceSpringback data in keyword format. Note that this contains the keyword header and the keyword cards. See also InterfaceSpringback.Keyword() and InterfaceSpringback.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for InterfaceSpringback i_s in keyword format

```
var i_str = i_s.toString();
```

LoadBeam class

The LoadBeam class gives you access to define load beam cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadBeam constants

Name	Description
LoadBeam.ELEMENT	Load is *LOAD_BEAM_ELEMENT.
LoadBeam.SET	LOAD is *LOAD_BEAM_SET.

LoadBeam properties

Name	Type	Description
dal	integer	Direction of applied load. 1 for r-axis, 2 for s-axis or 3 for t-axis of beam.
eid	integer	NodeBeam ID or beam set ID. The esid property is an alternative name for this.
esid	integer	NodeBeam ID or beam set ID. The eid property is an alternative name for this.
exists (read only)	logical	true if load beam exists, false if referred to but not defined.
include	integer	The Include file number that the load beam is in.
lcid	integer	Curve ID or function ID
model (read only)	integer	The Model number that the load beam is in.
sf	real	Load curve scale factor
type	constant	The Load Beam type. Can be LoadBeam.ELEMENT or LoadBeam.SET.

Detailed Description

The LoadBeam class allows you to create, modify, edit and manipulate load beam cards. See the documentation below for more details.

Constructor

new LoadBeam(Model*[Model]*, type*[constant]*, eid/esid*[integer]*, dal*[integer]*, lcid*[integer]*, sf (optional)*[real]*)

Description

Create a new LoadBeam object.

Arguments

- **Model** (Model)

Model that load beam will be created in

- **type** (constant)

Specify the type of load beam (Can be LoadBeam.ELEMENT or LoadBeam.SET)

- **eid/esid** (integer)

Beam ID or beam set ID

- **dal** (integer)

Direction of applied load. 1 for r-axis, 2 for s-axis or 3 for t-axis of beam.

- **lcid** (integer)

Curve ID

- **sf (optional)** (real)

Load curve scale factor

Returns

LoadBeam object

Return type

LoadBeam

Example

To create a new load beam in model m, of type SET, with beam set 100, load parallel to s-axis, loadcurve 9 and a scale factor of 0.5:

```
var lb = new LoadBeam(m, LoadBeam.SET, 100, 2, 9, 0.5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a load beam.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load beam

Returns

No return value

Example

To associate comment c to the load beam lb:

```
lb.AssociateComment(c);
```

Blank()

Description

Blanks the load beam

Arguments

No arguments

Returns

No return value

Example

To blank load beam lb:

```
lb.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load beams in the model.

Arguments

- **Model** (Model)

Model that all load beams will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load beams in model m:

```
LoadBeam.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load beams in the model.

Arguments

- **Model** (Model)

Model that all the flagged load beams will be blanked in

- **flag** (Flag)

Flag set on the load beams that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load beams in model m flagged with f:

```
LoadBeam.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load beam is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load beam lb is blanked:

```
if (lb.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse load beam lb:

```
lb.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load beam.

Arguments

- **flag** (Flag)

Flag to clear on the load beam

Returns

No return value

Example

To clear flag f for load beam lb:

```
lb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load beam. The target include of the copied load beam can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadBeam object

Return type

LoadBeam

Example

To copy load beam lb into load beam z:

```
var z = lb.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a load beam definition.

Arguments

- **Model** (Model)

Model that the load beam will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

LoadBeam object (or null if not made)

Return type

LoadBeam

Example

To start creating a load beam definition in model m:

```
var lb = LoadBeam.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load beam.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load beam

Returns

No return value

Example

To detach comment c from the load beam lb:

```
lb.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit load beam lb:

```
lb.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load beam lb:

```
lb.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load beam in the model.

Arguments

- **Model** (Model)

Model to get first load beam in

Returns

LoadBeam object (or null if there are no load beams in the model).

Return type

LoadBeam

Example

To get the first load beam in model m:

```
var lb = LoadBeam.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load beams in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load beams will be flagged in

- **flag** (Flag)

Flag to set on the load beams

Returns

No return value

Example

To flag all of the load beams with flag f in model m:

```
LoadBeam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load beam is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load beam

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load beam lb has flag f set on it:

```
if (lb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load beam in the model.
Note that ForEach has been designed to make looping over load beams as fast as possible and so has some limitations.
Firstly, a single temporary LoadBeam object is created and on each function call it is updated with the current load beam data. This means that you should not try to store the LoadBeam object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load beams inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load beams are in

- **func** (function)

Function to call for each load beam

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load beams in model m:

```
LoadBeam.ForEach(m, test);
function test(lb)
{
// lb is LoadBeam object
}
```

To call function test for all of the load beams in model m with optional object:

```
var data = { x:0, y:0 };
LoadBeam.ForEach(m, test, data);
function test(lb, extra)
{
// lb is LoadBeam object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of LoadBeam objects for all of the load beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load beams from

Returns

Array of LoadBeam objects

Return type

Array

Example

To make an array of LoadBeam objects for all of the load beams in model m

```
var lb = LoadBeam.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load beam.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load beam lb:

```
var comm_array = lb.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadBeam objects for all of the flagged load beams in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load beams from

- **flag** (Flag)

Flag set on the load beams that you want to retrieve

Returns

Array of LoadBeam objects

Return type

Array

Example

To make an array of LoadBeam objects for all of the load beams in model m flagged with f

```
var lb = LoadBeam.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadBeam object for a load beam ID.

Arguments

- **Model** (Model)

Model to find the load beam in

- **number** (integer)

number of the load beam you want the LoadBeam object for

Returns

LoadBeam object (or null if load beam does not exist).

Return type

LoadBeam

Example

To get the LoadBeam object for load beam 100 in model m

```
var lb = LoadBeam.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadBeam property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadBeam.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load beam property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadBeam property lb.example is a parameter:

```
Options.property_parameter_names = true;
if (lb.GetParameter(lb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadBeam property lb.example is a parameter by using the GetParameter method:

```
if (lb.ViewParameters().GetParameter(lb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this load beam (*LOAD_BEAM_xxxx). **Note that a carriage return is not added**. See also LoadBeam.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for load beam lb:

```
var key = lb.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the load beam. **Note that a carriage return is not added**. See also LoadBeam.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for load beam lb:

```
var cards = lb.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load beam in the model.

Arguments

- **Model** (Model)

Model to get last load beam in

Returns

LoadBeam object (or null if there are no load beams in the model).

Return type

LoadBeam

Example

To get the last load beam in model m:

```
var lb = LoadBeam.Last(m);
```

Next()

Description

Returns the next load beam in the model.

Arguments

No arguments

Returns

LoadBeam object (or null if there are no more load beams in the model).

Return type

LoadBeam

Example

To get the load beam in model m after load beam lb:

```
var lb = lb.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load beam.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load beams from that model can be picked. If the argument is a Flag then only load beams that are flagged with *limit* can be selected. If omitted, or null, any load beams from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadBeam object (or null if not picked)

Return type

LoadBeam

Example

To pick a load beam from model m giving the prompt 'Pick load beam from screen':

```
var lb = LoadBeam.Pick('Pick load beam from screen', m);
```

Previous()

Description

Returns the previous load beam in the model.

Arguments

No arguments

Returns

LoadBeam object (or null if there are no more load beams in the model).

Return type

LoadBeam

Example

To get the load beam in model m before load beam lb:

```
var lb = lb.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load beams using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load beams

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load beams from that model can be selected. If the argument is a Flag then only load beams that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load beams can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load beams selected or null if menu cancelled

Return type

Number

Example

To select load beams from model m, flagging those selected with flag f, giving the prompt 'Select load beams':

```
LoadBeam.Select(f, 'Select load beams', m);
```

To select load beams, flagging those selected with flag f but limiting selection to load beams flagged with flag l, giving the prompt 'Select load beams':

```
LoadBeam.Select(f, 'Select load beams', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load beam.

Arguments

- **flag** (Flag)

Flag to set on the load beam

Returns

No return value

Example

To set flag f for load beam lb:

```
lb.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load beam. The load beam will be sketched until you either call LoadBeam.Unsketch(), LoadBeam.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load beam is sketched. If omitted redraw is true. If you want to sketch several load beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load beam lb:

```
lb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load beams in the model. The load beams will be sketched until you either call LoadBeam.Unsketch(), LoadBeam.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load beams will be sketched in

- **flag** (Flag)

Flag set on the load beams that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load beams are sketched. If omitted redraw is true. If you want to sketch flagged load beams several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load beams flagged with flag in model m:

```
LoadBeam.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load beams in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load beams should be counted. If false or omitted referenced but undefined load beams will also be included in the total.

Returns

number of load beams

Return type

Number

Example

To get the total number of load beams in model m:

```
var total = LoadBeam.Total(m);
```

Unblank()

Description

Unblanks the load beam

Arguments

No arguments

Returns

No return value

Example

To unblank load beam lb:

```
lb.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load beams in the model.

Arguments

- **Model** (Model)

Model that all load beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load beams in model m:

```
LoadBeam.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load beams in the model.

Arguments

- **Model** (Model)

Model that the flagged load beams will be unblanked in

- **flag** (Flag)

Flag set on the load beams that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load beams in model m flagged with f:

```
LoadBeam.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load beams in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load beams will be unset in

- **flag** (Flag)

Flag to unset on the load beams

Returns

No return value

Example

To unset the flag f on all the load beams in model m:

```
LoadBeam.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load beam.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load beam is unsketched. If omitted redraw is true. If you want to unsketch several load beams and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load beam lb:

```
lb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load beams.

Arguments

- **Model** (Model)

Model that all load beams will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load beams in model m:

```
LoadBeam.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load beams in the model.

Arguments

- **Model** (Model)

Model that all load beams will be unsketched in

- **flag** (Flag)

Flag set on the load beams that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load beams are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load beams flagged with flag in model m:

```
LoadBeam.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadBeam object.

Return type

LoadBeam

Example

To check if LoadBeam property lb.example is a parameter by using the LoadBeam.GetParameter() method:

```
if (lb.ViewParameters().GetParameter(lb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load beam. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load beam lb:

```
lb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load beam.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load beam lb:

```
var xrefs = lb.Xrefs();
```

---

toString()

Description

Creates a string containing the load beam data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadBeam.Keyword() and LoadBeam.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for load beam lb in keyword format

```
var s = lb.toString();
```

LoadBody class

The LoadBody class gives you access to *LOAD_BODY cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadBody properties

Name	Type	Description
parts	Object	*LOAD_BODY_PARTS card
rx	Object	*LOAD_BODY_RX card
ry	Object	*LOAD_BODY_RY card
rz	Object	*LOAD_BODY_RZ card
vector	Object	*LOAD_BODY_VECTOR card
x	Object	*LOAD_BODY_X card
y	Object	*LOAD_BODY_Y card
z	Object	*LOAD_BODY_Z card

Properties for *LOAD_BODY_PARTS

Name	Type	Description
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
psid	integer	Part set id

Properties for *LOAD_BODY_RX

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_RY

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_RZ

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_VECTOR

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
v1	real	X-component of Vector
v2	real	Y-component of Vector
v3	real	Z-component of Vector
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_X

Name	Type	Description

cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_Y

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Properties for *LOAD_BODY_Z

Name	Type	Description
cid	integer	Coordinate system
exists	logical	true if LoadBody card exists
include	integer	The Include file number that the LoadBody card is in
lcid	integer	Load curve ID
lciddr	integer	Load curve ID for dynamic relaxation
sf	real	Load curve scale factor
xc	real	X centre of rotation
yc	real	Y centre of rotation
zc	real	Z centre of rotation

Detailed Description

The LoadBody class allows you to create, modify, edit and manipulate *LOAD_BODY cards. Unlike other classes there is no constructor and there are no functions. Instead a LoadBody object is available as the loadBody property of a Model object. This object allows you to access all of the *LOAD_BODY cards.
For example, to activate *LOAD_BODY_X in model m and set lcid to 1.

```
m.loadBody.x.exists = true;
m.loadBody.x.lcid = 1;
```

See the properties for more details.

LoadBodyGeneralized class

The LoadBodyGeneralized class gives you access to define load body generalized cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- toString()

LoadBodyGeneralized constants

Name	Description

LoadBodyGeneralized.NODE	Load is *LOAD_BODY_GENERALIZED.
LoadBodyGeneralized.SET_NODE	Load is *LOAD_BODY_GENERALIZED_SET_NODE.
LoadBodyGeneralized.SET_PART	LOAD is *LOAD_BODY_GENERALIZED_SET_PART.

LoadBodyGeneralized properties

Name	Type	Description
angtyp	string	Type of body loads
ax	real	Scale factor for acceleration in x-direction
ay	real	Scale factor for acceleration in y-direction
az	real	Scale factor for acceleration in z-direction
cid	integer	Coordinate system ID to define acceleration
drlcid	real	Curve ID for dynamic relaxation phase
exists (read only)	logical	true if load body generalized exists, false if referred to but not defined.
include	integer	The Include file number that the load body generalized is in.
lcid	integer	Curve ID
model (read only)	integer	The Model number that the load body generalized is in.
n1	integer	Beginning Node ID for body force load or the node or Part set ID
n2	integer	Ending Node ID for body force load. Set to zero if a set ID is defined
omx	real	Scale factor for x-angular velocity or acceleration
omy	real	Scale factor for y-angular velocity or acceleration
omz	real	Scale factor for z-angular velocity or acceleration
type	constant	The Load Node type, can be LoadBodyGeneralized.NODE or LoadBodyGeneralized.SET_NODE or LoadBodyGeneralized.SET_PART.
xc	real	X-center of rotation
yc	real	Y-center of rotation
zc	real	Z-center of rotation

Detailed Description

The LoadBodyGeneralized class allows you to create, modify, edit and manipulate load body generalized cards. See the documentation below for more details.

Constructor

new LoadBodyGeneralized(Model*[Model]*, type*[constant]*, n1*[integer]*, n2*[integer]*, lcid*[integer]*, drlcid (optional)*[integer]*, xc (optional)*[real]*, yc (optional)*[real]*, zc (optional)*[real]*, ax (optional)*[real]*, ay (optional)*[real]*, az (optional)*[real]*, omx (optional)*[real]*, omy (optional)*[real]*, omz (optional)*[real]*, cid (optional)*[integer]*, angtyp (optional)*[string]*)

Description

Create a new LoadBodyGeneralized object.

Arguments

- **Model** (Model)

Model that load body generalized will be created in

- **type** (constant)

Specify the type of load body generalized (Can be LoadBodyGeneralized.NODE or LoadBodyGeneralized.SET_NODE or LoadBodyGeneralized.SET_PART)

- **n1** (integer)

Beginning Node ID for body force load or the node or Part set ID

- **n2** (integer)

Ending Node ID for body force load. Set to zero if a set ID is defined

- **lcid** (integer)

Curve ID

- **drlcid (optional)** (integer)

Curve ID for dynamic relaxation phase

- **xc (optional)** (real)

X-center of rotation

- **yc (optional)** (real)

Y-center of rotation

- **zc (optional)** (real)

Z-center of rotation

- **ax (optional)** (real)

Scale factor for acceleration in x-direction

- **ay (optional)** (real)

Scale factor for acceleration in y-direction

- **az (optional)** (real)

Scale factor for acceleration in z-direction

- **omx (optional)** (real)

Scale factor for x-angular velocity or acceleration

- **omy (optional)** (real)

Scale factor for y-angular velocity or acceleration

- **omz (optional)** (real)

Scale factor for z-angular velocity or acceleration

- **cid (optional)** (integer)

Coordinate system ID to define acceleration

- **angtyp (optional)** (string)

Type of body loads

Returns

LoadBodyGeneralized object

Return type

LoadBodyGeneralized

Example

To create a new load body generalized in model m, of type SET_NODE, with LCID 9 and N2 is 2

```
var b = new LoadBodyGeneralized(m, LoadBodyGeneralized.SET_NODE, 100, 2, 9);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a load body generalized.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load body generalized

Returns

No return value

Example

To associate comment c to the load body generalized lbg:

```
lbg.AssociateComment(c);
```

Blank()

Description

Blanks the load body generalized

Arguments

No arguments

Returns

No return value

Example

To blank load body generalized lbg:

```
lbg.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that all load body generalizeds will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load body generalizeds in model m:

```
LoadBodyGeneralized.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that all the flagged load body generalizeds will be blanked in

- **flag** (Flag)

Flag set on the load body generalizeds that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load body generalizeds in model m flagged with f:

```
LoadBodyGeneralized.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load body generalized is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load body generalized lbg is blanked:

```
if (lbg.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load body generalized.

Arguments

- **flag** (Flag)

Flag to clear on the load body generalized

Returns

No return value

Example

To clear flag f for load body generalized lbg:

```
lbg.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load body generalized. The target include of the copied load body generalized can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadBodyGeneralized object

Return type

LoadBodyGeneralized

Example

To copy load body generalized lbg into load body generalized z:

```
var z = lbg.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load body generalized.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load body generalized

Returns

No return value

Example

To detach comment c from the load body generalized lbg:

```
lbg.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load body generalized. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load body generalized lbg:

```
lbg.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load body generalized in the model.

Arguments

- **Model** (Model)

Model to get first load body generalized in

Returns

LoadBodyGeneralized object (or null if there are no load body generalizeds in the model).

Return type

LoadBodyGeneralized

Example

To get the first load body generalized in model m:

```
var lbg = LoadBodyGeneralized.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load body generalizeds in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load body generalizeds will be flagged in

- **flag** (Flag)

Flag to set on the load body generalizeds

Returns

No return value

Example

To flag all of the load body generalizeds with flag f in model m:

```
LoadBodyGeneralized.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load body generalized is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load body generalized

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load body generalized lbg has flag f set on it:

```
if (lbg.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load body generalized in the model.
Note that ForEach has been designed to make looping over load body generalizeds as fast as possible and so has some limitations.
Firstly, a single temporary LoadBodyGeneralized object is created and on each function call it is updated with the current load body generalized data. This means that you should not try to store the LoadBodyGeneralized object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load body generalizeds inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load body generalizeds are in

- **func** (function)

Function to call for each load body generalized

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load body generalizeds in model m:

```
LoadBodyGeneralized.ForEach(m, test);
function test(lbg)
{
// lbg is LoadBodyGeneralized object
}
```

To call function test for all of the load body generalizeds in model m with optional object:

```
var data = { x:0, y:0 };
LoadBodyGeneralized.ForEach(m, test, data);
function test(lbg, extra)
{
// lbg is LoadBodyGeneralized object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of LoadBodyGeneralized objects for all of the load body generalizeds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load body generalizeds from

Returns

Array of LoadBodyGeneralized objects

Return type

Array

Example

To make an array of LoadBodyGeneralized objects for all of the load body generalizeds in model m

```
var lbg = LoadBodyGeneralized.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load body generalized.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load body generalized lbg:

```
var comm_array = lbg.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadBodyGeneralized objects for all of the flagged load body generalizeds in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load body generalizeds from

- **flag** (Flag)

Flag set on the load body generalizeds that you want to retrieve

Returns

Array of LoadBodyGeneralized objects

Return type

Array

Example

To make an array of LoadBodyGeneralized objects for all of the load body generalizeds in model m flagged with f

```
var lbg = LoadBodyGeneralized.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadBodyGeneralized object for a load body generalized ID.

Arguments

- **Model** (Model)

Model to find the load body generalized in

- **number** (integer)

number of the load body generalized you want the LoadBodyGeneralized object for

Returns

LoadBodyGeneralized object (or null if load body generalized does not exist).

Return type

LoadBodyGeneralized

Example

To get the LoadBodyGeneralized object for load body generalized 100 in model m

```
var lbg = LoadBodyGeneralized.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadBodyGeneralized property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadBodyGeneralized.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load body generalized property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadBodyGeneralized property lbg.example is a parameter:

```
Options.property_parameter_names = true;
if (lbg.GetParameter(lbg.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadBodyGeneralized property lbg.example is a parameter by using the GetParameter method:

```
if (lbg.ViewParameters().GetParameter(lbg.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this load body generalized (*LOAD_NODE_xxxx). **Note that a carriage return is not added**. See also LoadBodyGeneralized.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for load body generalized m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the load body generalized. **Note that a carriage return is not added**. See also LoadBodyGeneralized.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for load body generalized l:

```
var cards = l.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load body generalized in the model.

Arguments

- **Model** (Model)

Model to get last load body generalized in

Returns

LoadBodyGeneralized object (or null if there are no load body generalizeds in the model).

Return type

LoadBodyGeneralized

Example

To get the last load body generalized in model m:

```
var lbg = LoadBodyGeneralized.Last(m);
```

Next()

Description

Returns the next load body generalized in the model.

Arguments

No arguments

Returns

LoadBodyGeneralized object (or null if there are no more load body generalizeds in the model).

Return type

LoadBodyGeneralized

Example

To get the load body generalized in model m after load body generalized lbg:

```
var lbg = lbg.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load body generalized.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load body generalizeds from that model can be picked. If the argument is a Flag then only load body generalizeds that are flagged with *limit* can be selected. If omitted, or null, any load body generalizeds from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadBodyGeneralized object (or null if not picked)

Return type

LoadBodyGeneralized

Example

To pick a load body generalized from model m giving the prompt 'Pick load body generalized from screen':

```
var lbg = LoadBodyGeneralized.Pick('Pick load body generalized from screen', m);
```

Previous()

Description

Returns the previous load body generalized in the model.

Arguments

No arguments

Returns

LoadBodyGeneralized object (or null if there are no more load body generalizeds in the model).

Return type

LoadBodyGeneralized

Example

To get the load body generalized in model m before load body generalized lbg:

```
var lbg = lbg.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load body generalizeds using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load body generalizeds

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load body generalizeds from that model can be selected. If the argument is a Flag then only load body generalizeds that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load body generalizeds can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load body generalizeds selected or null if menu cancelled

Return type

Number

Example

To select load body generalizeds from model m, flagging those selected with flag f, giving the prompt 'Select load body generalizeds':

```
LoadBodyGeneralized.Select(f, 'Select load body generalizeds', m);
```

To select load body generalizeds, flagging those selected with flag f but limiting selection to load body generalizeds flagged with flag l, giving the prompt 'Select load body generalizeds':

```
LoadBodyGeneralized.Select(f, 'Select load body generalizeds', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load body generalized.

Arguments

- **flag** (Flag)

Flag to set on the load body generalized

Returns

No return value

Example

To set flag f for load body generalized lbg:

```
lbg.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load body generalized. The load body generalized will be sketched until you either call LoadBodyGeneralized.Unsketch(), LoadBodyGeneralized.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load body generalized is sketched. If omitted redraw is true. If you want to sketch several load body generalizeds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load body generalized lbg:

```
lbg.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load body generalizeds in the model. The load body generalizeds will be sketched until you either call LoadBodyGeneralized.Unsketch(), LoadBodyGeneralized.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load body generalizeds will be sketched in

- **flag** (Flag)

Flag set on the load body generalizeds that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load body generalizeds are sketched. If omitted redraw is true. If you want to sketch flagged load body generalizeds several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load body generalizeds flagged with flag in model m:

```
LoadBodyGeneralized.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load body generalizeds in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load body generalizeds should be counted. If false or omitted referenced but undefined load body generalizeds will also be included in the total.

Returns

number of load body generalizeds

Return type

Number

Example

To get the total number of load body generalizeds in model m:

```
var total = LoadBodyGeneralized.Total(m);
```

Unblank()

Description

Unblanks the load body generalized

Arguments

No arguments

Returns

No return value

Example

To unblank load body generalized lbg:

```
lbg.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that all load body generalizeds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load body generalizeds in model m:

```
LoadBodyGeneralized.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that the flagged load body generalizeds will be unblanked in

- **flag** (Flag)

Flag set on the load body generalizeds that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load body generalizeds in model m flagged with f:

```
LoadBodyGeneralized.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load body generalizeds will be unset in

- **flag** (Flag)

Flag to unset on the load body generalizeds

Returns

No return value

Example

To unset the flag f on all the load body generalizeds in model m:

```
LoadBodyGeneralized.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load body generalized.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load body generalized is unsketched. If omitted redraw is true. If you want to unsketch several load body generalizeds and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load body generalized lbg:

```
lbg.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load body generalizeds.

Arguments

- **Model** (Model)

Model that all load body generalizeds will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load body generalizeds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load body generalizeds in model m:

```
LoadBodyGeneralized.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load body generalizeds in the model.

Arguments

- **Model** (Model)

Model that all load body generalizeds will be unsketched in

- **flag** (Flag)

Flag set on the load body generalizeds that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load body generalizeds are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load body generalizeds flagged with flag in model m:

```
LoadBodyGeneralized.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadBodyGeneralized object.

Return type

LoadBodyGeneralized

Example

To check if LoadBodyGeneralized property lbg.example is a parameter by using the LoadBodyGeneralized.GetParameter() method:

```
if (lbg.ViewParameters().GetParameter(lbg.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load body generalized. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load body generalized lbg:

```
lbg.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load body generalized.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load body generalized lbg:

```
var xrefs = lbg.Xrefs();
```

---

toString()

Description

Creates a string containing the load body generalized data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadBodyGeneralized.Keyword() and LoadBodyGeneralized.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for load body generalized l in keyword format

```
var s = l.toString();
```

LoadGravity class

The LoadGravity class gives you access to define *LOAD_GRAVITY_PART cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadGravity constants

Name	Description
LoadGravity.PART	LOAD is *LOAD_GRAVITY_PART.

LoadGravity.SET_PART	LOAD is *LOAD_GRAVITY_PART_SET.

LoadGravity properties

Name	Type	Description
accel	real	Acceleration (will be multiplied by factor from curve)
dof	integer	Direction: enter 1, 2 or 3 for x, y, or z
exists (read only)	logical	true if LoadGravity exists, false if referred to but not defined.
include	integer	The Include file number that the LoadGravity is in.
lc	integer	Curve ID. Load curve defining factor vs. time (or zero if STGA, STGR are defined)
lcdr	integer	Curve ID. Load curve defining factor vs. time during dynamic relaxation
model (read only)	integer	The Model number that the load gravity is in.
pid	integer	Part ID or Part set ID
stga	integer	Construction Stages ID at which part is added (optional)
stgr	integer	Construction Stages ID at which part is removed (optional)
type	constant	The Load Gravity type. Can be LoadGravity.PART or LoadGravity.SET_PART.

Detailed Description

The LoadGravity class allows you to create, modify, edit and manipulate *LOAD_GRAVITY_PART cards. See the documentation below for more details.

Constructor

new LoadGravity(Model*[Model]*, type*[constant]*, pid*[integer]*, dof*[integer]*, lc*[integer]*, accel*[real]*, lcdr*[integer]*, stga (optional)*[integer]*, stgr (optional)*[integer]*)

Description

Create a new LoadGravity object.

Arguments

- **Model** (Model)

Model that LoadGravity will be created in

- **type** (constant)

Specify the type of LoadGravity (Can be LoadGravity.PART or LoadGravity.SET_PART

- **pid** (integer)

Part ID or Part set ID

- **dof** (integer)

Direction: enter 1, 2 or 3 for x, y or z

- **lc** (integer)

Curve ID. Load curve defining factor vs. time (or zero if STGA, STGR are defined)

- **accel** (real)

Acceleration (will be multiplied by factor from curve)

- **lcdr** (integer)

Curve ID. Load curve defining factor vs. time during dynamic relaxation

- **stga (optional)** (integer)

Construction Stage ID at which part is added

- **stgr (optional)** (integer)

Construction Stage ID at which part is removed

Returns

LoadGravity object

Return type

LoadGravity

Example

To create a new load gravity in model m, of type SET, with dof 2, loadcurve 9, acceleration of 0.5, and lcdr 10

```
var lg = new LoadGravity(m, LoadGravity.PART, 100, 2, 9, 0.5, 10);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a load gravity.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load gravity

Returns

No return value

Example

To associate comment c to the load gravity lg:

```
lg.AssociateComment(c);
```

Blank()

Description

Blanks the load gravity

Arguments

No arguments

Returns

No return value

Example

To blank load gravity lg:

```
lg.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load gravitys in the model.

Arguments

- **Model** (Model)

Model that all load gravitys will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load gravitys in model m:

```
LoadGravity.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load gravitys in the model.

Arguments

- **Model** (Model)

Model that all the flagged load gravitys will be blanked in

- **flag** (Flag)

Flag set on the load gravitys that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load gravitys in model m flagged with f:

```
LoadGravity.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load gravity is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load gravity lg is blanked:

```
if (lg.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load gravity.

Arguments

- **flag** (Flag)

Flag to clear on the load gravity

Returns

No return value

Example

To clear flag f for load gravity lg:

```
lg.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load gravity. The target include of the copied load gravity can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadGravity object

Return type

LoadGravity

Example

To copy load gravity lg into load gravity z:

```
var z = lg.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load gravity.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load gravity

Returns

No return value

Example

To detach comment c from the load gravity lg:

```
lg.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load gravity. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load gravity lg:

```
lg.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load gravity in the model.

Arguments

- **Model** (Model)

Model to get first load gravity in

Returns

LoadGravity object (or null if there are no load gravitys in the model).

Return type

LoadGravity

Example

To get the first load gravity in model m:

```
var lg = LoadGravity.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load gravitys in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load gravitys will be flagged in

- **flag** (Flag)

Flag to set on the load gravitys

Returns

No return value

Example

To flag all of the load gravitys with flag f in model m:

```
LoadGravity.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load gravity is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load gravity

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load gravity lg has flag f set on it:

```
if (lg.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load gravity in the model.
Note that ForEach has been designed to make looping over load gravitys as fast as possible and so has some limitations.
Firstly, a single temporary LoadGravity object is created and on each function call it is updated with the current load gravity data. This means that you should not try to store the LoadGravity object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load gravitys inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load gravitys are in

- **func** (function)

Function to call for each load gravity

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load gravitys in model m:

```
LoadGravity.ForEach(m, test);
function test(lg)
{
// lg is LoadGravity object
}
```

To call function test for all of the load gravitys in model m with optional object:

```
var data = { x:0, y:0 };
LoadGravity.ForEach(m, test, data);
function test(lg, extra)
{
// lg is LoadGravity object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of LoadGravity objects for all of the load gravitys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load gravitys from

Returns

Array of LoadGravity objects

Return type

Array

Example

To make an array of LoadGravity objects for all of the load gravitys in model m

```
var lg = LoadGravity.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load gravity.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load gravity lg:

```
var comm_array = lg.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadGravity objects for all of the flagged load gravitys in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load gravitys from

- **flag** (Flag)

Flag set on the load gravitys that you want to retrieve

Returns

Array of LoadGravity objects

Return type

Array

Example

To make an array of LoadGravity objects for all of the load gravitys in model m flagged with f

```
var lg = LoadGravity.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadGravity object for a load gravity ID.

Arguments

- **Model** (Model)

Model to find the load gravity in

- **number** (integer)

number of the load gravity you want the LoadGravity object for

Returns

LoadGravity object (or null if load gravity does not exist).

Return type

LoadGravity

Example

To get the LoadGravity object for load gravity 100 in model m

```
var lg = LoadGravity.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadGravity property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadGravity.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load gravity property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadGravity property lg.example is a parameter:

```
Options.property_parameter_names = true;
if (lg.GetParameter(lg.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadGravity property lg.example is a parameter by using the GetParameter method:

```
if (lg.ViewParameters().GetParameter(lg.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this LoadGravity (*LOAD_GRAVITY_PART). **Note that a carriage return is not added**. See also LoadGravity.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for LoadGravity lg:

```
var key = lg.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the LoadGravity. **Note that a carriage return is not added**. See also LoadGravity.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for LoadGravity lg:

```
var cards = lg.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load gravity in the model.

Arguments

- **Model** (Model)

Model to get last load gravity in

Returns

LoadGravity object (or null if there are no load gravitys in the model).

Return type

LoadGravity

Example

To get the last load gravity in model m:

```
var lg = LoadGravity.Last(m);
```

Next()

Description

Returns the next load gravity in the model.

Arguments

No arguments

Returns

LoadGravity object (or null if there are no more load gravitys in the model).

Return type

LoadGravity

Example

To get the load gravity in model m after load gravity lg:

```
var lg = lg.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load gravity.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load gravitys from that model can be picked. If the argument is a Flag then only load gravitys that are flagged with *limit* can be selected. If omitted, or null, any load gravitys from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadGravity object (or null if not picked)

Return type

LoadGravity

Example

To pick a load gravity from model m giving the prompt 'Pick load gravity from screen':

```
var lg = LoadGravity.Pick('Pick load gravity from screen', m);
```

Previous()

Description

Returns the previous load gravity in the model.

Arguments

No arguments

Returns

LoadGravity object (or null if there are no more load gravitys in the model).

Return type

LoadGravity

Example

To get the load gravity in model m before load gravity lg:

```
var lg = lg.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load gravitys using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load gravitys

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load gravitys from that model can be selected. If the argument is a Flag then only load gravitys that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load gravitys can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load gravitys selected or null if menu cancelled

Return type

Number

Example

To select load gravitys from model m, flagging those selected with flag f, giving the prompt 'Select load gravitys':

```
LoadGravity.Select(f, 'Select load gravitys', m);
```

To select load gravitys, flagging those selected with flag f but limiting selection to load gravitys flagged with flag l, giving the prompt 'Select load gravitys':

```
LoadGravity.Select(f, 'Select load gravitys', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load gravity.

Arguments

- **flag** (Flag)

Flag to set on the load gravity

Returns

No return value

Example

To set flag f for load gravity lg:

```
lg.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load gravity. The load gravity will be sketched until you either call LoadGravity.Unsketch(), LoadGravity.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load gravity is sketched. If omitted redraw is true. If you want to sketch several load gravitys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load gravity lg:

```
lg.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load gravitys in the model. The load gravitys will be sketched until you either call LoadGravity.Unsketch(), LoadGravity.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load gravitys will be sketched in

- **flag** (Flag)

Flag set on the load gravitys that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load gravitys are sketched. If omitted redraw is true. If you want to sketch flagged load gravitys several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load gravitys flagged with flag in model m:

```
LoadGravity.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load gravitys in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load gravitys should be counted. If false or omitted referenced but undefined load gravitys will also be included in the total.

Returns

number of load gravitys

Return type

Number

Example

To get the total number of load gravitys in model m:

```
var total = LoadGravity.Total(m);
```

Unblank()

Description

Unblanks the load gravity

Arguments

No arguments

Returns

No return value

Example

To unblank load gravity lg:

```
lg.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load gravitys in the model.

Arguments

- **Model** (Model)

Model that all load gravitys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load gravitys in model m:

```
LoadGravity.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load gravitys in the model.

Arguments

- **Model** (Model)

Model that the flagged load gravitys will be unblanked in

- **flag** (Flag)

Flag set on the load gravitys that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load gravitys in model m flagged with f:

```
LoadGravity.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load gravitys in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load gravitys will be unset in

- **flag** (Flag)

Flag to unset on the load gravitys

Returns

No return value

Example

To unset the flag f on all the load gravitys in model m:

```
LoadGravity.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load gravity.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load gravity is unsketched. If omitted redraw is true. If you want to unsketch several load gravitys and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load gravity lg:

```
lg.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load gravitys.

Arguments

- **Model** (Model)

Model that all load gravitys will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load gravitys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load gravitys in model m:

```
LoadGravity.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load gravitys in the model.

Arguments

- **Model** (Model)

Model that all load gravitys will be unsketched in

- **flag** (Flag)

Flag set on the load gravitys that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load gravitys are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load gravitys flagged with flag in model m:

```
LoadGravity.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadGravity object.

Return type

LoadGravity

Example

To check if LoadGravity property lg.example is a parameter by using the LoadGravity.GetParameter() method:

```
if (lg.ViewParameters().GetParameter(lg.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load gravity. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load gravity lg:

```
lg.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load gravity.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load gravity lg:

```
var xrefs = lg.Xrefs();
```

---

toString()

Description

Creates a string containing the LoadGravity data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadGravity.Keyword() and LoadGravity.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for LoadGravity lg in keyword format

```
var s = lg.toString();
```

LoadNode class

The LoadNode class gives you access to define load node cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadNode constants

Name	Description
LoadNode.POINT	Load is *LOAD_NODE_POINT.

LoadNode.SET	LOAD is *LOAD_NODE_SET.
LoadNode.SET_ONCE	LOAD is *LOAD_NODE_SET_ONCE.

LoadNode properties

Name	Type	Description
cid	integer	Coordinate system ID
dof	integer	Applicable degrees-of-freedom
exists (read only)	logical	true if load node exists, false if referred to but not defined.
include	integer	The Include file number that the load node is in.
lcid	integer	Curve ID
m1	integer	Node 1 ID
m2	integer	Node 2 ID
m3	integer	Node 3 ID
model (read only)	integer	The Model number that the load node is in.
nid	integer	Node ID or node set ID
sf	real	Curve scale factor
type	constant	The Load Node type. Can be LoadNode.POINT or LoadNode.SET. LoadNode.SET_ONCE.

Detailed Description

The LoadNode class allows you to create, modify, edit and manipulate load node cards. See the documentation below for more details.

Constructor

new LoadNode(Model*[Model]*, type*[constant]*, nid*[integer]*, dof*[integer]*, lcid*[integer]*, sf (optional)*[real]*, cid (optional)*[integer]*, m1 (optional)*[integer]*, m2 (optional)*[integer]*, m3 (optional)*[integer]*, lcidsf (optional)*[integer]*)

Description

Create a new LoadNode object.

Arguments

- **Model** (Model)

Model that load node will be created in

- **type** (constant)

Specify the type of load node (Can be LoadNode.POINT or LoadNode.SET) LoadNode.SET_ONCE)

- **nid** (integer)

Node ID or node set ID

- **dof** (integer)

Applicable degrees-of-freedom

- **lcid** (integer)

Curve ID

- **sf (optional)** (real)

Curve scale factor

- **cid (optional)** (integer)

Coordinate system ID

- **m1 (optional)** (integer)

Node 1 ID

- **m2 (optional)** (integer)

Node 2 ID

- **m3 (optional)** (integer)

Node 3 ID

- **lcidsf (optional)** (integer)

Curve ID

Returns

LoadNode object

Return type

LoadNode

Example

To create a new load node in model m, of type SET, with loadcurve 9 and a scale factor of 0.5

```
var b = new LoadNode(m, LoadNode.SET, 100, 2, 9, 0.5);
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a load node.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load node

Returns

No return value

Example

To associate comment c to the load node ln:

```
ln.AssociateComment(c);
```

Blank()

Description

Blanks the load node

Arguments

No arguments

Returns

No return value

Example

To blank load node ln:

```
ln.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load nodes in the model.

Arguments

- **Model** (Model)

Model that all load nodes will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load nodes in model m:

```
LoadNode.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load nodes in the model.

Arguments

- **Model** (Model)

Model that all the flagged load nodes will be blanked in

- **flag** (Flag)

Flag set on the load nodes that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load nodes in model m flagged with f:

```
LoadNode.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load node is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load node ln is blanked:

```
if (ln.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load node.

Arguments

- **flag** (Flag)

Flag to clear on the load node

Returns

No return value

Example

To clear flag f for load node ln:

```
ln.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load node. The target include of the copied load node can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadNode object

Return type

LoadNode

Example

To copy load node ln into load node z:

```
var z = ln.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load node.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load node

Returns

No return value

Example

To detach comment c from the load node ln:

```
ln.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load node. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load node ln:

```
ln.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load node in the model.

Arguments

- **Model** (Model)

Model to get first load node in

Returns

LoadNode object (or null if there are no load nodes in the model).

Return type

LoadNode

Example

To get the first load node in model m:

```
var ln = LoadNode.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load nodes in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load nodes will be flagged in

- **flag** (Flag)

Flag to set on the load nodes

Returns

No return value

Example

To flag all of the load nodes with flag f in model m:

```
LoadNode.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load node is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load node

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load node ln has flag f set on it:

```
if (ln.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load node in the model.
Note that ForEach has been designed to make looping over load nodes as fast as possible and so has some limitations.
Firstly, a single temporary LoadNode object is created and on each function call it is updated with the current load node data. This means that you should not try to store the LoadNode object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load nodes inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load nodes are in

- **func** (function)

Function to call for each load node

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load nodes in model m:

```
LoadNode.ForEach(m, test);
function test(ln)
{
// ln is LoadNode object
}
```

To call function test for all of the load nodes in model m with optional object:

```
var data = { x:0, y:0 };
LoadNode.ForEach(m, test, data);
function test(ln, extra)
{
// ln is LoadNode object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of LoadNode objects for all of the load nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load nodes from

Returns

Array of LoadNode objects

Return type

Array

Example

To make an array of LoadNode objects for all of the load nodes in model m

```
var ln = LoadNode.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load node.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load node ln:

```
var comm_array = ln.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadNode objects for all of the flagged load nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load nodes from

- **flag** (Flag)

Flag set on the load nodes that you want to retrieve

Returns

Array of LoadNode objects

Return type

Array

Example

To make an array of LoadNode objects for all of the load nodes in model m flagged with f

```
var ln = LoadNode.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadNode object for a load node ID.

Arguments

- **Model** (Model)

Model to find the load node in

- **number** (integer)

number of the load node you want the LoadNode object for

Returns

LoadNode object (or null if load node does not exist).

Return type

LoadNode

Example

To get the LoadNode object for load node 100 in model m

```
var ln = LoadNode.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadNode property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadNode.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load node property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadNode property ln.example is a parameter:

```
Options.property_parameter_names = true;
if (ln.GetParameter(ln.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadNode property ln.example is a parameter by using the GetParameter method:

```
if (ln.ViewParameters().GetParameter(ln.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this load node (*LOAD_NODE_xxxx). **Note that a carriage return is not added**. See also LoadNode.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for load node m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the load node. **Note that a carriage return is not added**. See also LoadNode.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for load node l:

```
var cards = l.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load node in the model.

Arguments

- **Model** (Model)

Model to get last load node in

Returns

LoadNode object (or null if there are no load nodes in the model).

Return type

LoadNode

Example

To get the last load node in model m:

```
var ln = LoadNode.Last(m);
```

Next()

Description

Returns the next load node in the model.

Arguments

No arguments

Returns

LoadNode object (or null if there are no more load nodes in the model).

Return type

LoadNode

Example

To get the load node in model m after load node ln:

```
var ln = ln.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load node.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load nodes from that model can be picked. If the argument is a Flag then only load nodes that are flagged with *limit* can be selected. If omitted, or null, any load nodes from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadNode object (or null if not picked)

Return type

LoadNode

Example

To pick a load node from model m giving the prompt 'Pick load node from screen':

```
var ln = LoadNode.Pick('Pick load node from screen', m);
```

Previous()

Description

Returns the previous load node in the model.

Arguments

No arguments

Returns

LoadNode object (or null if there are no more load nodes in the model).

Return type

LoadNode

Example

To get the load node in model m before load node ln:

```
var ln = ln.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load nodes using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load nodes

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load nodes from that model can be selected. If the argument is a Flag then only load nodes that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load nodes can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load nodes selected or null if menu cancelled

Return type

Number

Example

To select load nodes from model m, flagging those selected with flag f, giving the prompt 'Select load nodes':

```
LoadNode.Select(f, 'Select load nodes', m);
```

To select load nodes, flagging those selected with flag f but limiting selection to load nodes flagged with flag l, giving the prompt 'Select load nodes':

```
LoadNode.Select(f, 'Select load nodes', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load node.

Arguments

- **flag** (Flag)

Flag to set on the load node

Returns

No return value

Example

To set flag f for load node ln:

```
ln.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load node. The load node will be sketched until you either call LoadNode.Unsketch(), LoadNode.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load node is sketched. If omitted redraw is true. If you want to sketch several load nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load node ln:

```
ln.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load nodes in the model. The load nodes will be sketched until you either call LoadNode.Unsketch(), LoadNode.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load nodes will be sketched in

- **flag** (Flag)

Flag set on the load nodes that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load nodes are sketched. If omitted redraw is true. If you want to sketch flagged load nodes several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load nodes flagged with flag in model m:

```
LoadNode.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load nodes in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load nodes should be counted. If false or omitted referenced but undefined load nodes will also be included in the total.

Returns

number of load nodes

Return type

Number

Example

To get the total number of load nodes in model m:

```
var total = LoadNode.Total(m);
```

Unblank()

Description

Unblanks the load node

Arguments

No arguments

Returns

No return value

Example

To unblank load node ln:

```
ln.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load nodes in the model.

Arguments

- **Model** (Model)

Model that all load nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load nodes in model m:

```
LoadNode.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load nodes in the model.

Arguments

- **Model** (Model)

Model that the flagged load nodes will be unblanked in

- **flag** (Flag)

Flag set on the load nodes that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load nodes in model m flagged with f:

```
LoadNode.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load nodes in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load nodes will be unset in

- **flag** (Flag)

Flag to unset on the load nodes

Returns

No return value

Example

To unset the flag f on all the load nodes in model m:

```
LoadNode.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load node.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load node is unsketched. If omitted redraw is true. If you want to unsketch several load nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load node ln:

```
ln.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load nodes.

Arguments

- **Model** (Model)

Model that all load nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load nodes in model m:

```
LoadNode.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load nodes in the model.

Arguments

- **Model** (Model)

Model that all load nodes will be unsketched in

- **flag** (Flag)

Flag set on the load nodes that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load nodes flagged with flag in model m:

```
LoadNode.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadNode object.

Return type

LoadNode

Example

To check if LoadNode property ln.example is a parameter by using the LoadNode.GetParameter() method:

```
if (ln.ViewParameters().GetParameter(ln.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load node. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load node ln:

```
ln.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load node.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load node ln:

```
var xrefs = ln.Xrefs();
```

---

toString()

Description

Creates a string containing the load node data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadNode.Keyword() and LoadNode.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for load node l in keyword format

```
var s = l.toString();
```

LoadRemovePart class

The LoadRemovePart class gives you access to define *LOAD_REMOVE_PART cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadRemovePart constants

Name	Description
LoadRemovePart.PART	LOAD is *LOAD_REMOVE_PART.

LoadRemovePart.SET_PART	LOAD is *LOAD_REMOVE_PART_SET.

LoadRemovePart properties

Name	Type	Description
exists (read only)	logical	true if LoadRemovePart exists, false if referred to but not defined.
include	integer	The Include file number that the LoadRemovePart is in.
model (read only)	integer	The Model number that the load remove_part is in.
pid	integer	Part ID or Part Set ID
stgr	integer	Construction Stages ID at which part is removed.
time0	real	Time at which stress reduction starts.
time1	real	Time at which stresses become zero and elements are deleted.
type	constant	The Load RemovePart type. Can be LoadRemovePart.PART or LoadRemovePart.SET_PART.

Detailed Description

The LoadRemovePart class allows you to create, modify, edit and manipulate *LOAD_REMOVE_PART cards. See the documentation below for more details.

Constructor

new LoadRemovePart(Model*[Model]*, type*[constant]*, pid*[integer]*, time0 (optional)*[real]*, time1 (optional)*[real]*, stgr (optional)*[integer]*)

Description

Create a new LoadRemovePart object.

Arguments

- **Model** (Model)

Model that LoadRemovePart will be created in

- **type** (constant)

Specify the type of LoadRemovePart (Can be LoadRemovePart.PART or LoadRemovePart.SET_PART

- **pid** (integer)

Part ID or Part Set ID

- **time0 (optional)** (real)

Time at which stress reduction starts.

- **time1 (optional)** (real)

Time at which stresses become zero and elements are deleted.

- **stgr (optional)** (integer)

Construction Stage ID at which part is removed.

Returns

LoadRemovePart object

Return type

LoadRemovePart

Example

To create a new load remove_part in model m, of type PART, with pid 100, time0 2.5 and time1 4.5.

```
var l_r_p = new LoadRemovePart(m, LoadRemovePart.PART, 100, 2.5, 4.5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a load remove_part.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load remove_part

Returns

No return value

Example

To associate comment c to the load remove_part l_r_p:

```
l_r_p.AssociateComment(c);
```

Blank()

Description

Blanks the load remove_part

Arguments

No arguments

Returns

No return value

Example

To blank load remove_part l_r_p:

```
l_r_p.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load remove_parts in the model.

Arguments

- **Model** (Model)

Model that all load remove_parts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load remove_parts in model m:

```
LoadRemovePart.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load remove_parts in the model.

Arguments

- **Model** (Model)

Model that all the flagged load remove_parts will be blanked in

- **flag** (Flag)

Flag set on the load remove_parts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load remove_parts in model m flagged with f:

```
LoadRemovePart.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load remove_part is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load remove_part l_r_p is blanked:

```
if (l_r_p.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load remove_part.

Arguments

- **flag** (Flag)

Flag to clear on the load remove_part

Returns

No return value

Example

To clear flag f for load remove_part l_r_p:

```
l_r_p.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load remove_part. The target include of the copied load remove_part can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadRemovePart object

Return type

LoadRemovePart

Example

To copy load remove_part l_r_p into load remove_part z:

```
var z = l_r_p.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load remove_part.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load remove_part

Returns

No return value

Example

To detach comment c from the load remove_part l_r_p:

```
l_r_p.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load remove_part. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load remove_part l_r_p:

```
l_r_p.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load remove_part in the model.

Arguments

- **Model** (Model)

Model to get first load remove_part in

Returns

LoadRemovePart object (or null if there are no load remove_parts in the model).

Return type

LoadRemovePart

Example

To get the first load remove_part in model m:

```
var l_r_p = LoadRemovePart.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load remove_parts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load remove_parts will be flagged in

- **flag** (Flag)

Flag to set on the load remove_parts

Returns

No return value

Example

To flag all of the load remove_parts with flag f in model m:

```
LoadRemovePart.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load remove_part is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load remove_part

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load remove_part l_r_p has flag f set on it:

```
if (l_r_p.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load remove_part in the model.
Note that ForEach has been designed to make looping over load remove_parts as fast as possible and so has some limitations.
Firstly, a single temporary LoadRemovePart object is created and on each function call it is updated with the current load remove_part data. This means that you should not try to store the LoadRemovePart object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load remove_parts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load remove_parts are in

- **func** (function)

Function to call for each load remove_part

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load remove_parts in model m:

```
LoadRemovePart.ForEach(m, test);
function test(l_r_p)
{
// l_r_p is LoadRemovePart object
}
```

To call function test for all of the load remove_parts in model m with optional object:

```
var data = { x:0, y:0 };
LoadRemovePart.ForEach(m, test, data);
function test(l_r_p, extra)
{
// l_r_p is LoadRemovePart object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of LoadRemovePart objects for all of the load remove_parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load remove_parts from

Returns

Array of LoadRemovePart objects

Return type

Array

Example

To make an array of LoadRemovePart objects for all of the load remove_parts in model m

```
var l_r_p = LoadRemovePart.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load remove_part.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load remove_part l_r_p:

```
var comm_array = l_r_p.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadRemovePart objects for all of the flagged load remove_parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load remove_parts from

- **flag** (Flag)

Flag set on the load remove_parts that you want to retrieve

Returns

Array of LoadRemovePart objects

Return type

Array

Example

To make an array of LoadRemovePart objects for all of the load remove_parts in model m flagged with f

```
var l_r_p = LoadRemovePart.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadRemovePart object for a load remove_part ID.

Arguments

- **Model** (Model)

Model to find the load remove_part in

- **number** (integer)

number of the load remove_part you want the LoadRemovePart object for

Returns

LoadRemovePart object (or null if load remove_part does not exist).

Return type

LoadRemovePart

Example

To get the LoadRemovePart object for load remove_part 100 in model m

```
var l_r_p = LoadRemovePart.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadRemovePart property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadRemovePart.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load remove_part property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadRemovePart property l_r_p.example is a parameter:

```
Options.property_parameter_names = true;
if (l_r_p.GetParameter(l_r_p.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadRemovePart property l_r_p.example is a parameter by using the GetParameter method:

```
if (l_r_p.ViewParameters().GetParameter(l_r_p.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this LoadRemovePart (*LOAD_REMOVE_PART). **Note that a carriage return is not added**. See also LoadRemovePart.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for LoadRemovePart l_r_p:

```
var key = l_r_p.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the LoadRemovePart. **Note that a carriage return is not added**. See also LoadRemovePart.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for LoadRemovePart l_r_p:

```
var cards = l_r_p.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load remove_part in the model.

Arguments

- **Model** (Model)

Model to get last load remove_part in

Returns

LoadRemovePart object (or null if there are no load remove_parts in the model).

Return type

LoadRemovePart

Example

To get the last load remove_part in model m:

```
var l_r_p = LoadRemovePart.Last(m);
```

Next()

Description

Returns the next load remove_part in the model.

Arguments

No arguments

Returns

LoadRemovePart object (or null if there are no more load remove_parts in the model).

Return type

LoadRemovePart

Example

To get the load remove_part in model m after load remove_part l_r_p:

```
var l_r_p = l_r_p.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load remove_part.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load remove_parts from that model can be picked. If the argument is a Flag then only load remove_parts that are flagged with *limit* can be selected. If omitted, or null, any load remove_parts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadRemovePart object (or null if not picked)

Return type

LoadRemovePart

Example

To pick a load remove_part from model m giving the prompt 'Pick load remove_part from screen':

```
var l_r_p = LoadRemovePart.Pick('Pick load remove_part from screen', m);
```

Previous()

Description

Returns the previous load remove_part in the model.

Arguments

No arguments

Returns

LoadRemovePart object (or null if there are no more load remove_parts in the model).

Return type

LoadRemovePart

Example

To get the load remove_part in model m before load remove_part l_r_p:

```
var l_r_p = l_r_p.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load remove_parts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load remove_parts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load remove_parts from that model can be selected. If the argument is a Flag then only load remove_parts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load remove_parts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load remove_parts selected or null if menu cancelled

Return type

Number

Example

To select load remove_parts from model m, flagging those selected with flag f, giving the prompt 'Select load remove_parts':

```
LoadRemovePart.Select(f, 'Select load remove_parts', m);
```

To select load remove_parts, flagging those selected with flag f but limiting selection to load remove_parts flagged with flag l, giving the prompt 'Select load remove_parts':

```
LoadRemovePart.Select(f, 'Select load remove_parts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load remove_part.

Arguments

- **flag** (Flag)

Flag to set on the load remove_part

Returns

No return value

Example

To set flag f for load remove_part l_r_p:

```
l_r_p.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load remove_part. The load remove_part will be sketched until you either call LoadRemovePart.Unsketch(), LoadRemovePart.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load remove_part is sketched. If omitted redraw is true. If you want to sketch several load remove_parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load remove_part l_r_p:

```
l_r_p.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load remove_parts in the model. The load remove_parts will be sketched until you either call LoadRemovePart.Unsketch(), LoadRemovePart.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load remove_parts will be sketched in

- **flag** (Flag)

Flag set on the load remove_parts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load remove_parts are sketched. If omitted redraw is true. If you want to sketch flagged load remove_parts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load remove_parts flagged with flag in model m:

```
LoadRemovePart.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load remove_parts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load remove_parts should be counted. If false or omitted referenced but undefined load remove_parts will also be included in the total.

Returns

number of load remove_parts

Return type

Number

Example

To get the total number of load remove_parts in model m:

```
var total = LoadRemovePart.Total(m);
```

Unblank()

Description

Unblanks the load remove_part

Arguments

No arguments

Returns

No return value

Example

To unblank load remove_part l_r_p:

```
l_r_p.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load remove_parts in the model.

Arguments

- **Model** (Model)

Model that all load remove_parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load remove_parts in model m:

```
LoadRemovePart.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load remove_parts in the model.

Arguments

- **Model** (Model)

Model that the flagged load remove_parts will be unblanked in

- **flag** (Flag)

Flag set on the load remove_parts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load remove_parts in model m flagged with f:

```
LoadRemovePart.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load remove_parts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load remove_parts will be unset in

- **flag** (Flag)

Flag to unset on the load remove_parts

Returns

No return value

Example

To unset the flag f on all the load remove_parts in model m:

```
LoadRemovePart.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load remove_part.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load remove_part is unsketched. If omitted redraw is true. If you want to unsketch several load remove_parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load remove_part l_r_p:

```
l_r_p.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load remove_parts.

Arguments

- **Model** (Model)

Model that all load remove_parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load remove_parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load remove_parts in model m:

```
LoadRemovePart.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load remove_parts in the model.

Arguments

- **Model** (Model)

Model that all load remove_parts will be unsketched in

- **flag** (Flag)

Flag set on the load remove_parts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load remove_parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load remove_parts flagged with flag in model m:

```
LoadRemovePart.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadRemovePart object.

Return type

LoadRemovePart

Example

To check if LoadRemovePart property l_r_p.example is a parameter by using the LoadRemovePart.GetParameter() method:

```
if (l_r_p.ViewParameters().GetParameter(l_r_p.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load remove_part. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load remove_part l_r_p:

```
l_r_p.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load remove_part.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load remove_part l_r_p:

```
var xrefs = l_r_p.Xrefs();
```

---

toString()

Description

Creates a string containing the LoadRemovePart data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadRemovePart.Keyword() and LoadRemovePart.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for LoadRemovePart l_r_p in keyword format

```
var s = l_r_p.toString();
```

LoadRigidBody class

The LoadRigidBody class gives you access to define load rigidbody cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LoadRigidBody properties

Name	Type	Description
cid	integer	Coordinate system ID

dof	integer	Applicable degrees-of-freedom
exists (read only)	logical	true if load rigidbody exists, false if referred to but not defined.
include	integer	The Include file number that the load rigidbody is in.
lcid	integer	Curve ID
m1	integer	Node 1 ID
m2	integer	Node 2 ID
m3	integer	Node 3 ID
model (read only)	integer	The Model number that the load rigidbody is in.
pid	integer	Part ID
sf	real	Curve scale factor

Detailed Description

The LoadRigidBody class allows you to create, modify, edit and manipulate load rigidbody cards. See the documentation below for more details.

Constructor

new LoadRigidBody(Model*[Model]*, pid*[integer]*, dof*[integer]*, lcid*[integer]*, sf (optional)*[real]*, cid (optional)*[integer]*, m1 (optional)*[integer]*, m2 (optional)*[integer]*, m3 (optional)*[integer]*)

Description

Create a new LoadRigidBody object.

Arguments

- **Model** (Model)

Model that load rigidbody will be created in

- **pid** (integer)

Part ID

- **dof** (integer)

Applicable degrees-of-freedom

- **lcid** (integer)

Curve ID

- **sf (optional)** (real)

Curve scale factor

- **cid (optional)** (integer)

Coordinate system ID

- **m1 (optional)** (integer)

Node 1 ID

- **m2 (optional)** (integer)

Node 2 ID

- **m3 (optional)** (integer)

Node 3 ID

Returns

LoadRigidBody object

Return type

LoadRigidBody

Example

To create a new load rigidbody in model m, for part 100, with loadcurve 9 and a scale factor of 0.5

```
var lrb = new LoadRigidBody(m, 100, 2, 9, 0.5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a load rigidbody.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load rigidbody

Returns

No return value

Example

To associate comment c to the load rigidbody lrb:

```
lrb.AssociateComment(c);
```

Blank()

Description

Blanks the load rigidbody

Arguments

No arguments

Returns

No return value

Example

To blank load rigidbody lrb:

```
lrb.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that all load rigidbodies will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load rigidbodies in model m:

```
LoadRigidBody.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that all the flagged load rigidbodies will be blanked in

- **flag** (Flag)

Flag set on the load rigidbodies that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load rigidbodies in model m flagged with f:

```
LoadRigidBody.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load rigidbody is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load rigidbody lrb is blanked:

```
if (lrb.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load rigidbody.

Arguments

- **flag** (Flag)

Flag to clear on the load rigidbody

Returns

No return value

Example

To clear flag f for load rigidbody lrb:

```
lrb.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load rigidbody. The target include of the copied load rigidbody can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadRigidBody object

Return type

LoadRigidBody

Example

To copy load rigidbody lrb into load rigidbody z:

```
var z = lrb.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load rigidbody.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load rigidbody

Returns

No return value

Example

To detach comment c from the load rigidbody lrb:

```
lrb.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load rigidbody. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load rigidbody lrb:

```
lrb.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load rigidbody in the model.

Arguments

- **Model** (Model)

Model to get first load rigidbody in

Returns

LoadRigidBody object (or null if there are no load rigidbodies in the model).

Return type

LoadRigidBody

Example

To get the first load rigidbody in model m:

```
var lrb = LoadRigidBody.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load rigidbodies in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load rigidbodies will be flagged in

- **flag** (Flag)

Flag to set on the load rigidbodies

Returns

No return value

Example

To flag all of the load rigidbodies with flag f in model m:

```
LoadRigidBody.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load rigidbody is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load rigidbody

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load rigidbody lrb has flag f set on it:

```
if (lrb.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load rigidbody in the model.
Note that ForEach has been designed to make looping over load rigidbodies as fast as possible and so has some limitations.
Firstly, a single temporary LoadRigidBody object is created and on each function call it is updated with the current load rigidbody data. This means that you should not try to store the LoadRigidBody object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load rigidbodies inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load rigidbodies are in

- **func** (function)

Function to call for each load rigidbody

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load rigidbodies in model m:

```
LoadRigidBody.ForEach(m, test);
function test(lrb)
{
// lrb is LoadRigidBody object
}
```

To call function test for all of the load rigidbodies in model m with optional object:

```
var data = { x:0, y:0 };
LoadRigidBody.ForEach(m, test, data);
function test(lrb, extra)
{
// lrb is LoadRigidBody object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of LoadRigidBody objects for all of the load rigidbodies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load rigidbodies from

Returns

Array of LoadRigidBody objects

Return type

Array

Example

To make an array of LoadRigidBody objects for all of the load rigidbodies in model m

```
var lrb = LoadRigidBody.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load rigidbody.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load rigidbody lrb:

```
var comm_array = lrb.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadRigidBody objects for all of the flagged load rigidbodies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load rigidbodies from

- **flag** (Flag)

Flag set on the load rigidbodies that you want to retrieve

Returns

Array of LoadRigidBody objects

Return type

Array

Example

To make an array of LoadRigidBody objects for all of the load rigidbodies in model m flagged with f

```
var lrb = LoadRigidBody.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadRigidBody object for a load rigidbody ID.

Arguments

- **Model** (Model)

Model to find the load rigidbody in

- **number** (integer)

number of the load rigidbody you want the LoadRigidBody object for

Returns

LoadRigidBody object (or null if load rigidbody does not exist).

Return type

LoadRigidBody

Example

To get the LoadRigidBody object for load rigidbody 100 in model m

```
var lrb = LoadRigidBody.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadRigidBody property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadRigidBody.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load rigidbody property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadRigidBody property lrb.example is a parameter:

```
Options.property_parameter_names = true;
if (lrb.GetParameter(lrb.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadRigidBody property lrb.example is a parameter by using the GetParameter method:

```
if (lrb.ViewParameters().GetParameter(lrb.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this load rigidbody (*LOAD_RIGIDBODY). **Note that a carriage return is not added**. See also LoadRigidBody.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for load rigidbody lrb:

```
var key = lrb.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the load rigidbody. **Note that a carriage return is not added**. See also LoadRigidBody.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for load rigidbody lrb:

```
var cards = lrb.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last load rigidbody in the model.

Arguments

- **Model** (Model)

Model to get last load rigidbody in

Returns

LoadRigidBody object (or null if there are no load rigidbodies in the model).

Return type

LoadRigidBody

Example

To get the last load rigidbody in model m:

```
var lrb = LoadRigidBody.Last(m);
```

Next()

Description

Returns the next load rigidbody in the model.

Arguments

No arguments

Returns

LoadRigidBody object (or null if there are no more load rigidbodies in the model).

Return type

LoadRigidBody

Example

To get the load rigidbody in model m after load rigidbody lrb:

```
var lrb = lrb.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load rigidbody.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load rigidbodies from that model can be picked. If the argument is a Flag then only load rigidbodies that are flagged with *limit* can be selected. If omitted, or null, any load rigidbodies from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadRigidBody object (or null if not picked)

Return type

LoadRigidBody

Example

To pick a load rigidbody from model m giving the prompt 'Pick load rigidbody from screen':

```
var lrb = LoadRigidBody.Pick('Pick load rigidbody from screen', m);
```

Previous()

Description

Returns the previous load rigidbody in the model.

Arguments

No arguments

Returns

LoadRigidBody object (or null if there are no more load rigidbodies in the model).

Return type

LoadRigidBody

Example

To get the load rigidbody in model m before load rigidbody lrb:

```
var lrb = lrb.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load rigidbodies using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load rigidbodies

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load rigidbodies from that model can be selected. If the argument is a Flag then only load rigidbodies that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load rigidbodies can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load rigidbodies selected or null if menu cancelled

Return type

Number

Example

To select load rigidbodies from model m, flagging those selected with flag f, giving the prompt 'Select load rigidbodies':

```
LoadRigidBody.Select(f, 'Select load rigidbodies', m);
```

To select load rigidbodies, flagging those selected with flag f but limiting selection to load rigidbodies flagged with flag l, giving the prompt 'Select load rigidbodies':

```
LoadRigidBody.Select(f, 'Select load rigidbodies', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load rigidbody.

Arguments

- **flag** (Flag)

Flag to set on the load rigidbody

Returns

No return value

Example

To set flag f for load rigidbody lrb:

```
lrb.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load rigidbody. The load rigidbody will be sketched until you either call LoadRigidBody.Unsketch(), LoadRigidBody.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load rigidbody is sketched. If omitted redraw is true. If you want to sketch several load rigidbodies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load rigidbody lrb:

```
lrb.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load rigidbodies in the model. The load rigidbodies will be sketched until you either call LoadRigidBody.Unsketch(), LoadRigidBody.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load rigidbodies will be sketched in

- **flag** (Flag)

Flag set on the load rigidbodies that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load rigidbodies are sketched. If omitted redraw is true. If you want to sketch flagged load rigidbodies several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load rigidbodies flagged with flag in model m:

```
LoadRigidBody.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load rigidbodies in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load rigidbodies should be counted. If false or omitted referenced but undefined load rigidbodies will also be included in the total.

Returns

number of load rigidbodies

Return type

Number

Example

To get the total number of load rigidbodies in model m:

```
var total = LoadRigidBody.Total(m);
```

Unblank()

Description

Unblanks the load rigidbody

Arguments

No arguments

Returns

No return value

Example

To unblank load rigidbody lrb:

```
lrb.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that all load rigidbodies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load rigidbodies in model m:

```
LoadRigidBody.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that the flagged load rigidbodies will be unblanked in

- **flag** (Flag)

Flag set on the load rigidbodies that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load rigidbodies in model m flagged with f:

```
LoadRigidBody.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load rigidbodies will be unset in

- **flag** (Flag)

Flag to unset on the load rigidbodies

Returns

No return value

Example

To unset the flag f on all the load rigidbodies in model m:

```
LoadRigidBody.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load rigidbody.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load rigidbody is unsketched. If omitted redraw is true. If you want to unsketch several load rigidbodies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load rigidbody lrb:

```
lrb.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load rigidbodies.

Arguments

- **Model** (Model)

Model that all load rigidbodies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load rigidbodies are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load rigidbodies in model m:

```
LoadRigidBody.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load rigidbodies in the model.

Arguments

- **Model** (Model)

Model that all load rigidbodies will be unsketched in

- **flag** (Flag)

Flag set on the load rigidbodies that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load rigidbodies are unsketched. If omitted redraw is true. If you want to

unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load rigidbodies flagged with flag in model m:

```
LoadRigidBody.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadRigidBody object.

Return type

LoadRigidBody

Example

To check if LoadRigidBody property lrb.example is a parameter by using the LoadRigidBody.GetParameter() method:

```
if (lrb.ViewParameters().GetParameter(lrb.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load rigidbody. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load rigidbody lrb:

```
lrb.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load rigidbody.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load rigidbody lrb:

```
var xrefs = lrb.Xrefs();
```

---

toString()

Description

Creates a string containing the load rigidbody data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadRigidBody.Keyword() and LoadRigidBody.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for load rigidbody lrb in keyword format

```
var s = lrb.toString();
```

LoadShell class

The LoadShell class gives you access to define *LOAD_SHELL cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

LoadShell constants

Name	Description
LoadShell.ELEMENT	Load is *LOAD_SHELL_ELEMENT.
LoadShell.SET	LOAD is *LOAD_SHELL_SET.

LoadShell properties

Name	Type	Description
at	real	Arrival time for pressure
eid	integer	Shell ID or shell set ID
exists (read only)	logical	true if LoadShell exists, false if referred to but not defined.
heading	string	LoadShell heading
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the LoadShell is in.
label	integer	LoadShell number.
lcid	integer	Curve ID
lsid	integer	LoadShell number (identical to label).
model (read only)	integer	The Model number that the load shell is in.
sf	real	Curve scale factor
type	constant	The Load Node type. Can be LoadShell.ELEMENT or LoadShell.SET.

Detailed Description

The LoadShell class allows you to create, modify, edit and manipulate *LOAD_SHELL cards. See the documentation below for more details.

Constructor

new LoadShell(Model*[Model]*, type*[constant]*, eid*[integer]*, lcid*[integer]*, sf (optional)*[real]*, at (optional)*[real]*, lsid (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new LoadShell object.

Arguments

- **Model** (Model)

Model that LoadShell will be created in

- **type** (constant)

Specify the type of LoadShell (Can be LoadShell.ELEMENT or LoadShell.SET)

- **eid** (integer)

Shell ID or shell set ID

- **lcid** (integer)

Curve ID

- **sf (optional)** (real)

Curve scale factor

- **at (optional)** (real)

Arrival time for pressure

- **lsid (optional)** (integer)

LoadShell number

- **heading (optional)** (string)

Title for the LoadShell

Returns

LoadShell object

Return type

LoadShell

Example

To create a new load shell in model m, of type SET, with loadcurve 9 and a scale factor of 0.5

```
var b = new LoadShell(m, LoadShell.SET, 100, 2, 9, 0.5);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a load shell.

Arguments

- **Comment** (Comment)

Comment that will be attached to the load shell

Returns

No return value

Example

To associate comment c to the load shell ls:

```
ls.AssociateComment(c);
```

Blank()

Description

Blanks the load shell

Arguments

No arguments

Returns

No return value

Example

To blank load shell ls:

```
ls.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the load shells in the model.

Arguments

- **Model** (Model)

Model that all load shells will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load shells in model m:

```
LoadShell.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged load shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged load shells will be blanked in

- **flag** (Flag)

Flag set on the load shells that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the load shells in model m flagged with f:

```
LoadShell.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the load shell is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if load shell ls is blanked:

```
if (ls.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the load shell.

Arguments

- **flag** (Flag)

Flag to clear on the load shell

Returns

No return value

Example

To clear flag f for load shell ls:

```
ls.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the load shell. The target include of the copied load shell can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

LoadShell object

Return type

LoadShell

Example

To copy load shell ls into load shell z:

```
var z = ls.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a load shell.

Arguments

- **Comment** (Comment)

Comment that will be detached from the load shell

Returns

No return value

Example

To detach comment c from the load shell ls:

```
ls.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for load shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for load shell ls:

```
ls.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first load shell in the model.

Arguments

- **Model** (Model)

Model to get first load shell in

Returns

LoadShell object (or null if there are no load shells in the model).

Return type

LoadShell

Example

To get the first load shell in model m:

```
var ls = LoadShell.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free load shell label in the model. Also see LoadShell.LastFreeLabel(), LoadShell.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free load shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

LoadShell label.

Return type

Number

Example

To get the first free load shell label in model m:

```
var label = LoadShell.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the load shells in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all load shells will be flagged in

- **flag** (Flag)

Flag to set on the load shells

Returns

No return value

Example

To flag all of the load shells with flag f in model m:

```
LoadShell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the load shell is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the load shell

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if load shell ls has flag f set on it:

```
if (ls.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each load shell in the model.
Note that ForEach has been designed to make looping over load shells as fast as possible and so has some limitations.
Firstly, a single temporary LoadShell object is created and on each function call it is updated with the current load shell data. This means that you should not try to store the LoadShell object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new load shells inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all load shells are in

- **func** (function)

Function to call for each load shell

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the load shells in model m:

```
LoadShell.ForEach(m, test);
function test(ls)
{
// ls is LoadShell object
}
```

To call function test for all of the load shells in model m with optional object:

```
var data = { x:0, y:0 };
LoadShell.ForEach(m, test, data);
function test(ls, extra)
{
// ls is LoadShell object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of LoadShell objects for all of the load shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load shells from

Returns

Array of LoadShell objects

Return type

Array

Example

To make an array of LoadShell objects for all of the load shells in model m

```
var ls = LoadShell.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a load shell.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the load shell ls:

```
var comm_array = ls.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of LoadShell objects for all of the flagged load shells in a model in PRIMER

Arguments

- **Model** (Model)

Model to get load shells from

- **flag** (Flag)

Flag set on the load shells that you want to retrieve

Returns

Array of LoadShell objects

Return type

Array

Example

To make an array of LoadShell objects for all of the load shells in model m flagged with f

```
var ls = LoadShell.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the LoadShell object for a load shell ID.

Arguments

- **Model** (Model)

Model to find the load shell in

- **number** (integer)

number of the load shell you want the LoadShell object for

Returns

LoadShell object (or null if load shell does not exist).

Return type

LoadShell

Example

To get the LoadShell object for load shell 100 in model m

```
var ls = LoadShell.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a LoadShell property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the LoadShell.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

load shell property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if LoadShell property ls.example is a parameter:

```
Options.property_parameter_names = true;
if (ls.GetParameter(ls.example) ) do_something...
Options.property_parameter_names = false;
```

To check if LoadShell property ls.example is a parameter by using the GetParameter method:

```
if (ls.ViewParameters().GetParameter(ls.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this LoadShell (*LOAD_SHELL_xxxx). **Note that a carriage return is not added**. See also LoadShell.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for LoadShell m:

```
var key = m.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the LoadShell. **Note that a carriage return is not added**. See also LoadShell.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for LoadShell l:

```
var cards = l.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last load shell in the model.

Arguments

- **Model** (Model)

Model to get last load shell in

Returns

LoadShell object (or null if there are no load shells in the model).

Return type

LoadShell

Example

To get the last load shell in model m:

```
var ls = LoadShell.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free load shell label in the model. Also see LoadShell.FirstFreeLabel(), LoadShell.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free load shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

LoadShell label.

Return type

Number

Example

To get the last free load shell label in model m:

```
var label = LoadShell.LastFreeLabel(m);
```

Next()

Description

Returns the next load shell in the model.

Arguments

No arguments

Returns

LoadShell object (or null if there are no more load shells in the model).

Return type

LoadShell

Example

To get the load shell in model m after load shell ls:

```
var ls = ls.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) load shell label in the model. Also see LoadShell.FirstFreeLabel(), LoadShell.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free load shell label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

LoadShell label.

Return type

Number

Example

To get the next free load shell label in model m:

```
var label = LoadShell.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a load shell.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load shells from that model can be picked. If the argument is a Flag then only load shells that are flagged with *limit* can be selected. If omitted, or null, any load shells from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

LoadShell object (or null if not picked)

Return type

LoadShell

Example

To pick a load shell from model m giving the prompt 'Pick load shell from screen':

```
var ls = LoadShell.Pick('Pick load shell from screen', m);
```

Previous()

Description

Returns the previous load shell in the model.

Arguments

No arguments

Returns

LoadShell object (or null if there are no more load shells in the model).

Return type

LoadShell

Example

To get the load shell in model m before load shell ls:

```
var ls = ls.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the load shells in the model.

Arguments

- **Model** (Model)

Model that all load shells will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the load shells in model m, from 1000000:

```
LoadShell.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged load shells in the model.

Arguments

- **Model** (Model)

Model that all the flagged load shells will be renumbered in

- **flag** (Flag)

Flag set on the load shells that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the load shells in model m flagged with f, from 1000000:

```
LoadShell.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select load shells using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting load shells

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only load shells from that model can be selected. If the argument is a Flag then only load shells that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any load shells can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of load shells selected or null if menu cancelled

Return type

Number

Example

To select load shells from model m, flagging those selected with flag f, giving the prompt 'Select load shells':

```
LoadShell.Select(f, 'Select load shells', m);
```

To select load shells, flagging those selected with flag f but limiting selection to load shells flagged with flag l, giving the prompt 'Select load shells':

```
LoadShell.Select(f, 'Select load shells', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the load shell.

Arguments

- **flag** (Flag)

Flag to set on the load shell

Returns

No return value

Example

To set flag f for load shell ls:

```
ls.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the load shell. The load shell will be sketched until you either call LoadShell.Unsketch(), LoadShell.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load shell is sketched. If omitted redraw is true. If you want to sketch several load shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch load shell ls:

```
ls.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged load shells in the model. The load shells will be sketched until you either call LoadShell.Unsketch(), LoadShell.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged load shells will be sketched in

- **flag** (Flag)

Flag set on the load shells that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load shells are sketched. If omitted redraw is true. If you want to sketch flagged load shells several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all load shells flagged with flag in model m:

```
LoadShell.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of load shells in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing load shells should be counted. If false or omitted referenced but undefined load shells will also be included in the total.

Returns

number of load shells

Return type

Number

Example

To get the total number of load shells in model m:

```
var total = LoadShell.Total(m);
```

Unblank()

Description

Unblanks the load shell

Arguments

No arguments

Returns

No return value

Example

To unblank load shell ls:

```
ls.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the load shells in the model.

Arguments

- **Model** (Model)

Model that all load shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load shells in model m:

```
LoadShell.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged load shells in the model.

Arguments

- **Model** (Model)

Model that the flagged load shells will be unblanked in

- **flag** (Flag)

Flag set on the load shells that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the load shells in model m flagged with f:

```
LoadShell.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the load shells in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all load shells will be unset in

- **flag** (Flag)

Flag to unset on the load shells

Returns

No return value

Example

To unset the flag f on all the load shells in model m:

```
LoadShell.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the load shell.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load shell is unsketched. If omitted redraw is true. If you want to unsketch several load shells and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch load shell ls:

```
ls.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all load shells.

Arguments

- **Model** (Model)

Model that all load shells will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load shells in model m:

```
LoadShell.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged load shells in the model.

Arguments

- **Model** (Model)

Model that all load shells will be unsketched in

- **flag** (Flag)

Flag set on the load shells that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the load shells are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all load shells flagged with flag in model m:

```
LoadShell.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

LoadShell object.

Return type

LoadShell

Example

To check if LoadShell property ls.example is a parameter by using the LoadShell.GetParameter() method:

```
if (ls.ViewParameters().GetParameter(ls.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for load shell. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for load shell ls:

```
ls.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this load shell.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for load shell ls:

```
var xrefs = ls.Xrefs();
```

---

toString()

Description

Creates a string containing the LoadShell data in keyword format. Note that this contains the keyword header and the keyword cards. See also LoadShell.Keyword() and LoadShell.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for LoadShell l in keyword format

```
var s = l.toString();
```

Material class

The Material class gives you access to material cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Material properties

Name	Type	Description
addDamageGissmo	logical	True if *MAT_ADD_DAMAGE_GISSMO exists for material, false if not defined
addErosion	logical	True if *MAT_ADD_EROSION exists for material, false if not defined
addKeywords (read only)	integer	The number of **extra** *MAT_ADD_xxxx keywords that this material definition has. Note that if there is only a single *MAT_ADD_xxxx keyword for an ID this will be 0. For example, if for material 1 both a *MAT_PIECEWISE_LINEAR_PLASTICITY card and a *MAT_ADD_EROSION card exist then this will return 1. If for material 2 only a *MAT_ADD_EROSION card exists then this will return 0. Also see Material.Keyword() and Material.KeywordCards()
colour	Colour	The colour of the material
cols (read only)	real	The number of columns of data the material has
exists (read only)	logical	true if material exists, false if referred to but not defined.
include	integer	The Include file number that the material is in.
label	integer or string	Material number or character label. Also see the mid property which is an alternative name for this.
mid	integer or string	Material number or character label. Also see the label property which is an alternative name for this.
model (read only)	integer	The Model number that the material is in.
optionalCards (read only)	integer	The number of optional extra cards that this material definition can have. Also see Material.AddOptionalCards()
properties	integer	The total number of properties that the material has
rows (read only)	integer	The number of rows of data the material has
title	string	Material title
transparency	integer	The transparency of the material (0-100) 0% is opaque, 100% is transparent.

type	string	The material type name(e.g. 'ELASTIC', 'RIGID' etc).
typeNumber	string	The material type number (e.g. '001', '034M').

Detailed Description

The Material class allows you to create, modify, edit and manipulate material cards. See the documentation below for more details.

Constructor

new Material(Model*[Model]*, mid*[integer or string]*, type*[string]*)

Description

Create a new Material object.

Arguments

- **Model** (Model)

Model that material will be created in

- **mid** (integer or string)

Material number or character label

- **type** (string)

Material type. Either give the LS-DYNA material name or 3 digit number.

Returns

Material object

Return type

Material

Example

To create a new rigid material in model m with label 100

```
var mat = new Material(m, 100, "RIGID");
```

or

```
var mat = new Material(m, 100, "020");
```

or

```
var mat = new Material(m, 100, "*MAT_RIGID");
```

or

```
var mat = new Material(m, 100, "*MAT_020");
```

Details of functions

AddOptionalCards()

Description

Adds any optional cards for the material.
Some materials have extra optional cards in the input. If they are there LS-DYNA will read them but they are not required input. For example a material could have three required cards and one extra optional card. If PRIMER reads this material from a keyword file and it only has the three required cards then the properties in the material will only be defined for those cards. i.e. there will not be any properties in the material for the extra optional line.
If you edit the material interactively in PRIMER then the extra optional card will be shown so you can add values if required. When writing the material to a keyword file the extra optional card will be omitted if none of the fields are used.
If you want to add one of the properties for the extra optional card in JavaScript this method will ensure that the extra card is defined and the properties added to the material as zero values. You can then use Material.SetPropertyByIndex(), Material.SetPropertyByName() or Material.SetPropertyByRowCol() as normal to set the properties. Also see the optionalCards property.

Arguments

No arguments

Returns

no return value

Example

To add any optional cards for material m:

```
m.AddOptionalCards();
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a material.

Arguments

- **Comment** (Comment)

Comment that will be attached to the material

Returns

No return value

Example

To associate comment c to the material m:

```
m.AssociateComment(c);
```

Blank()

Description

Blanks the material

Arguments

No arguments

Returns

No return value

Example

To blank material m:

```
m.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the materials in the model.

Arguments

- **Model** (Model)

Model that all materials will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the materials in model m:

```
Material.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged materials in the model.

Arguments

- **Model** (Model)

Model that all the flagged materials will be blanked in

- **flag** (Flag)

Flag set on the materials that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the materials in model m flagged with f:

```
Material.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the material is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if material m is blanked:

```
if (m.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse material m:

```
m.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the material.

Arguments

- **flag** (Flag)

Flag to clear on the material

Returns

No return value

Example

To clear flag f for material m:

```
m.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the material. The target include of the copied material can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Material object

Return type

Material

Example

To copy material m into material z:

```
var z = m.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a material.

Arguments

- **Model** (Model)

Model that the material will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Material object (or null if not made)

Return type

Material

Example

To start creating a material in model m:

```
var mat = Material.Create(m);
```

Density()

Description

Get the density material.

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the density for material m:

```
var density = m.Density();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a material.

Arguments

- **Comment** (Comment)

Comment that will be detached from the material

Returns

No return value

Example

To detach comment c from the material m:

```
m.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit material m:

```
m.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for material. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for material m:

```
m.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for material.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the material colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the material.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing material m:

```
var colour = m.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first material in the model.

Arguments

- **Model** (Model)

Model to get first material in

Returns

Material object (or null if there are no materials in the model).

Return type

Material

Example

To get the first material in model m:

```
var m = Material.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free material label in the model. Also see Material.LastFreeLabel(), Material.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free material label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Material label.

Return type

Number

Example

To get the first free material label in model m:

```
var label = Material.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the materials in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all materials will be flagged in

- **flag** (Flag)

Flag to set on the materials

Returns

No return value

Example

To flag all of the materials with flag f in model m:

```
Material.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the material is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the material

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if material m has flag f set on it:

```
if (m.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each material in the model.
Note that ForEach has been designed to make looping over materials as fast as possible and so has some limitations.
Firstly, a single temporary Material object is created and on each function call it is updated with the current material data. This means that you should not try to store the Material object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new materials inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all materials are in

- **func** (function)

Function to call for each material

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the materials in model m:

```
Material.ForEach(m, test);
function test(m)
{
// m is Material object
}
```

To call function test for all of the materials in model m with optional object:

```
var data = { x:0, y:0 };
Material.ForEach(m, test, data);
function test(m, extra)
{
// m is Material object
// extra is data
}
```

GetAddDamageGissmoData()

Description

Returns the *MAT_ADD_DAMAGE_GISSMO data of material.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
biaxf	real	Reduction factor for regularization at triaxiality=2/3
dcrit	real	Damage treshold value
dmgexp	real	Exponent for nonlinear damage accumalation
dtyp	real	Flag for GISSMO damage type
ecrit	real/integer	Critical plastic strain (Curve/ table ID if negative)
fadexp	real/integer	Exponent for damage-related stress fadeout (Curve/ table ID if negative)
hisvn	real	History variable used to evaluate th 3-D table LCSDG
instf	integer	Flag for governing the behavior of instability measure F and fading exponent FADEXP
lcdlim	integer	Curve ID: damage limit values as a function of triaxiality
lcregd	integer	Curve/ table ID (positive) or Table ID (negative): Element-size dependent fading exponent
lcsdg	integer	Curve/ table ID (positive) or Function ID (negative): Failure strain curve/table or function
lcsoft	integer	Soft reduction factor for failure strain in crashfront elements.
lcsrs	integer	Curve/ table ID: Failure strain rate scaling factor v/s strain rate
lp2bi	real	Option to use bending indicator instead of the Lode parameter
midfail	integer	Mid-plane failure option for shell elements and GISSMO
numfip	real	Number of failed integration points prior to element deletion
refsz	real	Reference element size
rgtr1	real	First triaxiality value for optional "tub-shaped" regularization

rgtr2	real	Second triaxiality value for optional "tub-shaped" regularization
shrf	real	Reduction factor for regularization at triaxiality=0
soft	real	Softening reduction factor for failure strain in crashfront elements
stochastic	logical	stochastic = true if _STOCHASTIC is ON. Otherwise, _STOCHASTIC is OFF
volfrac	real	Volume fraction required to fail before element deletion

Return type

object

Example

To get the *MAT_ADD_DAMAGE_GISSMO data of material m:

```
m.GetAddDamageGissmoData();
```

GetAddErosionData()

Description

Returns the *MAT_ADD_EROSION data of material. Note that this method does not support pre-R11 properties.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
dteflt	real	Time period for the low pass filter
dtmin	real	Minimum time step size at failure
effeps	real	Maximum effective strain at failure
engcrt	real	Critical energy for nonlocal failure criterion
epssh	real	Shear strain at failure
epsthin	real	Thinning strain at failure for shells
excl	real	The exclusion number
failtm	real	Failure time
idam	integer	Flag for damage model
impulse	real	Stress impulse for failure
lceps12	integer	Load curve ID defining in-plane shear strain limit vs elem size
lceps13	integer	Load curve ID defining through-thickness shear strain limit vs elem size
lcepsmx	integer	Load curve ID defining in-plane major strain limit vs elem size
lcfld	integer	Curve (negative) or table (positive) ID: Forming limit diagram
lcregd	integer	Curve ID: Element-size dependent fading exponent
mneps	real	Minimum principal strain at failure
mnpres	real	Pressure at failure
mxeps	real/integer	Principal strain at failure (curve ID if negative)

mxpres	real	Maximum pressure at failure
mxtmp	real	Maximum temperature at failure
ncs	real	Number of failure conditions to satisfy before failure occurs
nsff	real	Number of explicit time step cycles for stress fade-out used in the LCFLD criterion
numfip	real	Number of failed integration points prior to element deletion
radcrt	real	Critical radius for nonlocal failure criterion
sigp1	real	Principal stress at failure
sigth	real	Threshold stress
sigvm	real/integer	Equivalent stress at failure (curve ID if negative)
voleps	real	Volumetric strain at failure
volfrac	real	The volume fraction required to fail before the element is deleted

Return type

object

Example

To get the *MAT_ADD_EROSION data of material m:

```
m.GetAddErosionData();
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Material objects for all of the materials in a model in PRIMER

Arguments

- **Model** (Model)

Model to get materials from

Returns

Array of Material objects

Return type

Array

Example

To make an array of Material objects for all of the materials in model m

```
var m = Material.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a material.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the material m:

```
var comm_array = m.GetComments();
```

GetErosionPropertyByName(acronym*[string]*, idam_index (optional)*[integer]*) [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Returns the value of Erosion property string *acronym* for this Material object or null if Erosion is not set on Material or no such Erosion property exists.

Arguments

- **acronym** (string)

The acronym of the Erosion property value to retrieve

- **idam_index (optional)** (integer)

Required if property is one of IDAM cards pair property (for IDAM value less than zero) . If the argument is not given, returns the property value for first IDAM cards Pair. The index value starts from zero.

Returns

Property value (real/integer)

Return type

Number

Example

To return the value of IDAM for material m:

```
var idam = m.GetErosionPropertyByName("IDAM");
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Material objects for all of the flagged materials in a model in PRIMER

Arguments

- **Model** (Model)

Model to get materials from

- **flag** (Flag)

Flag set on the materials that you want to retrieve

Returns

Array of Material objects

Return type

Array

Example

To make an array of Material objects for all of the materials in model m flagged with f

```
var m = Material.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Material object for a material ID.

Arguments

- **Model** (Model)

Model to find the material in

- **number** (integer)

number of the material you want the Material object for

Returns

Material object (or null if material does not exist).

Return type

Material

Example

To get the Material object for material 100 in model m

```
var m = Material.GetFromID(m, 100);
```

GetMaterialErosionExists() [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Checks if the Erosion properties are defined for this Material object.

Arguments

No arguments

Returns

logical

Return type

Boolean

Example

To get whether the Material has Erosion Properties:

```
m.GetMaterialErosionExists();
```

GetParameter(prop*[string]*)

Description

Checks if a Material property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Material.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

material property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Material property m.example is a parameter:

```
Options.property_parameter_names = true;
if (m.GetParameter(m.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Material property m.example is a parameter by using the GetParameter method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

GetPropertyByIndex(index*[integer]*)

Description

Returns the value of property at index *index* for this Material object or null if no property exists.

Arguments

- **index** (integer)

The index of the property value to retrieve. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for a material may not have adjacent indices.

Returns

Property value (real/integer)

Return type

Number

Example

To return the property at index 2, for material m:

```
var prop = m.GetPropertyByIndex(2);
```

GetPropertyByName(acronym*[string]*)

Description

Returns the value of property string *acronym* for this Material object or null if no property exists.

Arguments

- **acronym** (string)

The acronym of the property value to retrieve

Returns

Property value (real/integer)

Return type

Number

Example

To return the value of RO for material m:

```
var ro = m.GetPropertyByName("RO");
```

GetPropertyByRowCol(row*[integer]*, col*[integer]*)

Description

Returns the value of the property for row and col for this Material object or null if no property exists. **Note that rows and columns start at 0**.

Arguments

- **row** (integer)

The row of the property value to retrieve

- **col** (integer)

The column of the property value to retrieve

Returns

Property value (real/integer)

Return type

Number

Example

To return the value of the property at row 0, column 1 for material m:

```
var prop = m.GetPropertyByRowCol(0, 1);
```

GetPropertyNameForIndex(index*[integer]*)

Description

Returns the name of the property at index *index* for this Material object or null if there is no property.

Arguments

- **index** (integer)

The index of the property name to retrieve. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for a material may not have adjacent indices.

Returns

Property name (string)

Return type

String

Example

To return the name of the property at index 2, for material m:

```
var name = m.GetPropertyNameForIndex(2);
```

GetPropertyNameForRowCol(row*[integer]*, col*[integer]*)

Description

Returns the name of the property at row and col for this Material object or null if there is no property. **Note that rows and columns start at 0**.

Arguments

- **row** (integer)

The row of the property name to retrieve

- **col** (integer)

The column of the property name to retrieve

Returns

Property name (string)

Return type

String

Example

To return the name of the property at row 0, column 1 for material m:

```
var name = m.GetPropertyNameForRowCol(0, 1);
```

Keyword(index (optional)*[integer]*)

Description

Returns the keyword for this material (e.g. *MAT_RIGID, *MAT_ELASTIC etc). **Note that a carriage return is not added**. See also Material.KeywordCards()

Arguments

- **index (optional)** (integer)

If this argument is not given then the material keyword is returned as normal. However if the material also has *MAT_ADD_xxxx cards defined for it (e.g. *MAT_ADD_EROSION) then the index can be used to return the title for the *MAT_ADD card instead. The index value starts from zero. The number of *MAT_ADD cards can be found from the addKeywords property

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for material m:

```
var key = m.Keyword();
```

To print all of the keywords and keyword cards for any *MAT_ADD cards for material m:

```
for (i=0; i<m.addKeywords; i++)
{
    Message(m.Keyword(i));
    Message(m.KeywordCards(i));
}
```

KeywordCards(index (optional)*[integer]*)

Description

Returns the keyword cards for the material. **Note that a carriage return is not added**. See also Material.Keyword()

Arguments

- **index (optional)** (integer)

If this argument is not given then the material keyword cards are returned as normal. However if the material also has *MAT_ADD_xxxx cards defined for it (e.g. *MAT_ADD_EROSION) then the index can be used to return the cards for the *MAT_ADD card instead. The index value starts from zero. The number of *MAT_ADD cards can be found from the addKeywords property

Returns

string containing the cards.

Return type

String

Example

To get the cards for material m:

```
var cards = m.KeywordCards();
```

To print all of the keywords and keyword cards for any *MAT_ADD cards for material m:

```
for (i=0; i<m.addKeywords; i++)
{
    Message(m.Keyword(i));
    Message(m.KeywordCards(i));
}
```

Last(Model*[Model]*) [static]

Description

Returns the last material in the model.

Arguments

- **Model** (Model)

Model to get last material in

Returns

Material object (or null if there are no materials in the model).

Return type

Material

Example

To get the last material in model m:

```
var m = Material.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free material label in the model. Also see Material.FirstFreeLabel(), Material.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free material label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Material label.

Return type

Number

Example

To get the last free material label in model m:

```
var label = Material.LastFreeLabel(m);
```

Next()

Description

Returns the next material in the model.

Arguments

No arguments

Returns

Material object (or null if there are no more materials in the model).

Return type

Material

Example

To get the material in model m after material m:

```
var m = m.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) material label in the model. Also see Material.FirstFreeLabel(), Material.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free material label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Material label.

Return type

Number

Example

To get the next free material label in model m:

```
var label = Material.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a material.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only materials from that model can be picked. If the argument is a Flag then only materials that are flagged with *limit* can be selected. If omitted, or null, any materials from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Material object (or null if not picked)

Return type

Material

Example

To pick a material from model m giving the prompt 'Pick material from screen':

```
var m = Material.Pick('Pick material from screen', m);
```

PoissonsRatio()

Description

Get Poissons ratio for the material.

Arguments

No arguments

Returns

real

Return type

Number

Example

To get Poissons ratio for material m:

```
var pr = m.PoissonsRatio(f);
```

Previous()

Description

Returns the previous material in the model.

Arguments

No arguments

Returns

Material object (or null if there are no more materials in the model).

Return type

Material

Example

To get the material in model m before material m:

```
var m = m.Previous();
```

RemoveMaterialErosion() [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Removes the Erosion properties for this Material object.

Arguments

No arguments

Returns

No return value

Example

To remove the Erosion properties for material m:

```
m.RemoveMaterialErosion();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the materials in the model.

Arguments

- **Model** (Model)

Model that all materials will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the materials in model m, from 1000000:

```
Material.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged materials in the model.

Arguments

- **Model** (Model)

Model that all the flagged materials will be renumbered in

- **flag** (Flag)

Flag set on the materials that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the materials in model m flagged with f, from 1000000:

```
Material.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select materials using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting materials

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only materials from that model can be selected. If the argument is a Flag then only materials that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any materials can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of materials selected or null if menu cancelled

Return type

Number

Example

To select materials from model m, flagging those selected with flag f, giving the prompt 'Select materials':

```
Material.Select(f, 'Select materials', m);
```

To select materials, flagging those selected with flag f but limiting selection to materials flagged with flag l, giving the prompt 'Select materials':

```
Material.Select(f, 'Select materials', l);
```

SetAddDamageGissmoData(data*[object]*)

Description

Sets the *MAT_ADD_DAMAGE_GISSMO data of material.

Arguments

- **data** (object)

Data returned from Material.GetAddDamageGissmoData

Object has the following properties:

Name	Type	Description
biaxf	real	Reduction factor for regularization at triaxiality=2/3
dcrit	real	Damage treshold value
dmgexp	real	Exponent for nonlinear damage accumalation
dtyp	real	Flag for GISSMO damage type
ecrit	real/integer	Critical plastic strain (Curve/ table ID if negative)
fadexp	real/integer	Exponent for damage-related stress fadeout (Curve/ table ID if negative)
hisvn	real	History variable used to evaluate th 3-D table LCSDG
instf	integer	Flag for governing the behavior of instability measure F and fading exponent FADEXP
lcdlim	integer	Curve ID: damage limit values as a function of triaxiality
lcregd	integer	Curve/ table ID (positive) or Table ID (negative): Element-size dependent fading exponent
lcsdg	integer	Curve/ table ID (positive) or Function ID (negative): Failure strain curve/table or function
lcsoft	integer	Soft reduction factor for failure strain in crashfront elements.
lcsrs	integer	Curve/ table ID: Failure strain rate scaling factor v/s strain rate
lp2bi	real	Option to use bending indicator instead of the Lode parameter
midfail	integer	Mid-plane failure option for shell elements and GISSMO
numfip	real	Number of failed integration points prior to element deletion
refsz	real	Reference element size
rgtr1	real	First triaxiality value for optional "tub-shaped" regularization
rgtr2	real	Second triaxiality value for optional "tub-shaped" regularization
shrf	real	Reduction factor for regularization at triaxiality=0
soft	real	Softening reduction factor for failure strain in crashfront elements
stochastic	logical	stochastic = true if _STOCHASTIC is ON. Otherwise, _STOCHASTIC is OFF
volfrac	real	Volume fraction required to fail before element deletion

Returns

No return value

Example

To set the value of MIDFAIL Damage Gissmo for material m to be 3:

```
var data = m.GetAddDamageGissmoData();
data.midfail = 3;
m.SetAddDamageGissmoData(data);
```

SetAddErosionData(data*[object]*)

Description

Sets the *MAT_ADD_EROSION data of material. Note that this method does not support pre-R11 properties.

Arguments

- **data** (object)

Data returned from Material.GetAddErosionData.

Object has the following properties:

Name	Type	Description
dteflt	real	Time period for the low pass filter
dtmin	real	Minimum time step size at failure
effeps	real	Maximum effective strain at failure
engcrt	real	Critical energy for nonlocal failure criterion
epssh	real	Shear strain at failure
epsthin	real	Thinning strain at failure for shells
excl	real	The exclusion number
failtm	real	Failure time
idam	integer	Flag for damage model
impulse	real	Stress impulse for failure
lceps12	integer	Load curve ID defining in-plane shear strain limit vs elem size
lceps13	integer	Load curve ID defining through-thickness shear strain limit vs elem size
lcepsmx	integer	Load curve ID defining in-plane major strain limit vs elem size
lcfld	integer	Curve (negative) or table (positive) ID: Forming limit diagram
lcregd	integer	Curve ID: Element-size dependent fading exponent
mneps	real	Minimum principal strain at failure
mnpres	real	Pressure at failure
mxeps	real/integer	Principal strain at failure (curve ID if negative)
mxpres	real	Maximum pressure at failure
mxtmp	real	Maximum temperature at failure
ncs	real	Number of failure conditions to satisfy before failure occurs
nsff	real	Number of explicit time step cycles for stress fade-out used in the LCFLD criterion
numfip	real	Number of failed integration points prior to element deletion
radcrt	real	Critical radius for nonlocal failure criterion
sigp1	real	Principal stress at failure
sigth	real	Threshold stress
sigvm	real/integer	Equivalent stress at failure (curve ID if negative)
voleps	real	Volumetric strain at failure
volfrac	real	The volume fraction required to fail before the element is deleted

Returns

No return value

Example

To set the value of EXCL Erosion for material m to be 1.25:

```
var data = m.GetAddErosionData();
data.excl = 1.25;
m.SetAddErosionData(data);
```

SetErosionPropertyByName(acronym*[string]*, value*[integer/real for numeric properties, string for character properties]*, idam_index (optional)*[integer]*) [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Sets the value of Erosion property string *acronym* for this Material object

Arguments

- **acronym** (string)

The acronym of the property value to set

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

- **idam_index (optional)** (integer)

Required if property is one of IDAM cards pair property (for IDAM value less than zero) . If the argument is not given, set the property values for first IDAM cards Pair. The index value starts from zero.

Returns

No return value

Example

To set the value of IDAM Erosion for material m to be 8:

```
m.SetErosionPropertyByName("idam", 8);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the material.

Arguments

- **flag** (Flag)

Flag to set on the material

Returns

No return value

Example

To set flag f for material m:

```
m.SetFlag(f);
```

SetMaterialErosion() [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Initializes the Erosion properties for this Material object.

Arguments

No arguments

Returns

No return value

Example

To set the Erosion Property for material m:

```
m.SetMaterialErosion();
```

SetPropertyByIndex(index*[integer]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of property at index *index* for this Material object

Arguments

- **index** (integer)

The index of the property value to set. (the number of properties can be found from properties) **Note that indices start at 0**. There is no link between indices and rows/columns so adjacent fields on a line for a material may not have adjacent indices.

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the property at index 2, for material m to be 1.234:

```
m.SetPropertyByIndex(2, 1.234);
```

SetPropertyByName(acronym*[string]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of property string *acronym* for this Material object

Arguments

- **acronym** (string)

The acronym of the property value to set

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the value of RO for material m to be 7.89e-9:

```
m.SetPropertyByName("RO", 7.89e-9);
```

SetPropertyByRowCol(row*[integer]*, col*[integer]*, value*[integer/real for numeric properties, string for character properties]*)

Description

Sets the value of the property for row and col for this Material object.**Note that rows and columns start at 0**.

Arguments

- **row** (integer)

The row of the property value to set

- **col** (integer)

The column of the property value to set

- **value** (integer/real for numeric properties, string for character properties)

The value of the property to set.

Returns

No return value

Example

To set the value of the property at row 0, column 1 for material m to be 7.89e-9:

```
m.SetPropertyByRowCol(0, 1, 7.89e-9);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the material. The material will be sketched until you either call Material.Unsketch(), Material.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the material is sketched. If omitted redraw is true. If you want to sketch several materials and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch material m:

```
m.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged materials in the model. The materials will be sketched until you either call Material.Unsketch(), Material.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged materials will be sketched in

- **flag** (Flag)

Flag set on the materials that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the materials are sketched. If omitted redraw is true. If you want to sketch flagged materials several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all materials flagged with flag in model m:

```
Material.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of materials in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing materials should be counted. If false or omitted referenced but undefined materials will also be included in the total.

Returns

number of materials

Return type

Number

Example

To get the total number of materials in model m:

```
var total = Material.Total(m);
```

Unblank()

Description

Unblanks the material

Arguments

No arguments

Returns

No return value

Example

To unblank material m:

```
m.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the materials in the model.

Arguments

- **Model** (Model)

Model that all materials will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the materials in model m:

```
Material.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged materials in the model.

Arguments

- **Model** (Model)

Model that the flagged materials will be unblanked in

- **flag** (Flag)

Flag set on the materials that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the materials in model m flagged with f:

```
Material.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the materials in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all materials will be unset in

- **flag** (Flag)

Flag to unset on the materials

Returns

No return value

Example

To unset the flag f on all the materials in model m:

```
Material.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the material.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the material is unsketched. If omitted redraw is true. If you want to unsketch several materials and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch material m:

```
m.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all materials.

Arguments

- **Model** (Model)

Model that all materials will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the materials are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all materials in model m:

```
Material.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged materials in the model.

Arguments

- **Model** (Model)

Model that all materials will be unsketched in

- **flag** (Flag)

Flag set on the materials that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the materials are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all materials flagged with flag in model m:

```
Material.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Material object.

Return type

Material

Example

To check if Material property m.example is a parameter by using the Material.GetParameter() method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for material. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for material m:

```
m.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this material.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for material m:

```
var xrefs = m.Xrefs();
```

YieldStress()

Description

Get Yield stress for the material.

Arguments

No arguments

Returns

real

Return type

Number

Example

To get Yield stress for material m:

```
var yield = m.YieldStress();
```

YoungsModulus()

Description

Get Youngs modulus for the material.

Arguments

No arguments

Returns

real

Return type

Number

Example

To get Youngs modulus for material m:

```
var e = m.YoungsModulus();
```

---

toString()

Description

Creates a string containing the material data in keyword format. Note that this contains the keyword header and the keyword cards. See also Material.Keyword() and Material.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for material m in keyword format

```
var s = m.toString();
```

Node class

The Node class gives you access to node cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)

Node constants

Name	Description
Node.SCALAR	Node is *NODE_SCALAR.
Node.SCALAR_VALUE	Node is *NODE_SCALAR_VALUE.

Node properties

Name	Type	Description
colour	Colour	The colour of the node
exists (read only)	logical	true if node exists, false if referred to but not defined.
include	integer	The Include file number that the node is in.
label	integer	Node number. Also see the nid property which is an alternative name for this.
model (read only)	integer	The Model number that the node is in.
ndof	integer	Number of degrees of freedom (SCALAR and SCALAR_VALUE only).
nid	integer	Node number. Also see the label property which is an alternative name for this.
rc	integer	Rotational constraint (0-7)
scalar	integer	The type of the node. Can be false (*NODE), Node.SCALAR (*NODE_SCALAR) or Node.SCALAR_VALUE (*NODE_SCALAR_VALUE)
tc	integer	Translational constraint (0-7)
x	real	X coordinate
x1	integer	Initial value of 1st degree of freedom (SCALAR_VALUE only).
x2	integer	Initial value of 2nd degree of freedom (SCALAR_VALUE only).
x3	integer	Initial value of 3rd degree of freedom (SCALAR_VALUE only).
y	real	Y coordinate
z	real	Z coordinate

Detailed Description

The Node class allows you to create, modify, edit and manipulate node cards. See the documentation below for more details.

Constructor

new Node(Model*[Model]*, nid*[integer]*, x*[real]*, y*[real]*, z*[real]*, tc (optional)*[integer]*, rc (optional)*[integer]*)

Description

Create a new Node object.

Arguments

- **Model** (Model)

Model that node will be created in

- **nid** (integer)

Node number

- **x** (real)

X coordinate

- **y** (real)

Y coordinate

- **z** (real)

Z coordinate

- **tc (optional)** (integer)

Translational constraint (0-7). If omitted tc will be set to 0.

- **rc (optional)** (integer)

Rotational constraint (0-7). If omitted rc will be set to 0.

Returns

Node object

Return type

Node

Example

To create a new node in model m with label 100, at coordinates (20, 40, 10)

```
var n = new Node(m, 100, 20, 40, 10);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a node.

Arguments

- **Comment** (Comment)

Comment that will be attached to the node

Returns

No return value

Example

To associate comment c to the node n:

```
n.AssociateComment(c);
```

Blank()

Description

Blanks the node

Arguments

No arguments

Returns

No return value

Example

To blank node n:

```
n.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the nodes in the model.

Arguments

- **Model** (Model)

Model that all nodes will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodes in model m:

```
Node.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged nodes in the model.

Arguments

- **Model** (Model)

Model that all the flagged nodes will be blanked in

- **flag** (Flag)

Flag set on the nodes that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the nodes in model m flagged with f:

```
Node.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the node is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if node n is blanked:

```
if (n.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse node n:

```
n.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the node.

Arguments

- **flag** (Flag)

Flag to clear on the node

Returns

No return value

Example

To clear flag f for node n:

```
n.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the node. The target include of the copied node can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Node object

Return type

Node

Example

To copy node n into node z:

```
var z = n.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a node.

Arguments

- **Model** (Model)

Model that the node will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Node object (or null if not made)

Return type

Node

Example

To start creating a node in model m:

```
var n = Node.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a node.

Arguments

- **Comment** (Comment)

Comment that will be detached from the node

Returns

No return value

Example

To detach comment c from the node n:

```
n.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit node n:

```
n.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for node. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for node n:

```
n.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for node.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the node colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the node.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing node n:

```
var colour = n.ExtractColour();
```

First(Model[*Model*]) [static]

Description

Returns the first node in the model.

Arguments

- **Model** (Model)

Model to get first node in

Returns

Node object (or null if there are no nodes in the model).

Return type

Node

Example

To get the first node in model m:

```
var n = Node.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free node label in the model. Also see Node.LastFreeLabel(), Node.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free node label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Node label.

Return type

Number

Example

To get the first free node label in model m:

```
var label = Node.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the nodes in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all nodes will be flagged in

- **flag** (Flag)

Flag to set on the nodes

Returns

No return value

Example

To flag all of the nodes with flag f in model m:

```
Node.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the node is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the node

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if node n has flag f set on it:

```
if (n.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each node in the model.
Note that ForEach has been designed to make looping over nodes as fast as possible and so has some limitations. Firstly, a single temporary Node object is created and on each function call it is updated with the current node data. This means that you should not try to store the Node object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new nodes inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all nodes are in

- **func** (function)

Function to call for each node

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the nodes in model m:

```
Node.ForEach(m, test);
function test(n)
{
// n is Node object
}
```

To call function test for all of the nodes in model m with optional object:

```
var data = { x:0, y:0 };
Node.ForEach(m, test, data);
function test(n, extra)
{
// n is Node object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Node objects for all of the nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodes from

Returns

Array of Node objects

Return type

Array

Example

To make an array of Node objects for all of the nodes in model m

```
var n = Node.GetAll(m);
```

GetAttachedShells(recursive (optional)*[boolean]*)

Description

Returns the shells that are attached to the node.

Arguments

- **recursive (optional)** (boolean)

If recursive is false then only the shells actually attached to the node will be returned (this could also be done by using the Xrefs class but this method is provided for convenience. If recursive is true then PRIMER will keep finding attached shells until no more can be found. If omitted recursive will be false.

Returns

Array of Shell objects (or null if there are no attached shells).

Return type

Array

Example

To find the shells attached to node n, growing the selection until no more shells can be found:

```
var shell_array = n.GetAttachedShells(true);
```

GetComments()

Description

Extracts the comments associated to a node.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the node n:

```
var comm_array = n.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Node objects for all of the flagged nodes in a model in PRIMER

Arguments

- **Model** (Model)

Model to get nodes from

- **flag** (Flag)

Flag set on the nodes that you want to retrieve

Returns

Array of Node objects

Return type

Array

Example

To make an array of Node objects for all of the nodes in model m flagged with f

```
var n = Node.GetFlagged(m, f);
```

GetFreeEdgeNodes()

Description

If the node is on a shell free edge and that edge forms a loop like the boundary of a hole, then GetFreeEdgeNodes returns all of the nodes on the hole/boundary in order.

Note that a free edge is a shell edge which is only used by one shell, whereas edges in the middle of a shell part will have got more than one adjacent shell and are therefore not free edges. If every node on a boundary belongs to exactly two free edges, then this function returns the array as described. In more involved combinatorics of shells, for example multiple parts sharing nodes along their boundaries, there can be one, three or more free edges at a node, and this function should not be used.

If you only need to know whether or not a node is on a free edge, you should find the shells attached to it by cross references with Xrefs.GetItemID and see whether these shells have got other nodes in common as well. If nodes along an edge of a shell only appear in that one shell, this is a free edge.

Arguments

No arguments

Returns

Array of Node objects (or null if not on a shell free edge).

Return type

Array

Example

To find all the nodes on the hole/boundary that node n is on:

```
var node_array = n.GetFreeEdgeNodes();
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Node object for a node ID.

Arguments

- **Model** (Model)

Model to find the node in

- **number** (integer)

number of the node you want the Node object for

Returns

Node object (or null if node does not exist).

Return type

Node

Example

To get the Node object for node 100 in model m

```
var n = Node.GetFromID(m, 100);
```

GetInitialVelocities()

Description

Returns the initial velocity of the node. You need to be sure the field nvels of the node is populate before to use GetInitialVelocities. To do so you can use Model.PopNodeVels .

Arguments

No arguments

Returns

Array containing the 3 translational and 3 rotational velocity values.

Return type

Array

Example

To get the initial velocity of the node n:

```
var vel = n.GetInitialVelocities();
```

GetParameter(prop*[string]*)

Description

Checks if a Node property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Node.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

node property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Node property n.example is a parameter:

```
Options.property_parameter_names = true;
if (n.GetParameter(n.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Node property n.example is a parameter by using the GetParameter method:

```
if (n.ViewParameters().GetParameter(n.example) ) do_something...
```

GetReferenceGeometry()

Description

Returns the airbag reference geometry of the node

Arguments

No arguments

Returns

The reference geometry ID of the node (or 0 if it hasn't got any)

Return type

Number

Example

To get the reference geometry of the node n:

```
var a = n.GetReferenceGeometry();
```

Keyword()

Description

Returns the keyword for this node (*NODE, *NODE_SCALAR or *NODE_SCALAR_VALUE). **Note that a carriage return is not added**. See also Node.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for node n:

```
var key = n.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the node. **Note that a carriage return is not added**. See also Node.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for node n:

```
var cards = n.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last node in the model.

Arguments

- **Model** (Model)

Model to get last node in

Returns

Node object (or null if there are no nodes in the model).

Return type

Node

Example

To get the last node in model m:

```
var n = Node.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free node label in the model. Also see Node.FirstFreeLabel(), Node.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free node label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Node label.

Return type

Number

Example

To get the last free node label in model m:

```
var label = Node.LastFreeLabel(m);
```

Merge(Model*[Model]*, flag*[Flag]*, dist*[real]*, label (optional)*[integer]*, position (optional)*[integer]*) [static]

Description

Attempts to merge nodes flagged with flag for a model in PRIMER. Merging nodes on *AIRBAG_SHELL_REFERENCE_GEOMETRY can be controlled by using Options.node_replace_asrg. Also see Model.MergeNodes().

Arguments

- **Model** (Model)

Model that the nodes will be merged in

- **flag** (Flag)

Flag set on nodes to nodes

- **dist** (real)

Nodes closer than dist will be potentially merged.

- **label (optional)** (integer)

Label to keep after merge. If > 0 then highest label kept. If <= 0 then lowest kept. If omitted the lowest label will be kept.

- **position (optional)** (integer)

Position to merge at. If > 0 then merged at highest label position. If < 0 then merged at lowest label position. If 0 then merged at midpoint. If omitted the merge will be done at the lowest label.

Returns

The number of nodes merged

Return type

Number

Example

To (try to) merge nodes in model m flagged with flag f, with a distance of 0.1:

```
Node.Merge(m, f, 0.1);
```

Next()

Description

Returns the next node in the model.

Arguments

No arguments

Returns

Node object (or null if there are no more nodes in the model).

Return type

Node

Example

To get the node in model m after node n:

```
var n = n.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) node label in the model. Also see Node.FirstFreeLabel(), Node.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free node label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Node label.

Return type

Number

Example

To get the next free node label in model m:

```
var label = Node.NextFreeLabel(m);
```

NodalMass()

Description

Get the mass of a node. This will be the sum of the structural element mass attached to the node plus any lumped mass. If called on the node of a PART_INERTIA or NRBC_INERTIA, this function will return the mass of the part/nrbc, as 'nodal mass' has no meaning in this context.

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the mass for node n:

```
var mass = n.NodalMass();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a node.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodes from that model can be picked. If the argument is a Flag then only nodes that are flagged with *limit* can be selected. If omitted, or null, any nodes from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Node object (or null if not picked)

Return type

Node

Example

To pick a node from model m giving the prompt 'Pick node from screen':

```
var n = Node.Pick('Pick node from screen', m);
```

Previous()

Description

Returns the previous node in the model.

Arguments

No arguments

Returns

Node object (or null if there are no more nodes in the model).

Return type

Node

Example

To get the node in model m before node n:

```
var n = n.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the nodes in the model.

Arguments

- **Model** (Model)

Model that all nodes will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the nodes in model m, from 1000000:

```
Node.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged nodes in the model.

Arguments

- **Model** (Model)

Model that all the flagged nodes will be renumbered in

- **flag** (Flag)

Flag set on the nodes that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the nodes in model m flagged with f, from 1000000:

```
Node.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select nodes using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting nodes

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only nodes from that model can be selected. If the argument is a Flag then only nodes that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any nodes can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of nodes selected or null if menu cancelled

Return type

Number

Example

To select nodes from model m, flagging those selected with flag f, giving the prompt 'Select nodes':

```
Node.Select(f, 'Select nodes', m);
```

To select nodes, flagging those selected with flag f but limiting selection to nodes flagged with flag l, giving the prompt 'Select nodes':

```
Node.Select(f, 'Select nodes', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the node.

Arguments

- **flag** (Flag)

Flag to set on the node

Returns

No return value

Example

To set flag f for node n:

```
n.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the node. The node will be sketched until you either call Node.Unsketch(), Node.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node is sketched. If omitted redraw is true. If you want to sketch several nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch node n:

```
n.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged nodes in the model. The nodes will be sketched until you either call Node.Unsketch(), Node.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged nodes will be sketched in

- **flag** (Flag)

Flag set on the nodes that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodes are sketched. If omitted redraw is true. If you want to sketch flagged nodes several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all nodes flagged with flag in model m:

```
Node.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of nodes in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing nodes should be counted. If false or omitted referenced but undefined nodes will also be included in the total.

Returns

number of nodes

Return type

Number

Example

To get the total number of nodes in model m:

```
var total = Node.Total(m);
```

Unblank()

Description

Unblanks the node

Arguments

No arguments

Returns

No return value

Example

To unblank node n:

```
n.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the nodes in the model.

Arguments

- **Model** (Model)

Model that all nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodes in model m:

```
Node.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged nodes in the model.

Arguments

- **Model** (Model)

Model that the flagged nodes will be unblanked in

- **flag** (Flag)

Flag set on the nodes that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the nodes in model m flagged with f:

```
Node.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the nodes in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all nodes will be unset in

- **flag** (Flag)

Flag to unset on the nodes

Returns

No return value

Example

To unset the flag f on all the nodes in model m:

```
Node.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the node.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the node is unsketched. If omitted redraw is true. If you want to unsketch several nodes and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch node n:

```
n.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all nodes.

Arguments

- **Model** (Model)

Model that all nodes will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodes in model m:

```
Node.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged nodes in the model.

Arguments

- **Model** (Model)

Model that all nodes will be unsketched in

- **flag** (Flag)

Flag set on the nodes that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the nodes are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all nodes flagged with flag in model m:

```
Node.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Node object.

Return type

Node

Example

To check if Node property n.example is a parameter by using the Node.GetParameter() method:

```
if (n.ViewParameters().GetParameter(n.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for node. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for node n:

```
n.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this node.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for node n:

```
var xrefs = n.Xrefs();
```

---

toString()

Description

Creates a string containing the node data in keyword format. Note that this contains the keyword header and the keyword cards. See also Node.Keyword() and Node.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for node n in keyword format

```
var s = n.toString();
```

Parameter class

The Parameter class allows you to access the parameters in a model. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AutoReorder(Model*[Model]*)
- FlagAll(Model*[Model]*, flag*[Flag]*)
- GetAll(Model*[Model]*)
- GetAllOfName(Model*[Model]*)
- GetFromName(Model*[Model]*, parameter name*[string]*)
- SaveAll(Model*[Model]*)
- UnflagAll(Model*[Model]*, flag*[Flag]*)
- UpdateAll(Model*[Model]*)

Member functions

- ClearFlag(flag*[Flag]*)
- Error(message*[string]*, details (optional)*[string]*)
- Evaluate()
- Flagged(flag*[Flag]*)
- Keyword()
- KeywordCards()
- SetFlag(flag*[Flag]*)
- Warning(message*[string]*, details (optional)*[string]*)
- Xrefs()
- toString()

Parameter constants

Name	Description
Parameter.CHARACTER	Parameter is a character.
Parameter.INTEGER	Parameter is an integer.
Parameter.LOCAL	Parameter has _LOCAL suffix (used in suffix argument for constructor).
Parameter.MUTABLE	Parameter has _MUTABLE suffix (used in suffix argument for constructor).
Parameter.NOECHO	Parameter has _NOECHO suffix (used in suffix argument for constructor).
Parameter.REAL	Parameter is a real.

Parameter properties

Name	Type	Description
expression (read only)	logical	true if this parameter is a *PARAMETER_EXPRESSION, false otherwise.
include	integer	The Include file number that the parameter is in.
local	logical	true if this parameter is a *PARAMETER_... _LOCAL, false otherwise.

model	integer	The Model number that the parameter is in.
mutable	logical	true if this parameter is a *PARAMETER_... _MUTABLE, false otherwise.
name (read only)	string	Parameter name.
noecho	logical	true if this parameter is a *PARAMETER_... _NOECHO, false otherwise.
type (read only)	constant	Can be Parameter.INTEGER, Parameter.REAL or Parameter.CHARACTER.
value	integer/real/string	Parameter value. The value will be a string for parameter expressions, or a number for normal parameters. By default when a parameter value is changed PRIMER will re-evaluate and update all of the parameters in the model as changing this parameter could cause others to change because of parameter expressions. There could be some situations where changing parameters one at a time could cause problems with re-evaluation. For example, changing parameter A could temporarily cause a division by zero when re-evaluating parameter expression B until parameter C is changed. In this case the automatic re-evaluation can be prevented by using Parameter.SaveAll and Parameter.UpdateAll.

Detailed Description

The Parameter class allows to create and query parameters in a model. See the documentation below for more details.

Constructor

new Parameter(Model*[Model]*, name*[string]*, type*[constant]*, expression*[boolean]*, value*[integer/real/string]*, suffix (optional)*[constant]*)

Description

Create a new Parameter object.

Arguments

- **Model** (Model)

Model that parameter will be created in

- **name** (string)

Parameter name

- **type** (constant)

Can be Parameter.INTEGER, Parameter.REAL or Parameter.CHARACTER.

- **expression** (boolean)

true if *PARAMETER_EXPRESSION, false otherwise.

- **value** (integer/real/string)

Parameter value. The value will be a string for character parameters or parameter expressions, or a number for integer or real parameters.

- **suffix (optional)** (constant)

Keyword suffix Can be Parameter.LOCAL for *PARAMETER_..._LOCAL, Parameter.MUTABLE for *PARAMETER_..._MUTABLE, or Parameter.NOECHO for *PARAMETER_..._NOECHO. These may be bitwise ORed together, ie Parameter.LOCAL | Parameter.MUTABLE | Parameter.NOECHO. If omitted the parameter will not be local or mutable.

Returns

Parameter object

Return type

Parameter

Example

To create a new real parameter THK in model m with value 5.0

```
var p = new Parameter(m, "THK", Parameter.REAL, false, 5.0);
```

To create a new LOCAL integer parameter INDEX in model m with value 3

```
var p = new Parameter(m, "INDEX", Parameter.INTEGER, false, 3, Parameter.LOCAL);
```

Details of functions

AutoReorder(Model[*Model*]) [static]

Description

Auto Reorders all the parameters in the model.

Arguments

- **Model** (Model)

Model that contains all parameters that will be re-ordered

Returns

No return value

Example

To auto-reorder all parameters in model m:

```
Parameter.AutoReorder(m);
```

ClearFlag(flag[*Flag*])

Description

Clears a flag on the parameter.

Arguments

- **flag** (Flag)

Flag to clear on the parameter

Returns

No return value

Example

To clear flag f for parameter p:

```
p.ClearFlag(f);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for a parameter. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for parameter p:

```
p.Error("My custom error");
```

Evaluate()

Description

Evaluates a parameter expression, updating the evaluated value stored in PRIMER and returns the value. If the parameter is not an expression then the parameter value will just be returned.
If evaluating the expression cannot be done because of an error (e.g. dividing by zero) an exception will be thrown.

Arguments

No arguments

Returns

number (real and integer parameters) or string (character parameters)

Return type

Number

Example

To evaluate parameter p:

```
var value = p.Evaluate();
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the parameters in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all parameters will be flagged in

- **flag** (Flag)

Flag to set on the parameters

Returns

No return value

Example

To flag all of the parameters with flag f in model m:

```
Parameter.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the parameter is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the parameter

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if parameter p has flag f set on it:

```
if (p.Flagged(f) ) do_something...
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Parameter objects for all of the parameters in a model in Primer

Arguments

- **Model** (Model)

Model to get parameters from

Returns

Array of Parameter objects

Return type

Array

Example

To make an array of Parameter objects for all of the parameters in model m

```
var p = Parameter.GetAll(m);
```

GetAllOfName(Model*[Model]*) [static]

Description

Returns an array of Parameter objects for all parameters in a model matching Name. If none are found that match it will return NULL. (Multiple parameters of the same name may exist if they use the _LOCAL or _MUTABLE suffices. PRIMER will also store multiple illegal instances of parameter name, using the instance as determined by the PARAMETER_DUPLICATION card.)

Arguments

- **Model** (Model)

Model to get parameters from

Returns

Array of Parameter objects

Return type

Array

Example

To make an array of Parameter objects for all of the parameters of name in model m

```
var p = Parameter.GetAllOfName(m, name);
```

GetFromName(Model*[Model]*, parameter name*[string]*) [static]

Description

Returns the stored Parameter object for a parameter name. WARNING: if more than one parameter Name exists (eg _LOCAL, _MUTABLE) then only the first occurrence is returned. To return all parameters matching Name use GetAllOfName() instead.

Arguments

- **Model** (Model)

Model to find the parameter in

- **parameter name** (string)

name of the parameter you want the Parameter object for

Returns

Parameter object (or null if parameter does not exist).

Return type

Parameter

Example

To get the Parameter object for parameter "THK" in model m

```
var p = Parameter.GetFromName(m, "THK");
```

Keyword()

Description

Returns the keyword for this parameter (*PARAMETER, *PARAMETER_EXPRESSION). **Note that a carriage return is not added**. See also Parameter.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for parameter p:

```
var key = p.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the parameter. **Note that a carriage return is not added**. See also Parameter.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for parameter p:

```
var cards = p.KeywordCards();
```

SaveAll(Model[*Model*]) [static]

Description

Saves the current status and values of all of the parameters in the model. Calling this will also have the effect of turning off re-evaluating and updating of all parameters in the model when a parameter value is changed.
To update several parameters in a model without re-evaluating all the parameters after each one is changed first call this, then update all of the parameter values, and then call Parameter.UpdateAll to apply the update.
Parameter.SaveAll **must** be called before using Parameter.UpdateAll.

Arguments

- **Model** (Model)

Model that the parameters will be saved in

Returns

No return value

Example

To save the status of all of the parameters in model m:

```
Parameter.SaveAll(m);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the parameter.

Arguments

- **flag** (Flag)

Flag to set on the parameter

Returns

No return value

Example

To set flag f for parameter p:

```
p.SetFlag(f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the parameters in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all parameters will be unset in

- **flag** (Flag)

Flag to unset on the parameters

Returns

No return value

Example

To unset the flag f on all of the parameters in model m:

```
Parameter.UnflagAll(m, f);
```

UpdateAll(Model*[Model]*) [static]

Description

Updates all of the parameters in the model after saving the state of all parameters using Parameter.SaveAll and modifying the parameter values. As parameter re-evaluation has been suppressed by Parameter.SaveAll you should ensure that all parameters in the model can be evaluated correctly before calling this to ensure that there are no errors. If any of the parameters cannot be evaluated then the values saved in Parameter.SaveAll will be restored, the update will be aborted and an exception thrown. Calling this will also have the effect of turning back on re-evaluating and updating of all parameters in the model when a parameter value is changed.
Parameter.SaveAll **must** be called before this method can be used.

Arguments

- **Model** (Model)

Model that the parameters will be updated in

Returns

No return value

Example

To update all of the parameters in model m:

```
Parameter.UpdateAll(m);
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for a parameter. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for parameter p:

```
p.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this parameter.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for parameter p:

```
var xrefs = p.Xrefs();
```

---

toString()

Description

Creates a string containing the parameter data in keyword format. Note that this contains the keyword header and the keyword cards. See also Parameter.Keyword() and Parameter.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for parameter p in keyword format

```
var s = p.toString();
```

Part class

The Part class gives you access to part cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Part properties

Name	Type	Description
adpopt	integer	Adaptivity flag
ansid	integer	Attachment node set ID
attachment_nodes	logical	If _ATTACHMENT_NODES option is set. Can be true or false
averaged	logical	If _AVERAGED option is set. Can be true or false
cadname	string	CAD name stored for Part (or null if doesn't exist). This property is only used by PRIMER.
cid	integer	Coordinate system number
cmsn	integer	CAL3D/MADYMO number
colour	Colour	The colour of the part
composite	logical	If _COMPOSITE option is set. Can be true or false
composite_long	logical	If _COMPOSITE_LONG option is set. Can be true or false
contact	logical	If _CONTACT option is set. Can be true or false
dc	real	Exponential decay coefficient
element_type (read only)	string	The type of elements the Part contains. e.g. "SHELL", "SOLID" or null if empty/no section.
elform	integer	Element formulation
eosid	integer or string	Equation of state number or character label
exists (read only)	logical	true if part exists, false if referred to but not defined.
fd	real	Dynamic coefficient of friction
fs	real	Static coefficient of friction
grav	integer	Gravity loading
heading	string	Part heading
hgid	integer or string	Hourglass number or character label
hmname	string	Hypermesh comment read from keyword file for Part (or null if doesn't exist).
iga_shell	logical	If _COMPOSITE_IGA_SHELL option is set. Can be true or false
include	integer	The Include file number that the part is in.
inertia	logical	If _INERTIA option is set. Can be true or false

ircs	integer	Flag for inertia tensor reference coordinate system
irl	integer	Lamina integration rule
ixx	real	Ixx component of inertia tensor
ixy	real	Ixy component of inertia tensor
ixz	real	Ixz component of inertia tensor
iyy	real	Iyy component of inertia tensor
iyz	real	Iyz component of inertia tensor
izz	real	Izz component of inertia tensor
label	integer or string	Part number or character label. Also see the pid property which is an alternative name for this.
marea	real	Non structural mass per unit area
mdep	integer	MADYMO ellipse/plane number
mid	integer or string	Material number or character label
model (read only)	integer	The Model number that the part is in.
movopt	integer	Flag to deactivate moving for merged rigid bodies
nip	integer	Number of integration points (layers) present for _COMPOSITE parts
nloc	integer	Location of reference surface
nodeid	integer	Node ID for centre of rigid body
optt	real	Contact thickness
pid	integer or string	Part number or character label. Also see the label property which is an alternative name for this.
prbf	integer	Print flag for RBDOUT and MATSUM files
print	logical	If _PRINT option is set. Can be true or false
reposition	logical	If _REPOSITION option is set. Can be true or false
rigid (read only)	logical	true if part is rigid, false if deformable.
secid	integer or string	Section number or character label
sft	real	Thickness scale factor
shrf	real	Shear correction factor
ssf	real	Scale factor on default slave penalty stiffness
thshel	integer	Thermal shell formulation
tm	real	total mass
tmid	integer or string	Thermal material number or character label
transparency	integer	The transparency of the part (0-100) 0% is opaque, 100% is transparent.
tshear	integer	Flag for transverse shear strain distribution
tshell	logical	If _COMPOSITE_TSHELL option is set. Can be true or false
vc	real	Coefficient for viscous friction
vrx	real	x rotational velocity
vry	real	y rotational velocity

vrz	real	z rotational velocity
vtx	real	x translational velocity
vty	real	y translational velocity
vtz	real	z translational velocity
xc	real	x coordinate of centre of mass
xl	real	x coordinate of local x axis
xlip	real	x coordinate of vector in local xy plane
yc	real	y coordinate of centre of mass
yl	real	y coordinate of local x axis
ylip	real	y coordinate of vector in local xy plane
zc	real	z coordinate of centre of mass
zl	real	z coordinate of local x axis
zlip	real	z coordinate of vector in local xy plane

Detailed Description

The Part class allows you to create, modify, edit and manipulate part cards. See the documentation below for more details.

Constructor

new Part(Model*[Model]*, pid*[integer or string]*, secid*[integer or string]*, mid*[integer or string]*, heading (optional)*[string]*)

Description

Create a new Part object.

Arguments

- **Model** (Model)

Model that part will be created in

- **pid** (integer or string)

Part number or character label

- **secid** (integer or string)

Section number or character label

- **mid** (integer or string)

Material number or character label

- **heading (optional)** (string)

Title for the part

Returns

Part object

Return type

Part

Example

To create a new part called 'Example' in model m with label 100, section 1, material 10:

```
var p = new Part(m, 100, 1, 10, 'Example');
```

Details of functions

AllTableProperties(Model[*Model*]) [static]

Description

Returns all of the properties available in the part table for the parts. The table values are returned in an array of objects (an object for each part). The object property names are the same as the table headers but spaces are replaced with underscore characters and characters other than 0-9, a-z and A-Z are removed to ensure that the property name is valid in JavaScript. If a table value is undefined the property value will be the JavaScript undefined value. If the table value is a valid number it will be a number, otherwise the value will returned as a string.

Arguments

- **Model** (Model)

Model that the flagged parts are in

Returns

Array of objects

Return type

Array

Example

To get all of the properties for parts in model m:

```
var properties = Part.AllTableProperties(m);
for (var p=0; p<properties.length; p++)
{
    for (var x in properties[p])
    {
        Message(x+"="+properties[p][x]);
    }
}
```

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a part.

Arguments

- **Comment** (Comment)

Comment that will be attached to the part

Returns

No return value

Example

To associate comment c to the part p:

```
p.AssociateComment(c);
```

Blank()

Description

Blanks the part

Arguments

No arguments

Returns

No return value

Example

To blank part p:

```
p.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the parts in the model.

Arguments

- **Model** (Model)

Model that all parts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the parts in model m:

```
Part.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged parts in the model.

Arguments

- **Model** (Model)

Model that all the flagged parts will be blanked in

- **flag** (Flag)

Flag set on the parts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the parts in model m flagged with f:

```
Part.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the part is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if part p is blanked:

```
if (p.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse part p:

```
p.Browse();
```

CentreOfGravity(options (optional)*[object]*)

Description

Returns the centre of gravity for a part.

Arguments

- **options (optional)** (object)

Options specifying how the mass calculation should be done.

Object has the following properties:

Name	Type	Description
constrainedparts (optional)	boolean	Mass of rigid lead part includes mass of its constrained parts. On by default.
lumpedmass (optional)	boolean	Lumped mass is included for deformable parts. Off by default.
nrbmass (optional)	boolean	NRB mass is included for deformable parts. Off by default. (tranfermass:true required for this option)
plot (optional)	boolean	Plot CofG.
skipconstrained (optional)	boolean	Constrained rigid part is assigned zero mass (if constrainedparts = true). On by default.
timestepmass (optional)	boolean	Timestep added mass is included for deformable parts. Off by default.
transfermass (optional)	boolean	Mass of deformable nodes attached to rigid part/nrb is transferred. On by default.

Returns

An array containing the x, y and z coordinates for the CofG.

Return type

Array

Example

To get the centre of gravity for part p with options configured:

```
var cofg = p.CentreOfGravity({constrainedparts:false, transfermass:true,
lumpedmass:false, nrbmass:true, timestepmass:false, plot:true});
var x = cofg[0];
var y = cofg[1];
var z = cofg[2];
```

CentreOfGravity(option (optional)*[boolean]*) [deprecated]

This function is deprecated in version 16.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Returns the centre of gravity for a part. Rigid parts will always include mass of slave parts.
Mass is transferred from deformable to rigid when nodes attach.

Arguments

- **option (optional)** (boolean)

If set, centre of gravity calculation for deformable parts includes lumped mass, mass of nodal rigid bodies and timestep added mass.

Returns

An array containing the x, y and z coordinates for the CofG.

Return type

Array

Example

To get the centre of gravity for part p:

```
var cofg = p.CentreOfGravity();
           var x = cofg[0];
           var y = cofg[1];
           var z = cofg[2];
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the part.

Arguments

- **flag** (Flag)

Flag to clear on the part

Returns

No return value

Example

To clear flag f for part p:

```
p.ClearFlag(f);
```

ClosestNode(x*[real]*, y*[real]*, z*[real]*)

Description

Finds the Node on the part closest to a coordinate.

Arguments

- **x** (real)

X coordinate of point

- **y** (real)

Y coordinate of point

- **z** (real)

Z coordinate of point

Returns

ID of Node or null if part has no nodes

Return type

Number

Example

To find the node on part p closest to point (1, 2, 3):

```
var n = p.ClosestNode(1, 2, 3);
```

Copy(range (optional)*[boolean]*)

Description

Copies the part. The target include of the copied part can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Part object

Return type

Part

Example

To copy part p into part z:

```
var z = p.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a part.

Arguments

- **Model** (Model)

Model that the part will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Part object (or null if not made)

Return type

Part

Example

To start creating a part in model m:

```
var p = Part.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a part.

Arguments

- **Comment** (Comment)

Comment that will be detached from the part

Returns

No return value

Example

To detach comment c from the part p:

```
p.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit part p:

```
p.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for part. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for part p:

```
p.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for part.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the part colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the part.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing part p:

```
var colour = p.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first part in the model.

Arguments

- **Model** (Model)

Model to get first part in

Returns

Part object (or null if there are no parts in the model).

Return type

Part

Example

To get the first part in model m:

```
var p = Part.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free part label in the model. Also see Part.LastFreeLabel(), Part.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free part label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Part label.

Return type

Number

Example

To get the first free part label in model m:

```
var label = Part.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the parts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all parts will be flagged in

- **flag** (Flag)

Flag to set on the parts

Returns

No return value

Example

To flag all of the parts with flag f in model m:

```
Part.FlagAll(m, f);
```

FlagVisible(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all the unblanked parts in the model.

Arguments

- **Model** (Model)

Model for which all unblanked parts will be flagged in

- **flag** (Flag)

Flag to set on the unblanked parts

Returns

No return value

Example

To flag all unblanked parts in model m with flag f:

```
Part.FlagVisible(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the part is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the part

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if part p has flag f set on it:

```
if (p.Flagged(f) ) do_something...
```

FlaggedTableProperties(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns all of the properties available in the part table for the flagged parts. The table values are returned in an array of objects (an object for each part). The object property names are the same as the table headers but spaces are replaced with underscore characters and characters other than 0-9, a-z and A-Z are removed to ensure that the property name is valid in JavaScript. If a table value is undefined the property value will be the JavaScript undefined value. If the table value is a valid number it will be a number, otherwise the value will returned as a string.

Arguments

- **Model** (Model)

Model that the flagged parts are in

- **flag** (Flag)

Flag set on the parts that you want properties for

Returns

Array of objects

Return type

Array

Example

To get all of the properties for parts in model m flagged with f:

```
var properties = Part.FlaggedTableProperties(m, f);
for (var p=0; p<properties.length; p++)
{
    for (var x in properties[p])
    {
        Message(x+"="+properties[p][x]);
    }
}
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each part in the model.
Note that ForEach has been designed to make looping over parts as fast as possible and so has some limitations. Firstly, a single temporary Part object is created and on each function call it is updated with the current part data. This means that you should not try to store the Part object for later use (e.g. in an array) as it is temporary. Secondly, you cannot create new parts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all parts are in

- **func** (function)

Function to call for each part

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the parts in model m:

```
Part.ForEach(m, test);
function test(p)
{
// p is Part object
}
```

To call function test for all of the parts in model m with optional object:

```
var data = { x:0, y:0 };
Part.ForEach(m, test, data);
function test(p, extra)
{
// p is Part object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Part objects for all of the parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get parts from

Returns

Array of Part objects

Return type

Array

Example

To make an array of Part objects for all of the parts in model m

```
var p = Part.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a part.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the part p:

```
var comm_array = p.GetComments();
```

GetCompositeData(ipt*[integer]*)

Description

Returns the composite data for an integration point in *PART_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array containing the material id, thickness, beta angle and thermal material values. If the _COMPOSITE_LONG option is set, then the array returned will also contain the ply ID.

Return type

Array

Example

To get the composite data for the 3rd integration point for part p:

```
if (p.composite && p.nip >= 3)
{
    var ipt_data = p.GetCompositeData(2);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Part objects for all of the flagged parts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get parts from

- **flag** (Flag)

Flag set on the parts that you want to retrieve

Returns

Array of Part objects

Return type

Array

Example

To make an array of Part objects for all of the parts in model m flagged with f

```
var p = Part.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Part object for a part ID.

Arguments

- **Model** (Model)

Model to find the part in

- **number** (integer)

number of the part you want the Part object for

Returns

Part object (or null if part does not exist).

Return type

Part

Example

To get the Part object for part 100 in model m

```
var p = Part.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Part property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Part.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

part property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Part property p.example is a parameter:

```
Options.property_parameter_names = true;
if (p.GetParameter(p.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Part property p.example is a parameter by using the GetParameter method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this part (*PART, *PART_SCALAR or *PART_SCALAR_VALUE). **Note that a carriage return is not added**. See also Part.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for part p:

```
var key = p.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the part. **Note that a carriage return is not added**. See also Part.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for part p:

```
var cards = p.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last part in the model.

Arguments

- **Model** (Model)

Model to get last part in

Returns

Part object (or null if there are no parts in the model).

Return type

Part

Example

To get the last part in model m:

```
var p = Part.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free part label in the model. Also see Part.FirstFreeLabel(), Part.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free part label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Part label.

Return type

Number

Example

To get the last free part label in model m:

```
var label = Part.LastFreeLabel(m);
```

Mass()

Description

Returns the mass properties for a part.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
Assign_Mass	real	Assign mass
Component_Mass	real	Component mass
Dyna_Added_Mass	real	Dyna added mass
Dyna_Part_Mass	real	Dyna part mass
Lumped_Mass	real	Lumped mass
NRB_Mass	real	NRB mass
NS_Mass	real	Non-structural mass
Struct_Mass	real	Structural mass
Transferrd_Mass	real	Transferred mass when deformable meshed to rigid

Return type

object

Example

To get the structural mass for part p:

```
var mprops = p.Mass();
var struct_mass = mprops.Struct_Mass;
```

MaxMin()

Description

Returns the max and min bounds of a part

Arguments

No arguments

Returns

An array containing the xMin, xMax, yMin, yMax, zMin and zMax coordinates for a box bounding the part, or null if the bounds cannot be calculated (e.g. the part has no structural elements)

Return type

array

Example

To get the bounds for part p:

```
var bounds = p.MaxMin();
if (bounds) {
    xMin = bounds[0];
    xMax = bounds[1];
    yMin = bounds[2];
    yMax = bounds[3];
    zMin = bounds[4];
    zMax = bounds[5];
}
```

MeasurePartToPart(part1*[Part]*, part2*[Part]*) [static]

Description

This static method measures the distance between two part objects contained in the same model or in two different models

Arguments

- **part1** (Part)

Part to measure from

- **part2** (Part)

Part to measure to

Returns

Object with the following properties:

Name	Type	Description
distance	real	Distance between the two parts
vector	Array of reals	Components of distance vector

Return type

object

Example

To measure the distance between part object p1 and part object p2:

```
var m = Part.MeasurePartToPart(p1, p2);
var d = m.distance;
var XComp = m.vector[0];
var YComp = m.vector[1];
var ZComp = m.vector[2];
```

Next()

Description

Returns the next part in the model.

Arguments

No arguments

Returns

Part object (or null if there are no more parts in the model).

Return type

Part

Example

To get the part in model m after part p:

```
var p = p.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) part label in the model. Also see Part.FirstFreeLabel(), Part.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free part label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Part label.

Return type

Number

Example

To get the next free part label in model m:

```
var label = Part.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a part.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only parts from that model can be picked. If the argument is a Flag then only parts that are flagged with *limit* can be selected. If omitted, or null, any parts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Part object (or null if not picked)

Return type

Part

Example

To pick a part from model m giving the prompt 'Pick part from screen':

```
var p = Part.Pick('Pick part from screen', m);
```

Previous()

Description

Returns the previous part in the model.

Arguments

No arguments

Returns

Part object (or null if there are no more parts in the model).

Return type

Part

Example

To get the part in model m before part p:

```
var p = p.Previous();
```

RemoveCompositeData(ipt*[integer]*)

Description

Removes the composite data for an integration point in *PART_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to remove. **Note that integration points start at 0, not 1**.

Returns

No return value.

Example

To remove the composite data for the 3rd integration point for part p:

```
p.RemoveCompositeData(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the parts in the model.

Arguments

- **Model** (Model)

Model that all parts will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the parts in model m, from 1000000:

```
Part.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged parts in the model.

Arguments

- **Model** (Model)

Model that all the flagged parts will be renumbered in

- **flag** (Flag)

Flag set on the parts that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the parts in model m flagged with f, from 1000000:

```
Part.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select parts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting parts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only parts from that model can be selected. If the argument is a Flag then only parts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any parts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of parts selected or null if menu cancelled

Return type

Number

Example

To select parts from model m, flagging those selected with flag f, giving the prompt 'Select parts':

```
Part.Select(f, 'Select parts', m);
```

To select parts, flagging those selected with flag f but limiting selection to parts flagged with flag l, giving the prompt 'Select parts':

```
Part.Select(f, 'Select parts', l);
```

SetCompositeData(ipt*[integer]*, mid*[integer]*, thick*[real]*, beta*[real]*, tmid (optinal)*[integer]*, plyid (optional)*[integer]*, shrfac (optional)*[real]*)

Description

Sets the composite data for an integration point in *PART_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want to set the data for. **Note that integration points start at 0, not 1**.

- **mid** (integer)

Material ID for the integration point.

- **thick** (real)

Thickness of the integration point.

- **beta** (real)

Material angle of the integration point.

- **tmid (optinal)** (integer)

Thermal material ID for the integration point.

- **plyid (optional)** (integer)

Ply ID for the integration point. This should be used if the _COMPOSITE_LONG option is set for the part.

- **shrfac (optional)** (real)

Transverse shear stress scale factor.

Returns

No return value.

Example

To set the composite data for the 3rd integration point to mat 1, thickness 0.5 and angle 45, for part p:

```
p.SetCompositeData(2, 1, 0.5, 45);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the part.

Arguments

- **flag** (Flag)

Flag to set on the part

Returns

No return value

Example

To set flag f for part p:

```
p.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the part. The part will be sketched until you either call Part.Unsketch(), Part.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the part is sketched. If omitted redraw is true. If you want to sketch several parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch part p:

```
p.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged parts in the model. The parts will be sketched until you either call Part.Unsketch(), Part.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged parts will be sketched in

- **flag** (Flag)

Flag set on the parts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the parts are sketched. If omitted redraw is true. If you want to sketch flagged parts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all parts flagged with flag in model m:

```
Part.SketchFlagged(m, flag);
```

TableProperties()

Description

Returns all of the properties available for the part in the part table. The table values are returned in an object. The object property names are the same as the table headers but spaces are replaced with underscore characters and characters other than 0-9, a-z and A-Z are removed to ensure that the property name is valid in JavaScript. If a table value is undefined the property value will be the JavaScript undefined value. If the table value is a valid number it will be a number, otherwise the value will returned as a string.

Arguments

No arguments

Returns

object.

Return type

Object

Example

To get all of the properties for part p:

```
var properties = p.TableProperties();
for (var x in properties)
{
    Message(x+"="+properties[x]);
}
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of parts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing parts should be counted. If false or omitted referenced but undefined parts will also be included in the total.

Returns

number of parts

Return type

Number

Example

To get the total number of parts in model m:

```
var total = Part.Total(m);
```

Unblank()

Description

Unblanks the part

Arguments

No arguments

Returns

No return value

Example

To unblank part p:

```
p.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the parts in the model.

Arguments

- **Model** (Model)

Model that all parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the parts in model m:

```
Part.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged parts in the model.

Arguments

- **Model** (Model)

Model that the flagged parts will be unblanked in

- **flag** (Flag)

Flag set on the parts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the parts in model m flagged with f:

```
Part.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the parts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all parts will be unset in

- **flag** (Flag)

Flag to unset on the parts

Returns

No return value

Example

To unset the flag f on all the parts in model m:

```
Part.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the part.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the part is unsketched. If omitted redraw is true. If you want to unsketch several parts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch part p:

```
p.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all parts.

Arguments

- **Model** (Model)

Model that all parts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the parts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all parts in model m:

```
Part.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged parts in the model.

Arguments

- **Model** (Model)

Model that all parts will be unsketched in

- **flag** (Flag)

Flag set on the parts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the parts are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all parts flagged with flag in model m:

```
Part.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Part object.

Return type

Part

Example

To check if Part property p.example is a parameter by using the Part.GetParameter() method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for part. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for part p:

```
p.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this part.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for part p:

```
var xrefs = p.Xrefs();
```

---

toString()

Description

Creates a string containing the part data in keyword format. Note that this contains the keyword header and the keyword cards. See also Part.Keyword() and Part.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for part p in keyword format

```
var str = p.toString();
```

Rigidwall class

The Rigidwall class gives you access to rigidwall cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Rigidwall constants

Name	Description
Rigidwall.CYLINDER	Rigidwall is *RIGIDWALL_GEOMETRIC_CYLINDER.
Rigidwall.FLAT	Rigidwall is *RIGIDWALL_GEOMETRIC_FLAT.
Rigidwall.PLANAR	Rigidwall is *RIGIDWALL_PLANAR.
Rigidwall.PRISM	Rigidwall is *RIGIDWALL_GEOMETRIC_PRISM.
Rigidwall.SPHERE	Rigidwall is *RIGIDWALL_GEOMETRIC_SPHERE.

Rigidwall properties

Name	Type	Description
birth	real	Birth time.
boxid	integer	Box for nodes.
d1	real	X component of vector defn.
d2	real	Y component of vector defn.
d3	real	Z component of vector defn.
death	real	Death time.
decaya	real	Friction decay const in local A dir.
decayb	real	Friction decay const in local B dir.
dfrica	real	Dynamic friction coeff in local A dir.
dfricb	real	Dynamic friction coeff in local B dir.
display	logical	DISPLAY flag.
e	real	Young’s modulus of rigidwall (for _DISPLAY option).
exists (read only)	logical	true if rigidwall exists, false if referred to but not defined.
finite	logical	Finite flag.
forces	logical	Forces flag.
fric	real	Friction coefficient.
heading	string	Rigidwall heading
id	logical	true if _ID option is set, false if not
include	integer	The Include file number that the rigidwall is in.
label	integer	Rigidwall number.
lcid	integer	Vel/disp vs time curve number.
lencyl	real	Length of cylinder.
lenl	real	Length of L edge.
lenm	real	Length of M edge.

lenp	real	Length of prism in -ve N.
mass	real	Mass of moving wall.
model (read only)	integer	The Model number that the rigidwall is in.
motion	logical	Motion flag.
moving	logical	Moving flag.
n1	integer	1st node for visualisation.
n2	integer	2nd node for visualisation.
n3	integer	3rd node for visualisation.
n4	integer	4th node for visualisation.
node1	integer	Node 1 for vector defn.
node2	integer	Node 2 for vector defn.
nsegs	integer	Number of subsections.
nsid	integer	Slave node set included in wall.
nsidex	integer	Slave node set exempted from wall.
offset	real	Offset for planar option.
opt	integer	Motion type.
ortho	logical	Ortho flag.
pid	integer	Part ID for display of geometric rigidwall (for _DISPLAY option).
pr	real	Poisson’s ratio of rigidwall (for _DISPLAY option).
radcyl	real	Radius of cylinder.
radsph	real	Radius of sphere.
ro	real	Density of rigidwall (for _DISPLAY option).
rwid	integer	Rigidwall number (identical to label).
rwksf	real	Stiffness scaling factor.
sfrica	real	Static friction coeff in local A dir.
sfricb	real	Static friction coeff in local B dir.
soft	integer	No. of cycles to zero relative velocity.
ssid	integer	Segment set number.
type	constant	The rigidwall type. Can be Rigidwall.FLAT, Rigidwall.PRISM, Rigidwall.CYLINDER, Rigidwall.SPHERE, Rigidwall.PLANAR,
v0	real	Initial velocity.
vx	real	X component of motion vector.
vy	real	Y component of motion vector.
vz	real	Z component of motion vector.
wvel	real	Velocity at which nodes weld to wall.
xh	real	Head X coord of outward normal.
xhev	real	Head X coord of edge I vector.
xt	real	Tail X coord of outward normal.
yh	real	Head Y coord of outward normal.

yhev	real	Head Y coord of edge I vector.
yt	real	Tail Y coord of outward normal.
zh	real	Head Z coord of outward normal.
zhev	real	Head Z coord of edge I vector.
zt	real	Tail Z coord of outward normal.

Detailed Description

The Rigidwall class allows you to create, modify, edit rigidwall cards. See the documentation below for more details.

Constructor

new Rigidwall(Model*[Model]*, type*[constant]*, nsid (optional)*[integer]*, rwid (optional)*[integer]*, heading (optional)*[string]*)

Description

Create a new Rigidwall object.

Arguments

- **Model** (Model)

Model that Rigidwall will be created in

- **type** (constant)

Specify the type of rigidwall (Can be Rigidwall.FLAT, Rigidwall.PRISM, Rigidwall.CYLINDER, Rigidwall.SPHERE, Rigidwall.PLANAR)

- **nsid (optional)** (integer)

Node set number.

- **rwid (optional)** (integer)

Rigidwall number

- **heading (optional)** (string)

Title for the Rigidwall

Returns

Rigidwall object

Return type

Rigidwall

Example

To create a new rigidwall 200 of type GEOMETRIC_SPHERE in model m using node set 100 having the title "test wall"

```
var r = new Rigidwall(m, Rigidwall.SPHERE, 200, 100, "test wall");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a rigidwall.

Arguments

- **Comment** (Comment)

Comment that will be attached to the rigidwall

Returns

No return value

Example

To associate comment c to the rigidwall r:

```
r.AssociateComment(c);
```

Blank()

Description

Blanks the rigidwall

Arguments

No arguments

Returns

No return value

Example

To blank rigidwall r:

```
r.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all rigidwalls will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the rigidwalls in model m:

```
Rigidwall.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all the flagged rigidwalls will be blanked in

- **flag** (Flag)

Flag set on the rigidwalls that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the rigidwalls in model m flagged with f:

```
Rigidwall.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the rigidwall is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if rigidwall r is blanked:

```
if (r.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse rigidwall r:

```
r.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the rigidwall.

Arguments

- **flag** (Flag)

Flag to clear on the rigidwall

Returns

No return value

Example

To clear flag f for rigidwall r:

```
r.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the rigidwall. The target include of the copied rigidwall can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Rigidwall object

Return type

Rigidwall

Example

To copy rigidwall r into rigidwall z:

```
var z = r.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a rigidwall.

Arguments

- **Model** (Model)

Model that the rigidwall will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Rigidwall object (or null if not made)

Return type

Rigidwall

Example

To start creating a rigidwall in model m:

```
var r = Rigidwall.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a rigidwall.

Arguments

- **Comment** (Comment)

Comment that will be detached from the rigidwall

Returns

No return value

Example

To detach comment c from the rigidwall r:

```
r.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit rigidwall r:

```
r.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for rigidwall. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for rigidwall r:

```
r.Error("My custom error");
```

FindNodesBehind(flag*[Flag]*)

Description

Flags nodes that are behind a rigidwall

Arguments

- **flag** (Flag)

Flag to be set on nodes behind rigidwall.

Returns

Number of nodes found

Return type

Number

Example

To set flag f on nodes behind rigidwall w:

```
w.FlagNodesBehind(f);
```

First(Model*[Model]*) [static]

Description

Returns the first rigidwall in the model.

Arguments

- **Model** (Model)

Model to get first rigidwall in

Returns

Rigidwall object (or null if there are no rigidwalls in the model).

Return type

Rigidwall

Example

To get the first rigidwall in model m:

```
var r = Rigidwall.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free rigidwall label in the model. Also see Rigidwall.LastFreeLabel(), Rigidwall.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free rigidwall label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Rigidwall label.

Return type

Number

Example

To get the first free rigidwall label in model m:

```
var label = Rigidwall.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the rigidwalls in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all rigidwalls will be flagged in

- **flag** (Flag)

Flag to set on the rigidwalls

Returns

No return value

Example

To flag all of the rigidwalls with flag f in model m:

```
Rigidwall.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the rigidwall is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the rigidwall

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if rigidwall r has flag f set on it:

```
if (r.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each rigidwall in the model.
Note that ForEach has been designed to make looping over rigidwalls as fast as possible and so has some limitations.
Firstly, a single temporary Rigidwall object is created and on each function call it is updated with the current rigidwall data. This means that you should not try to store the Rigidwall object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new rigidwalls inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all rigidwalls are in

- **func** (function)

Function to call for each rigidwall

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the rigidwalls in model m:

```
Rigidwall.ForEach(m, test);
function test(r)
{
// r is Rigidwall object
}
```

To call function test for all of the rigidwalls in model m with optional object:

```
var data = { x:0, y:0 };
Rigidwall.ForEach(m, test, data);
function test(r, extra)
{
// r is Rigidwall object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Rigidwall objects for all of the rigidwalls in a model in PRIMER

Arguments

- **Model** (Model)

Model to get rigidwalls from

Returns

Array of Rigidwall objects

Return type

Array

Example

To make an array of Rigidwall objects for all of the rigidwalls in model m

```
var r = Rigidwall.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a rigidwall.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the rigidwall r:

```
var comm_array = r.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Rigidwall objects for all of the flagged rigidwalls in a model in PRIMER

Arguments

- **Model** (Model)

Model to get rigidwalls from

- **flag** (Flag)

Flag set on the rigidwalls that you want to retrieve

Returns

Array of Rigidwall objects

Return type

Array

Example

To make an array of Rigidwall objects for all of the rigidwalls in model m flagged with f

```
var r = Rigidwall.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Rigidwall object for a rigidwall ID.

Arguments

- **Model** (Model)

Model to find the rigidwall in

- **number** (integer)

number of the rigidwall you want the Rigidwall object for

Returns

Rigidwall object (or null if rigidwall does not exist).

Return type

Rigidwall

Example

To get the Rigidwall object for rigidwall 100 in model m

```
var r = Rigidwall.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Rigidwall property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Rigidwall.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

rigidwall property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Rigidwall property r.example is a parameter:

```
Options.property_parameter_names = true;
if (r.GetParameter(r.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Rigidwall property r.example is a parameter by using the GetParameter method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

GetRow(row*[integer]*)

Description

Returns the data for an NSEGS card row in the rigidwall.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

An array of numbers containing the row variables VL and HEIGHT.

Return type

Number

Example

To get the data for the 2nd row in rigidwall r:

```
var data = r.GetRow(1);
var vl = data[0];
var height = data[1];
```

Keyword()

Description

Returns the keyword for this Rigidwall (*RIGIDWALL). **Note that a carriage return is not added**. See also Rigidwall.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Rigidwall pm:

```
var key = r.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Rigidwall. **Note that a carriage return is not added**. See also Rigidwall.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Rigidwall pm:

```
var cards = r.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last rigidwall in the model.

Arguments

- **Model** (Model)

Model to get last rigidwall in

Returns

Rigidwall object (or null if there are no rigidwalls in the model).

Return type

Rigidwall

Example

To get the last rigidwall in model m:

```
var r = Rigidwall.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free rigidwall label in the model. Also see Rigidwall.FirstFreeLabel(), Rigidwall.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free rigidwall label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Rigidwall label.

Return type

Number

Example

To get the last free rigidwall label in model m:

```
var label = Rigidwall.LastFreeLabel(m);
```

Next()

Description

Returns the next rigidwall in the model.

Arguments

No arguments

Returns

Rigidwall object (or null if there are no more rigidwalls in the model).

Return type

Rigidwall

Example

To get the rigidwall in model m after rigidwall r:

```
var r = r.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) rigidwall label in the model. Also see Rigidwall.FirstFreeLabel(), Rigidwall.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free rigidwall label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Rigidwall label.

Return type

Number

Example

To get the next free rigidwall label in model m:

```
var label = Rigidwall.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a rigidwall.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only rigidwalls from that model can be picked. If the argument is a Flag then only rigidwalls that are flagged with *limit* can be selected. If omitted, or null, any rigidwalls from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Rigidwall object (or null if not picked)

Return type

Rigidwall

Example

To pick a rigidwall from model m giving the prompt 'Pick rigidwall from screen':

```
var r = Rigidwall.Pick('Pick rigidwall from screen', m);
```

Previous()

Description

Returns the previous rigidwall in the model.

Arguments

No arguments

Returns

Rigidwall object (or null if there are no more rigidwalls in the model).

Return type

Rigidwall

Example

To get the rigidwall in model m before rigidwall r:

```
var r = r.Previous();
```

RemoveRow(row*[integer]*)

Description

Removes an NSEGS card row in the *RIGIDWALL.

Arguments

- **row** (integer)

The row you want to remove the data for. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second row of data for rigidwall r:

```
r.RemoveRow(1);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all rigidwalls will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the rigidwalls in model m, from 1000000:

```
Rigidwall.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all the flagged rigidwalls will be renumbered in

- **flag** (Flag)

Flag set on the rigidwalls that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the rigidwalls in model m flagged with f, from 1000000:

```
Rigidwall.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select rigidwalls using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting rigidwalls

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only rigidwalls from that model can be selected. If the argument is a Flag then only rigidwalls that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any rigidwalls can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of rigidwalls selected or null if menu cancelled

Return type

Number

Example

To select rigidwalls from model m, flagging those selected with flag f, giving the prompt 'Select rigidwalls':

```
Rigidwall.Select(f, 'Select rigidwalls', m);
```

To select rigidwalls, flagging those selected with flag f but limiting selection to rigidwalls flagged with flag l, giving the prompt 'Select rigidwalls':

```
Rigidwall.Select(f, 'Select rigidwalls', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the rigidwall.

Arguments

- **flag** (Flag)

Flag to set on the rigidwall

Returns

No return value

Example

To set flag f for rigidwall r:

```
r.SetFlag(f);
```

SetRow(row*[integer]*, data*[Array of data]*)

Description

Sets the data for an NSEGS card row in the *RIGIDWALL.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **data** (Array of data)

The data you want to set the row to

Returns

No return value.

Example

To set the second row of data for rigidwall r to be vl 10.0 and height 1.0:

```
var array = [10.0, 1.0];
r.SetRow(1, array);
```

To append a new row of data (using the same array of values):

```
r.SetRow(r.nsegs, array);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the rigidwall. The rigidwall will be sketched until you either call Rigidwall.Unsketch(), Rigidwall.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigidwall is sketched. If omitted redraw is true. If you want to sketch several rigidwalls and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch rigidwall r:

```
r.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged rigidwalls in the model. The rigidwalls will be sketched until you either call Rigidwall.Unsketch(), Rigidwall.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged rigidwalls will be sketched in

- **flag** (Flag)

Flag set on the rigidwalls that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigidwalls are sketched. If omitted redraw is true. If you want to sketch flagged rigidwalls several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all rigidwalls flagged with flag in model m:

```
Rigidwall.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of rigidwalls in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing rigidwalls should be counted. If false or omitted referenced but undefined rigidwalls will also be included in the total.

Returns

number of rigidwalls

Return type

Number

Example

To get the total number of rigidwalls in model m:

```
var total = Rigidwall.Total(m);
```

Unblank()

Description

Unblanks the rigidwall

Arguments

No arguments

Returns

No return value

Example

To unblank rigidwall r:

```
r.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all rigidwalls will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the rigidwalls in model m:

```
Rigidwall.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged rigidwalls in the model.

Arguments

- **Model** (Model)

Model that the flagged rigidwalls will be unblanked in

- **flag** (Flag)

Flag set on the rigidwalls that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the rigidwalls in model m flagged with f:

```
Rigidwall.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the rigidwalls in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all rigidwalls will be unset in

- **flag** (Flag)

Flag to unset on the rigidwalls

Returns

No return value

Example

To unset the flag f on all the rigidwalls in model m:

```
Rigidwall.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the rigidwall.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigidwall is unsketched. If omitted redraw is true. If you want to unsketch several rigidwalls and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch rigidwall r:

```
r.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all rigidwalls.

Arguments

- **Model** (Model)

Model that all rigidwalls will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigidwalls are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all rigidwalls in model m:

```
Rigidwall.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged rigidwalls in the model.

Arguments

- **Model** (Model)

Model that all rigidwalls will be unsketched in

- **flag** (Flag)

Flag set on the rigidwalls that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the rigidwalls are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all rigidwalls flagged with flag in model m:

```
Rigidwall.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Rigidwall object.

Return type

Rigidwall

Example

To check if Rigidwall property r.example is a parameter by using the Rigidwall.GetParameter() method:

```
if (r.ViewParameters().GetParameter(r.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for rigidwall. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for rigidwall r:

```
r.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this rigidwall.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for rigidwall r:

```
var xrefs = r.Xrefs();
```

---

toString()

Description

Creates a string containing the Rigidwall data in keyword format. Note that this contains the keyword header and the keyword cards. See also Rigidwall.Keyword() and Rigidwall.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Rigidwall pm in keyword format

```
var r = r.toString();
```

Section class

The Section class gives you access to section cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Section constants

Name	Description
Section.ALE1D	Section ale1d type
Section.ALE2D	Section ale2d type
Section.BEAM	Section beam type
Section.DISCRETE	Section discrete type
Section.POINT_SOURCE	Section point source type
Section.SEATBELT	Section seatbelt type
Section.SHELL	Section shell type
Section.SOLID	Section solid type
Section.SPH	Section sph type
Section.TSHELL	Section thick shell type

Section properties

Name	Type	Description
aafac	real	ALE advection factor(SHELL, SOLID)
aet	integer	Ambient element type (ALE1D, ALE2D, SOLID)
afac	real	Smoothing weight factor - Simple average (SHELL, SOLID)
ale	logical	If _ALE option is set. Can be true or false (SHELL, SOLID)
aleform	integer	ALE formulation (ALE1D, ALE2D)
baselm	integer	Base element type for XFEM (SHELL)
bfac	real	Smoothing weight factor - Volume weighting (SHELL, SOLID)
cfac	real	Smoothing weight factor - Isoparametric (SHELL, SOLID)
cmid	integer	Cohesive material (SHELL, SOLID)
cohthk	real	Cohesive thickness (SOLID)
colour	Colour	The colour of the section
dfac	real	Smoothing weight factor - Equipotential (SHELL, SOLID)
domint	integer	Domain integration in XFEM (SHELL)
dr	real	PERI normalized horizon size (SOLID)
dx	real	Normalized dilation parameter of kernel function in X (SHELL, SOLID)
dy	real	Normalized dilation parameter of kernel function in Y (SHELL, SOLID)
dz	real	Normalized dilation parameter of kernel function in Z (SOLID)

efac	real	Smoothing weight factor - Equilibrium (SHELL)
efg	logical	If _EFG option is set. Can be true or false (SHELL, SOLID)
elform	integer	Element formulation (ALE1D, ALE2D, BEAM, SHELL, SOLID, TSHELL)
end	real	End time for smoothing (SHELL, SOLID)
exists (read only)	logical	true if section exists, false if referred to but not defined.
failcr	integer	Different failure criteria (SHELL)
fs	real	SPG Failure strain if IDAM = 1 (SOLID)
icomp	integer	Composite flag (SHELL, TSHELL)
idam	integer	SPG Option of damage mechanism (SOLID)
idila	integer	Normalized dilation parameter definition (SOLID)
idim	integer	Domain integration method (SOLID)
iebt	integer	Essential boundary condition treatment (SOLID)
ihgf	integer	Flag for using hourglass stabilization (SHELL, SOLID)
iloc	integer	Coordinate system option (SHELL)
include	integer	The Include file number that the section is in.
ispline	integer	EFG kernel function definition (SHELL, SOLID)
itaj	integer	Flag for setting up finite element matrices (SHELL, SOLID)
itb	integer	SPG Stabilization flag (SOLID)
ithelfm	integer	THERMAL shell formulation (SHELL)
iunf	integer	Flag for using nodal fibre vectors (SHELL)
kernel	integer	SPG kernel type approximation (SOLID)
label	integer or string	Section ID (all types) or character label. Also see the secid property which is an alternative name for this.
lmc	integer	Number of property parameters (SHELL, SOLID)
lprint	integer	Debug printout option (SHELL)
lscale	real	SPG length scale for displacement regularisation (SOLID)
misc	logical	If _MISC option is set. Can be true or false (SHELL, SOLID)
model (read only)	integer	The Model number that the section is in.
nhsv	integer	Number of history variables (SHELL, SOLID)
nip	integer	Number of integration points (SHELL, SOLID, TSHELL)
nipp	integer	Number of in-plane integration points (SHELL)
nxdof	integer	Number of extra degrees of freedom per node (SHELL, SOLID)
peri	logical	If _PERI option is set. Can be true or false (SOLID)
propcr	integer	Not used (SHELL)
propt	real	Printout option (SHELL, TSHELL)
ptype	integer	PERI peridynamics formulation (SOLID)
qr	real	Quadrature rule (BEAM, SHELL, TSHELL)
secid	integer or string	Section ID (all types) or character label. Also see the label property which is an alternative name for this.

shrf	real	Shear correction factor (BEAM, SHELL, TSHELL)
smstep	integer	SPG Interval of timestep to conduction displ regularisation (SOLID)
spg	logical	If _SPG option is set. Can be true or false (SOLID)
start	real	Time imposed SPH approximation is activated (SPH) **or** Start time for smoothing (SHELL, SOLID)
stretch	real	SPG stretching parameter if IDAM = 1 (SOLID)
swtime	real	SPG Time to switch from updated Lagrangian to Eulerian kernel (SOLID)
thermal	logical	If _THERMAL option is set. Can be true or false (SHELL)
thick	real	Thickness (ALE1D, SEATBELT)
title	string	Section title (all types)
toldef	real	Deformation tolerance (SOLID)
transparency	integer	The transparency of the section (0-100) 0% is opaque, 100% is transparent.
type (read only)	constant	Section type. Can be Section.ALE1D, Section.ALE2D, Section.BEAM, Section.DISCRETE, Section.POINT_SOURCE, Section.SEATBELT, Section.SHELL, Section.SOLID, Section.SPH or Section.TSHELL
xfem	logical	If _THERMAL option is set. Can be true or false (SHELL)

Properties for BEAM

Name	Type	Description
a	real	Cross sectional area
aisc	logical	If _AISC option is set. Can be true or false
aisc_label	string	AISC section label
ca	real	Cable area
cid	integer	Coordinate system ID for orientation
cst	real	Cross section type
d1	real	Input parameter 1 for section type
d2	real	Input parameter 2 for section type
d3	real	Input parameter 3 for section type
d4	real	Input parameter 4 for section type
d5	real	Input parameter 5 for section type
d6	real	Input parameter 6 for section type
dofn1	real	Active degree of freedom at node 1
dofn2	real	Active degree of freedom at node 2
iner	real	Mass moment of inertia
iovpr	integer	Print flag for the elbow ovalization degrees of freedom (elform 14)
iprstr	integer	Flag for adding stress due to pressure into the material routine (elform 14)
irr	real	Irr
iss	real	Iss
ist	real	Ist
itoff	real	Option to specify torsional behaviour for spotwelds
itorm	real	Itorm

itt	real	Itt
iw	real	Warping constant
iwr	real	Warping constant
iyr	real	IYR integral
izr	real	IZR integral
j	real	torsional constant
nsloc	real	Location of s reference surface
nsm	real	Non structural mass per unit length
ntloc	real	Location of t reference surface
offset	real	Offset for cable
pr	real	Pressure inside elements (elform 14)
print	real	Output spot force resultants from spotwelds
rampt	real	Ramp up time for dynamic relaxation
rrcon	real	r rotational constraint
sa	real	Shear area
scoor	real	Location of triad for discrete beam
srcon	real	s rotational constraint
stress	real	Initial stress for dynamic relaxation
stype	string	Section type
trcon	real	t rotational constraint
ts1	real	s thickness or outer diameter at N1
ts2	real	s thickness or outer diameter at N2
tt1	real	t thickness or inner diameter at N1
tt2	real	t thickness or inner diameter at N2
vol	real	Volume of discrete beam
ys	real	s coordinate of shear centre of cross section
zs	real	t coordinate of shear centre of cross section

Properties for DISCRETE

Name	Type	Description
cdl	real	Deflection limit in compression
cl	real	Clearance
dro	integer	Displacement/rotation option
fd	real	Failure deflection
kd	real	Dynamic magnification factor
tdl	real	Deflection limit in tension
v0	real	Test velocity

Properties for POINT SOURCE

Name	Type	Description
lcidt	integer	Temperature loadcurve ID

lcidvel	integer	Inlet flow velocity loadcurve ID
lcidvolr	integer	Relative volume loadcurve ID
lcmdot1	integer	Mass flowrate loadcurve for gas 1
lcmdot2	integer	Mass flowrate loadcurve for gas 2
lcmdot3	integer	Mass flowrate loadcurve for gas 3
lcmdot4	integer	Mass flowrate loadcurve for gas 4
lcmdot5	integer	Mass flowrate loadcurve for gas 5
lcmdot6	integer	Mass flowrate loadcurve for gas 6
lcmdot7	integer	Mass flowrate loadcurve for gas 7
lcmdot8	integer	Mass flowrate loadcurve for gas 8
mixture	logical	If _MIXTURE option is set. Can be true or false
nidlc001	integer	1st node ID defining a local coordinate
nidlc002	integer	2nd node ID defining a local coordinate
nidlc003	integer	3rd node ID defining a local coordinate
points	integer	Number of point sources

Properties for SEATBELT

Name	Type	Description
area	real	Optional cross sectional area used in contact

Properties for SHELL

Name	Type	Description
edgset	integer	Edge node set
idof	real	Thickness field value
marea	real	Non structural mass per unit area
nloc	integer	Location of reference surface
setyp	integer	2D solid element type
t1	real	Thickness at Node 1
t2	real	Thickness at Node 2
t3	real	Thickness at Node 3
t4	real	Thickness at Node 4

Properties for SOLID

Name	Type	Description
cohoff	real	Relative location of cohesive layer (for cohesive solid elements 20 and 22)
ds	real	Displacement jump
ecut	real	Minimum distance to the node that a crack surface can cut to the edge
gaskett	real	Gasket thickness for converting elform 19-22 elements to gasket element
ibr	integer	Branching
iken	integer	approximation

ips	integer	Pressure smoothing/recovery
sf	real	Failure strain
stime	real	Time to switch from stabilized EFG to standard EFG formulation

Properties for SPH

Name	Type	Description
cslh	real	Smoothing length constant
death	real	Time imposed SPH approximation is stopped
ellipse	logical	If _ELLIPSE option is set (was _TENSOR pre R8). Can be true or false
hmax	real	Max smoothing length scale factor
hmin	real	Min smoothing length scale factor
hxcslh	real	Constant for smoothing length in X for tensor/ellipse case
hxini	real	Initial smoothing length in X for tensor/ellipse case
hycslh	real	Constant for smoothing length in Y for tensor/ellipse case
hyini	real	Initial smoothing length in Y for tensor/ellipse case
hzcslh	real	Constant for smoothing length in Z for tensor/ellipse case
hzini	real	Initial smoothing length in Z for tensor/ellipse case
iform	integer	SPH element formulation
interaction	logical	If _INTERACTION option is set. Can be true or false
sphini	real	Optional initial smoothing length
tensor	logical	If _TENSOR option is set (_ELLIPSE from R8 onwards). Can be true or false
user	logical	If _USER option is set. Can be true or false

Properties for TSHELL

Name	Type	Description
tshear	integer	Flag for transverse shear strain or stress distribution

Detailed Description

The Section class allows you to create, modify, edit and manipulate section cards. See the documentation below for more details.

Constructor

new Section(Model*[Model]*, secid*[integer or string]*, type*[constant]*, title (optional)*[string]*)

Description

Create a new Section object.

Arguments

- **Model** (Model)

Model that section will be created in

- **secid** (integer or string)

Section number or character label

- **type** (constant)

Section type. Can be Section.BEAM, Section.DISCRETE, Section.POINT_SOURCE, Section.SEATBELT, Section.SHELL, Section.SOLID, Section.SPH or Section.TSHELL

- **title (optional)** (string)

Title for the section

Returns

Section object

Return type

Section

Example

To create a new section, type shell, called 'Example' in model m with label 100:

```
var s = new Section(m, 100, Section.SHELL, 'Example');
```

Details of functions

AssociateComment(Comment[*Comment*])

Description

Associates a comment with a section.

Arguments

- **Comment** (Comment)

Comment that will be attached to the section

Returns

No return value

Example

To associate comment c to the section s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the section

Arguments

No arguments

Returns

No return value

Example

To blank section s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the sections in the model.

Arguments

- **Model** (Model)

Model that all sections will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sections in model m:

```
Section.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged sections will be blanked in

- **flag** (Flag)

Flag set on the sections that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sections in model m flagged with f:

```
Section.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the section is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if section s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse section s:

```
s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the section.

Arguments

- **flag** (Flag)

Flag to clear on the section

Returns

No return value

Example

To clear flag f for section s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the section. The target include of the copied section can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Section object

Return type

Section

Example

To copy section s into section z:

```
var z = s.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a section.

Arguments

- **Model** (Model)

Model that the sect will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Section object (or null if not made)

Return type

Section

Example

To start creating a section in model m:

```
var d = Section.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a section.

Arguments

- **Comment** (Comment)

Comment that will be detached from the section

Returns

No return value

Example

To detach comment c from the section s:

```
s.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit section s:

```
s.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for section. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for section s:

```
s.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for section.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the section colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the section.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing section s:

```
var colour = s.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first section in the model.

Arguments

- **Model** (Model)

Model to get first section in

Returns

Section object (or null if there are no sections in the model).

Return type

Section

Example

To get the first section in model m:

```
var s = Section.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free section label in the model. Also see Section.LastFreeLabel(), Section.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Section label.

Return type

Number

Example

To get the first free section label in model m:

```
var label = Section.FirstFreeLabel(m);
```

FlagAll(Model[*Model*], flag[*Flag*]) [static]

Description

Flags all of the sections in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all sections will be flagged in

- **flag** (Flag)

Flag to set on the sections

Returns

No return value

Example

To flag all of the sections with flag f in model m:

```
Section.FlagAll(m, f);
```

Flagged(flag[*Flag*])

Description

Checks if the section is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the section

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if section s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each section in the model.
Note that ForEach has been designed to make looping over sections as fast as possible and so has some limitations.
Firstly, a single temporary Section object is created and on each function call it is updated with the current section data. This means that you should not try to store the Section object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new sections inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all sections are in

- **func** (function)

Function to call for each section

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the sections in model m:

```
Section.ForEach(m, test);
function test(s)
{
// s is Section object
}
```

To call function test for all of the sections in model m with optional object:

```
var data = { x:0, y:0 };
Section.ForEach(m, test, data);
function test(s, extra)
{
// s is Section object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Section objects for all of the sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sections from

Returns

Array of Section objects

Return type

Array

Example

To make an array of Section objects for all of the sections in model m

```
var s = Section.GetAll(m);
```

GetBetaData(ipt*[integer]*)

Description

Returns the beta angle data for an integration point in *SECTION_SHELL or *SECTION_TSHELL.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

real

Return type

Number

Example

To get the beta angle for the 3rd integration point for section shell s:

```
if (s.icomp && s.nip >= 3)
{
    var beta = s.GetBetaData(2);
}
```

GetComments()

Description

Extracts the comments associated to a section.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the section s:

```
var comm_array = s.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Section objects for all of the flagged sections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get sections from

- **flag** (Flag)

Flag set on the sections that you want to retrieve

Returns

Array of Section objects

Return type

Array

Example

To make an array of Section objects for all of the sections in model m flagged with f

```
var s = Section.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Section object for a section ID.

Arguments

- **Model** (Model)

Model to find the section in

- **number** (integer)

number of the section you want the Section object for

Returns

Section object (or null if section does not exist).

Return type

Section

Example

To get the Section object for section 100 in model m

```
var s = Section.GetFromID(m, 100);
```

GetLmcData(i*[integer]*)

Description

Returns the LMC property parameter for *SECTION_SHELL or *SECTION_SOLID.

Arguments

- **i** (integer)

The point you want the parameter for. **Note that points start at 0, not 1**.

Returns

real

Return type

Number

Example

To get the 3rd LMC parameter for section shell s:

```
if (s.lmc >= 3)
{
    var p = s.GetLmcData(2);
}
```

GetParameter(prop*[string]*)

Description

Checks if a Section property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Section.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

section property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Section property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Section property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

GetPointData(ipt*[integer]*)

Description

Returns the point data for a single point in *SECTION_POINT_SOURCE.

Arguments

- **ipt** (integer)

The point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array of numbers containing the node id, vector id and orifice area.

Return type

Number

Example

To get the data for the 3rd point for section point source s:

```
if (s.points >= 3)
{
    var pt_data = s.GetPointData(3);
}
```

GetUserData(ipt*[integer]*)

Description

Returns the user defined data for an integration point in *SECTION_SHELL and *SECTION_SOLID.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array containing the data (XI, ETA, WGT for *SECTION_SHELL, XI, ETA, ZETA, WGT for *SECTION_SOLID).

Return type

Array

Example

To get the data for the 3rd integration point for section shell s:

```
if (s.nipp >= 3)
{
    var user_data = s.GetUserData(2);
}
```

Keyword()

Description

Returns the keyword for this section (*SECT, *SECT_SCALAR or *SECT_SCALAR_VALUE). **Note that a carriage return is not added**. See also Section.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for section s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the section. **Note that a carriage return is not added**. See also Section.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for section s:

```
var cards = n.KeywordCards();
```

Last(Model*[Model]*) [static]

Description

Returns the last section in the model.

Arguments

- **Model** (Model)

Model to get last section in

Returns

Section object (or null if there are no sections in the model).

Return type

Section

Example

To get the last section in model m:

```
var s = Section.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free section label in the model. Also see Section.FirstFreeLabel(), Section.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Section label.

Return type

Number

Example

To get the last free section label in model m:

```
var label = Section.LastFreeLabel(m);
```

Next()

Description

Returns the next section in the model.

Arguments

No arguments

Returns

Section object (or null if there are no more sections in the model).

Return type

Section

Example

To get the section in model m after section s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) section label in the model. Also see Section.FirstFreeLabel(), Section.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free section label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Section label.

Return type

Number

Example

To get the next free section label in model m:

```
var label = Section.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a section.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sections from that model can be picked. If the argument is a Flag then only sections that are flagged with *limit* can be selected. If omitted, or null, any sections from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Section object (or null if not picked)

Return type

Section

Example

To pick a section from model m giving the prompt 'Pick section from screen':

```
var s = Section.Pick('Pick section from screen', m);
```

Previous()

Description

Returns the previous section in the model.

Arguments

No arguments

Returns

Section object (or null if there are no more sections in the model).

Return type

Section

Example

To get the section in model m before section s:

```
var s = s.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the sections in the model.

Arguments

- **Model** (Model)

Model that all sections will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sections in model m, from 1000000:

```
Section.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged sections in the model.

Arguments

- **Model** (Model)

Model that all the flagged sections will be renumbered in

- **flag** (Flag)

Flag set on the sections that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the sections in model m flagged with f, from 1000000:

```
Section.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select sections using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting sections

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sections from that model can be selected. If the argument is a Flag then only sections that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any sections can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of sections selected or null if menu cancelled

Return type

Number

Example

To select sections from model m, flagging those selected with flag f, giving the prompt 'Select sections':

```
Section.Select(f, 'Select sections', m);
```

To select sections, flagging those selected with flag f but limiting selection to sections flagged with flag l, giving the prompt 'Select sections':

```
Section.Select(f, 'Select sections', l);
```

SetBetaData(ipt*[integer]*, beta*[real]*)

Description

Sets the beta angle for an integration point in *SECTION_SHELL or *SECTION_TSHELL.

Arguments

- **ipt** (integer)

The integration point you want to set the data for. **Note that integration points start at 0, not 1**.

- **beta** (real)

Beta angle for the integration point.

Returns

No return value.

Example

To set the beta angle for the 3rd integration point to 45, for section s:

```
s.SetBetaData(2, 45);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the section.

Arguments

- **flag** (Flag)

Flag to set on the section

Returns

No return value

Example

To set flag f for section s:

```
s.SetFlag(f);
```

SetLmcData(ipt*[integer]*, lmc*[real]*)

Description

Sets the lmc parameter for a point in *SECTION_SHELL or *SECTION_SOLID.

Arguments

- **ipt** (integer)

The point you want to set the data for. **Note that points start at 0, not 1**.

- **lmc** (real)

Lmc parameter for the point.

Returns

No return value.

Example

To set the 3rd lmc point to 0.1, for section s:

```
s.SetLmcData(2, 0.1);
```

SetPointData(ipt*[integer]*, nodeid*[integer]*, vecid*[integer]*, area*[real]*)

Description

Sets the data for a single point in *SECTION_POINT_SOURCE.

Arguments

- **ipt** (integer)

The point you want to set the data for. **Note that integration points start at 0, not 1**.

- **nodeid** (integer)

Node ID for the point.

- **vecid** (integer)

Vector ID for the point.

- **area** (real)

Orifice area for the point.

Returns

No return value.

Example

To set the data for the 3rd point to node 1, vector 10 and area 0.2, for section s:

```
s.SetPointData(2, 1, 10, 0.2);
```

SetUserData(ipt*[integer]*, xi*[real]*, eta*[real]*, zeta (SOLID) **or** wgt (SHELL)*[real]*, wgt (SOLID only)*[real]*)

Description

Sets the user defined data for an integration point in *SECTION_SHELL and *SECTION_SOLID.

Arguments

- **ipt** (integer)

The integration point you want to set the data for. **Note that integration points start at 0, not 1**.

- **xi** (real)

First isoparametric coordinate.

- **eta** (real)

Second isoparametric coordinate.

- **zeta (SOLID) or**
  wgt (SHELL) (real)

Second isoparametric coordinate (SOLID) **or**
Isoparametric weight (SHELL)

- **wgt (SOLID only)** (real)

Isoparametric weight (SOLID)

Returns

No return value.

Example

To set the user data for the 3rd integration point to xi 0.5, eta 0.5, zeta -0.5, wgt 0.125, for section solid s:

```
s.SetUserData(2, 0.5, 0.5, -0.5, 0.125);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the section. The section will be sketched until you either call Section.Unsketch(), Section.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the section is sketched. If omitted redraw is true. If you want to sketch several sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch section s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged sections in the model. The sections will be sketched until you either call Section.Unsketch(), Section.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged sections will be sketched in

- **flag** (Flag)

Flag set on the sections that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sections are sketched. If omitted redraw is true. If you want to sketch flagged sections several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all sections flagged with flag in model m:

```
Section.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of sections in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing sections should be counted. If false or omitted referenced but undefined sections will also be included in the total.

Returns

number of sections

Return type

Number

Example

To get the total number of sections in model m:

```
var total = Section.Total(m);
```

Unblank()

Description

Unblanks the section

Arguments

No arguments

Returns

No return value

Example

To unblank section s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the sections in the model.

Arguments

- **Model** (Model)

Model that all sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sections in model m:

```
Section.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged sections in the model.

Arguments

- **Model** (Model)

Model that the flagged sections will be unblanked in

- **flag** (Flag)

Flag set on the sections that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sections in model m flagged with f:

```
Section.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the sections in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all sections will be unset in

- **flag** (Flag)

Flag to unset on the sections

Returns

No return value

Example

To unset the flag f on all the sections in model m:

```
Section.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the section.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the section is unsketched. If omitted redraw is true. If you want to unsketch several sections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch section s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all sections.

Arguments

- **Model** (Model)

Model that all sections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sections in model m:

```
Section.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged sections in the model.

Arguments

- **Model** (Model)

Model that all sections will be unsketched in

- **flag** (Flag)

Flag set on the sections that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sections flagged with flag in model m:

```
Section.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Section object.

Return type

Section

Example

To check if Section property s.example is a parameter by using the Section.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for section. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for section s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this section.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for section s:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the section data in keyword format. Note that this contains the keyword header and the keyword cards. See also Section.Keyword() and Section.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for section s in keyword format

```
var str = s.toString();
```

SensorControl class

The SensorControl class gives you access to *SENSOR_CONTROL keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

SensorControl properties

Name	Type	Description
cntlid	integer	SensorControl number. The label property is an alternative name for this.

estyp	string	Element Set Type to be controlled. Can be "BEAM", "DISC", "SHELL", "SOLID", "TSHELL".
exists (read only)	logical	true if *SENSOR_CONTROL exists, false if referred to but not defined.
include	integer	The Include file number that the *SENSOR_CONTROL is in.
initstt	string	Initial status. Can be "On" or "Off".
label	integer	SensorControl number. The cntlid property is an alternative name for this.
model (read only)	integer	The Model number that the *SENSOR_CONTROL is in.
nrep	integer	Number of repeat of cycle of switches.
swit1	integer	ID of 1st switch.
swit2	integer	ID of 2nd switch.
swit3	integer	ID of 3rd switch.
swit4	integer	ID of 4th switch.
swit5	integer	ID of 5th switch.
swit6	integer	ID of 6th switch.
swit7	integer	ID of 7th switch.
timeoff	integer	Flag for offset of time in curve.
timeoff/idiscl	integer	Flag for offset of time in curve./Flag for the reference length of the discrete element
type	string	Entity to be controlled. Can be "AIRBAG", "BAGVENTPOP", "BELTPRET", "BELTRETRA", "BELTSLIP", "CONTACT", "CONTACT2D", "CNRB", "DEF2RIG", "DISC-ELE", "DISC-ELES", "ELESET", "FUNCTION", "JOINT", "JOINTSTIFF", "LOADTHM", "M PRESSURE", "RWALL", "SPC", "SPOTWELD".
typeid	integer	ID of entity to be controlled if type is not FUNCTION or input value for FUNCTION.

Detailed Description

The SensorControl class allows you to create, modify, edit and manipulate *SENSOR_CONTROL. See the documentation below for more details.

Constructor

new SensorControl(Model*[Model]*, Sensor control ID*[integer]*, Type*[string]*, Type ID (optional)*[integer]*, estyp (optional)*[string]*)

Description

Create a new SensorControl object.

Arguments

- **Model** (Model)

Model that *SENSOR_CONTROL will be created in

- **Sensor control ID** (integer)

SensorControl id.

- **Type** (string)

Entity type to be controlled. Can be "AIRBAG", "BAGVENTPOP", "BELTPRET", "BELTRETRA", "BELTSLIP", "CONTACT", "CONTACT2D", "DEF2RIG", "DISC-ELE", "DISC-ELES", "ELESET", "FUNCTION", "JOINT", "JOINTSTIFF", "M PRESSURE", "RWALL", "SPC", "SPOTWELD".

- **Type ID (optional)** (integer)

ID of entity to be controlled if type is not FUNCTION or input value for FUNCTION.

- **estyp (optional)** (string)

Element Set Type to be controlled. Can be "BEAM", "DISC", "SHELL", "SOLID", "TSHELL". **Required only if Type argument is "ELESET"**.

Returns

SensorControl object

Return type

SensorControl

Example

To create a new *SENSOR_CONTROL in model m with label 100 and type JOINT:

```
var sc = new SensorControl(m, 100, "JOINT");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *SENSOR_CONTROL.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *SENSOR_CONTROL

Returns

No return value

Example

To associate comment c to the *SENSOR_CONTROL sc:

```
sc.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *SENSOR_CONTROL sc:

```
sc.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *SENSOR_CONTROL.

Arguments

- **flag** (Flag)

Flag to clear on the *SENSOR_CONTROL

Returns

No return value

Example

To clear flag f for *SENSOR_CONTROL sc:

```
sc.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *SENSOR_CONTROL. The target include of the copied *SENSOR_CONTROL can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

SensorControl object

Return type

SensorControl

Example

To copy *SENSOR_CONTROL sc into *SENSOR_CONTROL z:

```
var z = sc.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *SENSOR_CONTROL.

Arguments

- **Model** (Model)

Model that the *SENSOR_CONTROL will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

SensorControl object (or null if not made)

Return type

SensorControl

Example

To start creating a *SENSOR_CONTROL in model m:

```
var sc = SensorControl.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *SENSOR_CONTROL.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *SENSOR_CONTROL

Returns

No return value

Example

To detach comment c from the *SENSOR_CONTROL sc:

```
sc.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *SENSOR_CONTROL sc:

```
sc.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *SENSOR_CONTROL. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *SENSOR_CONTROL sc:

```
sc.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *SENSOR_CONTROL in the model.

Arguments

- **Model** (Model)

Model to get first *SENSOR_CONTROL in

Returns

SensorControl object (or null if there are no *SENSOR_CONTROLs in the model).

Return type

SensorControl

Example

To get the first *SENSOR_CONTROL in model m:

```
var sc = SensorControl.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free *SENSOR_CONTROL label in the model. Also see SensorControl.LastFreeLabel(), SensorControl.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free *SENSOR_CONTROL label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

SensorControl label.

Return type

Number

Example

To get the first free *SENSOR_CONTROL label in model m:

```
var label = SensorControl.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *SENSOR_CONTROLs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *SENSOR_CONTROLs will be flagged in

- **flag** (Flag)

Flag to set on the *SENSOR_CONTROLs

Returns

No return value

Example

To flag all of the *SENSOR_CONTROLs with flag f in model m:

```
SensorControl.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *SENSOR_CONTROL is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *SENSOR_CONTROL

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *SENSOR_CONTROL sc has flag f set on it:

```
if (sc.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *SENSOR_CONTROL in the model.
Note that ForEach has been designed to make looping over *SENSOR_CONTROLs as fast as possible and so has some limitations.
Firstly, a single temporary SensorControl object is created and on each function call it is updated with the current *SENSOR_CONTROL data. This means that you should not try to store the SensorControl object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *SENSOR_CONTROLs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *SENSOR_CONTROLs are in

- **func** (function)

Function to call for each *SENSOR_CONTROL

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *SENSOR_CONTROLs in model m:

```
SensorControl.ForEach(m, test);
function test(sc)
{
// sc is SensorControl object
}
```

To call function test for all of the *SENSOR_CONTROLs in model m with optional object:

```
var data = { x:0, y:0 };
SensorControl.ForEach(m, test, data);
function test(sc, extra)
{
// sc is SensorControl object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of SensorControl objects for all of the *SENSOR_CONTROLs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_CONTROLs from

Returns

Array of SensorControl objects

Return type

Array

Example

To make an array of SensorControl objects for all of the *SENSOR_CONTROLs in model m

```
var sc = SensorControl.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *SENSOR_CONTROL.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *SENSOR_CONTROL sc:

```
var comm_array = sc.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of SensorControl objects for all of the flagged *SENSOR_CONTROLs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_CONTROLs from

- **flag** (Flag)

Flag set on the *SENSOR_CONTROLs that you want to retrieve

Returns

Array of SensorControl objects

Return type

Array

Example

To make an array of SensorControl objects for all of the *SENSOR_CONTROLs in model m flagged with f

```
var sc = SensorControl.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the SensorControl object for a *SENSOR_CONTROL ID.

Arguments

- **Model** (Model)

Model to find the *SENSOR_CONTROL in

- **number** (integer)

number of the *SENSOR_CONTROL you want the SensorControl object for

Returns

SensorControl object (or null if *SENSOR_CONTROL does not exist).

Return type

SensorControl

Example

To get the SensorControl object for *SENSOR_CONTROL 100 in model m

```
var sc = SensorControl.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a SensorControl property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the SensorControl.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*SENSOR_CONTROL property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if SensorControl property sc.example is a parameter:

```
Options.property_parameter_names = true;
if (sc.GetParameter(sc.example) ) do_something...
Options.property_parameter_names = false;
```

To check if SensorControl property sc.example is a parameter by using the GetParameter method:

```
if (sc.ViewParameters().GetParameter(sc.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this *SENSOR_CONTROL. **Note that a carriage return is not added**. See also SensorControl.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for SensorControl sc:

```
var key = sc.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *SENSOR_CONTROL. **Note that a carriage return is not added**. See also SensorControl.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for sensor control sc:

```
var cards = sc.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *SENSOR_CONTROL in the model.

Arguments

- **Model** (Model)

Model to get last *SENSOR_CONTROL in

Returns

SensorControl object (or null if there are no *SENSOR_CONTROLs in the model).

Return type

SensorControl

Example

To get the last *SENSOR_CONTROL in model m:

```
var sc = SensorControl.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free *SENSOR_CONTROL label in the model. Also see SensorControl.FirstFreeLabel(), SensorControl.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free *SENSOR_CONTROL label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

SensorControl label.

Return type

Number

Example

To get the last free *SENSOR_CONTROL label in model m:

```
var label = SensorControl.LastFreeLabel(m);
```

Next()

Description

Returns the next *SENSOR_CONTROL in the model.

Arguments

No arguments

Returns

SensorControl object (or null if there are no more *SENSOR_CONTROLs in the model).

Return type

SensorControl

Example

To get the *SENSOR_CONTROL in model m after *SENSOR_CONTROL sc:

```
var sc = sc.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) *SENSOR_CONTROL label in the model. Also see SensorControl.FirstFreeLabel(), SensorControl.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free *SENSOR_CONTROL label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

SensorControl label.

Return type

Number

Example

To get the next free *SENSOR_CONTROL label in model m:

```
var label = SensorControl.NextFreeLabel(m);
```

Previous()

Description

Returns the previous *SENSOR_CONTROL in the model.

Arguments

No arguments

Returns

SensorControl object (or null if there are no more *SENSOR_CONTROLs in the model).

Return type

SensorControl

Example

To get the *SENSOR_CONTROL in model m before *SENSOR_CONTROL sc:

```
var sc = sc.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the *SENSOR_CONTROLs in the model.

Arguments

- **Model** (Model)

Model that all *SENSOR_CONTROLs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_CONTROLs in model m, from 1000000:

```
SensorControl.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged *SENSOR_CONTROLs in the model.

Arguments

- **Model** (Model)

Model that all the flagged *SENSOR_CONTROLs will be renumbered in

- **flag** (Flag)

Flag set on the *SENSOR_CONTROLs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_CONTROLs in model m flagged with f, from 1000000:

```
SensorControl.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *SENSOR_CONTROLs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *SENSOR_CONTROLs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *SENSOR_CONTROLs from that model can be selected. If the argument is a Flag then only *SENSOR_CONTROLs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *SENSOR_CONTROLs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *SENSOR_CONTROLs selected or null if menu cancelled

Return type

Number

Example

To select *SENSOR_CONTROLs from model m, flagging those selected with flag f, giving the prompt 'Select *SENSOR_CONTROLs':

```
SensorControl.Select(f, 'Select *SENSOR_CONTROLs', m);
```

To select *SENSOR_CONTROLs, flagging those selected with flag f but limiting selection to *SENSOR_CONTROLs flagged with flag l, giving the prompt 'Select *SENSOR_CONTROLs':

```
SensorControl.Select(f, 'Select *SENSOR_CONTROLs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *SENSOR_CONTROL.

Arguments

- **flag** (Flag)

Flag to set on the *SENSOR_CONTROL

Returns

No return value

Example

To set flag f for *SENSOR_CONTROL sc:

```
sc.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the *SENSOR_CONTROL. The *SENSOR_CONTROL will be sketched until you either call SensorControl.Unsketch(), SensorControl.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the *SENSOR_CONTROL is sketched. If omitted redraw is true. If you want to sketch several *SENSOR_CONTROLs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch *SENSOR_CONTROL sc:

```
sc.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged *SENSOR_CONTROLs in the model. The *SENSOR_CONTROLs will be sketched until you either call SensorControl.Unsketch(), SensorControl.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged *SENSOR_CONTROLs will be sketched in

- **flag** (Flag)

Flag set on the *SENSOR_CONTROLs that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the *SENSOR_CONTROLs are sketched. If omitted redraw is true. If you want to sketch flagged *SENSOR_CONTROLs several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all *SENSOR_CONTROLs flagged with flag in model m:

```
SensorControl.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *SENSOR_CONTROLs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *SENSOR_CONTROLs should be counted. If false or omitted referenced but undefined *SENSOR_CONTROLs will also be included in the total.

Returns

number of *SENSOR_CONTROLs

Return type

Number

Example

To get the total number of *SENSOR_CONTROLs in model m:

```
var total = SensorControl.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *SENSOR_CONTROLs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *SENSOR_CONTROLs will be unset in

- **flag** (Flag)

Flag to unset on the *SENSOR_CONTROLs

Returns

No return value

Example

To unset the flag f on all the *SENSOR_CONTROLs in model m:

```
SensorControl.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the *SENSOR_CONTROL.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the *SENSOR_CONTROL is unsketched. If omitted redraw is true. If you want to unsketch several *SENSOR_CONTROLs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch *SENSOR_CONTROL sc:

```
sc.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all *SENSOR_CONTROLs.

Arguments

- **Model** (Model)

Model that all *SENSOR_CONTROLs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the *SENSOR_CONTROLs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all *SENSOR_CONTROLs in model m:

```
SensorControl.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged *SENSOR_CONTROLs in the model.

Arguments

- **Model** (Model)

Model that all *SENSOR_CONTROLs will be unsketched in

- **flag** (Flag)

Flag set on the *SENSOR_CONTROLs that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the *SENSOR_CONTROLs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all *SENSOR_CONTROLs flagged with flag in model m:

```
SensorControl.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with ’method chaining’ (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

SensorControl object.

Return type

SensorControl

Example

To check if SensorControl property sc.example is a parameter by using the SensorControl.GetParameter() method:

```
if (sc.ViewParameters().GetParameter(sc.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *SENSOR_CONTROL. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *SENSOR_CONTROL sc:

```
sc.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *SENSOR_CONTROL.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *SENSOR_CONTROL sc:

```
var xrefs = sc.Xrefs();
```

---

toString()

Description

Creates a string containing the sensor control data in keyword format. Note that this contains the keyword header and the keyword cards. See also SensorControl.Keyword() and SensorControl.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for sensor control sc in keyword format

```
var str = sc.toString();
```

SensorDefine class

The SensorDefine class gives you access to *SENSOR_DEFINE keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

SensorDefine constants

Name	Description
SensorDefine.DEFINE_CALC_MATH	Sensor define is *SENSOR_DEFINE_CALC_MATH.
SensorDefine.DEFINE_ELEMENT	Sensor define is *SENSOR_DEFINE_ELEMENT.
SensorDefine.DEFINE_ELEMENT_SET	Sensor define is *SENSOR_DEFINE_ELEMENT_SET.
SensorDefine.DEFINE_FORCE	Sensor define is *SENSOR_DEFINE_FORCE.

SensorDefine.DEFINE_FUNCTION	Sensor define is *SENSOR_DEFINE_FUNCTION.
SensorDefine.DEFINE_MISC	Sensor define is *SENSOR_DEFINE_MISC.
SensorDefine.DEFINE_NODE	Sensor define is *SENSOR_DEFINE_NODE.
SensorDefine.DEFINE_NODE_SET	Sensor define is *SENSOR_DEFINE_NODE_SET.

SensorDefine properties

Name	Type	Description
calc	string	Mathematical calculation. Can be "ABSSUM", "MIN", "MAX", "MAXMAG", "MINMAG", "MULTIPLY", "SQRE", "SQRTSQRE", "SQRT", "SUMABS", "SUM" .
comp	string	Component type. Can be "XX", "YY", "ZZ", "XY", "YZ", "ZX", "AXIAL", "SHEARS", "SHEART".
crd	integer	Optional coordinate system.
ctype	string	Sensor type or Output component type. Can be "STRAIN", "STRESS", "FORCE", "MOMENT", "DLEN" or "FAIL" for SensorDefine.DEFINE_ELEMENT or SensorDefine.DEFINE_ELEMENT_SET and "ACC", "VEL", "COORD" or "TEMP" for SensorDefine.DEFINE_NODE or SensorDefine.DEFINE_NODE_SET
elemid	integer	Element ID or element set ID when option_SET is active.
etype	string	Element type. Can be "BEAM", "SHELL", "SOLID", "DISC-ELE", "SEATBELT" or "TSHELL".
exists (read only)	logical	true if *SENSOR_DEFINE exists, false if referred to but not defined.
ftype	string	Force type. Can be "AIRBAG", "CONTACT", "CONTACT2D", "CPM", "JOINT", "JOINTSTIF", "PRESC-MOT", "RWALL", "SPC", "SPOTWELD", "X-SECTION".
func	integer	Function ID.
func_sens1	integer	1st Sensor ID if positive or number of sensor ID if negative.
func_sens10	integer	10th Sensor ID.
func_sens11	integer	11th Sensor ID.
func_sens12	integer	12th Sensor ID.
func_sens13	integer	13th Sensor ID.
func_sens14	integer	14th Sensor ID.
func_sens15	integer	15th Sensor ID.
func_sens16	integer	16th Sensor ID.
func_sens2	integer	2nd Sensor ID.
func_sens3	integer	3rd Sensor ID.
func_sens4	integer	4th Sensor ID.

func_ sens5	integer	5th Sensor ID.
func_ sens6	integer	6th Sensor ID.
func_ sens7	integer	7th Sensor ID.
func_ sens8	integer	8th Sensor ID.
func_ sens9	integer	9th Sensor ID.
i0	string	I0. Can be ’KINETIC", "INTERNAL", "ERODEKE", or "ERODEIE" when MTYPE = "MATSUM" or "SOLID", "SHELL", "TSHELL", "BEAM", or "DISC" when MTYPE = "NFAILE" or "TEMP", or "VOL" when MTYPE = "CVBAG", or "PRES", or "VOL" when MTYPE = "ICVOL".
i1	integer/string	I1. Applicable for "ANGLE", "BNDOUT", "CURVE", "CVBAG", "ICVOL", "MATSUM" or "NFAILE".
i2	integer/string	I2. Applicable only for when MTYPE = "ANGLE".
i3	integer/string	I3. Applicable only for MTYPE = "ANGLE".
i4	integer/string	I4. Applicable only for MTYPE = "ANGLE".
i5	string	I5.
include	integer	The Include file number that the *SENSOR_DEFINE is in.
label	integer	SensorDefine number. The sensid property is an alternative name for this.
layer	integer/string	Layer of integration. Can be "BOT", "TOP" or "i" to monitor the stress of the ith integration point when ctype = "STRESS".
model (read only)	integer	The Model number that the *SENSOR_DEFINE is in.
mtype	string	Entity to be traced. Can be "ANGLE", "BNDOUT", "CURVE", "CVBAG", "ICVOL",’MATSUM’, "NFAILE", "RETRACTOR", "RIGIDBODY" .
node1	integer	Node or Node set ID based on option SET for an accelerometer sensor.
node2	integer	Node ID for an accelerometer sensor.
option	constant	SENSOR_DEFINE suffix. Can be SensorDefine.DEFINE_CALC_MATH, SensorDefine.DEFINE_ELEMENT, SensorDefine.DEFINE_ELEMENT_SET, SensorDefine.DEFINE_FORCE, SensorDefine.DEFINE_MISC, SensorDefine.DEFINE_ NODE, SensorDefine.DEFINE_NODE_SET or SensorDefine.DEFINE_FUNCTION.
pwr	real	Power (Optional parameters).
sens1	integer	1st Sensor ID.
sens2	integer	2nd Sensor ID.
sens3	integer	3rd Sensor ID.
sens4	integer	4th Sensor ID.
sens5	integer	5th Sensor ID.
sens6	integer	6th Sensor ID.
sensid	integer	SensorDefine number. The label property is an alternative name for this.
setopt	string	Option to process set of data when SET option is specified. Can be "AVG", "MAX", "MIN" or "SUM".
sf	real	Scale factor (Optional parameters).
typeid	integer	ID defined in the associated KEYWORD command.

vid	integer/string	Vector along which the forces is measured. Can be "X", "Y", "Z", "XL", "YL", "ZL", "XMOMENT", "YMOMENT", "ZMOMENT", "XLMOMENT", "YLMOMENT", "ZLMOMENT" or vector ID n in coordinate system CRD for SensorDefine.DEFINE_FORCE or ID of vector along which the nodal values for SensorDefine.DEFINE_NODE and SensorDefine.DEFINE_NODE_SET.

Detailed Description

The SensorDefine class allows you to create, modify, edit and manipulate *SENSOR_DEFINE. See the documentation below for more details.

Constructor

new SensorDefine(Option*[constant]*, Model*[Model]*, Define ID*[integer]*, Type or Entity 1*[string/label]*, Entity 2*[label]*)

Description

Create a new SensorDefine object.

Arguments

- **Option** (constant)

SENSOR_DEFINE suffix. Can be SensorDefine.DEFINE_CALC_MATH, SensorDefine.DEFINE_ELEMENT, SensorDefine.DEFINE_ELEMENT_SET, SensorDefine.DEFINE_FORCE, SensorDefine.DEFINE_MISC, SensorDefine.DEFINE_NODE, SensorDefine.DEFINE_NODE_SET or SensorDefine.DEFINE_FUNCTION.

- **Model** (Model)

Model that *SENSOR_DEFINE will be created in

- **Define ID** (integer)

SensorDefine id.

- **Type or Entity 1** (string/label)

For SensorDefine.DEFINE_NODE, SensorDefine.DEFINE_NODE_SET option it is Node ID or NODE set ID respectively, For SensorDefine.DEFINE_FUNCTION option it is DEFINE_FUNCTION ID, For SensorDefine.DEFINE_CALC_MATH option it is Calc string, For SensorDefine.DEFINE_ELEMENT and SensorDefine.DEFINE_ELEMENT_SET option it is Etype string, For SensorDefine.DEFINE_FORCE option it is Ftype string, For SensorDefine.DEFINE_MISC option it is Mtype string.

- **Entity 2** (label)

Applicable only for SensorDefine.DEFINE_NODE, SensorDefine.DEFINE_NODE_SET, SensorDefine.DEFINE_CALC_MATH, SensorDefine.DEFINE_ELEMENT, SensorDefine.DEFINE_ELEMENT_SET or SensorDefine.DEFINE_FORCE. It is NODE or NODE set ID for SensorDefine.DEFINE_NODE or SensorDefine.DEFINE_NODE_SET respectively, Sensor Define ID for SensorDefine.DEFINE_CALC_MATH, Element ID or Element set ID for SensorDefine.DEFINE_ELEMENT or SensorDefine.DEFINE_ELEMENT_SET respectively or Type ID for SensorDefine.DEFINE_FORCE.

Returns

SensorDefine object

Return type

SensorDefine

Example

To create a new *SENSOR_DEFINE_CALC-MATH in model m with label 100 with CALC option as MAX and SENS1 as -2:

```
var sd1 = new SensorDefine(SensorDefine.DEFINE_CALC_MATH, m, 100, "MAX", -2);
```

To create a new *SENSOR_DEFINE_MISC in model m with label 10 with MTYPE option as ANGLE:

```
var sd2 = new SensorDefine(SensorDefine.DEFINE_MISC, m, 10, "ANGLE");
```

To create a new *SENSOR_DEFINE_NODE in model m with label 11 with NODE1 and NODE2 as 5 and 6:

```
var sd3 = new SensorDefine(SensorDefine.DEFINE_NODE, m, 11, 5, 6);
```

To create a new *SENSOR_DEFINE_FUNCTION in model m with label 12 and FUNCTION ID as 6:

```
var sd4 = new SensorDefine(SensorDefine.DEFINE_FUNCTION, m, 12, 6);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *SENSOR_DEFINE.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *SENSOR_DEFINE

Returns

No return value

Example

To associate comment c to the *SENSOR_DEFINE sd:

```
sd.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *SENSOR_DEFINE sd:

```
sd.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *SENSOR_DEFINE.

Arguments

- **flag** (Flag)

Flag to clear on the *SENSOR_DEFINE

Returns

No return value

Example

To clear flag f for *SENSOR_DEFINE sd:

```
sd.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *SENSOR_DEFINE. The target include of the copied *SENSOR_DEFINE can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

SensorDefine object

Return type

SensorDefine

Example

To copy *SENSOR_DEFINE sd into *SENSOR_DEFINE z:

```
var z = sd.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *SENSOR_DEFINE.

Arguments

- **Model** (Model)

Model that the *SENSOR_DEFINE will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

SensorDefine object (or null if not made)

Return type

SensorDefine

Example

To start creating a *SENSOR_DEFINE in model m:

```
var sd = SensorDefine.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *SENSOR_DEFINE.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *SENSOR_DEFINE

Returns

No return value

Example

To detach comment c from the *SENSOR_DEFINE sd:

```
sd.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *SENSOR_DEFINE sd:

```
sd.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *SENSOR_DEFINE. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *SENSOR_DEFINE sd:

```
sd.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *SENSOR_DEFINE in the model.

Arguments

- **Model** (Model)

Model to get first *SENSOR_DEFINE in

Returns

SensorDefine object (or null if there are no *SENSOR_DEFINEs in the model).

Return type

SensorDefine

Example

To get the first *SENSOR_DEFINE in model m:

```
var sd = SensorDefine.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free *SENSOR_DEFINE label in the model. Also see SensorDefine.LastFreeLabel(), SensorDefine.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free *SENSOR_DEFINE label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

SensorDefine label.

Return type

Number

Example

To get the first free *SENSOR_DEFINE label in model m:

```
var label = SensorDefine.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *SENSOR_DEFINEs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *SENSOR_DEFINEs will be flagged in

- **flag** (Flag)

Flag to set on the *SENSOR_DEFINEs

Returns

No return value

Example

To flag all of the *SENSOR_DEFINEs with flag f in model m:

```
SensorDefine.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *SENSOR_DEFINE is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *SENSOR_DEFINE

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *SENSOR_DEFINE sd has flag f set on it:

```
if (sd.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *SENSOR_DEFINE in the model.
Note that ForEach has been designed to make looping over *SENSOR_DEFINEs as fast as possible and so has some limitations.
Firstly, a single temporary SensorDefine object is created and on each function call it is updated with the current *SENSOR_DEFINE data. This means that you should not try to store the SensorDefine object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *SENSOR_DEFINEs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *SENSOR_DEFINEs are in

- **func** (function)

Function to call for each *SENSOR_DEFINE

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *SENSOR_DEFINEs in model m:

```
SensorDefine.ForEach(m, test);
function test(sd)
{
// sd is SensorDefine object
}
```

To call function test for all of the *SENSOR_DEFINEs in model m with optional object:

```
var data = { x:0, y:0 };
SensorDefine.ForEach(m, test, data);
function test(sd, extra)
{
// sd is SensorDefine object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of SensorDefine objects for all of the *SENSOR_DEFINEs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_DEFINEs from

Returns

Array of SensorDefine objects

Return type

Array

Example

To make an array of SensorDefine objects for all of the *SENSOR_DEFINEs in model m

```
var sd = SensorDefine.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *SENSOR_DEFINE.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *SENSOR_DEFINE sd:

```
var comm_array = sd.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of SensorDefine objects for all of the flagged *SENSOR_DEFINEs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_DEFINEs from

- **flag** (Flag)

Flag set on the *SENSOR_DEFINEs that you want to retrieve

Returns

Array of SensorDefine objects

Return type

Array

Example

To make an array of SensorDefine objects for all of the *SENSOR_DEFINEs in model m flagged with f

```
var sd = SensorDefine.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the SensorDefine object for a *SENSOR_DEFINE ID.

Arguments

- **Model** (Model)

Model to find the *SENSOR_DEFINE in

- **number** (integer)

number of the *SENSOR_DEFINE you want the SensorDefine object for

Returns

SensorDefine object (or null if *SENSOR_DEFINE does not exist).

Return type

SensorDefine

Example

To get the SensorDefine object for *SENSOR_DEFINE 100 in model m

```
var sd = SensorDefine.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a SensorDefine property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the SensorDefine.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*SENSOR_DEFINE property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if SensorDefine property sd.example is a parameter:

```
Options.property_parameter_names = true;
if (sd.GetParameter(sd.example) ) do_something...
Options.property_parameter_names = false;
```

To check if SensorDefine property sd.example is a parameter by using the GetParameter method:

```
if (sd.ViewParameters().GetParameter(sd.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this *SENSOR_DEFINE. **Note that a carriage return is not added**. See also SensorDefine.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for SensorDefine sd:

```
var key = sd.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *SENSOR_DEFINE. **Note that a carriage return is not added**. See also SensorDefine.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for sensor define sd:

```
var cards = sd.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *SENSOR_DEFINE in the model.

Arguments

- **Model** (Model)

Model to get last *SENSOR_DEFINE in

Returns

SensorDefine object (or null if there are no *SENSOR_DEFINEs in the model).

Return type

SensorDefine

Example

To get the last *SENSOR_DEFINE in model m:

```
var sd = SensorDefine.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free *SENSOR_DEFINE label in the model. Also see SensorDefine.FirstFreeLabel(), SensorDefine.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free *SENSOR_DEFINE label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

SensorDefine label.

Return type

Number

Example

To get the last free *SENSOR_DEFINE label in model m:

```
var label = SensorDefine.LastFreeLabel(m);
```

Next()

Description

Returns the next *SENSOR_DEFINE in the model.

Arguments

No arguments

Returns

SensorDefine object (or null if there are no more *SENSOR_DEFINEs in the model).

Return type

SensorDefine

Example

To get the *SENSOR_DEFINE in model m after *SENSOR_DEFINE sd:

```
var sd = sd.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) *SENSOR_DEFINE label in the model. Also see SensorDefine.FirstFreeLabel(), SensorDefine.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free *SENSOR_DEFINE label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

SensorDefine label.

Return type

Number

Example

To get the next free *SENSOR_DEFINE label in model m:

```
var label = SensorDefine.NextFreeLabel(m);
```

Previous()

Description

Returns the previous *SENSOR_DEFINE in the model.

Arguments

No arguments

Returns

SensorDefine object (or null if there are no more *SENSOR_DEFINEs in the model).

Return type

SensorDefine

Example

To get the *SENSOR_DEFINE in model m before *SENSOR_DEFINE sd:

```
var sd = sd.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the *SENSOR_DEFINEs in the model.

Arguments

- **Model** (Model)

Model that all *SENSOR_DEFINEs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_DEFINEs in model m, from 1000000:

```
SensorDefine.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged *SENSOR_DEFINEs in the model.

Arguments

- **Model** (Model)

Model that all the flagged *SENSOR_DEFINEs will be renumbered in

- **flag** (Flag)

Flag set on the *SENSOR_DEFINEs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_DEFINEs in model m flagged with f, from 1000000:

```
SensorDefine.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *SENSOR_DEFINEs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *SENSOR_DEFINEs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *SENSOR_DEFINEs from that model can be selected. If the argument is a Flag then only *SENSOR_DEFINEs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *SENSOR_DEFINEs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *SENSOR_DEFINEs selected or null if menu cancelled

Return type

Number

Example

To select *SENSOR_DEFINEs from model m, flagging those selected with flag f, giving the prompt 'Select *SENSOR_DEFINEs':

```
SensorDefine.Select(f, 'Select *SENSOR_DEFINEs', m);
```

To select *SENSOR_DEFINEs, flagging those selected with flag f but limiting selection to *SENSOR_DEFINEs flagged with flag l, giving the prompt 'Select *SENSOR_DEFINEs':

```
SensorDefine.Select(f, 'Select *SENSOR_DEFINEs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *SENSOR_DEFINE.

Arguments

- **flag** (Flag)

Flag to set on the *SENSOR_DEFINE

Returns

No return value

Example

To set flag f for *SENSOR_DEFINE sd:

```
sd.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *SENSOR_DEFINEs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *SENSOR_DEFINEs should be counted. If false or omitted referenced but undefined *SENSOR_DEFINEs will also be included in the total.

Returns

number of *SENSOR_DEFINEs

Return type

Number

Example

To get the total number of *SENSOR_DEFINEs in model m:

```
var total = SensorDefine.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *SENSOR_DEFINEs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *SENSOR_DEFINEs will be unset in

- **flag** (Flag)

Flag to unset on the *SENSOR_DEFINEs

Returns

No return value

Example

To unset the flag f on all the *SENSOR_DEFINEs in model m:

```
SensorDefine.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

SensorDefine object.

Return type

SensorDefine

Example

To check if SensorDefine property sd.example is a parameter by using the SensorDefine.GetParameter() method:

```
if (sd.ViewParameters().GetParameter(sd.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *SENSOR_DEFINE. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *SENSOR_DEFINE sd:

```
sd.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *SENSOR_DEFINE.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *SENSOR_DEFINE sd:

```
var xrefs = sd.Xrefs();
```

---

toString()

Description

Creates a string containing the sensor define data in keyword format. Note that this contains the keyword header and the keyword cards. See also SensorDefine.Keyword() and SensorDefine.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for sensor define sd in keyword format

```
var str = sd.toString();
```

SensorSwitch class

The SensorSwitch class gives you access to *SENSOR_SWITCH keyword in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

SensorSwitch constants

Name	Description

SensorSwitch.SWITCH	Sensor switch is *SENSOR_SWITCH.
SensorSwitch.SWITCH_CALC_LOGIC	Sensor switch is *SENSOR_SWITCH_CALC-LOGIC.
SensorSwitch.SWITCH_SHELL_TO_VENT	Sensor switch is *SENSOR_SWITCH_SHELL_TO_VENT.

SensorSwitch properties

Name	Type	Description
abid	integer	Airbag ID.
amax	real	Maximum allowable area for failed vent surface area (VA).
c23	integer/real	Vent coefficient if positive or user defined load curve ID if negative.
exists (read only)	logical	true if *SENSOR_SWITCH exists, false if referred to but not defined.
filtrid	integer	Filter ID.
id	integer	Part set ID or Part ID.
id_flag	logical	Turns _TITLE/_ID ON or OFF. Used only for SensorSwitch.SWITCH_SHELL_TO_VENT.
include	integer	The Include file number that the *SENSOR_SWITCH is in.
itype	integer	0 for Part, 1 for Part Set.
label	integer	SensorSwitch number. The switid property is an alternative name for this.
logic	string	Logic operator.
model (read only)	integer	The Model number that the *SENSOR_SWITCH is in.
nrow	integer	Number of Shell Fail Time Cards.
nswit (read only)	integer	Number of sensor switch IDs defined. IDs can be positive for "AND", negative ID for "OR". Applicable to SensorSwitch.SWITCH_CALC_LOGIC.
option	constant	SENSOR_SWITCH suffix. Can be SensorSwitch.SWITCH, SensorSwitch.SWITCH_CALC_LOGIC or SensorSwitch.SWITCH_SHELL_TO_VENT.
sensid	integer	ID of the sensor whose value will be compared.
switid	integer	SensorSwitch number. The label property is an alternative name for this.
timwin	real	Trigger status change when the value given by the sensor is less/greater (depending on logic) than value for duration defined by timwin.
title	string	SensorSwitch title. Used only for SensorSwitch.SWITCH_SHELL_TO_VENT.
type	string	This property is deprecated in version R9.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Type used for sensor. Can either be "SENSOR" or "TIME" [deprecated]
value	real	Critical value.

Detailed Description

The SensorSwitch class allows you to create, modify, edit and manipulate *SENSOR_SWITCH. See the documentation below for more details.

Constructor

new SensorSwitch(Option*[constant]*, Model*[Model]*, Switch ID*[integer]*)

Description

Create a new SensorSwitch object.

Arguments

- **Option** (constant)

SENSOR_SWITCH suffix. Can be SensorSwitch.SWITCH, SensorSwitch.SWITCH_CALC_LOGIC or SensorSwitch.SWITCH_SHELL_TO_VENT.

- **Model** (Model)

Model that *SENSOR_SWITCH will be created in

- **Switch ID** (integer)

SensorSwitch id. This is required for the SensorSwitch.SWITCH and SensorSwitch.SWITCH_CALC_LOGIC options and ignored for SensorSwitch.SWITCH_SHELL_TO_VENT.

Returns

SensorSwitch object

Return type

SensorSwitch

Example

To create a new *SENSOR_SWITCH in model m with label 100:

```
var sc = new SensorSwitch(SensorSwitch.SWITCH, m, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a *SENSOR_SWITCH.

Arguments

- **Comment** (Comment)

Comment that will be attached to the *SENSOR_SWITCH

Returns

No return value

Example

To associate comment c to the *SENSOR_SWITCH ss:

```
ss.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse *SENSOR_SWITCH ss:

```
ss.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the *SENSOR_SWITCH.

Arguments

- **flag** (Flag)

Flag to clear on the *SENSOR_SWITCH

Returns

No return value

Example

To clear flag f for *SENSOR_SWITCH ss:

```
ss.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the *SENSOR_SWITCH. The target include of the copied *SENSOR_SWITCH can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

SensorSwitch object

Return type

SensorSwitch

Example

To copy *SENSOR_SWITCH ss into *SENSOR_SWITCH z:

```
var z = ss.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a *SENSOR_SWITCH.

Arguments

- **Model** (Model)

Model that the *SENSOR_SWITCH will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

SensorSwitch object (or null if not made)

Return type

SensorSwitch

Example

To start creating a *SENSOR_SWITCH in model m:

```
var ss = SensorSwitch.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a *SENSOR_SWITCH.

Arguments

- **Comment** (Comment)

Comment that will be detached from the *SENSOR_SWITCH

Returns

No return value

Example

To detach comment c from the *SENSOR_SWITCH ss:

```
ss.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit *SENSOR_SWITCH ss:

```
ss.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for *SENSOR_SWITCH. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for *SENSOR_SWITCH ss:

```
ss.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first *SENSOR_SWITCH in the model.

Arguments

- **Model** (Model)

Model to get first *SENSOR_SWITCH in

Returns

SensorSwitch object (or null if there are no *SENSOR_SWITCHs in the model).

Return type

SensorSwitch

Example

To get the first *SENSOR_SWITCH in model m:

```
var ss = SensorSwitch.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free *SENSOR_SWITCH label in the model. Also see SensorSwitch.LastFreeLabel(), SensorSwitch.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free *SENSOR_SWITCH label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

SensorSwitch label.

Return type

Number

Example

To get the first free *SENSOR_SWITCH label in model m:

```
var label = SensorSwitch.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the *SENSOR_SWITCHs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all *SENSOR_SWITCHs will be flagged in

- **flag** (Flag)

Flag to set on the *SENSOR_SWITCHs

Returns

No return value

Example

To flag all of the *SENSOR_SWITCHs with flag f in model m:

```
SensorSwitch.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the *SENSOR_SWITCH is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the *SENSOR_SWITCH

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if *SENSOR_SWITCH ss has flag f set on it:

```
if (ss.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each *SENSOR_SWITCH in the model.
Note that ForEach has been designed to make looping over *SENSOR_SWITCHs as fast as possible and so has some limitations.
Firstly, a single temporary SensorSwitch object is created and on each function call it is updated with the current *SENSOR_SWITCH data. This means that you should not try to store the SensorSwitch object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new *SENSOR_SWITCHs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all *SENSOR_SWITCHs are in

- **func** (function)

Function to call for each *SENSOR_SWITCH

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the *SENSOR_SWITCHs in model m:

```
SensorSwitch.ForEach(m, test);
function test(ss)
{
// ss is SensorSwitch object
}
```

To call function test for all of the *SENSOR_SWITCHs in model m with optional object:

```
var data = { x:0, y:0 };
SensorSwitch.ForEach(m, test, data);
function test(ss, extra)
{
// ss is SensorSwitch object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of SensorSwitch objects for all of the *SENSOR_SWITCHs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_SWITCHs from

Returns

Array of SensorSwitch objects

Return type

Array

Example

To make an array of SensorSwitch objects for all of the *SENSOR_SWITCHs in model m

```
var ss = SensorSwitch.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a *SENSOR_SWITCH.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the *SENSOR_SWITCH ss:

```
var comm_array = ss.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of SensorSwitch objects for all of the flagged *SENSOR_SWITCHs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get *SENSOR_SWITCHs from

- **flag** (Flag)

Flag set on the *SENSOR_SWITCHs that you want to retrieve

Returns

Array of SensorSwitch objects

Return type

Array

Example

To make an array of SensorSwitch objects for all of the *SENSOR_SWITCHs in model m flagged with f

```
var ss = SensorSwitch.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the SensorSwitch object for a *SENSOR_SWITCH ID.

Arguments

- **Model** (Model)

Model to find the *SENSOR_SWITCH in

- **number** (integer)

number of the *SENSOR_SWITCH you want the SensorSwitch object for

Returns

SensorSwitch object (or null if *SENSOR_SWITCH does not exist).

Return type

SensorSwitch

Example

To get the SensorSwitch object for *SENSOR_SWITCH 100 in model m

```
var ss = SensorSwitch.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a SensorSwitch property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the SensorSwitch.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

*SENSOR_SWITCH property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if SensorSwitch property ss.example is a parameter:

```
Options.property_parameter_names = true;
if (ss.GetParameter(ss.example) ) do_something...
Options.property_parameter_names = false;
```

To check if SensorSwitch property ss.example is a parameter by using the GetParameter method:

```
if (ss.ViewParameters().GetParameter(ss.example) ) do_something...
```

GetRow(row*[integer]*)

Description

Returns the data for a row in the SENSOR_SWITCH_SHELL_TO_VENT.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

An array of numbers containing the row variables SSID, FTIME and C23V.

Return type

Number

Example

To get the data for the 2nd row in sensor switch ss:

```
var data = ss.GetRow(1);
```

GetSwitch(row*[integer]*)

Description

Returns switch ID information for *SENSOR_SWITCH_CALC-LOGIC.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

Object containing sensor switch ID information.

Return type

Object

Example

To get the data for the 2nd switch in sensor switch ss:

```
var data = ss.GetSwitch(1);
Message("Switch 2: " + data.swit);
```

Keyword()

Description

Returns the keyword for this *SENSOR_SWITCH. **Note that a carriage return is not added**. See also SensorSwitch.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for SensorSwitch ss:

```
var key = ss.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the *SENSOR_SWITCH. **Note that a carriage return is not added**. See also SensorSwitch.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for sensor switch ss:

```
var cards = ss.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last *SENSOR_SWITCH in the model.

Arguments

- **Model** (Model)

Model to get last *SENSOR_SWITCH in

Returns

SensorSwitch object (or null if there are no *SENSOR_SWITCHs in the model).

Return type

SensorSwitch

Example

To get the last *SENSOR_SWITCH in model m:

```
var ss = SensorSwitch.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free *SENSOR_SWITCH label in the model. Also see SensorSwitch.FirstFreeLabel(), SensorSwitch.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free *SENSOR_SWITCH label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

SensorSwitch label.

Return type

Number

Example

To get the last free *SENSOR_SWITCH label in model m:

```
var label = SensorSwitch.LastFreeLabel(m);
```

Next()

Description

Returns the next *SENSOR_SWITCH in the model.

Arguments

No arguments

Returns

SensorSwitch object (or null if there are no more *SENSOR_SWITCHs in the model).

Return type

SensorSwitch

Example

To get the *SENSOR_SWITCH in model m after *SENSOR_SWITCH ss:

```
var ss = ss.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) *SENSOR_SWITCH label in the model. Also see SensorSwitch.FirstFreeLabel(), SensorSwitch.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free *SENSOR_SWITCH label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

SensorSwitch label.

Return type

Number

Example

To get the next free *SENSOR_SWITCH label in model m:

```
var label = SensorSwitch.NextFreeLabel(m);
```

Previous()

Description

Returns the previous *SENSOR_SWITCH in the model.

Arguments

No arguments

Returns

SensorSwitch object (or null if there are no more *SENSOR_SWITCHs in the model).

Return type

SensorSwitch

Example

To get the *SENSOR_SWITCH in model m before *SENSOR_SWITCH ss:

```
var ss = ss.Previous();
```

RemoveRow(row*[integer]*)

Description

Removes the data for a row in *SENSOR_SWITCH_SHELL_TO_VENT.

Arguments

- **row** (integer)

The row you want to remove the data for. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second row of data for sensor switch ss:

```
ss.RemoveRow(1);
```

RemoveSwitch(row*[integer]*)

Description

Removes sensor switch ID from *SENSOR_SWITCH_CALC-LOGIC.

Arguments

- **row** (integer)

The sensor switch ID that you want to remove. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second sensor switch ID for sensor switch ss:

```
ss.RemoveSwitch(1);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the *SENSOR_SWITCHs in the model.

Arguments

- **Model** (Model)

Model that all *SENSOR_SWITCHs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_SWITCHs in model m, from 1000000:

```
SensorSwitch.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged *SENSOR_SWITCHs in the model.

Arguments

- **Model** (Model)

Model that all the flagged *SENSOR_SWITCHs will be renumbered in

- **flag** (Flag)

Flag set on the *SENSOR_SWITCHs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the *SENSOR_SWITCHs in model m flagged with f, from 1000000:

```
SensorSwitch.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select *SENSOR_SWITCHs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting *SENSOR_SWITCHs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only *SENSOR_SWITCHs from that model can be selected. If the argument is a Flag then only *SENSOR_SWITCHs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any *SENSOR_SWITCHs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of *SENSOR_SWITCHs selected or null if menu cancelled

Return type

Number

Example

To select *SENSOR_SWITCHs from model m, flagging those selected with flag f, giving the prompt 'Select *SENSOR_SWITCHs':

```
SensorSwitch.Select(f, 'Select *SENSOR_SWITCHs', m);
```

To select *SENSOR_SWITCHs, flagging those selected with flag f but limiting selection to *SENSOR_SWITCHs flagged with flag l, giving the prompt 'Select *SENSOR_SWITCHs':

```
SensorSwitch.Select(f, 'Select *SENSOR_SWITCHs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the *SENSOR_SWITCH.

Arguments

- **flag** (Flag)

Flag to set on the *SENSOR_SWITCH

Returns

No return value

Example

To set flag f for *SENSOR_SWITCH ss:

```
ss.SetFlag(f);
```

SetRow(row*[integer]*, data*[Array of data]*)

Description

Sets the data for a row in *SENSOR_SWITCH_SHELL_TO_VENT.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **data** (Array of data)

An array containing the row variables SSID, FTIME and C23V.

Returns

No return value.

Example

To set the second row of data for sensor switch ss to be shell set list 11, time 12.0 and vent coefficient 0.7:

```
var array = [11, 12.0, 0.7];
ss.SetRow(1, array);
```

To append a new row of data (using the same array of values):

```
ss.SetRow(ss.nrow, array);
```

SetSwitch(index*[integer]*, data*[object]*)

Description

Specifies a sensor switch ID for a *SENSOR_SWITCH_CALC-LOGIC.

Arguments

- **index** (integer)

The index of the *SENSOR_SWITCH_CALC-LOGIC data to set. **Note that indices start at 0, not 1**.
0 <= index <= nswit

- **data** (object)

Object containing sensor swith ID data.

Object has the following properties:

Name	Type	Description
swit	integer	Positive or negative sensor switch id.

Returns

No return value.

Example

To set the value of -10 for sensor switch 5 (indices start with 0) for *SENSOR_SWITCH_CALC-LOGIC s:

```
var data = { swit: -10 };
s.SetSwitch(4, data);
```

To append a new line of data (using the same example values):

```
var data2 = {swit: -10};
s.SetSwitch(b.lines, data2);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of *SENSOR_SWITCHs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing *SENSOR_SWITCHs should be counted. If false or omitted referenced but undefined *SENSOR_SWITCHs will also be included in the total.

Returns

number of *SENSOR_SWITCHs

Return type

Number

Example

To get the total number of *SENSOR_SWITCHs in model m:

```
var total = SensorSwitch.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the *SENSOR_SWITCHs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all *SENSOR_SWITCHs will be unset in

- **flag** (Flag)

Flag to unset on the *SENSOR_SWITCHs

Returns

No return value

Example

To unset the flag f on all the *SENSOR_SWITCHs in model m:

```
SensorSwitch.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

SensorSwitch object.

Return type

SensorSwitch

Example

To check if SensorSwitch property ss.example is a parameter by using the SensorSwitch.GetParameter() method:

```
if (ss.ViewParameters().GetParameter(ss.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for *SENSOR_SWITCH. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for *SENSOR_SWITCH ss:

```
ss.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this *SENSOR_SWITCH.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for *SENSOR_SWITCH ss:

```
var xrefs = ss.Xrefs();
```

---

toString()

Description

Creates a string containing the sensor switch data in keyword format. Note that this contains the keyword header and the keyword cards. See also SensorSwitch.Keyword() and SensorSwitch.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for sensor switch ss in keyword format

```
var str = ss.toString();
```

Set (SetK) class

The Set class gives you access to sets in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- Create(Model*[Model]*, type*[constant]*, modal (optional)*[boolean]*)
- First(Model*[Model]*, type*[constant]*)
- FirstFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*)
- FlagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*)
- GetAll(Model*[Model]*, type*[constant]*)
- GetFlagged(Model*[Model]*, flag*[Flag]*, type*[constant]*)
- GetFromID(Model*[Model]*, set number*[integer]*, type*[constant]*)
- Last(Model*[Model]*, type*[constant]*)
- LastFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*)
- NextFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*)
- Pick(type*[constant]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*)
- RenumberAll(Model*[Model]*, start*[integer]*, type (optional)*[constant]*)
- RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*, type (optional)*[constant]*)
- Select(type*[constant]*, flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*)
- SketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- UnblankAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- UnblankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- UnflagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*)
- UnsketchAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)
- UnsketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*)

Member functions

- Add(id1*[integer]*, id2 (optional)*[integer]*, id3 (optional)*[integer]*, id4 (optional)*[integer]*)
- AddCollectChild(set*[Set]*)
- AddFlagged(flag*[Flag]*)
- Blanked()
- Browse(modal (optional)*[boolean]*)
- ClearFlag(flag*[Flag]*)
- Contains(id*[integer]*)
- Copy(range (optional)*[boolean]*)
- Edit(modal (optional)*[boolean]*)
- Empty()
- Error(message*[string]*, details (optional)*[string]*)
- Flagged(flag*[Flag]*)
- GetCollectChild(number*[Integer]*)
- GetGeneralData(index*[Integer]*)
- Keyword()
- KeywordCards()
- Next()
- Previous()
- RebuildCache()
- Remove(id*[integer]*)
- RemoveFlagged(flag*[Flag]*)
- RemoveGeneralData(index*[Integer]*)
- SetFlag(flag*[Flag]*)
- SetGeneralData(index*[Integer]*, data*[Array of data]*)
- Sketch(redraw (optional)*[boolean]*)

- Spool()
- StartSpool(raw (optional)*[boolean]*)
- Unsketch(redraw (optional)*[boolean]*)
- Warning(message*[string]*, details (optional)*[string]*)
- Xrefs()
- toString()

Set constants

Name	Description
Set.2D_SEGMENT	This constant is deprecated in version 11.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Set.SEGMENT_2D instead. [deprecated]
Set.ADD	Set type is *SET_XYZ_ADD.
Set.ALL_TYPES	All set types - used in blanking etc.
Set.BEAM	Set beam type
Set.BOX	Set box type
Set.DISCRETE	Set discrete type
Set.GENERAL	Set type is *SET_XYZ_GENERAL.
Set.GENERATE	Set type is *SET_XYZ_GENERATE.
Set.INTERSECT	Set type is *SET_XYZ_INTERSECT.
Set.MM_GROUP	Set multi-material group type
Set.MODE	Set mode type
Set.NODE	Set node type
Set.PART	Set part type
Set.PART_TREE	Set part tree type
Set.PERI_ LAMINATE	Set Peri Laminate type
Set.SEGMENT	Set segment type
Set.SEGMENT_2D	Set segment 2d type
Set.SHELL	Set shell type
Set.SOLID	Set solid type
Set.TSHELL	Set thick shell type

Set properties

Name	Type	Description
add	logical	If _ADD option is active.
advanced (read only)	logical	If _ADD_ADVANCED option is active.

collect	logical	If _COLLECT option is active. To manage _COLLECT sets PRIMER creates a 'parent' set that can be used to sketch/view all of the items from the _COLLECT sets with the same label. PRIMER then manages each _COLLECT set with the same label as a 'child' of this 'parent' set. Also see collect_children and GetCollectChild. If the collect property is unset for a child collect set then a new label will be assigned for the child set. If the collect property is unset for a parent collect set then all of the child sets will be reassigned new labels.
collect_ children (read only)	integer	The number of child _COLLECT sets if _COLLECT option is active.
colour	Colour	The colour of the set
column (read only)	logical	If _COLUMN option is active.
da1	real	The first default attribute for the set (only valid for Set.NODE, Set.PART, Set.SEGMENT, Set.SEGMENT_2D and Set.SHELL)
da2	real	The second default attribute for the set (only valid for Set.NODE, Set.PART, Set.SEGMENT, Set.SEGMENT_2D and Set.SHELL)
da3	real	The third default attribute for the set (only valid for Set.NODE, Set.PART, Set.SEGMENT, Set.SEGMENT_2D and Set.SHELL)
da4	real	The fourth default attribute for the set (only valid for Set.NODE, Set.PART, Set.SEGMENT, Set.SEGMENT_2D and Set.SHELL)
exists (read only)	logical	true if set exists, false if referred to but not defined.
general	logical	If _GENERAL option is active.
general_lines (read only)	integer	Number of lines of data for _GENERAL set (if _GENERAL option is active).
generate	logical	If _GENERATE option is active.
include	integer	The Include file number that the set is in.
increment (read only)	logical	If _GENERATE_INCREMENT option is active.
intersect	logical	If _INTERSECT option is active.
its	integer	Coupling type across different scales in two-scale cosimulation (only valid for Set.SEGMENT or Set.NODE).
label	integer	Set number. Also see the sid property which is an alternative name for this.
model	integer	The Model number that the set is in.
sid	integer	Set number. Also see the label property which is an alternative name for this.
smooth (read only)	logical	If _LIST_SMOOTH option is active.
solver	string	Solver to attach to set. Can be "MECH", "CESE", "EM", "ICFD" or blank (only valid for Set.NODE, Set.PART, Set.SEGMENT and Set.SOLID).
title	string	Set title
total (read only)	integer	The total number of items in the set. Note that for _GENERAL and _GENERATE sets this is expensive to compute.
transparency	integer	The transparency of the set (0-100) 0% is opaque, 100% is transparent.
type (read only)	constant	Set type. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Detailed Description

The Set class allows you to create, modify, edit and manipulate sets. See the documentation below for more details.
ECMAScript 6 defines a Set class for Set objects so unfortunately this clashes with the Set class we have defined in PRIMER for the LS-DYNA keyword *SET. By default the Set class is used for the LS-DYNA keyword *SET but this can be changed by using the preference 'set_class' in the preferences editor.
The LS-DYNA keyword *SET class is also available (regardless of whether Set is used for the keyword or ECMAScript 6 Set objects) by using SetK (similarly to Nrb being an alias for the NodalRigidBody class).

For convenience "SetK" can also be used as the class name instead of "Set".

Constructor

new Set(Model*[Model]*, sid*[integer]*, type*[constant]*, title (optional)*[string]*, option (optional)*[constant]*)

Description

Create a new Set object.

Arguments

- **Model** (Model)

Model that set will be created in

- **sid** (integer)

Set number

- **type** (constant)

Type of set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

- **title (optional)** (string)

Title for the set

- **option (optional)** (constant)

Set type. Can be Set.ADD, Set.INTERSECT, Set.GENERAL or Set.GENERATE

Returns

Set object

Return type

Set

Example

To create a new node set in model m with label 100:

```
var s = new Set(m, 100, Set.NODE);
```

To create a new *NODE_SET_ADD in model m with label 101:

```
var s = new Set(m, 101, Set.NODE,"", Set.ADD);
```

Details of functions

Add(id1*[integer]*, id2 (optional)*[integer]*, id3 (optional)*[integer]*, id4 (optional)*[integer]*)

Description

Adds an item to the set. **This cannot be used for _COLUMN and _GENERAL sets**. For segment sets four nodes must be given to define a segment to add to the set.

Arguments

- **id1** (integer)

id of the item to add to the set (normal, _ADD or _ADD_ADVANCED sets) or Start ID (_GENERATE sets)

- **id2 (optional)** (integer)

type of the item to add to the set [1-7] (_ADD_ADVANCED sets) or End ID (_GENERATE sets)
(only for SEGMENT, _GENERATE, _GENERATE_INCREMENT and _ADD_ADVANCED sets)

- **id3 (optional)** (integer)

Increment for _GENERATE_INCREMENT sets, otherwise id of the item to add to the set
(only for SEGMENT and _GENERATE_INCREMENT sets)

- **id4 (optional)** (integer)

id of the item to add to the set
(only for SEGMENT sets)

Returns

No return value

Example

To add node 10 to node set ns:

```
ns.Add(10);
```

To add segment 10, 11, 12, 13 to segment set ss:

```
ss.Add(10, 11, 12, 13);
```

SET PART TREE is a special type of set, which can contain PARTs (negative) and/or child SET PART TREEs (positive).
To add part 10 to SET PART TREE spt:

```
spt.Add(-10);
```

To add child SET PART TREE 20 to SET PART TREE spt:

```
spt.Add(20);
```

AddCollectChild(set*[Set]*)

Description

Adds a child collect set to the set. The child set label will be changed to be the same as the parent set and it will become a child. Also see Set.collect_children and Set.GetCollectChild.

Arguments

- **set** (Set)

Set to be added as a child collect set.

Returns

No return value

Example

To make set ns2 to node set ns:

```
ns.AddCollectChild(ns2);
```

AddFlagged(flag*[Flag]*)

Description

Adds flagged items to the set. **This cannot be used for _GENERAL or _GENERATE sets** and **cannot be used for segment sets**

Arguments

- **flag** (Flag)

Flag for items to add to the set

Returns

No return value

Example

To add any nodes flagged with flag f to node set ns:

```
ns.AddFlagged(f);
```

BlankAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the sets in the model.

Arguments

- **Model** (Model)

Model that all sets will be blanked in

- **type (optional)** (constant)

Type of sets to blank. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. Set.ALL_TYPES. If omitted sets of all types will be blanked.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sets in model m:

```
Set.BlankAll(m);
```

To blank all of the node sets in model m:

```
Set.BlankAll(m, Set.NODE);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged sets in the model.

Arguments

- **Model** (Model)

Model that all the flagged sets will be blanked in

- **flag** (Flag)

Flag set on the sets that you want to blank

- **type (optional)** (constant)

Type of sets to blank. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. Set.ALL_TYPES. If set, only flagged sets of this type will be blanked. If omitted flagged sets of all types will be blanked.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the sets in model m flagged with f:

```
Set.BlankFlagged(m, f);
```

To blank all of the node sets in model m flagged with f:

```
Set.BlankFlagged(m, f, Set.NODE);
```

Blanked()

Description

Checks if the set is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if set s is blanked:

```
if (s.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

No return value

Example

To browse set s:

```
var s.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the set.

Arguments

- **flag** (Flag)

Flag to clear on the set

Returns

No return value

Example

To clear flag f for set s:

```
s.ClearFlag(f);
```

Contains(id*[integer]*)

Description

Checks if an item is in the set. **This cannot be used for ADD_ADVANCED, _GENERAL or _GENERATE sets** and **cannot be used for segment sets**

Arguments

- **id** (integer)

id of the item to check.

Returns

true if item is in set, false if not

Return type

Boolean

Example

To see if node 10 is in node set ns:

```
if (ns.Contains(10) )
{
    do something...
}
```

Copy(range (optional)*[boolean]*)

Description

Copies the set.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. To set current include, use Include.MakeCurrentLayer() .

Returns

Set object

Return type

Set

Example

To copy node net ns into node net ns1:

```
var ns1 = ns.Copy();
```

Create(Model*[Model]*, type*[constant]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a set.

Arguments

- **Model** (Model)

Model that the set will be created in

- **type** (constant)

Type of the set that you want to create. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Set object (or null if not made)

Return type

Set

Example

To start creating a node set in model m:

```
var s = Set.Create(m, Set.NODE);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel to edit the set.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

No return value

Example

To edit set s:

```
var s.Edit();
```

Empty()

Description

Removes all items from the set. **This cannot be used for _GENERATE sets** and **cannot be used for segment sets**

Arguments

No arguments

Returns

No return value

Example

To remove all nodes from node set ns:

```
ns.Empty(f);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for a set. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for set s:

```
s.Error("My custom error");
```

First(Model*[Model]*, type*[constant]*) [static]

Description

Returns the first set in the model.

Arguments

- **Model** (Model)

Model to get first set in

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

Set object (or null if there are no sets in the model).

Return type

Set

Example

To get the first node set in model m:

```
var n = Set.First(m, Set.NODE);
```

FirstFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free set label in the model. Also see Set.LastFreeLabel(), Set.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free Set label in

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the

whole model will be used (Equivalent to *First free* in editing panels).

Returns

Set label.

Return type

Number

Example

To get the first free node set label in model m:

```
var label = Set.FirstFreeLabel(m, Set.NODE);
```

FlagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*) [static]

Description

Flags all of the sets in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all sets will be flagged in

- **flag** (Flag)

Flag to set on the sets

- **type (optional)** (constant)

Type of the set. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. If set, only sets of this type will be flagged. If omitted sets of all types will be flagged.

Returns

No return value

Example

To flag all of the node sets with flag f in model m:

```
Set.FlagAll(m, f, Set.NODE);
```

Flagged(flag*[Flag]*)

Description

Checks if the set is flagged or not.

Arguments

- **flag** (Flag)

Flag to clear on the set

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(Model*[Model]*, type*[constant]*) [static]

Description

Returns an array of Set objects for all of the sets in a models in PRIMER

Arguments

- **Model** (Model)

Model to get sets from

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

Array of Set objects

Return type

Array

Example

To make an array of Set objects for all of the node sets in model m

```
var n = Set.GetAll(m, Set.NODE);
```

GetCollectChild(number*[Integer]*)

Description

Returns a child collect set. Also see Set.collect_children and Set.AddCollectChild.

Arguments

- **number** (Integer)

The index of the child collect set to return. **Note that indices start at 0, not 1**

Returns

Set object

Return type

Set

Example

To loop over the child collect sets for set ns:

```
if (ns.collect)
{
    for (i=0; i<ns.collect_children; i++)
        var child = ns.GetCollectChild(i);
}
```

GetFlagged(Model*[Model]*, flag*[Flag]*, type*[constant]*) [static]

Description

Returns an array of Set objects for all of the flagged sets in a models in PRIMER

Arguments

- **Model** (Model)

Model to get sets from

- **flag** (Flag)

Flag set on the set that you want to retrieve

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

Array of Set objects

Return type

Array

Example

To make an array of Set objects for all of the node sets in model m flagged with f

```
var n = Set.GetFlagged(m, f, Set.NODE);
```

GetFromID(Model*[Model]*, set number*[integer]*, type*[constant]*) [static]

Description

Returns the Set object for a set ID.

Arguments

- **Model** (Model)

Model to find the set in

- **set number** (integer)

number of the set you want the Set object for

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

Set object (or null if set does not exist).

Return type

Set

Example

To get the Set object for node set 100 in model m

```
var n = Set.GetFromID(m, 100, Set.NODE);
```

GetGeneralData(index*[Integer]*)

Description

Returns a line of data for a GENERAL set.

Arguments

- **index** (Integer)

The index of the GENERAL data to return. **Note that indices start at 0, not 1**.
0 <= index < general_lines

Returns

Array containing data.

Return type

Array

Example

To loop over the lines of general data sets for set s:

```
if (s.general)
{
    for (i=0; i<s.general_lines; i++)
        var data = s.GetGeneralData(i);
}
```

Keyword()

Description

Returns the keyword for this set (*SET_NODE etc). **Note that a carriage return is not added**. See also Set.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for set s:

```
var key = s.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the set. **Note that a carriage return is not added**. See also Set.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for set s:

```
var cards = s.KeywordCards();
```

Last(Model*[Model]*, type*[constant]*) [static]

Description

Returns the last set in the model.

Arguments

- **Model** (Model)

Model to get last set in

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

Set object (or null if there are no sets in the model).

Return type

Set

Example

To get the last node set in model m:

```
var n = Set.Last(m, Set.NODE);
```

LastFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free set label in the model. Also see Set.FirstFreeLabel(), Set.NextFreeLabel() and Model.LastFreeItemLabel().

Arguments

- **Model** (Model)

Model to get last free Set label in

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Set label.

Return type

Number

Example

To get the last free node set label in model m:

```
var label = Set.LastFreeLabel(m, Set.NODE);
```

Next()

Description

Returns the next set in the model.

Arguments

No arguments

Returns

Set object (or null if there are no more sets in the model).

Return type

Set

Example

To get the set in model m after set n:

```
var n = n.Next();
```

NextFreeLabel(Model*[Model]*, type*[constant]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free set label in the model. Also see Set.FirstFreeLabel(), Set.LastFreeLabel() and Model.NextFreeItemLabel().

Arguments

- **Model** (Model)

Model to get next free Set label in

- **type** (constant)

Type of the set. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Set label.

Return type

Number

Example

To get the next free node set label in model m:

```
var label = Set.NextFreeLabel(m, Set.NODE);
```

Pick(type*[constant]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a set.

Arguments

- **type** (constant)

Type of sets to pick. Can be Set.BEAM, Set.BOX, Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL.

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sets from that model can be picked. If the argument is a Flag then only sets that are flagged with *limit* can be selected. If omitted, or null, any sets from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Set object (or null if not picked)

Return type

Set

Example

To pick a node set from model m giving the prompt 'Pick set from screen':

```
var n = Set.Pick(Set.NODE, 'Pick set from screen', m);
```

Previous()

Description

Returns the previous set in the model.

Arguments

No arguments

Returns

Set object (or null if there are no more sets in the model).

Return type

Set

Example

To get the set in model m before this one:

```
var s = s.Previous();
```

RebuildCache()

Description

Rebuilds the cache for a set. As sets can be built using complex combinations of _GENERAL, _ADD, _INTERSECT options etc PRIMER creates a 'cache' for the set to speed up set drawing and usage. During normal interactive use this cache is rebuilt as necessary but in JavaScript it is possible for the cache to become out of date (e.g. you change a box position in JavaScript that is used by a *SET_GENERAL). Calling this forces the cache to be rebuilt.

Arguments

No arguments

Returns

No return type

Return type

null

Example

To rebuild the cache for set s:

```
s.RebuildCache();
```

Remove(id*[integer]*)

Description

Removes an item from the set. If the item is not in the set nothing is done. **This cannot be used for ADD_ ADVANCED, _COLUMN, _GENERAL or _GENERATE sets** and **cannot be used for segment sets**

Arguments

- **id** (integer)

id of the item to remove from the set.

Returns

No return value

Example

To remove node 10 from node set ns:

```
ns.Remove(10);
```

RemoveFlagged(flag*[Flag]*)

Description

Removes flagged items from the set. **This cannot be used for _GENERAL or _GENERATE sets** and **cannot be used for segment sets**

Arguments

- **flag** (Flag)

Flag for items to remove from the set

Returns

No return value

Example

To remove any nodes flagged with flag f from node set ns:

```
ns.RemoveFlagged(f);
```

RemoveGeneralData(index*[Integer]*)

Description

Removes a line of data from a GENERAL set.

Arguments

- **index** (Integer)

The index of the GENERAL data to remove. **Note that indices start at 0, not 1**.
0 <= index < general_lines

Returns

No return value

Example

To remove the first line of general data sets for set s:

```
if (s.general)
{
    s.RemoveGeneralData(0);
}
```

RenumberAll(Model*[Model]*, start*[integer]*, type (optional)*[constant]*) [static]

Description

Renumbers all of the sets in the model.

Arguments

- **Model** (Model)

Model that all sets will be renumbered in

- **start** (integer)

Start point for renumbering

- **type (optional)** (constant)

Type of sets to renumber. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or

Set.TSHELL. If omitted sets of all types will be blanked.

Returns

No return value

Example

To renumber all of the sets in model m, from 1000000:

```
Set.RenumberAll(m, 1000000);
```

To renumber all of the node sets in model m, from 1000000:

```
Set.RenumberAll(m, 1000000, Set.NODE);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*, type (optional)*[constant]*) [static]

Description

Renumbers all of the flagged sets in the model.

Arguments

- **Model** (Model)

Model that all the flagged sets will be renumbered in

- **flag** (Flag)

Flag set on the sets that you want to renumber

- **start** (integer)

Start point for renumbering

- **type (optional)** (constant)

Type of sets to renumber. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. If omitted sets of all types will be blanked.

Returns

No return value

Example

To renumber all of the sets in model m flagged with f, from 1000000:

```
Set.RenumberFlagged(m, f, 1000000);
```

To renumber all of the node sets in model m flagged with f, from 1000000:

```
Set.RenumberFlagged(m, f, 1000000, Set.NODE);
```

Select(type*[constant]*, flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select sets using standard PRIMER object menus.

Arguments

- **type** (constant)

Type of sets to pick. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL.

- **flag** (Flag)

Flag to use when selecting sets

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only sets from that model can be selected. If the argument is a Flag then only sets that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any sets from any model can be selected.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of items selected or null if menu cancelled

Return type

Number

Example

To select node sets from model m, flagging those selected with flag f, giving the prompt 'Select sets':

```
Set.Select(Set.NODE, f, 'Select sets', m);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the set.

Arguments

- **flag** (Flag)

Flag to set on the set

Returns

No return value

Example

To set flag f for set s:

```
s.SetFlag(f);
```

SetGeneralData(index*[Integer]*, data*[Array of data]*)

Description

Sets a line of data for a GENERAL set.

Arguments

- **index** (Integer)

The index of the GENERAL data to set. **Note that indices start at 0, not 1**.
0 <= index <= general_lines

- **data** (Array of data)

Array containing GENERAL data to set.

Returns

No return value.

Example

To add nodes inside boxes 1, 2 and 3 as a new line of data to node general set s:

```
var data = [ "BOX", 1, 2, 3];
s.SetGeneralData(s.general_lines, data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the set. The set will be sketched until you either call Set.Unsketch(), Set.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the set is sketched. If omitted redraw is true. If you want to sketch several sets and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch set s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged sets in the model.

Arguments

- **Model** (Model)

Model that all the flagged sets will be sketched in

- **flag** (Flag)

Flag set on the sets that you want to sketch

- **type (optional)** (constant)

Type of sets to sketch. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. Set.ALL_TYPES. If set, only flagged sets of this type will be sketched. If omitted flagged sets of all types will be sketched.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is true. If you want to do several (un)sketches and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To sketch all of the sets in model m flagged with f:

```
Set.SketchFlagged(m, f);
```

To sketch all of the node sets in model m flagged with f:

```
Set.SketchFlagged(m, f, Set.NODE);
```

Spool()

Description

Spools a set, entry by entry. See also Set.StartSpool

Arguments

No arguments

Returns

For Set.SEGMENT returns an array containing node IDs, for all other set types returns the ID of the item. Returns 0 if no more items

Return type

Array

Example

To spool set s:

```
var id;
s.StartSpool();
while (id = s.Spool())
{
    do something...
}
```

StartSpool(raw (optional)*[boolean]*)

Description

Starts a set spooling operation. See also Set.Spool

Arguments

- **raw (optional)** (boolean)

If true then the raw data from _GENERATE, _ADD and _INTERSECT sets will be returned instead of expanding the data ranges or child set contents. If omitted raw will be false.

Returns

No return value

Example

To start spooling set s:

```
s.StartSpool();
```

UnblankAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the sets in the model.

Arguments

- **Model** (Model)

Model that all sets will be unblanked in

- **type (optional)** (constant)

Type of sets to unblank. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. Set.ALL_TYPES. If omitted sets of all types will be blanked.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sets in model m:

```
Set.UnblankAll(m);
```

To unblank all of the node sets in model m:

```
Set.UnblankAll(m, Set.NODE);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged sets in the model.

Arguments

- **Model** (Model)

Model that the flagged sets will be unblanked in

- **flag** (Flag)

Flag set on the sets that you want to unblank

- **type (optional)** (constant)

Type of sets to unblank. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. Set.ALL_TYPES. If set, only flagged sets of this type will be unblanked. If omitted flagged sets of all types will be unblanked.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the sets in model m flagged with f:

```
Set.UnblankFlagged(m, f);
```

To unblank all of the node sets in model m flagged with f:

```
Set.UnblankFlagged(m, f, Set.NODE);
```

UnflagAll(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*) [static]

Description

Unsets a defined flag on all of the sets in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all sets will be unset in

- **flag** (Flag)

Flag to unset on the sets

- **type (optional)** (constant)

Type of the set. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.MODE, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL

Returns

No return value

Example

To unset the flag f on all the sets in model m:

```
Set.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the set.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the set is unsketched. If omitted redraw is true. If you want to unsketch several sets and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch set s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all sets.

Arguments

- **Model** (Model)

Model that all sets will be unsketched in

- **type (optional)** (constant)

Type of sets to unsketch. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. If omitted sets of all types will be unsketched.

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sets are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sets in model m:

```
Set.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, type (optional)*[constant]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged sets.

Arguments

- **Model** (Model)

Model that all sets will be unsketched in

- **flag** (Flag)

Flag set on the sets that you want to unsketch

- **type (optional)** (constant)

Type of sets to unsketch. Can be Set.BEAM, Set.BOX Set.DISCRETE, Set.MM_GROUP, Set.NODE, Set.PART, Set.PART_TREE, Set.PERI_LAMINATE, Set.SEGMENT, Set.SEGMENT_2D, Set.SHELL, Set.SOLID or Set.TSHELL. If omitted sets of all types will be unsketched.

- **redraw (optional)** (boolean)

If model should be redrawn or not after the sets are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all sets in model m flagged with f:

```
Set.UnsketchFlagged(m, f);
```

To unsketch all of the node sets in model m flagged with f:

```
Set.UnsketchFlagged(m, f, Set.NODE);
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for a set. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for set s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this set.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for this set:

```
var xrefs = s.Xrefs();
```

---

toString()

Description

Creates a string containing the set data in keyword format. Note that this contains the keyword header and the keyword cards. See also Set.Keyword() and Set.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for set n in keyword format

```
var s = n.toString();
```

Termination class

The Termination class gives you access to *TERMINATION_XXXX cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

Termination constants

Constants for Direction for Degrees of Freedom (field: dof)

Name	Description
Termination.DOF_X	Degree of freedom in X direction for Force magnitude. Used for Termination.CONTACT.
Termination.DOF_Y	Degree of freedom in Y direction for Force magnitude. Used for Termination.CONTACT.
Termination.DOF_Z	Degree of freedom in Z direction for Force magnitude. Used for Termination.CONTACT.

Constants for Global Direction for Stop Criterion (field: stop)

Name	Description
Termination.STOP_MAG	Stop if displacement magnitude is exceeded. Used for Termination.BODY or Termination.NODE.
Termination.STOP_X	Stop criterion is in Global X direction. Used for Termination.BODY or Termination.NODE.
Termination.STOP_Y	Stop criterion is in Global Y direction. Used for Termination.BODY or Termination.NODE.
Termination.STOP_Z	Stop criterion is in Global X direction. Used for Termination.BODY or Termination.NODE.

Constants for Type of Keyword

Name	Description
Termination.BODY	TERMINATION is *TERMINATION_BODY.
Termination.CONTACT	TERMINATION is *TERMINATION_CONTACT.
Termination.CURVE	TERMINATION is *TERMINATION_CURVE.
Termination.DELETED_SHELLS	TERMINATION is *TERMINATION_DELETED_SHELLS.
Termination.DELETED_SHELLS_SET	TERMINATION is *TERMINATION_DELETED_SHELLS_SET.
Termination.DELETED_SOLIDS	TERMINATION is *TERMINATION_DELETED_SOLIDS.
Termination.DELETED_SOLIDS_SET	TERMINATION is *TERMINATION_DELETED_SOLIDS_SET.
Termination.NODE	TERMINATION is *TERMINATION_NODE.
Termination.SENSOR	TERMINATION is *TERMINATION_SENSOR.

Termination properties

Name	Type	Description
actTime	real	Activation time value. Used for Termination.CONTACT or Termination.CURVE.
dof	integer	Directions to consider for Force Magnitude. Valid values are: Termination.DOF_X or Termination.DOF_Y or Termination.DOF_Z. Used for Termination.CONTACT.
duration	real	Time duration of null resultant force prior to termination. Used for Termination.CONTACT.
exists (read only)	logical	true if termination exists, false if referred to but not defined.
id	integer	Can be Part or NRBC ID based on ptype value for Termination.BODY, OR Contact ID for Termination.CONTACT, OR Node ID for Termination.NODE, OR Curve ID for Termination.CURVE, OR Part for Termination.DELETED_SHELLS or Termination.DELETED_SOLIDS, OR Part Set ID for Termination.DELETED_SHELLS_SET or Termination.DELETED_SOLIDS_SET, OR Sensor Switch ID for Termination.SENSOR.
include	integer	The Include file number that the termination is in.
maxc	real	Maximum (most positive) displacement. If value is 0.0, it is set to 1.0e21. Value should be more than minc. Used for Termination.BODY or Termination.NODE.
minc	real	Minimum (most negative) displacement. If value is 0.0, it is set to -1.0e21. Value should be less than maxc. Used for Termination.BODY or Termination.NODE.
model (read only)	integer	The Model number that the termination is in.
numDeletedElems	integer	Number of elements that must be deleted for the specified Part ID's, before an error termination occurs. Used for Termination.DELETED_SHELLS_SET or Termination.DELETED_SOLIDS_SET.

ptype (read only)	integer	Gives the type of Part for Termination.BODY. Values can be 0 for Part or 1 for NRBC
stop	integer	Stop Criterion. Valid values are: Termination.STOP_X or Termination.STOP_Y or Termination.STOP_Z or Termination.STOP_MAG. Used for Termination.BODY or Termination.NODE.
threshold	real	Any measured force magnitude below or equal to this specified threshold is taken as a null force. Used for Termination.CONTACT.
type (read only)	integer	Gives the type of *TERMINATION keyword.

Detailed Description

The Termination class allows you to create, modify, edit and manipulate termination cards. See the documentation below for more details.

Constructor

new Termination(Model*[Model]*, Type*[constant]*, id *[integer]*)

Description

Create a new Termination object.

Arguments

- **Model** (Model)

Model that termination will be created in

- **Type** (constant)

Specify the type of Termination (Can be Termination.BODY or Termination.CONTACT or Termination.CURVE or Termination.DELETED_SHELLS or Termination.DELETED_SOLIDS or Termination.NODE or Termination.SENSOR).

- **id** (integer)

Can be Part ID for Termination.BODY or Termination.DELETED_SHELLS or Termination.DELETED_SOLIDS, OR Contact ID for Termination.CONTACT, OR Node ID for Termination.NODE, OR Curve ID for Termination.CURVE, OR Part Set ID for Termination.DELETED_SHELLS_SET or Termination.DELETED_SOLIDS_SET, OR Sensor Switch ID for Termination.SENSOR.

Returns

Termination object

Return type

Termination

Example

To create a new termination in model m, type BODY, part id 100:

```
var term = new Termination(m, Termination.BODY, 100);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a termination.

Arguments

- **Comment** (Comment)

Comment that will be attached to the termination

Returns

No return value

Example

To associate comment c to the termination term:

```
term.AssociateComment(c);
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse termination term:

```
term.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the termination.

Arguments

- **flag** (Flag)

Flag to clear on the termination

Returns

No return value

Example

To clear flag f for termination term:

```
term.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the termination. The target include of the copied termination can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current

include, use Include.MakeCurrentLayer().

Returns

Termination object

Return type

Termination

Example

To copy termination term into termination z:

```
var z = term.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create an Termination definition.

Arguments

- **Model** (Model)

Model that the Termination will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Termination object (or null if not made)

Return type

Termination

Example

To start creating an termination in model m:

```
var term = Termination.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a termination.

Arguments

- **Comment** (Comment)

Comment that will be detached from the termination

Returns

No return value

Example

To detach comment c from the termination term:

```
term.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit termination term:

```
term.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for termination. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for termination term:

```
term.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first termination in the model.

Arguments

- **Model** (Model)

Model to get first termination in

Returns

Termination object (or null if there are no terminations in the model).

Return type

Termination

Example

To get the first termination in model m:

```
var term = Termination.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the terminations in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all terminations will be flagged in

- **flag** (Flag)

Flag to set on the terminations

Returns

No return value

Example

To flag all of the terminations with flag f in model m:

```
Termination.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the termination is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the termination

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if termination term has flag f set on it:

```
if (term.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each termination in the model.
Note that ForEach has been designed to make looping over terminations as fast as possible and so has some limitations.
Firstly, a single temporary Termination object is created and on each function call it is updated with the current termination data. This means that you should not try to store the Termination object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new terminations inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all terminations are in

- **func** (function)

Function to call for each termination

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the terminations in model m:

```
Termination.ForEach(m, test);
function test(term)
{
// term is Termination object
}
```

To call function test for all of the terminations in model m with optional object:

```
var data = { x:0, y:0 };
Termination.ForEach(m, test, data);
function test(term, extra)
{
// term is Termination object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Termination objects for all of the terminations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get terminations from

Returns

Array of Termination objects

Return type

Array

Example

To make an array of Termination objects for all of the terminations in model m

```
var term = Termination.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a termination.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the termination term:

```
var comm_array = term.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Termination objects for all of the flagged terminations in a model in PRIMER

Arguments

- **Model** (Model)

Model to get terminations from

- **flag** (Flag)

Flag set on the terminations that you want to retrieve

Returns

Array of Termination objects

Return type

Array

Example

To make an array of Termination objects for all of the terminations in model m flagged with f

```
var term = Termination.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Termination object for a termination ID.

Arguments

- **Model** (Model)

Model to find the termination in

- **number** (integer)

number of the termination you want the Termination object for

Returns

Termination object (or null if termination does not exist).

Return type

Termination

Example

To get the Termination object for termination 100 in model m

```
var term = Termination.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Termination property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Termination.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

termination property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Termination property term.example is a parameter:

```
Options.property_parameter_names = true;
if (term.GetParameter(term.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Termination property term.example is a parameter by using the GetParameter method:

```
if (term.ViewParameters().GetParameter(term.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this Termination (*TERMINATION_xxxx) **Note that a carriage return is not added**. See also Termination.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for Termination termination:

```
var key = Termination.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Termination. **Note that a carriage return is not added**. See also Termination.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Termination termination:

```
var cards = Termination.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last termination in the model.

Arguments

- **Model** (Model)

Model to get last termination in

Returns

Termination object (or null if there are no terminations in the model).

Return type

Termination

Example

To get the last termination in model m:

```
var term = Termination.Last(m);
```

Next()

Description

Returns the next termination in the model.

Arguments

No arguments

Returns

Termination object (or null if there are no more terminations in the model).

Return type

Termination

Example

To get the termination in model m after termination term:

```
var term = term.Next();
```

Previous()

Description

Returns the previous termination in the model.

Arguments

No arguments

Returns

Termination object (or null if there are no more terminations in the model).

Return type

Termination

Example

To get the termination in model m before termination term:

```
var term = term.Previous();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select terminations using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting terminations

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only terminations from that model can be selected. If the argument is a Flag then only terminations that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any

terminations can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of terminations selected or null if menu cancelled

Return type

Number

Example

To select terminations from model m, flagging those selected with flag f, giving the prompt 'Select terminations':

```
Termination.Select(f, 'Select terminations', m);
```

To select terminations, flagging those selected with flag f but limiting selection to terminations flagged with flag l, giving the prompt 'Select terminations':

```
Termination.Select(f, 'Select terminations', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the termination.

Arguments

- **flag** (Flag)

Flag to set on the termination

Returns

No return value

Example

To set flag f for termination term:

```
term.SetFlag(f);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of terminations in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing terminations should be counted. If false or omitted referenced but undefined terminations will also be included in the total.

Returns

number of terminations

Return type

Number

Example

To get the total number of terminations in model m:

```
var total = Termination.Total(m);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the terminations in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all terminations will be unset in

- **flag** (Flag)

Flag to unset on the terminations

Returns

No return value

Example

To unset the flag f on all the terminations in model m:

```
Termination.UnflagAll(m, f);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Termination object.

Return type

Termination

Example

To check if Termination property term.example is a parameter by using the Termination.GetParameter() method:

```
if (term.ViewParameters().GetParameter(term.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for termination. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for termination term:

```
term.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this termination.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for termination term:

```
var xrefs = term.Xrefs();
```

---

toString()

Description

Creates a string containing the Termination data in keyword format. Note that this contains the keyword header and the keyword cards. See also Termination.Keyword() and Termination.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Termination termination in keyword format

```
var term = termination.toString();
```

Attached class

The Attached class contains constants and static functions relating to the Attached() member function from the Model class. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Beam3rdNodes(Setting*[boolean]*)
- BeamPid(Setting*[boolean]*)
- Deformable(Setting*[constant]*)
- FlagPart(Setting*[boolean]*)
- Recursive(Setting*[boolean]*, Number (optional)*[integer]*)
- Rigid(Setting*[constant]*)
- SetEntity(Type*[string]*, Setting*[boolean]*)
- TiedContacts(Setting*[boolean]*)

Attached constants

Name	Description
Attached.SINGLE	Find attached option - find attached through single elements only
Attached.WHOLE	Find attached option - find through whole attached part

Detailed Description

The Attached class staic functions are used to set options for the find attached feature in PRIMER. Once set, these settings are used when using the Attached() member function from the Model class

Details of functions

Beam3rdNodes(Setting*[boolean]*) [static]

Description

Sets the find attached option for beam 3rd nodes on or off

Arguments

- **Setting** (boolean)

If true beam 3rd nodes are considered for find attached, if false, they are not.

Returns

No return value

Example

To set the 3rd node option to on:

```
Attached.Beam3rdNodes(true);
```

BeamPid(Setting*[boolean]*) [static]

Description

Sets the find attached option for beam pid on or off

Arguments

- **Setting** (boolean)

If true beam pid's are considered for find attached, if false, they are not.

Returns

No return value

Example

To set the beam pid option to on:

```
Attached.BeamPid(true);
```

Deformable(Setting*[constant]*) [static]

Description

Sets the deformable option for find attached

Arguments

- **Setting** (constant)

Option. Can be Attached.WHOLE, Attached.SINGLE

Returns

No return value

Example

To set the deformable option to find attached through the whole part:

```
Attached.Deformable(Attached.WHOLE);
```

FlagPart(Setting*[boolean]*) [static]

Description

Sets an option to flag parts after a find attached if any elements within that part are flagged

Arguments

- **Setting** (boolean)

If true, parts are flagged after a find attached if any elements within that part are flagged, if false, they are not.

Returns

No return value

Example

To set the flag part option to on:

```
Attached.FlagPart(true);
```

Recursive(Setting*[boolean]*, Number (optional)*[integer]*) [static]

Description

Sets the find attached option for recursive on or off

Arguments

- **Setting** (boolean)

If true recursive is on, if false, it is off.

- **Number (optional)** (integer)

Option to set the number of find attached iterations used when the recursive option is set.

Returns

No return value

Example

To set the recursive option to on:

```
Attached.Recursive(true);
```

Rigid(Setting*[constant]*) [static]

Description

Sets the rigid option for find attached

Arguments

- **Setting** (constant)

Option. Can be Attached.WHOLE, Attached.SINGLE

Returns

No return value

Example

To set the rigid option to find attached through the whole part:

```
Attached.Rigid(Attached.WHOLE);
```

SetEntity(Type*[string]*, Setting*[boolean]*) [static]

Description

Sets entity to be on or off to find attached through.

Arguments

- **Type** (string)

The type of the item to switch on or off (for a list of types see Appendix I of the PRIMER manual).

- **Setting** (boolean)

If true you turn the entity switch on, if false you turn it off.

Returns

No return value

Example

To set the SHELL switch to on so that when you run a find attached you fnd attached through shells:

```
Attached.SetEntity("SHELL", true);
```

TiedContacts(Setting*[boolean]*) [static]

Description

Sets the find attached option for tied contacts on or off

Arguments

- **Setting** (boolean)

If true tied contacts are considered for find attached, if false, they are not.

Returns

No return value

Example

To set the tied contacts option to on:

```
Attached.TiedContacts(true);
```

Belt class

The Belt class gives you access to belt fitting in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Belt constants

Constants for Mesh segments

Name	Description
Belt.MSEG_B1_ONLY	Old style all 1D belt
Belt.MSEG_B2_ONLY	Old style all 2D belt
Belt.MSEG_BD_NEW	Indicates new mode. **This must be set before any of the new style constants can be used**
Belt.MSEG_CE_1D	New style 1D at centre
Belt.MSEG_CE_2D	New style 2D at centre
Belt.MSEG_CE_SH	New style SH at centre
Belt.MSEG_E1_1D	New style 1D at end 1
Belt.MSEG_E1_2D	New style 2D at end 1
Belt.MSEG_E1_SH	New style shells at end 1
Belt.MSEG_E2_1D	New style 1D at end 2
Belt.MSEG_E2_2D	New style 2D at end 2
Belt.MSEG_E2_SH	New style shells at end 2
Belt.MSEG_MIX_SB1	Old style 1D at ends, shells in middle
Belt.MSEG_MIX_SB2	Old style 2D at ends, shells in middle
Belt.MSEG_SH_ONLY	Old style all shell belt

Constants for Meshing start Labels

Name	Description
Belt.MESH_2D_SLIPRING_SET_NODE	Set meshing start Labels for 2D slipring node sets
Belt.MESH_ALL	Set meshing start Labels for everything used in the seatbelt definition
Belt.MESH_NODE	Set meshing start Labels for nodes
Belt.MESH_NRBC	Set meshing start Labels for nodal rigid bodies
Belt.MESH_RETRACTOR	Set meshing start Labels for retractors
Belt.MESH_SEATBELT	Set meshing start Labels for seatbelt elements
Belt.MESH_SET_NODE	Set meshing start Labels for node sets
Belt.MESH_SET_PART	Set meshing start Labels for part sets
Belt.MESH_SET_SHELL	Set meshing start Labels for shell sets
Belt.MESH_SHELL	Set meshing start Labels for shells
Belt.MESH_SLIPRING	Set meshing start Labels for slipring elements
Belt.MESH_XSEC	Set meshing start Labels for Database cross sections

Constants for Path point fixity

Name	Description
Belt.B_POST_SLIPRING	There is a B-Post slipring at this point.
Belt.FIXED	Point is fixed
Belt.FREE_SLIPRING	There is a free (eg pelvis) slipring at this point.
Belt.KNOWN	The belt path is known to pass through this point
Belt.RETRACTOR	There is a retractor at this point
Belt.SLIPRING	There is a slipring at this point. (Deprecated from V12 onwards, use FREE_SLIPRING or B_POST_SLIPRING instead)
Belt.TWIST	Point has twist vectors or twist nodes defined
Belt.XSEC	There is a database cross section at this point

Constants for Path point insertion

Name	Description
Belt.INSERT_AFTER	Insert after given path point.
Belt.INSERT_BEFORE	Insert before given path point.

Belt properties

Name	Type	Description
acuteAngle	real	Limiting angle to be considered "acute" (0 means 90)
curvature	real	Maximum permitted transverse belt curvature in degrees
elemSet (read only)	integer	Set of shell or 2D seatbelt elements. Only created if the option to generate a contact for the belt is used
exists (read only)	logical	true if belt exists, false if referred to but not defined.
friction	real	Transverse friction coefficient
id	integer	Belt number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the belt is in.
iterations	integer	The number of fitting iterations between contact bucket resorts
label	integer	Belt number. Also see the id property which is an alternative name for this.
length	real	The characteristic length of each belt element
meshSegs (read only)	integer	Number of mesh segments defined
model (read only)	integer	The Model number that the belt is in.
n2sContact (read only)	integer	Nodes to Surface contact used between nodes on 1D belt elements and dummy structure. Only set if the AUTOMATIC_NODES_TO_SURFACE contact is defined in Seatbelts contact panel. Optional contact, see "Contact: Creating a Contact between Belt and Dummy" section in the PRIMER manual for more information.
nodeSet (read only)	integer	Set of all nodes in seatbelt. Only created if the option to generate a contact for the belt is used
nrbFirst (read only)	integer	First nodal rigid body ID

nrbLast (read only)	integer	Last nodal rigid body ID
nsboSet (read only)	integer	Set of nodes on 1D seatbelt elements only. Only created if the option to generate a contact for the belt is used
overlap	real	Fraction by which facets are extended during contact checking to stop nodes "falling into gaps"
parts	integer	Part set ID defining structure. Note that if you are creating the seatbelt definition from scratch in JavaScript you **must** define a shell, solid or thick shell set.
penetration	real	Maximum penetration distance considered for contact into solid and thick shell elements
pidShell	integer	The part ID for any 2D seatbelt elements
pid_1d	integer	The part ID for any 1D seatbelt elements
pid_2d	integer	The part ID for any 2D seatbelt elements
points (read only)	integer	Number of path points defined
projection	real	Initial projection distance by which belt path is "thrown outwards" at start of fitting
psiShell	real	Optional orthotropic angle for any shell elements
psi_2d	real	Optional orthotropic angle for any 2D seatbelt elements
retractorFirst (read only)	integer	First retractor ID
retractorLast (read only)	integer	Last retractor ID
rows	integer	The number of rows of 2D elements across the belt
s2sContact (read only)	integer	Surface to Surface contact used between shell/2D belt elements and dummy structure. Only set if the AUTOMATIC_SURFACE_TO_SURFACE contact is defined in Seatbelts contact panel. Optional contact, see "Contact: Creating a Contact between Belt and Dummy" section in the PRIMER manual for more information.
seatbeltFirst (read only)	integer	First 1D seatbelt ID
seatbeltLast (read only)	integer	Last 1D seatbelt ID
segments (read only)	integer	Segment set created for contact
shells	integer	Shell set ID defining structure. Note that if you are creating the seatbelt definition from scratch in JavaScript you **must** define a shell, solid or thick shell set.
slen_1d	real	The initial slack length for any 1D seatbelt elements
slipringFirst (read only)	integer	First slipring ID
slipringLast (read only)	integer	Last slipring ID
solids	integer	Solid set ID defining structure. Note that if you are creating the seatbelt definition from scratch in JavaScript you **must** define a shell, solid or thick shell set.
t1Shell	real	Optional thickness at n1 for any shell elements
t1_2d	real	Optional thickness at n1 for any 2D seatbelt elements
t2Shell	real	Optional thickness at n2 for any shell elements
t2_2d	real	Optional thickness at n2 for any 2D seatbelt elements
t3Shell	real	Optional thickness at n3 for any shell elements

t3_2d	real	Optional thickness at n3 for any 2D seatbelt elements
t4Shell	real	Optional thickness at n4 for any shell elements
t4_2d	real	Optional thickness at n4 for any 2D seatbelt elements
thickFactor	real	Factor used when thickFlag is 1
thickFlag	integer	Thickness used during fitting: 0 (default)=use true thickness; 1=use true thickness x factor; 2=use neutral axis (no thickness)
thickness	real	The thickness of 2D belt elements
title	string	Belt title.
tolerance	real	The convergence tolerance at which fitting halts
tshells	integer	Thick shell set ID defining structure. Note that if you are creating the seatbelt definition from scratch in JavaScript you **must** define a shell, solid or thick shell set.
width	real	The overall belt width
xsect_pretext	string	If X-Section pretext option is set to 2 then string for additional pretext
xsect_pretext_option	integer	X-Section pretext option, 0: None, 1: Automatic, 2: Manual
xsectionFirst (read only)	integer	First cross section ID
xsectionLast (read only)	integer	Last cross section ID

Detailed Description

The Belt class allows you to create, modify, and manipulate belt fitting definitions. See the documentation below for more details.

Constructor

new Belt(model*[Model]*, id*[integer]*, title (optional)*[string]*, structural_type (optional)*[string]*, flag (optional)*[integer]*)

Description

Create a new Belt object.

Arguments

- **model** (Model)

Model that the belt definition will be created in

- **id** (integer)

Belt number

- **title (optional)** (string)

Title for the belt

- **structural_type (optional)** (string)

Seatbelt will be fitted around this entity type. This will trigger creation of sets as required. Type can be one of MODEL, DUMMY, PART, any ELEMENT subtype such as SHELL, or any SET subtype such as SET_PART. See Appendix I of the PRIMER manual for more information on PRIMER types

- **flag (optional)** (integer)

Flag used to identify entities that the belt should fit around. This argument is ignored if structural_type is MODEL. Instead, the current model is used

Returns

Belt object

Return type

Belt

Example

To create a new belt called 'Example' in model m with label 100:

```
var b = new Belt(m, 100, 'Example');
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a belt.

Arguments

- **Comment** (Comment)

Comment that will be attached to the belt

Returns

No return value

Example

To associate comment c to the belt b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the belt

Arguments

No arguments

Returns

No return value

Example

To blank belt b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the belts in the model.

Arguments

- **Model** (Model)

Model that all belts will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the belts in model m:

```
Belt.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged belts in the model.

Arguments

- **Model** (Model)

Model that all the flagged belts will be blanked in

- **flag** (Flag)

Flag set on the belts that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the belts in model m flagged with f:

```
Belt.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the belt is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if belt b is blanked:

```
if (b.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the belt.

Arguments

- **flag** (Flag)

Flag to clear on the belt

Returns

No return value

Example

To clear flag f for belt b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the belt. The target include of the copied belt can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Belt object

Return type

Belt

Example

To copy belt b into belt z:

```
var z = b.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a belt.

Arguments

- **Comment** (Comment)

Comment that will be detached from the belt

Returns

No return value

Example

To detach comment c from the belt b:

```
b.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for belt. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for belt b:

```
b.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first belt in the model.

Arguments

- **Model** (Model)

Model to get first belt in

Returns

Belt object (or null if there are no belts in the model).

Return type

Belt

Example

To get the first belt in model m:

```
var b = Belt.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free belt label in the model. Also see Belt.LastFreeLabel(), Belt.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free belt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Belt label.

Return type

Number

Example

To get the first free belt label in model m:

```
var label = Belt.FirstFreeLabel(m);
```

Fit()

Description

(Re)fits belt

Arguments

No arguments

Returns

No return value

Example

To (re)fit belt b:

```
b.Fit();
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the belts in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all belts will be flagged in

- **flag** (Flag)

Flag to set on the belts

Returns

No return value

Example

To flag all of the belts with flag f in model m:

```
Belt.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the belt is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the belt

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if belt b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each belt in the model.
Note that ForEach has been designed to make looping over belts as fast as possible and so has some limitations. Firstly, a single temporary Belt object is created and on each function call it is updated with the current belt data. This means that you should not try to store the Belt object for later use (e.g. in an array) as it is temporary. Secondly, you cannot create new belts inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all belts are in

- **func** (function)

Function to call for each belt

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the belts in model m:

```
Belt.ForEach(m, test);
function test(b)
{
// b is Belt object
}
```

To call function test for all of the belts in model m with optional object:

```
var data = { x:0, y:0 };
Belt.ForEach(m, test, data);
function test(b, extra)
{
// b is Belt object
// extra is data
}
```

Generate()

Description

Generates belt mesh. Extracts and uses existing mesh properties when a mesh is present; inserts a default mesh otherwise.

Arguments

No arguments

Returns

No return value

Example

To generate a mesh for belt b:

```
b.Generate();
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Belt objects for all of the belts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get belts from

Returns

Array of Belt objects

Return type

Array

Example

To make an array of Belt objects for all of the belts in model m

```
var b = Belt.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a belt.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the belt b:

```
var comm_array = b.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Belt objects for all of the flagged belts in a model in PRIMER

Arguments

- **Model** (Model)

Model to get belts from

- **flag** (Flag)

Flag set on the belts that you want to retrieve

Returns

Array of Belt objects

Return type

Array

Example

To make an array of Belt objects for all of the belts in model m flagged with f

```
var b = Belt.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Belt object for a belt ID.

Arguments

- **Model** (Model)

Model to find the belt in

- **number** (integer)

number of the belt you want the Belt object for

Returns

Belt object (or null if belt does not exist).

Return type

Belt

Example

To get the Belt object for belt 100 in model m

```
var b = Belt.GetFromID(m, 100);
```

GetMesh(index*[integer]*)

Description

Returns the information for a belt mesh section (properties base_pt1, base_pt2, path_pt1, path_pt2, mode, lb1, lb2). See Belt.SetMesh() for more information on supported properties. Must be preceded by a call to Belt.Generate().

Arguments

- **index** (integer)

The index of the mesh section you want the information for. **Note that mesh segments start at 0, not 1**. 0 <= index < meshSegs

Returns

Object containing the mesh section information

Return type

Object

Example

To get the information for the 3rd mesh section for belt b:

```
var info = b.GetMesh(2);
```

GetParameter(prop*[string]*)

Description

Checks if a Belt property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Belt.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

belt property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Belt property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Belt property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

GetPoint(index*[integer]*)

Description

Returns the information for a path point (properties fixity, x, y, z, node, trx1, try1, trz1, tnx1, tny1, tnz1, tnode1, trx2, try2, trz2, tnx2, tny2, tnz2, tnode2). Properties fixity, x, y, z and node will always be returned. Twist properties trx1, try1, trz1, tnx1, tny1, tnz1, tnode1, trx2, try2, trz2, tnx2, tny2, tnz2 and tnode2 will only be returned if defined for the point.

Arguments

- **index** (integer)

The index of the path point you want the information for. **Note that path points start at 0, not 1**. 0 <= index < points

Returns

Object containing the path point information

Return type

Object

Example

To get the information for the 3rd path point for belt b:

```
var info = b.GetPoint(2);
```

InsertPoint(index*[integer]*, position*[integer]*, data*[object]*)

Description

Inserts a path point before/after an existing one. Subsequent path points will be moved ’up’ as required.

Arguments

- **index** (integer)

The index of an existing path point. **Note that path points start at 0, not 1**. 0 <= index < points

- **position** (integer)

Do we want to insert before or after the path point denoted by index? The position can be Belt.INSERT_AFTER or Belt.INSERT_BEFORE

- **data** (object)

Object containing the path point data.

Object has the following properties:

Name	Type	Description
fixity	integer	Point fixity type. Bitwise ’or’ of the Path point fixity constants: Belt.B_POST_SLIPRING, Belt.FREE_SLIPRING, Belt.KNOWN, Belt.RETRACTOR, Belt.TWIST, Belt.XSEC

node (optional)	integer	Node label (not required if using x, y and z)
tnode1 (optional)	integer	Twist node 1 label
tnode2 (optional)	integer	Twist node 2 label
tnx1 (optional)	real	X component of normal vector 1
tnx2 (optional)	real	X component of normal vector 2
tny1 (optional)	real	Y component of normal vector 1
tny2 (optional)	real	Y component of normal vector 2
tnz1 (optional)	real	Z component of normal vector 1
tnz2 (optional)	real	Z component of normal vector 2
trx1 (optional)	real	X component of twist radial vector 1
trx2 (optional)	real	X component of twist radial vector 2
try1 (optional)	real	Y component of twist radial vector 1
try2 (optional)	real	Y component of twist radial vector 2
trz1 (optional)	real	Z component of twist radial vector 1
trz2 (optional)	real	Z component of twist radial vector 2
x (optional)	real	X coordinate (not required if using node)
y (optional)	real	Y coordinate (not required if using node)
z (optional)	real	Z coordinate (not required if using node)

Returns

no return value

Example

To insert a new 2nd path point for belt b with B-Post slipring fixity using twist nodes 1000 and 10001:

```
var data = { fixity:Belt.RETRACTOR|Belt.TWIST, node:999 tnode1:1000, tnode2:1001
};
b.InsertPoint(1, Belt.INSERT_BEFORE, data);
```

Last(Model[*Model*]) [static]

Description

Returns the last belt in the model.

Arguments

- **Model** (Model)

Model to get last belt in

Returns

Belt object (or null if there are no belts in the model).

Return type

Belt

Example

To get the last belt in model m:

```
var b = Belt.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free belt label in the model. Also see Belt.FirstFreeLabel(), Belt.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free belt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Belt label.

Return type

Number

Example

To get the last free belt label in model m:

```
var label = Belt.LastFreeLabel(m);
```

Next()

Description

Returns the next belt in the model.

Arguments

No arguments

Returns

Belt object (or null if there are no more belts in the model).

Return type

Belt

Example

To get the belt in model m after belt b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) belt label in the model. Also see Belt.FirstFreeLabel(), Belt.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free belt label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Belt label.

Return type

Number

Example

To get the next free belt label in model m:

```
var label = Belt.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a belt.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only belts from that model can be picked. If the argument is a Flag then only belts that are flagged with *limit* can be selected. If omitted, or null, any belts from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Belt object (or null if not picked)

Return type

Belt

Example

To pick a belt from model m giving the prompt 'Pick belt from screen':

```
var b = Belt.Pick('Pick belt from screen', m);
```

Previous()

Description

Returns the previous belt in the model.

Arguments

No arguments

Returns

Belt object (or null if there are no more belts in the model).

Return type

Belt

Example

To get the belt in model m before belt b:

```
var b = b.Previous();
```

RemovePoint(index*[integer]*)

Description

Removes a path point from a belt

Arguments

- **index** (integer)

The index of the path point you want to remove. **Note that path points start at 0, not 1**. 0 <= index < points

Returns

no return value

Example

To remove for the 3rd path point for belt b:

```
b.RemovePoint(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the belts in the model.

Arguments

- **Model** (Model)

Model that all belts will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the belts in model m, from 1000000:

```
Belt.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged belts in the model.

Arguments

- **Model** (Model)

Model that all the flagged belts will be renumbered in

- **flag** (Flag)

Flag set on the belts that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the belts in model m flagged with f, from 1000000:

```
Belt.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select belts using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting belts

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only belts from that model can be selected. If the argument is a Flag then only belts that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any belts can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of belts selected or null if menu cancelled

Return type

Number

Example

To select belts from model m, flagging those selected with flag f, giving the prompt 'Select belts':

```
Belt.Select(f, 'Select belts', m);
```

To select belts, flagging those selected with flag f but limiting selection to belts flagged with flag l, giving the prompt 'Select belts':

```
Belt.Select(f, 'Select belts', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the belt.

Arguments

- **flag** (Flag)

Flag to set on the belt

Returns

No return value

Example

To set flag f for belt b:

```
b.SetFlag(f);
```

SetMesh(index*[integer]*, data*[object]*)

Description

Sets the data for various properties for a mesh section in a belt. Values for properties not invoked will be retained as is. Must be preceded by a call to Belt.Generate()

Arguments

- **index** (integer)

The index of the mesh section you want to set. **Note that mesh segments start at 0, not 1**

- **data** (object)

Object containing the mesh section data.

Object has the following properties:

Name	Type	Description
base_pt1	integer	1st base point number
base_pt2	integer	2nd base point number

lb1	integer	Number of belt elements at the 1st end for mixed modes
lb2	integer	Number of belt elements at the 2nd end for mixed modes
mode	integer	Meshing modes can be of old style or new style. The following old style constants are available: Belt.MSEG_B1_ONLY, Belt.MSEG_B2_ONLY, Belt.MSEG_SH_ONLY, Belt.MSEG_MIX_SB1, Belt.MSEG_MIX_SB2 The following constant must be invoked in order to use the new style: Belt.MSEG_BD_NEW The following new style constants are available: Belt.MSEG_E1_1D, Belt.MSEG_E1_2D, Belt.MSEG_E1_SH, Belt.MSEG_E2_1D, Belt.MSEG_E2_2D, Belt.MSEG_E2_SH, Belt.MSEG_CE_1D, Belt.MSEG_CE_2D, Belt.MSEG_CE_SH
path_pt1	integer	1st path point number
path_pt2	integer	2nd path point number
retractor (optional)	integer	Retractor id to be used

Returns

no return value

Example

To set the following properties for the final mesh section: base points: 5, 9, path points: 59, 92, mode: 1D at ends, shells at centre, number of elements at either end: 4 and 10:

```
var data = { base_pt1: 5, base_pt2: 9, path_pt1: 59, path_pt2: 92, mode:
Belt.MSEG_BD_NEW | Belt.MSEG_E1_1D | Belt.MSEG_CE_SH | Belt.MSEG_E2_1D, lb1: 4,
lb2: 10 };
b.SetMesh(b.meshSegs-1, data);
```

SetMeshingLabels(entity_type*[constant]*, label_value*[integer]*) [static]

Description

Set the start labels for the entities created for a Seat Belt.

Arguments

- **entity_type** (constant)

The Meshing label can be Belt.MESH_NODE, Belt.MESH_SHELL, Belt.MESH_SET_NODE, Belt.MESH_SET_SHELL, Belt.MESH_SEATBELT, Belt.MESH_NRBC, BELT.MESH_RETRACTOR, Belt.MESH_XSEC, Belt.MESH_SLIPRING, Belt.MESH_SET_PART, Belt.MESH_2D_SLIPRING_SET_NODE, Belt.MESH_ALL.

- **label_value** (integer)

The initial label value to be assigned for the entity type.

Returns

no return value

Example

To get the initial value of the node label in seatbelt meshing as 1000:

```
Belt.SetMeshingLabels(Belt.MESH_NODE,1000)
```

SetPoint(index*[integer]*, data*[object]*)

Description

Sets the data for a path point in a belt

Arguments

- **index** (integer)

The index of the path point you want to set. **Note that path points start at 0, not 1**. To add a new point use index points

- **data** (object)

Object containing the path point data.

Object has the following properties:

Name	Type	Description
fixity	integer	Point fixity type. Bitwise 'or' of the Path point fixity constants: Belt.B_POST_SLIPRING, Belt.FREE_SLIPRING, Belt.KNOWN, Belt.RETRACTOR, Belt.TWIST, Belt.XSEC
node (optional)	integer	Node label (not required if using x, y and z)
tnode1 (optional)	integer	Twist node 1 label
tnode2 (optional)	integer	Twist node 2 label
tnx1 (optional)	real	X component of normal vector 1
tnx2 (optional)	real	X component of normal vector 2
tny1 (optional)	real	Y component of normal vector 1
tny2 (optional)	real	Y component of normal vector 2
tnz1 (optional)	real	Z component of normal vector 1
tnz2 (optional)	real	Z component of normal vector 2
trx1 (optional)	real	X component of twist radial vector 1
trx2 (optional)	real	X component of twist radial vector 2
try1 (optional)	real	Y component of twist radial vector 1
try2 (optional)	real	Y component of twist radial vector 2
trz1 (optional)	real	Z component of twist radial vector 1
trz2 (optional)	real	Z component of twist radial vector 2
x (optional)	real	X coordinate (not required if using node)
y (optional)	real	Y coordinate (not required if using node)
z (optional)	real	Z coordinate (not required if using node)

Returns

no return value

Example

To add a new B-Post slipring path point to belt b at node 1000:

```
var data = { fixity:Belt.B_POST_SLIPRING, node:1000 };
b.SetPoint(b.points, data);
```

To add a new path point to belt b at coordinate (10, 20, 30):

```
var data = { fixity:0, x:10, y:20, z:30 };
b.SetPoint(b.points, data);
```

To add a new retractor path point to belt b at (10, 20, 30) with twist nodes 1000 and 1001:

```
var data = { fixity:Belt.RETRACTOR|Belt.TWIST, x:10, y:20, z:30, tnode1:1000,
tnode2:1001 };
b.SetPoint(b.points, data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the belt. The belt will be sketched until you either call Belt.Unsketch(), Belt.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the belt is sketched. If omitted redraw is true. If you want to sketch several belts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch belt b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged belts in the model. The belts will be sketched until you either call Belt.Unsketch(), Belt.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged belts will be sketched in

- **flag** (Flag)

Flag set on the belts that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the belts are sketched. If omitted redraw is true. If you want to sketch flagged belts several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all belts flagged with flag in model m:

```
Belt.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of belts in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing belts should be counted. If false or omitted referenced but undefined belts will also be included in the total.

Returns

number of belts

Return type

Number

Example

To get the total number of belts in model m:

```
var total = Belt.Total(m);
```

Unblank()

Description

Unblanks the belt

Arguments

No arguments

Returns

No return value

Example

To unblank belt b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the belts in the model.

Arguments

- **Model** (Model)

Model that all belts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the belts in model m:

```
Belt.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged belts in the model.

Arguments

- **Model** (Model)

Model that the flagged belts will be unblanked in

- **flag** (Flag)

Flag set on the belts that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the belts in model m flagged with f:

```
Belt.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the belts in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all belts will be unset in

- **flag** (Flag)

Flag to unset on the belts

Returns

No return value

Example

To unset the flag f on all the belts in model m:

```
Belt.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the belt.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the belt is unsketched. If omitted redraw is true. If you want to unsketch several belts and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch belt b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all belts.

Arguments

- **Model** (Model)

Model that all belts will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the belts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all belts in model m:

```
Belt.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged belts in the model.

Arguments

- **Model** (Model)

Model that all belts will be unsketched in

- **flag** (Flag)

Flag set on the belts that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the belts are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all belts flagged with flag in model m:

```
Belt.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Belt object.

Return type

Belt

Example

To check if Belt property b.example is a parameter by using the Belt.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for belt. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for belt b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this belt.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for belt b:

```
var xrefs = b.Xrefs();
```

Check class

The Check class enables you to access model checking in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AddDashboardComment(comment*[string]*)
- AddDashboardHealth(model health*[String]*, Health text colour (optional)*[constant]*, Health button colour(optional)*[constant]*)
- Error(message*[string]*, details (optional)*[string]*)
- GetAllDashboards()
- KeyoutHook(interrupt flag*[boolean]*)
- SetDashboardMessage(first*[string]*, second (optional)*[string]*)
- SetDashboardStatus(status*[constant]*)
- Warning(message*[string]*, details (optional)*[string]*)

Check constants

Constants for Dashboard

Name	Description
Check.ERROR	Dashboard check gave error(s)
Check.OK	Dashboard check status OK
Check.UNKNOWN	Dashboard check status unknown (not run)
Check.WARNING	Dashboard check gave warning(s)

Constants for dashboard health colour

Name	Description
Check.BLACK	Colour black
Check.BLUE	Colour blue
Check.CYAN	Colour cyan
Check.DARKBLUE	Colour dark blue
Check.DARKGREEN	Colour dark green
Check.DARKGREY	Colour dark grey
Check.DARKRED	Colour dark red
Check.GREEN	Colour green
Check.GREY	Colour grey
Check.LIGHTGREY	Colour light grey
Check.MAGENTA	Colour magenta
Check.ORANGE	Colour orange

Check.RED	Colour red
Check.WHITE	Colour white
Check.YELLOW	Colour yellow

Detailed Description

The Check class is used add checks to PRIMER using JavaScript. Two different types of checks can be added:

- Individual checks for each node, part, shell etc in a model.
- Custom checks that can reference multiple entities for checking in a model

PRIMER will look in 3 locations for additional JavaScript checks to run when doing checking:

- OA_ADMIN/primer_library/scripts/checks
- OA_INSTALL/primer_library/scripts/checks
- HOME/primer_library/scripts/checks

The directories OA_INSTALL/primer_library/scripts etc can be changed with the primer*script_dir preference.

For individual checks PRIMER will look in these directories for a script with the name 'class_name.js'. For example if you wanted to write a script that will be run for every part in a model the script should be called 'Part.js'.
For custom checks PRIMER will look in these directories for a script called 'custom.js'. This obviously means that there can only be one custom script in each directory. **These filenames are case sensitive**.
Individual scripts will be called with 3 arguments:
arguments[0] = Name of the script
arguments[1] = model object
arguments[2] = Item object
Individual scripts can add warnings or errors by using the Warning() or Error() methods of the appropriate class. For example for a Part the script can call the methods Part.Error() and Part.Warning(). **The script should not call the Error() and Warning() methods of other classes**.
As a simple example of an individual check, suppose you wanted it to be an error if any shell parts in your model did not use type 16 shells. Add a script called 'Part.js' in the directory 'OA_INSTALL/primer_library/scripts/checks' (or one of the other directories) containing:

```
// arguments[0] is name of script
var m = arguments[1]; // arguments[1] is model pointer
var p = arguments[2]; // arguments[2] is part pointer
if (p.exists && p.secid)
{
    var s = Section.GetFromID(m, p.secid);
    if (s.exists && s.type == Section.SHELL && s.elform != 16)
        p.Error("Shell part elform not 16", "Fictional company policy is to use
elform 16 for shell parts");
}
```

Custom scripts will be called with 2 arguments:
arguments[0] = Name of the script
arguments[1] = model object
Custom scripts can add warnings or errors by using the static Check.Error() and Check.Warning() methods. **The script should not call the Error() and Warning() methods of other classes**.
As a simple example of a custom check, suppose a dummy uses node 1000 for the H-point and this should be at coordinates (1000, -500, 100) within tolerance of 0.1 for an analysis . You do not want to run a check for every node in the model (i.e. an individual check). You just want to check that node 1000 is at the correct coordinates. To do this you could create a script called 'custom.js' in the directory 'OA_INSTALL/primer_library/scripts/checks' (or one of the other directories) containing:

```
// arguments[0] is name of script
var m = arguments[1]; // arguments[1] is model pointer
var n = Node.GetFromID(m, 1000);
if (!n)
    Check.Error("No H-point node", "Model does not contain node for dummy
H-point");
if (!n.exists)
    Check.Error("H-point node not defined", "Dummy H-point node is referred to
but not defined");
var dx = n.x - 1000;
var dy = n.y - (-500);
var dy = n.z - 100;
var d = Math.sqrt(dx*dx + dy*dy + dz*dz);
if (d > 0.1)
    Check.Error("H-point not at correct position", "Dummy H-point is "+d+"mm
away from target position");
```

See the documentation below for more details.

Details of functions

AddDashboardComment(comment*[string]*) [static]

Description

Adds a comment for a user dashboard check. Multiple comments can be added. Call this function as many times as required.
This function should only be called from a user JavaScript dashboard script.

Arguments

- **comment** (string)

The comment to add.

Returns

No return value

Example

To add a comment:

```
Check.AddDashboardComment("This is a comment");
```

AddDashboardHealth(model health*[String]*, Health text colour (optional)*[constant]*, Health button colour(optional)*[constant]*) [static]

Description

Allows the user to add the value of model health based on the other dashboard results
This function should only be called from model_health.config.js which should be placed with the other user defined dashboard scripts.

Arguments

- **model health** (String)

Text which will be displayed on the dashboard panel and the summary files.

- **Health text colour (optional)** (constant)

Colour of the model health text. The default colour is Black.

- **Health button colour(optional)** (constant)

Colour of the model health button. The default colour is dark grey.

Returns

No return value

Example

To add computed health as "Model Health 85.1%" and the text colour to red and the button colour to green

```
Check.AddDashboardHealth("Model Health 85.1%",Check.RED,Check.GREEN);
```

Error(message*[string]*, details (optional)*[string]*) [static]

Description

Adds a custom error. This function should only be called from a custom JavaScript check script. See the details in the Check class for how to do this.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error":

```
Check.Error('My custom error');
```

GetAllDashboards() [static]

Description

Returns data from all the dashboards that are defined.
This function should only be called from model_health.config.js which should be placed with the other user defined dashboard scripts.
The dashboard properties are:

- result (Overall result of the dashboard)
- title (dashboard title)
- message1 (First message of the dashboard)
- message2 (Second message of the dashboard)
- comments (Array of comments on the dashboard)

Arguments

No arguments

Returns

Array of dashboard objects

Return type

Array

Example

To get the status of all the dashboards:

```
Check.GetAllDashboards();
```

For more details on how to use this function, please take a look at the example script model_health.config.js which is present in the dashboard scrips folder

---

KeyoutHook(interrupt flag*[boolean]*) [static]

Description

Used to proceed with or abort the keyout operation (LS-DYNA output) from the keyout_hook.js script. The current hooks are launched just before the keyout operation from the model write tab, writing from the dialogue box and during keyout from the include tree. Please look at the example_keyout_script.js for an example of its usage.

Arguments

- **interrupt flag** (boolean)

If this flag is set to true then keyout is aborted else keyout proceeds as usual.

Returns

No return value

Example

To abort a keyout, set the following line in keyout_hook.js:

```
Check.KeyoutHook(true);
```

SetDashboardMessage(first*[string]*, second (optional)*[string]*) [static]

Description

Adds a message for a user dashboard check. Each dashboard can currently show two messages.
This function should only be called from a user JavaScript dashboard script.

Arguments

- **first** (string)

The first message to add.

- **second (optional)** (string)

The second message to add.

Returns

No return value

Example

To add the message with two lines:

```
Check.SetDashboardMessage("This is a message", "shown on two lines");
```

To add the message with one line:

```
Check.SetDashboardMessage("This is a single message");
```

SetDashboardStatus(status*[constant]*) [static]

Description

Sets the status of a user dashboard check.
This function should only be called from a user JavaScript dashboard script.

Arguments

- **status** (constant)

The status. Can be Check.OK, Check.WARNING, Check.ERROR or Check.UNKNOWN.

Returns

No return value

Example

To set the status to OK (green):

```
Check.SetDashboardStatus(Check.OK);
```

Warning(message*[string]*, details (optional)*[string]*) [static]

Description

Adds a custom warning. This function should only be called from a custom JavaScript check script. See the details in the Check class for how to do this.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning":

```
Check.Warning('My custom warning');
```

Colour class

The Colour class contains constants relating to colours. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetFromName(name*[string]*)
- RGB(red*[integer]*, green*[integer]*, blue*[integer]*)

Colour constants

Name	Description
Colour.ASSEMBLY	Base colour on assembly
Colour.BACKGROUND	Background colour
Colour.BLACK	Colour black
Colour.BLUE	Colour blue
Colour.CYAN	Colour cyan
Colour.DARK_ORANGE	Colour dark orange
Colour.DEFAULT	Default colour for objects
Colour.GREEN	Colour green
Colour.GREEN_CYAN	Colour green/cyan
Colour.GREY	Colour grey
Colour.INCLUDE	Base colour on include file
Colour.LIGHT_BLUE	Colour light blue
Colour.MAGENTA	Colour magenta
Colour.MATERIAL	For elements with part IDs base colour on material ID
Colour.MEDIUM_BLUE	Colour medium blue
Colour.MODEL	Base colour on model
Colour.NOT_BACKGROUND	Not the background colour
Colour.ORANGE	Colour orange
Colour.PART	For elements with part IDs base colour on part ID
Colour.RED	Colour red
Colour.RED_MAGENTA	Colour red/magenta
Colour.SECTION	For elements with part IDs base colour on section ID
Colour.SKETCH	Sketch colour
Colour.TEXT	Text colour

Colour.WHITE	Colour white
Colour.YELLOW	Colour yellow
Colour.YELLOW_GREEN	Colour yellow/green

Detailed Description

The Colour class is used to define colours, either by predefined colours or by RGB values. The easiest way to set the colour of something is to use the predefined colour constants. e.g. to set the colour of part p to red:

```
p.colour = Colour.RED;
```

For other colours use Colour.RGB().

Details of functions

GetFromName(name*[string]*) [static]

Description

Returns the colour for a given core or user colour name

Arguments

- **name** (string)

The name of the colour, for example red or user_green or green/cyan.

Returns

colour value (integer)

Return type

Number

RGB(red*[integer]*, green*[integer]*, blue*[integer]*) [static]

Description

Creates a colour from red, green and blue components

Arguments

- **red** (integer)

red component of colour (0-255).

- **green** (integer)

green component of colour (0-255).

- **blue** (integer)

blue component of colour (0-255).

Returns

colour value (integer)

Return type

Number

Example

To set the colour of model m to red:

```
m.SetColour( Colour.RGB(255, 0, 0) );
```

To set the colour of part p to red:

```
p.colour = Colour.RGB(255, 0, 0);
```

Conx class

The Conx class gives you access to connections in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Conx constants

Name	Description
Conx.ADHESIVE	Connection is adhesive.
Conx.ADHESIVE_PATCH	Connection adhesive type is a patch.
Conx.ADHESIVE_SOLID	Connection adhesive type is a solid line.
Conx.ASSEMBLY	If the connection refers to an assembly rather than individual layers, the assembly is defined by part tree assembly.
Conx.BAD	Connection is bad (e.g. necessary data is missing).
Conx.BOLT	Connection is a bolt.
Conx.BOLT_MODULE	Library bolt.
Conx.BOLT_MRG_2PTS	2pt Patch Beam.
Conx.BOLT_MRG_2PTS_RB	2pt Patch (Rigid Beam).
Conx.BOLT_MRG_2PTS_RJ	2pt Patch Revolute joint.
Conx.BOLT_MRG_CYL	Cylindrical Merge.
Conx.BOLT_MRG_CYL_BALL	Cylindrical Patch Ball joint.
Conx.BOLT_MRG_CYL_BEAM	Cylindrical Patch Beam.
Conx.BOLT_NRB_2PTS	2pt NRB Beam.
Conx.BOLT_NRB_CYL	Cylindrical NRB.
Conx.BOLT_NRB_CYL_BALL	Cylindrical NRB Ball joint.

Conx.BOLT_NRB_CYL_BEAM	Cylindrical NRB Beam.
Conx.BOLT_NRB_SPH	Spherical NRB.
Conx.BOLT_NRB_SPH_BALL	Spherical NRB Ball joint.
Conx.BOLT_NRB_SPH_DISC	Spherical NRB Discrete Beam.
Conx.DORMANT	Connection is dormant (not yet made).
Conx.INVALID	Connection has been made but something is wrong (e.g. part moved).
Conx.MADE	Connection has been made but status is unknown.
Conx.PART_SET	If the connection refers to an assembly rather than individual layers, the assembly is defined by part set.
Conx.REALIZED	Connection has been made and is OK (checks OK).
Conx.RIGID	This constant is deprecated in version 10.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Conx.BOLT instead. [deprecated]
Conx.RIGID_MERGE	This constant is deprecated in version 10.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Conx.BOLT_MRG_CYL instead. [deprecated]
Conx.RIGID_NRB	This constant is deprecated in version 10.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Conx.BOLT_NRB_CYL instead. [deprecated]
Conx.RIVET	Connection is rivet.
Conx.SPOTWELD	Connection is a spotweld.
Conx.SPOTWELD_BEAM	Connection spotweld type is beam.
Conx.SPOTWELD_LINE	Connection is a spotweld line.
Conx.SPOTWELD_MIG	Connection spotweld type is (beam) MIG weld.
Conx.SPOTWELD_SOLID1	Connection spotweld type is one solid/spotweld layer.
Conx.SPOTWELD_SOLID12	Connection spotweld type is twelve solids/spotweld layer.
Conx.SPOTWELD_SOLID16	Connection spotweld type is sixteen solids/spotweld layer.
Conx.SPOTWELD_SOLID4	Connection spotweld type is four solids/spotweld layer.
Conx.SPOTWELD_SOLID8	Connection spotweld type is eight solids/spotweld layer.

Conx properties

Name	Type	Description
adhesive_esize	real	Element size along the length of the adhesive run
adhesive_nelem	integer	The number of elements across the width of the adhesive

adhesive_ width	real	The width of the adhesive run
angtol	real	angle tolerance for bolt
angtol2	real	angle tolerance at end 2 for 2 point bolt
assembly	integer/string	Assembly used to specify panels connection together, rather than individual layers. Integer for a part set ID, string for a PRIMER assembly (name).
assembly_ type	constant	The assembly type. Can be Conx.PART_SET or Conx.ASSEMBLY.
colour	Colour	The colour of the connection
diameter	real	Diameter of spotweld/rigid
diameter2	real	Diameter of rigid at end 2
edge_ distance	real	Spotweld line edge distance
edge_lock	logical	true if a spotweld line is locked to an edge, false if not
error (read only)	string	Description of the error if the connection cannot be made
error_details (read only)	string	Details of the error if the connection cannot be made
fit	integer	contact fitting method for library bolts
id	integer	Conx number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the connection is in.
label	integer	Conx number. Also see the id property which is an alternative name for this.
layers	integer	The number of layers the connection has.
length	real	Length of 1 point bolt, max thickness for 2 point bolt
length2	real	max thickness at end 2 for 2 point bolt
material	integer	The ID of the Material used for 'merge' bolt connections. i.e. Conx.BOLT_MRG_CYL, Conx.BOLT_MRG_CYL_BEAM,
model (read only)	integer	The Model number that the connection is in.
module	string	name of library module for bolt
part	integer	The ID of the Part used for adhesive or spotweld connections. Note that in v11.0 and above you are able to specify a different part IDs for elements in the connection between different layers. If you only have one part for the elements in the connection, then this is the value of this property. If there is more than one used, then the value of this property is the first part. If you set this property to a new value, then the all the elements in the connection will have this new part ID when it is realized. To set and retrieve information on parts used between different layers, the functions GetPidData() and SetPidData() should be used.
patch_coords	integer	The number of patch coordinate points the connection has (Adhesive patch only).
patch_topol	integer	The number of patch topology entries the connection has (Adhesive patch only).
path	integer	The number of path points the connection has (Adhesive only). Note that these points do **NOT** include the start and end points for the adhesive run. These are defined using the properties x, y, z and x2, y2, z2
pitch	real	Spotweld line pitch
resize	integer	snap to points fitting method for library bolts

saved_ settings	boolean	Whether settings are saved for a connection or not
shape	integer	shape for bolt attachment
shape2	integer	shape for bolt attachment at end 2 for 2 point bolt
spr2_id (read only)	integer	Internal label of C_SPR2 which applied to this rivet connection
spr2_match	boolean	True to use matching C_SPR2 for this rivet. False to create new C_SPR2 for each rivet. IF unset, a new C_SPR2 will be created.
spr2_ unshared (read only)	boolean	True if C_SPR2 is unique for this rivet
status	constant	The status of the connection. Can be Conx.DORMANT, Conx.MADE, Conx.INVALID, Conx.REALIZED or Conx.BAD.
subtype	constant	The connection subtype. For SPOTWELD and SPOTWELD_LINE connections the subtype can be: • Conx.SPOTWELD_BEAM • Conx.SPOTWELD_MIG • Conx.SPOTWELD_SOLID1 • Conx.SPOTWELD_SOLID4 • Conx.SPOTWELD_SOLID8 • Conx.SPOTWELD_SOLID12 • Conx.SPOTWELD_SOLID16 For BOLT connections the subtype can be: • Conx.BOLT_MRG_CYL • Conx.BOLT_MRG_CYL_BEAM • Conx.BOLT_MRG_CYL_BALL • Conx.BOLT_MRG_2PTS • Conx.BOLT_MRG_2PTS_RB • Conx.BOLT_MRG_2PTS_RJ • Conx.BOLT_MRG_CYL • Conx.BOLT_NRB_CYL_BEAM • Conx.BOLT_NRB_CYL_BALL • Conx.BOLT_NRB_SPH • Conx.BOLT_NRB_SPH_BALL • Conx.BOLT_NRB_SPH_DISC • Conx.BOLT_NRB_2PTS • Conx.BOLT_MODULE For ADHESIVE connections the subtype can be: Conx.ADHESIVE_SOLID. Conx.ADHESIVE_PATCH.
title	string	Title for connection
transparency	integer	The transparency of the connection (0-100) 0% is opaque, 100% is transparent.
type	constant	The connection type. Can be Conx.SPOTWELD, Conx.BOLT or Conx.RIVET or Conx.ADHESIVE.
user_data	string	User data for connection
x	real	X coordinate
x2	real	X coordinate for second point (adhesive only)
y	real	Y coordinate
y2	real	Y coordinate for second point (adhesive only)
z	real	Z coordinate
z2	real	Z coordinate for second point (adhesive only)

Detailed Description

The Conx class allows you to create, modify, edit and manipulate connections. See the documentation below for more details.

Constructor

new Conx(Model*[Model]*, x*[real]*, y*[real]*, z*[real]*, type (optional)*[constant]*, subtype (optional)*[constant]*, title (optional)*[string]*)

Description

Create a new Conx object.

Arguments

- **Model** (Model)

Model that connection will be created in

- **x** (real)

X coordinate

- **y** (real)

Y coordinate

- **z** (real)

Z coordinate

- **type (optional)** (constant)

Type of connection. Can be Conx.SPOTWELD, Conx.BOLT, Conx.ADHESIVE Conx.SPOTWELD_LINE or Conx.RIVET. If omitted type will be set to Conx.SPOTWELD.

- **subtype (optional)** (constant)

Subtype of connection. See property subtype for valid values. If omitted subtype will be set to the default subtype for this type of connection.

- **title (optional)** (string)

Title for the connection

Returns

Conx object

Return type

Conx

Example

To create a new connection in model m, at coordinates (20, 40, 10)

```
var c = new Conx(m, 20, 40, 10);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a connection.

Arguments

- **Comment** (Comment)

Comment that will be attached to the connection

Returns

No return value

Example

To associate comment c to the connection c:

```
c.AssociateComment(c);
```

Blank()

Description

Blanks the connection

Arguments

No arguments

Returns

No return value

Example

To blank connection c:

```
c.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the connections in the model.

Arguments

- **Model** (Model)

Model that all connections will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the connections in model m:

```
Conx.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged connections in the model.

Arguments

- **Model** (Model)

Model that all the flagged connections will be blanked in

- **flag** (Flag)

Flag set on the connections that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the connections in model m flagged with f:

```
Conx.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the connection is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if connection c is blanked:

```
if (c.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the connection.

Arguments

- **flag** (Flag)

Flag to clear on the connection

Returns

No return value

Example

To clear flag f for connection c:

```
c.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the connection. The target include of the copied connection can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Conx object

Return type

Conx

Example

To copy connection c into connection z:

```
var z = c.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a connection.

Arguments

- **Comment** (Comment)

Comment that will be detached from the connection

Returns

No return value

Example

To detach comment c from the connection c:

```
c.DetachComment(c);
```

EmptyPatch()

Description

Empties the patch topology/coordinates data.

Arguments

No arguments

Returns

No return value.

Example

To empty the patch topology/coordinates data for connection c;

```
c.EmptyPatch();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for connection. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for connection c:

```
c.Error("My custom error");
```

ExtractColour()

Description

Extracts the **actual** colour used for connection.
By default in PRIMER many entities such as elements get their colour automatically from the part that they are in. PRIMER cycles through 13 default colours based on the label of the entity. In this case the connection colour property will return the value Colour.PART instead of the actual colour. This method will return the actual colour which is used for drawing the connection.

Arguments

No arguments

Returns

colour value (integer)

Return type

Number

Example

To return the colour used for drawing connection c:

```
var colour = c.ExtractColour();
```

First(Model*[Model]*) [static]

Description

Returns the first connection in the model.

Arguments

- **Model** (Model)

Model to get first connection in

Returns

Conx object (or null if there are no connections in the model).

Return type

Conx

Example

To get the first connection in model m:

```
var c = Conx.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free connection label in the model. Also see Conx.LastFreeLabel(), Conx.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free connection label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Conx label.

Return type

Number

Example

To get the first free connection label in model m:

```
var label = Conx.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the connections in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all connections will be flagged in

- **flag** (Flag)

Flag to set on the connections

Returns

No return value

Example

To flag all of the connections with flag f in model m:

```
Conx.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the connection is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the connection

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if connection c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each connection in the model.
Note that ForEach has been designed to make looping over connections as fast as possible and so has some limitations.
Firstly, a single temporary Conx object is created and on each function call it is updated with the current connection data. This means that you should not try to store the Conx object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new connections inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all connections are in

- **func** (function)

Function to call for each connection

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the connections in model m:

```
Conx.ForEach(m, test);
function test(c)
{
// c is Conx object
}
```

To call function test for all of the connections in model m with optional object:

```
var data = { x:0, y:0 };
Conx.ForEach(m, test, data);
function test(c, extra)
{
// c is Conx object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Conx objects for all of the connections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get connections from

Returns

Array of Conx objects

Return type

Array

Example

To make an array of Conx objects for all of the connections in model m

```
var c = Conx.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a connection.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the connection c:

```
var comm_array = c.GetComments();
```

GetElements()

Description

Returns the beams/solids that are used in the connection weld.

Arguments

No arguments

Returns

An array containing the element IDs (or null if no elements).

Return type

Array

Example

To get the elements for connection c:

```
var elems = c.GetElements();
```

GetEntities(type*[string]*)

Description

Returns list of the entities of type that are used in the connection.

Arguments

- **type** (string)

The type of the item in the reference list (for a list of types see Appendix I of the PRIMER manual).

Returns

An array containing the item IDs (or null if none).

Return type

Array

Example

To get list of nodes for connection c:

```
var items = c.GetEntities("NODE");
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Conx objects for all of the flagged connections in a model in PRIMER

Arguments

- **Model** (Model)

Model to get connections from

- **flag** (Flag)

Flag set on the connections that you want to retrieve

Returns

Array of Conx objects

Return type

Array

Example

To make an array of Conx objects for all of the connections in model m flagged with f

```
var c = Conx.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Conx object for a connection ID.

Arguments

- **Model** (Model)

Model to find the connection in

- **number** (integer)

number of the connection you want the Conx object for

Returns

Conx object (or null if connection does not exist).

Return type

Conx

Example

To get the Conx object for connection 100 in model m

```
var c = Conx.GetFromID(m, 100);
```

GetLayerData(layer*[integer]*)

Description

Returns the data for a layer of the connection.

Arguments

- **layer** (integer)

The layer you want the data for. **Note that layers start at 0, not 1**.

Returns

An array containing the layer data.

Return type

Array

Example

To get the data for the 3rd layer for connection c:

```
var l_data = c.GetLayerData(2);
```

GetLayerShells(layer*[integer]*)

Description

Returns the attached shells for a layer of the connection.

Arguments

- **layer** (integer)

The layer you want the data for. **Note that layers start at 0, not 1**.

Returns

Array of Shell objects or null if not valid

Return type

Array

Example

To get the attached shells for the 3rd layer for connection c:

```
var shells = c.GetLayerShells(2);
```

GetParameter(prop*[string]*)

Description

Checks if a Conx property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Conx.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

connection property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Conx property c.example is a parameter:

```
Options.property_parameter_names = true;
if (c.GetParameter(c.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Conx property c.example is a parameter by using the GetParameter method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

GetPatchCoords(point*[integer]*)

Description

Returns the data for a patch coordinate of an adhesive patch connection.

Arguments

- **point** (integer)

The point you want the data for. **Note that points start at 0, not 1**.

Returns

An array containing the patch coordinate.

Return type

Array

Example

To get the data for the 3rd patch coordinate for connection c:

```
var p_data = c.GetPatchCoords(2);
```

GetPatchTopol(point*[integer]*)

Description

Returns the topology for a patch quad/tria of an adhesive patch connection.

Arguments

- **point** (integer)

The patch quad/tria you want the data for. **Note that points start at 0, not 1**.

Returns

Array of numbers containing the patch topology information.

Return type

Number

Example

To get the data for the 3rd patch quad/tria for connection c:

```
var p_data = c.GetPatchTopol(2);
```

GetPathData(point*[integer]*)

Description

Returns the data for a path point of an adhesive/spotweld line connection.

Arguments

- **point** (integer)

The point you want the data for. **Note that points start at 0, not 1**.

Returns

An array containing the path data.

Return type

Array

Example

To get the data for the 3rd path point for connection c:

```
var p_data = c.GetPathData(2);
```

GetPidData()

Description

Returns an array of Part objects for the connection FE entities. A connection can contain elements with different part ID’s between different layers. If one part ID is returned, that part is used for all elements in the connection. Not applicable for bolts.

Arguments

No arguments

Returns

Array of Part objects

Return type

Array

Example

To make an array of Part objects for connection c

```
var arr = Conx.GetPidData();
```

GetSettings()

Description

Returns an object of settings stored with the connection.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
angle_tolerance	real	Angle tolerance
bolt_adjust_mass	boolean	Adjust bolt mass when creating bolt entitites
bolt_dth_beam	boolean	Add database history beam when bolt beam is created
bolt_feature_line	boolean	Consider feature line for bolt holes
bolt_nrb_min_mass	real	Bolt rigid NRB minimum mass
bolt_part_min_mass	real	Bolt rigid part minimum mass
clinch	boolean	Allow connections to join a clinch type connection
consistent_weld_area	boolean	Turn on consistent weld area so multihex welds are pi*d*d/4
edge_distance	real	Edge distance
glue_break_angle	real	Glue break angle
glue_hard_aspect	real	Glue hard aspect ratio
glue_soft_aspect	real	Glue soft aspect ratio
length_check	boolean	Check length
max_length	real	Maximum length
max_panels	integer	Maximum number of panels
max_warpage	real	Maximum warpage
min_length	real	Minimum length
panel_check	boolean	Check for maximum number of panels
patch_angle	real	Patch angle setting
patch_angle_check	boolean	Turn on or off patch angle check
same_part	boolean	Allow connections to join a part to itself
solid_free_edges	boolean	Consider free edges when orienting single solid spotwelds
spot_line_tol	real	Spotweld line search tolerance
spot_thickness	real	Search thickness
total_length	real	Total length
use_pid	boolean	Use _PID for beam connections
warpage_check	boolean	Check warpage value

Return type

object

Example

To make an Oject containing the stored settings of connection c

```
var o = Conx.GetSettings();
```

GetShellThickness(Layer*[integer]*)

Description

Returns an array containing a number of objects equal to the number of solid elements in the connection. Each object contains the corresponding solid element object, and shell element objects and their thicknesses. The argument allows the user to output only shells from all layers, or a particular layer. **Note that a carriage return is not added**.

Arguments

- **Layer** (integer)

ID of the connection layer containing the shells from which the thicknesses will be extracted. If a value of zero or lower is input, all layers will be considered in the output data.

Returns

An array containing a number of objects equal to the number of solid elements in the connection. Each object has the following properties:

Name	Type	Description
shell*n*	Shell	Shell object in the specified layer in contact with the *n*th node the solid adhesive element, where *n* can be a value from 1 to 8. This corresponds to the maximum number of nodes in the solid element.
solid	Solid	Solid object associated with the shells in the return object.
sthk*n*	Double	Thickness of shell in the specified layer in contact with the *n*th node of the solid adhesive element, where *n* can be a value from 1 to 8.

Return type

object

Example

To get the data for connection c layer 1:

```
var sThkArr = c.GetShellThickness(1); // sThkArr is an array of objects
containing shells and shell thicknesses in only layer 1 for each solid element
in the connection.
var st0_1 = sThkArr[0].sthk1;         // st0_1 is the shell thickness of the
shell attached to node 1 in the first solid element (array index 0) in the
sThkArr array.
var sh1_4 = sThkArr[1].shell4;        // sth1_4 is the shell object
corresponding to node 1 in the second solid element (array index 1) in the
sThkArr array.
var so4   = sThkArr[4].solid;         // so4 is the fifth solid element object
(array index 4) in the sThkArr array.
```

Keyword()

Description

Returns the keyword for this connection (*CONNECTION_START_SPOTWELD etc). **Note that a carriage return is not added**. See also Conx.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for connection c:

```
var key = c.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the connection. **Note that a carriage return is not added**. See also Conx.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for connection c:

```
var cards = c.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last connection in the model.

Arguments

- **Model** (Model)

Model to get last connection in

Returns

Conx object (or null if there are no connections in the model).

Return type

Conx

Example

To get the last connection in model m:

```
var c = Conx.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free connection label in the model. Also see Conx.FirstFreeLabel(), Conx.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free connection label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Conx label.

Return type

Number

Example

To get the last free connection label in model m:

```
var label = Conx.LastFreeLabel(m);
```

Next()

Description

Returns the next connection in the model.

Arguments

No arguments

Returns

Conx object (or null if there are no more connections in the model).

Return type

Conx

Example

To get the connection in model m after connection c:

```
var c = c.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) connection label in the model. Also see Conx.FirstFreeLabel(), Conx.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free connection label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Conx label.

Return type

Number

Example

To get the next free connection label in model m:

```
var label = Conx.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a connection.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only connections from that model can be picked. If the argument is a Flag then only connections that are flagged with *limit* can be selected. If omitted, or null, any connections from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Conx object (or null if not picked)

Return type

Conx

Example

To pick a connection from model m giving the prompt 'Pick connection from screen':

```
var c = Conx.Pick('Pick connection from screen', m);
```

Previous()

Description

Returns the previous connection in the model.

Arguments

No arguments

Returns

Conx object (or null if there are no more connections in the model).

Return type

Conx

Example

To get the connection in model m before connection c:

```
var c = c.Previous();
```

RealizeAll(Model*[Model]*) [static]

Description

Realizes all of the connections in the model.

Arguments

- **Model** (Model)

Model that all connections will be realized in

Returns

No return value

Example

To realize all of the connections in model m:

```
Conx.RealizeAll(m);
```

RealizeFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Realizes all of the flagged connections in the model.

Arguments

- **Model** (Model)

Model that the flagged connections will be realized in

- **flag** (Flag)

Flag set on the connections that you want to realize

Returns

No return value

Example

To realize all of the connections in model m flagged with f:

```
Conx.RealizeFlagged(m, f);
```

ReloadConnectors() [static]

Description

Reload all modules from primer_library/connectors

Arguments

No arguments

Returns

No return value

Example

```
Conx.ReloadConnectors();
```

RemovePatchTopol(layer*[integer]*)

Description

Deletes the topology at a particular location for patch type adhesive.

Arguments

- **layer** (integer)

The topology location you want to remove. **Note that layers start at 0, not 1**.

Returns

No return value.

Example

To remove the 3rd topology data for connection c:

```
c.RemovePatchTopol(2);
```

RemovePathData(layer*[integer]*)

Description

Deletes a pathc point for a line adhesive connection.

Arguments

- **layer** (integer)

The point you want to remove. **Note that layers start at 0, not 1**.

Returns

No return value.

Example

To remove the 3rd point from connection c:

```
c.RemovePathData(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the connections in the model.

Arguments

- **Model** (Model)

Model that all connections will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the connections in model m, from 1000000:

```
Conx.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged connections in the model.

Arguments

- **Model** (Model)

Model that all the flagged connections will be renumbered in

- **flag** (Flag)

Flag set on the connections that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the connections in model m flagged with f, from 1000000:

```
Conx.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select connections using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting connections

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only connections from that model can be selected. If the argument is a Flag then only connections that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any connections can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of connections selected or null if menu cancelled

Return type

Number

Example

To select connections from model m, flagging those selected with flag f, giving the prompt 'Select connections':

```
Conx.Select(f, 'Select connections', m);
```

To select connections, flagging those selected with flag f but limiting selection to connections flagged with flag l, giving the prompt 'Select connections':

```
Conx.Select(f, 'Select connections', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the connection.

Arguments

- **flag** (Flag)

Flag to set on the connection

Returns

No return value

Example

To set flag f for connection c:

```
c.SetFlag(f);
```

SetLayerData(layer*[integer]*, item1*[integer/string]*, item2 (optional)*[integer/string]*, ... (optional)*[integer/string]*)

Description

Sets the data for a layer of the connection.

Arguments

- **layer** (integer)

The layer you want to set the data for. **Note that layers start at 0, not 1**.

- **item1** (integer/string)

The first item for the layer definition. As layer definitions can be part IDs, part names, CAD names, part set IDs, part set names or assemby names the following logic is used. If the item is an integer it is assumed to be a part ID. If the item is a string then it must be in the format 'P<part ID>', 'P:<part name>', 'C:<CAD name>', 'S<set ID>', 'S:<set

name>’
or ’A:<assembly name>’.

- **item2 (optional)** (integer/string)

The second item for the layer definition. **This must be type same type as item1. e.g. if item1 is a part ID, item2 must be a part ID (it cannot be a part name etc).**

- **... (optional)** (integer/string)

The nth item for the layer definition. **This must be type same type as item1. e.g. if item1 is a part ID, this item must be a part ID (it cannot be a part name etc).**

Returns

No return value.

Example

To set the data for the 3rd layer for connection c, to be part IDs 10 and 20:

```
c.SetLayerData(2, 10, 20);
```

or

```
var a = new Array(10, 20);
c.SetLayerData(2, a);
```

SetPatchCoords(point*[integer]*, x*[real]*, y*[real]*, z*[real]*)

Description

Sets a coordinate used by the adhesive patch connection type.

Arguments

- **point** (integer)

The point you want to set the data for. **Note that points start at 0, not 1**.

- **x** (real)

X coordinate of point

- **y** (real)

Y coordinate of point

- **z** (real)

Z coordinate of point

Returns

No return value.

Example

To set the position for the 3rd patch point for connection c, to be (10, 20, 30);

```
c.SetPatchCoords(2, 10, 20, 30);
```

SetPatchTopol(point*[integer]*, c1*[integer]*, c2*[integer]*, c3*[integer]*, c4 (optional)*[integer]*)

Description

Sets the topology used by the adhesive patch connection type.

Arguments

- **point** (integer)

The point you want to set the data for. **Note that points start at 0, not 1**.

- **c1** (integer)

1st coordinate location point

- **c2** (integer)

2nd coordinate location point

- **c3** (integer)

3rd coordinate location point

- **c4 (optional)** (integer)

4th coordinate location point

Returns

No return value.

Example

To set the topology for the 3rd patch quad/tria for connection c, to be (1, 4, 3, 6);

```
c.SetPatchTopol(2, 1, 4, 3, 6);
```

SetPathData(point*[integer]*, x*[real]*, y*[real]*, z*[real]*)

Description

Sets the data for a path point of the connection.

Arguments

- **point** (integer)

The point you want to set the data for. **Note that points start at 0, not 1**.

- **x** (real)

X coordinate of point

- **y** (real)

Y coordinate of point

- **z** (real)

Z coordinate of point

Returns

No return value.

Example

To set the position for the 3rd path point for connection c, to be (10, 20, 30);

```
c.SetPathData(2, 10, 20, 30);
```

SetPidData(item1*[integer/string]*, item2 (optional)*[integer/string]*, ... (optional)*[integer/string]*)

Description

Sets the element part IDs for the connection. A different part can be defined for elements in the connection between different layers. Not applicable for bolts.

Arguments

- **item1** (integer/string)

Part label of the first item in the PID layer list.

- **item2 (optional)** (integer/string)

The second item for the layer definition.

- **... (optional)** (integer/string)

The nth item for the layer definition.

Returns

No return value.

Example

To set the part data for c, to be part IDs 10 and 20:

```
c.SetPidData(10, 20);
```

or

```
var a = new Array(10, 20);
c.SetPidData(a);
```

SetRuleDiameter(diameter*[integer]*) [static]

Description

Set the diameter for a spotweld ring when running a rule. Note that this method can only be called when running a connection rule script. It will not have any effect if used in a 'normal' script.

Arguments

- **diameter** (integer)

The diameter to set for the ring

Returns

No return value

Example

To set the diameter for a ring to be 10.0:

```
Conx.SetRuleDiameter(10.0);
```

SetRuleFEPID(pid*[integer]*) [static]

Description

Set the PID for spotweld beam/solid elements or adhesive solids when running a rule. Note that this method can only be called when running a connection rule script. It will not have any effect if used in a 'normal' script.

Arguments

- **pid** (integer)

The PID to set for the spotweld or adhesive elements

Returns

No return value

Example

To set the PID for a spotweld to be 1000:

```
Conx.SetRuleFEPID(1000);
```

SetRulePID(pid*[integer]*) [static]

Description

Set the PID for a spotweld ring when running a rule. Note that this method can only be called when running a connection rule script. It will not have any effect if used in a 'normal' script.

Arguments

- **pid** (integer)

The PID to set for the ring

Returns

No return value

Example

To set the PID for a ring to be 1000:

```
Conx.SetRulePID(1000);
```

SetSettings(data*[object]*)

Description

Sets the settings stored on a connection entity. Not applicable for bolts.

Arguments

- **data** (object)

Object containing the connection settings data. The properties can be:

Object has the following properties:

Name	Type	Description
angle_tolerance (optional)	real	Angle tolerance
bolt_adjust_mass (optional)	boolean	Adjust bolt mass when creating bolt entities
bolt_dth_beam (optional)	boolean	Add database history beam when bolt is created
bolt_feature_line (optional)	boolean	Consider feature line for bolt holes
bolt_nrb_min_mass (optional)	real	Bolt NRB minimum mass
bolt_part_min_mass (optional)	real	Bolt rigid part minimum mass
clinch (optional)	boolean	Allow connections to join a clinch type connection
consistent_weld_area (optional)	boolean	Use consistent area for multihex welds
edge_distance (optional)	real	Edge distance
glue_break_angle (optional)	real	Glue break angle
glue_hard_aspect (optional)	real	Glue hard aspect ratio
glue_soft_aspect (optional)	real	Glue soft aspect ratio

length_check (optional)	boolean	Check the connection length
max_length (optional)	real	Maximum length of connection
max_panels (optional)	integer	Maximum number of panels
max_warpage (optional)	real	Maximum warpage
min_length (optional)	real	Minimum length of connection
panel_check (optional)	boolean	Check for maximum number of panels
patch_angle (optional)	real	Patch angle
patch_angle_check (optional)	boolean	Check the patch angle
same_part (optional)	boolean	Allow connections to join a part to itself
solid_free_edges (optional)	boolean	Consider free edges when orienting single solid spotwelds
spot_line_tol (optional)	real	Spotweld line search tolerance
spot_thickness (optional)	real	Search thickness
total_length (optional)	real	Total length of connection
use_pid (optional)	boolean	Use _PID for beam connections
warpage_check (optional)	boolean	Check warpage value

Returns

No return value.

Example

To set the various settings for a connection c:

```
var data = { length_check:true, total_length:1.5, warpage_check:false, angle_
tolerance:5.0 };
c.SetSettings(data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the connection. The connection will be sketched until you either call Conx.Unsketch(), Conx.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the connection is sketched. If omitted redraw is true. If you want to sketch several connections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch connection c:

```
c.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged connections in the model. The connections will be sketched until you either call Conx.Unsketch(), Conx.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged connections will be sketched in

- **flag** (Flag)

Flag set on the connections that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the connections are sketched. If omitted redraw is true. If you want to sketch flagged connections several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all connections flagged with flag in model m:

```
Conx.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of connections in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing connections should be counted. If false or omitted referenced but undefined connections will also be included in the total.

Returns

number of connections

Return type

Number

Example

To get the total number of connections in model m:

```
var total = Conx.Total(m);
```

Unblank()

Description

Unblanks the connection

Arguments

No arguments

Returns

No return value

Example

To unblank connection c:

```
c.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the connections in the model.

Arguments

- **Model** (Model)

Model that all connections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the connections in model m:

```
Conx.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged connections in the model.

Arguments

- **Model** (Model)

Model that the flagged connections will be unblanked in

- **flag** (Flag)

Flag set on the connections that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the connections in model m flagged with f:

```
Conx.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the connections in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all connections will be unset in

- **flag** (Flag)

Flag to unset on the connections

Returns

No return value

Example

To unset the flag f on all the connections in model m:

```
Conx.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the connection.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the connection is unsketched. If omitted redraw is true. If you want to unsketch several connections and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch connection c:

```
c.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all connections.

Arguments

- **Model** (Model)

Model that all connections will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the connections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all connections in model m:

```
Conx.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged connections in the model.

Arguments

- **Model** (Model)

Model that all connections will be unsketched in

- **flag** (Flag)

Flag set on the connections that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the connections are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all connections flagged with flag in model m:

```
Conx.UnsketchAll(m, flag);
```

UseParentLayer(option*[boolean]*) [static]

Description

True (default) means put bolt FE into parent layer where possible.

Arguments

- **option** (boolean)

True (default) means put bolt FE into parent layer where possible.

Returns

No return value

Example

To switch off use of parent layer (and use current layer)

```
Conx.UseParentLayer(false);
```

UseSPR2Pref(option*[boolean]*) [static]

Description

True (default) means use the pref settings for C_SPR2 created when rivet realized.

Arguments

- **option** (boolean)

True (default) means use the pref settings for C_SPR2 created when rivet realized.

Returns

No return value

Example

To ignore any pref settings and use zero for newly created C_SPR2 cards

```
Conx.UseSPR2Pref(false);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Conx object.

Return type

Conx

Example

To check if Conx property c.example is a parameter by using the Conx.GetParameter() method:

```
if (c.ViewParameters().GetParameter(c.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for connection. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for connection c:

```
c.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this connection.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for connection c:

```
var xrefs = c.Xrefs();
```

---

toString()

Description

Creates a string containing the connection data in keyword format. Note that this contains the keyword header and the keyword cards. See also Conx.Keyword() and Conx.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for connection n in keyword format

```
var s = c.toString();
```

Dummy class

The Dummy class gives you access to dummy cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)
- First(Model*[Model]*)
- FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*)

Dummy properties

Name	Type	Description
assemblies (read only)	integer	Number of assemblies defined.
exists (read only)	logical	true if dummy exists, false if referred to but not defined.
id (read only)	integer	Dummy number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the dummy is in.
label (read only)	integer	Dummy number. Also see the id property which is an alternative name for this.
model (read only)	integer	The Model number that the dummy is in.
points (read only)	integer	Number of reference points defined.
title	string	Dummy title.
xhpoint (read only)	real	H-Point X coordinate.
yhpoint (read only)	real	H-Point Y coordinate.
zhpoint (read only)	real	H-Point Z coordinate.

Detailed Description

The Dummy class allows you to create, modify, edit and manipulate dummy cards. See the documentation below for more details.

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a dummy.

Arguments

- **Comment** (Comment)

Comment that will be attached to the dummy

Returns

No return value

Example

To associate comment c to the dummy d:

```
d.AssociateComment(c);
```

Blank()

Description

Blanks the dummy

Arguments

No arguments

Returns

No return value

Example

To blank dummy d:

```
d.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the dummies in the model.

Arguments

- **Model** (Model)

Model that all dummies will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the dummies in model m:

```
Dummy.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged dummies in the model.

Arguments

- **Model** (Model)

Model that all the flagged dummies will be blanked in

- **flag** (Flag)

Flag set on the dummies that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the dummies in model m flagged with f:

```
Dummy.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the dummy is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if dummy d is blanked:

```
if (d.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the dummy.

Arguments

- **flag** (Flag)

Flag to clear on the dummy

Returns

No return value

Example

To clear flag f for dummy d:

```
d.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the dummy. The target include of the copied dummy can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Dummy object

Return type

Dummy

Example

To copy dummy d into dummy z:

```
var z = d.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a dummy.

Arguments

- **Comment** (Comment)

Comment that will be detached from the dummy

Returns

No return value

Example

To detach comment c from the dummy d:

```
d.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for dummy. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for dummy d:

```
d.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first dummy in the model.

Arguments

- **Model** (Model)

Model to get first dummy in

Returns

Dummy object (or null if there are no dummies in the model).

Return type

Dummy

Example

To get the first dummy in model m:

```
var d = Dummy.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free dummy label in the model. Also see Dummy.LastFreeLabel(), Dummy.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free dummy label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Dummy label.

Return type

Number

Example

To get the first free dummy label in model m:

```
var label = Dummy.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the dummies in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all dummies will be flagged in

- **flag** (Flag)

Flag to set on the dummies

Returns

No return value

Example

To flag all of the dummies with flag f in model m:

```
Dummy.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the dummy is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the dummy

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if dummy d has flag f set on it:

```
if (d.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each dummy in the model.
Note that ForEach has been designed to make looping over dummies as fast as possible and so has some limitations.
Firstly, a single temporary Dummy object is created and on each function call it is updated with the current dummy data. This means that you should not try to store the Dummy object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new dummies inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all dummies are in

- **func** (function)

Function to call for each dummy

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the dummies in model m:

```
Dummy.ForEach(m, test);
function test(d)
{
// d is Dummy object
}
```

To call function test for all of the dummies in model m with optional object:

```
var data = { x:0, y:0 };
Dummy.ForEach(m, test, data);
function test(d, extra)
{
// d is Dummy object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Dummy objects for all of the dummies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get dummies from

Returns

Array of Dummy objects

Return type

Array

Example

To make an array of Dummy objects for all of the dummies in model m

```
var d = Dummy.GetAll(m);
```

GetAssembly(index*[integer]*)

Description

Returns the information for an assembly

Arguments

- **index** (integer)

The index of the assembly you want the coordinates for. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

Returns

Object with the following properties:

Name	Type	Description
label	integer	Assembly label

parent	integer	Parent assembly label
title	string	Assembly title

Return type

object

Example

To get the information for the 3rd assembly for dummy d:

```
var info = d.GetAssembly(2);
```

GetAssemblyChildInfo(label*[integer]*, index*[integer]*)

Description

Get information about a child assembly from its parent assembly.

Arguments

- **label** (integer)

The label of the parent assembly.

- **index** (integer)

index of the child (start with 0 till n-1, where n is total number of child).

Returns

Object with the following properties:

Name	Type	Description
dof_code	String	Degree of freedom codes
joint_stiff	integer	Constrained joint stiffness label
label	integer	Label of the child assembly
node_a	integer	Node A label
node_b	integer	Node B label

Return type

object

Example

To get the information of first child assembly for which index will be 0 (starts with 0) in the assembly with label = 2 for dummy d:

```
var info = d.GetAssemblyChildInfo(2, 0);
```

GetAssemblyFromID(label*[integer]*)

Description

Get assembly information for a given assembly ID and returns an object containing the details.

Arguments

- **label** (integer)

The label of the assembly you want the Assembly object for.

Returns

Object with the following properties:

Name	Type	Description
child (read only)	integer	Total number of child assembly(s).
exists (read only)	logical	true if assembly exists, false if not defined.
index	integer	Assembly index
label	integer	Assembly label
parent	integer	Parent assembly label
rx (read only)	real	x-angle of the assembly.
ry (read only)	real	y-angle of the assembly.
rz (read only)	real	z-angle of the assembly.
title	string	Assembly title

Return type

object

Example

To get the information for the assembly with label = 2 for dummy d:

```
var info = d.GetAssemblyFromID(2);
```

GetAssemblyPart(label*[integer]*)

Description

Returns an array of Part objects representing all the parts within the assembly.

Arguments

- **label** (integer)

The label of the assembly.

Returns

Array of Part objects

Return type

Array

Example

To get all the parts in the assembly with label = 2 for dummy d:

```
var info = d.GetAssemblyPart(2);
```

GetComments()

Description

Extracts the comments associated to a dummy.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the dummy d:

```
var comm_array = d.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Dummy objects for all of the flagged dummies in a model in PRIMER

Arguments

- **Model** (Model)

Model to get dummies from

- **flag** (Flag)

Flag set on the dummies that you want to retrieve

Returns

Array of Dummy objects

Return type

Array

Example

To make an array of Dummy objects for all of the dummies in model m flagged with f

```
var d = Dummy.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Dummy object for a dummy ID.

Arguments

- **Model** (Model)

Model to find the dummy in

- **number** (integer)

number of the dummy you want the Dummy object for

Returns

Dummy object (or null if dummy does not exist).

Return type

Dummy

Example

To get the Dummy object for dummy 100 in model m

```
var d = Dummy.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Dummy property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Dummy.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

dummy property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Dummy property d.example is a parameter:

```
Options.property_parameter_names = true;
if (d.GetParameter(d.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Dummy property d.example is a parameter by using the GetParameter method:

```
if (d.ViewParameters().GetParameter(d.example) ) do_something...
```

GetPoint(index*[integer]*)

Description

Returns the information for a reference point

Arguments

- **index** (integer)

The index of the reference point you want the information for. **Note that reference points start at 0, not 1**. 0 <= index < points

Returns

Object with the following properties:

Name	Type	Description
assembly	integer	Assembly label
csys	integer	Coordinate system
hpt	boolean	If point has been automatically created by PRIMER at the H-point
label	integer	Point label
node	integer	Node label (0 if coordinate)
rx	boolean	Point restrained rotationally in X
ry	boolean	Point restrained rotationally in Y
rz	boolean	Point restrained rotationally in Z
title	string	Point title
tx	boolean	Point restrained translationally in X
ty	boolean	Point restrained translationally in Y
tz	boolean	Point restrained translationally in Z
x	real	Node/point x coordinate
y	real	Node/point y coordinate
z	real	Node/point z coordinate

Return type

object

Example

To get the information for the 3rd reference point for dummy d:

```
var info = d.GetPoint(2);
```

GetPointData(rpt*[integer]*)

Description

Returns the coordinates of a reference point

Arguments

- **rpt** (integer)

The reference point you want the coordinates for. **Note that reference points start at 0, not 1**.

Returns

Array containing the reference point coordinates

Return type

Array

Example

To get the coordinates of the 3rd reference point for dummy d:

```
var c = d.GetPointData(2);
```

GetPointTitle(rpt*[integer]*)

Description

Returns the title of a reference point

Arguments

- **rpt** (integer)

The reference point you want the title for. **Note that reference points start at 0, not 1**.

Returns

The reference point title

Return type

String

Example

To get the title of the 3rd reference point for dummy d:

```
var c = d.GetPointTitle(2);
```

Last(Model*[Model]*) [static]

Description

Returns the last dummy in the model.

Arguments

- **Model** (Model)

Model to get last dummy in

Returns

Dummy object (or null if there are no dummies in the model).

Return type

Dummy

Example

To get the last dummy in model m:

```
var d = Dummy.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free dummy label in the model. Also see Dummy.FirstFreeLabel(), Dummy.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free dummy label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted

the whole model will be used.

Returns

Dummy label.

Return type

Number

Example

To get the last free dummy label in model m:

```
var label = Dummy.LastFreeLabel(m);
```

Next()

Description

Returns the next dummy in the model.

Arguments

No arguments

Returns

Dummy object (or null if there are no more dummies in the model).

Return type

Dummy

Example

To get the dummy in model m after dummy d:

```
var d = d.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) dummy label in the model. Also see Dummy.FirstFreeLabel(), Dummy.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free dummy label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Dummy label.

Return type

Number

Example

To get the next free dummy label in model m:

```
var label = Dummy.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a dummy.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only dummies from that model can be picked. If the argument is a Flag then only dummies that are flagged with *limit* can be selected. If omitted, or null, any dummies from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Dummy object (or null if not picked)

Return type

Dummy

Example

To pick a dummy from model m giving the prompt 'Pick dummy from screen':

```
var d = Dummy.Pick('Pick dummy from screen', m);
```

Previous()

Description

Returns the previous dummy in the model.

Arguments

No arguments

Returns

Dummy object (or null if there are no more dummies in the model).

Return type

Dummy

Example

To get the dummy in model m before dummy d:

```
var d = d.Previous();
```

RemovePoint(index*[integer]*)

Description

Removes a reference point from a dummy

Arguments

- **index** (integer)

The index of the reference point you want to remove. **Note that reference points start at 0, not 1**. 0 <= index < points

Returns

no return value

Example

To remove for the 3rd reference point for dummy d:

```
d.RemovePoint(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the dummies in the model.

Arguments

- **Model** (Model)

Model that all dummies will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the dummies in model m, from 1000000:

```
Dummy.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged dummies in the model.

Arguments

- **Model** (Model)

Model that all the flagged dummies will be renumbered in

- **flag** (Flag)

Flag set on the dummies that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the dummies in model m flagged with f, from 1000000:

```
Dummy.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select dummies using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting dummies

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only dummies from that model can be selected. If the argument is a Flag then only dummies that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any dummies can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of dummies selected or null if menu cancelled

Return type

Number

Example

To select dummies from model m, flagging those selected with flag f, giving the prompt 'Select dummies':

```
Dummy.Select(f, 'Select dummies', m);
```

To select dummies, flagging those selected with flag f but limiting selection to dummies flagged with flag l, giving the prompt 'Select dummies':

```
Dummy.Select(f, 'Select dummies', l);
```

SelectAssembly()

Description

Returns an array of objects containing the assembly informaitons or null if menu cancelled.

Arguments

No arguments

Returns

Array of objects with the following properties:

Name	Type	Description
label	integer	Assembly label
parent	integer	Parent assembly label
title	string	Assembly title

Return type

object

Example

To select assemblies in dummy d, giving the prompt "Select assemblies":

```
d.SelectAssembly();
```

SetAssemblyStopAngle(label*[integer]*, axis*[integer]*, stop_neg*[real]*, stop_pos*[real]*)

Description

Sets -ve and +ve stop angles in the assembly.

Arguments

- **label** (integer)

The label of the assembly.

- **axis** (integer)

Axis (0 = X, 1 = Y, or 2 = Z) on which to define stop angles.

- **stop_neg** (real)

-ve stop angle.

- **stop_pos** (real)

+ve stop angle.

Returns

No return value

Example

To set -90 and 90 stop angles in X-axis in the assembly with label = 2 for dummy d:

```
d.SetAssemblyStopAngle(2, 0, -90, 90);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the dummy.

Arguments

- **flag** (Flag)

Flag to set on the dummy

Returns

No return value

Example

To set flag f for dummy d:

```
d.SetFlag(f);
```

SetPoint(index*[integer]*, data*[object]*)

Description

Sets the data for a reference point in a dummy

Arguments

- **index** (integer)

The index of the reference point you want to set. **Note that reference points start at 0, not 1**. To add a new point use index points

- **data** (object)

Object containing the reference point data. The properties can be:

Object has the following properties:

Name	Type	Description
assembly	integer	Assembly label
csys (optional)	integer	Coordinate system label
node (optional)	integer	Node label (not rewuired if using x, y and z)
rx (optional)	boolean	Point restrained rotationally in X
ry (optional)	boolean	Point restrained rotationally in Y
rz (optional)	boolean	Point restrained rotationally in Z
title (optional)	string	Title
tx (optional)	boolean	Point restrained translationally in X
ty (optional)	boolean	Point restrained translationally in Y
tz (optional)	boolean	Point restrained translationally in Z
x (optional)	real	X coordinate (not required if using node)
y (optional)	real	Y coordinate (not required if using node)
z (optional)	real	Z coordinate (not required if using node)

Returns

no return value

Example

To add a new reference point to dummy d assembly 5 at node 1000 with title "Example point" restrained in x:

```
var data = { assembly:5, node:1000, title:"Example point", tx:true };
d.SetPoint(d.points, data);
```

To add a new reference point to dummy d assembly 5 at (10, 20, 30) with title "Example point":

```
var data = { assembly:5, x:10, y:20, z:30, title:"Example point" };
d.SetPoint(d.points, data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the dummy. The dummy will be sketched until you either call Dummy.Unsketch(), Dummy.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the dummy is sketched. If omitted redraw is true. If you want to sketch several dummies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch dummy d:

```
d.Sketch();
```

SketchAssembly(label*[integer]*, redraw (optional)*[boolean]*)

Description

Sketches the assembly

Arguments

- **label** (integer)

The label of the assembly you want to sketch.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To sketch the assembly with label 3 in dummy d:

```
var info = d.SketchAssembly(3);
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged dummies in the model. The dummies will be sketched until you either call Dummy.Unsketch(), Dummy.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged dummies will be sketched in

- **flag** (Flag)

Flag set on the dummies that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the dummies are sketched. If omitted redraw is true. If you want to sketch flagged dummies several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all dummies flagged with flag in model m:

```
Dummy.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of dummies in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing dummies should be counted. If false or omitted referenced but undefined dummies will also be included in the total.

Returns

number of dummies

Return type

Number

Example

To get the total number of dummies in model m:

```
var total = Dummy.Total(m);
```

Unblank()

Description

Unblanks the dummy

Arguments

No arguments

Returns

No return value

Example

To unblank dummy d:

```
d.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the dummies in the model.

Arguments

- **Model** (Model)

Model that all dummies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the dummies in model m:

```
Dummy.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged dummies in the model.

Arguments

- **Model** (Model)

Model that the flagged dummies will be unblanked in

- **flag** (Flag)

Flag set on the dummies that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the dummies in model m flagged with f:

```
Dummy.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the dummies in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all dummies will be unset in

- **flag** (Flag)

Flag to unset on the dummies

Returns

No return value

Example

To unset the flag f on all the dummies in model m:

```
Dummy.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the dummy.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the dummy is unsketched. If omitted redraw is true. If you want to unsketch several dummies and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch dummy d:

```
d.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all dummies.

Arguments

- **Model** (Model)

Model that all dummies will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the dummies are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all dummies in model m:

```
Dummy.UnsketchAll(m);
```

UnsketchAssembly(label*[integer]*, redraw (optional)*[boolean]*)

Description

Unsketches the assembly

Arguments

- **label** (integer)

The label of the assembly you want to unsketch.

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unsketch the assembly with label 3 in dummy d:

```
var info = d.UnsketchAssembly(3);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged dummies in the model.

Arguments

- **Model** (Model)

Model that all dummies will be unsketched in

- **flag** (Flag)

Flag set on the dummies that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the dummies are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all dummies flagged with flag in model m:

```
Dummy.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Dummy object.

Return type

Dummy

Example

To check if Dummy property d.example is a parameter by using the Dummy.GetParameter() method:

```
if (d.ViewParameters().GetParameter(d.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for dummy. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for dummy d:

```
d.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this dummy.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for dummy d:

```
var xrefs = d.Xrefs();
```

File class

The File class allows you to read and write text files. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Copy(source*[string]*, dest*[string]*)
- Delete(filename*[string]*)
- DriveMapFilename(filename*[string]*, format*[constant]*)
- Exists(filename*[string]*)
- FindFiles(directory*[string]*, type (optional)*[constant]*)
- Get(url*[string]*, filename*[string]*, options (optional)*[object]*)
- IsAbsolute(filename*[string]*)
- IsDirectory(filename*[string]*)
- IsFile(filename*[string]*)
- IsReadable(filename*[string]*)
- IsWritable(filename*[string]*)
- Mkdir(directory*[string]*)
- Mktemp()
- Proxy(name*[string]*)
- ProxyPassword(name*[string]*)
- ProxyUsername(username*[string]*)
- ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*)
- Rename(oldname*[string]*, newname*[string]*)
- Size(filename*[string]*)
- Upload(filename*[string]*, url*[string]*, options (optional)*[object]*)

Member functions

- Close()

- Write(string*[Any valid javascript type]*)
- WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)
- Writeln(string*[Any valid javascript type]*)

File constants

Name	Description
File.APPEND	Flag to open file for appending
File.BINARY	Flag to open file in binary mode. This will have no effect on unix/linux but for windows if a file is opened for writing with binary mode \n will not be translated to \r\n (CRLF), it will be written as \n (LF)
File.READ	Flag to open file for reading

File.UTF8	Flag to open file for reading as UTF-8 encoding.
File.WRITE	Flag to open file for writing

Constants for Find types

Name	Description
File.DIRECTORY	Find directories
File.FILE	Find files

Constants for Seek types

Name	Description
File.CURRENT	Seek relative to current file position
File.END	Seek relative to end of the file
File.START	Seek relative to start of the file

File properties

Name	Type	Description
filename (read only)	string	Name of the file
mode (read only)	constant	Mode the file was opened with (File.READ, File.WRITE etc)

Detailed Description

The File class gives you simple functions to read and write text files. The following simple example shows how to read from the file "/data/test/file.txt" and print each line read to the dialogue box:

```
var f, line;
f = new File("/data/test/file.txt", File.READ);
while ( (line = f.ReadLine()) != undefined)
{
    Message(line);
}
f.Close();
```

The following simple example shows how to write the numbers 1 to 10 to the file "/data/test/file.txt":

```
var n, line;
f = new File("/data/test/file.txt", File.WRITE);
for (n=1; n<=10; n++)
{
    f.Writeln(n);
}
f.Close();
```

See the documentation below for more details.

Constructor

new File(filename*[string]*, mode*[constant]*)

Description

Create a new File object for reading and writing text files.

Arguments

- **filename** (string)

Filename of the file you want to read/write. If reading, the file must exist. If writing, the file will be overwritten (if it exists) if mode is File.WRITE, or if mode is File.APPEND it will be appended to if it exists, or created if it does not. When reading a file the filename can also be a URL (uniform resource locator) in which case the file will be read from the remote site. See File.Get() for more details on the format of the URL.

- **mode** (constant)

The mode to open the file with. Can be File.READ, File.WRITE or File.APPEND. For File.WRITE or File.APPEND it can also be ORed with File.BINARY if required. By default text is read and written as ASCII. To read/write text in utf-8 mode can also be ORed with File.UTF8 if required.

Returns

File object

Return type

File

Example

To create a new file object to read file "/data/test/file.txt"

```
var f = new File("/data/test/file.txt", File.READ);
```

Details of functions

Close()

Description

Close a file opened by a File object.

Arguments

No arguments

Returns

No return value

Example

To close File object f.

```
f.Close();
```

Copy(source*[string]*, dest*[string]*) [static]

Description

Copies a file

Arguments

- **source** (string)

Source filename you want to copy.

- **dest** (string)

Destination filename you want to copy source file to.

Returns

true if copy successful, false otherwise.

Return type

Boolean

Example

To copy the file "/data/test/file.key" to "/data/test/file.key_backup"

```
var copied = File.Copy("/data/test/file.key", "/data/test/file.key_backup");
```

Delete(filename*[string]*) [static]

Description

Deletes a file

Arguments

- **filename** (string)

Filename you want to delete.

Returns

true if successful, false if not.

Return type

Boolean

Example

To delete the file "/data/test/file.key"

```
var deleted = File.Delete("/data/test/file.key");
```

DriveMapFilename(filename*[string]*, format*[constant]*) [static]

Description

Changes a filename or directory name to the correct format for a specific operating system using the directory mappings (if present)

Arguments

- **filename** (string)

Filename you want to drive map.

- **format** (constant)

The format for the file/directory name. Can be Include.NATIVE, Include.UNIX or Include.WINDOWS

Returns

string containing drive mapped filename

Return type

String

Example

If PRIMER has drive S: mapped to "/data" (by using the primer*drive_s, this*drive_s, d3plot*drive_s or oasys*drive_s preference)

```
var mapped = File.DriveMapFilename("/data/test/file.key", Include.WINDOWS);
```

mapped will be "S:\test\file.key".

```
var mapped = File.DriveMapFilename("S:\\test\\file.key", Include.UNIX);
```

mapped will be "/data/test/file.key".

Exists(filename*[string]*) [static]

Description

Check if a file exists. See also File.IsDirectory() and See also File.IsFile().

Arguments

- **filename** (string)

Filename you want to check for existance.

Returns

true/false

Return type

Boolean

Example

To see if the file "/data/test/file.key" exists

```
if (File.Exists("/data/test/file.key")) { do something }
```

FindFiles(directory*[string]*, type (optional)*[constant]*) [static]

Description

Find any files and/or directories in a directory.

Arguments

- **directory** (string)

Directory to look for files/directories in.

- **type (optional)** (constant)

Type of things to find. Can be bitwise OR of File.FILE and File.DIRECTORY. If omitted only files will be returned.

Returns

Array of filenames/directories

Return type

Array

Example

To return the filenames in the directory /data/test:

```
var fileList = File.FindFiles("/data/test")
```

To return the directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.DIRECTORY)
```

To return the files and directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.FILE|File.DIRECTORY)
```

FindLineContaining(contain*[string]*)

Description

Reads a line from a file which contains **contain**, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must contain that string. If more than one argument is used then lines which contain any of the arguments will be returned

Arguments

- **contain** (string)

String which matching lines must contain

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which contain 'example'.

```
var line;
while ( (line = f.FindLineContaining("example") ) != undefined)
{
}
```

FindLineStarting(start*[string]*)

Description

Reads a line from a file which starts with start, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must start with that string. If more than one argument is used then lines which start with any of the arguments will be returned

Arguments

- **start** (string)

String which matching lines must start with

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which start 'example'.

```
var line;
while ( (line = f.FindLineStarting("example") ) != undefined)
{
}
```

Flush()

Description

Flushes a file opened for writing by a File object.

Arguments

No arguments

Returns

No return value

Example

To flush File object f.

```
f.Flush();
```

Get(url*[string]*, filename*[string]*, options (optional)*[object]*) [static]

Description

Get a file from a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **url** (string)

URL (uniform resource locator) of remote file you want to get. Currently http and ftp are supported. For http give the full address including the leading 'http://'. e.g.
'http://www.example.com/file.html'.
For ftp an optional username and password can be given. e.g.
'ftp://ftp.example.com' retrieves the directory listing for the root directory.
'ftp://ftp.example.com/readme.txt' downloads the file readme.txt from the root directory.
'ftp://user:password@ftp.example.com/readme.txt' retrieves the readme.txt file from the user's home directory.

- **filename** (string)

Filename you want to save the file to.

- **options (optional)** (object)

Options for get. If 'username' and 'password' are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description

password (optional)	string	Password
response (optional)	boolean	If set to true, then the response code will be returned instead of true/false. This can be used to retieve error messages and codes when the file is not returned successfully.
username (optional)	string	Username

Returns

true if file was successfully got, false otherwise.

Return type

Boolean

Example

To get the file "http://www.example.com/file.html" and save it to C:\temp:

```
File.Get("http://www.example.com/file.html", "C:\temp\file.html");
```

IsAbsolute(filename*[string]*) [static]

Description

Check if a filename is absolute or relative.

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is absolute (which it is!)

```
if (File.IsAbsolute("/data/test")) { do something }
```

IsDirectory(filename*[string]*) [static]

Description

Check if a filename is a directory. See also File.Exists(), File.IsFile(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a directory

```
if (File.IsDirectory("/data/test")) { do something }
```

IsFile(filename*[string]*) [static]

Description

Check if a filename is a file. See also File.Exists(), File.IsDirectory(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a file

```
if (File.IsFile("/data/test")) { do something }
```

IsReadable(filename*[string]*) [static]

Description

Check if a filename has read permissions. See also File.Exists(), File.IsDirectory() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is readable

```
if (File.IsReadable("/data/test")) { do something }
```

IsWritable(filename*[string]*) [static]

Description

Check if a filename has write permissions. If *filename* exists and it is a file then it is checked to see if it can be opened with write (File.APPEND permissions). If *filename* exists and it is a directory then the directory is checked for write permission (can files be created in the directory). If *filename* does not exist then it is assumed to be a file and is checked to see if it can be opened for writing (File.WRITE permissions). See also File.Exists(), File.IsDirectory() and File.IsReadable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is writable

```
if (File.IsWritable("/data/test")) { do something }
```

Mkdir(directory*[string]*) [static]

Description

Make a directory. If PRIMER preference 'directory_permission' is set e.g.755 then this will apply (same as if set by chmod 755) ignoring any setting of umask. If there is no preference then the users current setting of umask will control permissions (same as system mkdir)

Arguments

- **directory** (string)

The name of the directory you want to create.

Returns

true if successfully created, false if not.

Return type

Boolean

Example

To make the directory "/data/test"

```
var success = File.Mkdir("/data/test");
```

Mktemp() [static]

Description

Make a temporary filename for writing a temporary file.

Arguments

No arguments

Returns

String name of temporary filename that can be used.

Return type

String

Example

To get a temp filename"

```
var filename = File.Mktemp();
```

Proxy(name*[string]*) [static]

Description

Set a proxy for files opened by http, ftp etc. See also File.Get(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **name** (string)

The name of the proxy.

Returns

No return value

Example

To set the proxy to "http://example.proxy.com" using port 80:

```
File.Proxy("http://example.proxy.com:80");
```

ProxyPassword(name*[string]*) [static]

Description

Set a proxy password for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyUsername().

Arguments

- **name** (string)

Password for the proxy server.

Returns

No return value

Example

To set the proxy password to "password":

```
File.ProxyPassword("password");
```

ProxyUsername(username*[string]*) [static]

Description

Set a proxy username for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyPassword().

Arguments

- **username** (string)

The username for the proxy.

Returns

No return value

Example

To set the proxy username to "username":

```
File.ProxyUsername("username");
```

ReadAll()

Description

Reads **all** the remaining characters from a file opened for reading by a File object. As this function can read the entire file as a string be careful when reading large files as it will consume large amounts of memory.

Arguments

No arguments

Returns

String. Characters read from file or undefined if end of file

Return type

String

Example

Read all characters from File object f.

```
var c = f.ReadAll();
```

ReadArrayBuffer(length (optional)*[integer]*)

Description

Reads binary data from a file opened for reading by a File object. The data is returned as an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **length (optional)** (integer)

Number of bytes to try to read from the file. If omitted all the remaining data from the file will be read.

Returns

ArrayBuffer object or undefined if end of file

Return type

ArrayBuffer

Example

To read data as 32bit unsigned integers from File object f.

```
var ab = f.ReadArrayBuffer();
var u32 = new Uint32Array(ab);
for (var i=0; i<u32.length; i++
{
    var value = u32[i];
}
```

ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*) [static]

Description

Reads the input CSV file and returns an array of string arrays. If the CSV file has legitimate records the function returns an Array object containing sub-arrays of strings otherwise the function returns NULL. The lengths of all the sub-arrays are the same and equal to maximum number of fields in any of the records. For records in a CSV file having fewer fields, the respective sub-arrays are padded with NULL elements to the maximum array length.

Arguments

- **filename** (string)

Filename you want to read CSV options from.

- **delimiter (optional)** (string)

Delimiter string to be used. Default is a comma (",").

- **comment (optional)** (string)

Comment string to be used. Default is a dollar sign ("$").

Returns

Array object containing string arrays.

Return type

String

Example

To Read CSV file "sample.csv" and print all records to a Window.

```
var csv_file_path = "C:\\sample.csv";
var records = "";
if(!File.Exists(csv_file_path))
{
    Window.Information("CSV file %s not present", csv_file_path);
    Exit();
}
var csv_array = File.ReadCSV(csv_file_path);
if(csv_array != null)
{
    for(var i = 0; i < csv_array.length; i++)
    {
        var record_array = csv_array[i];
        for(var j = 0; j < record_array.length; j++)
        {
            if(record_array[j] != null)
                records = records + record_array[j] + " , ";
        }
        records = records + "\n";
    }
}
Options.max_window_lines = csv_array.length;
Window.Information("File.ReadCSV Ouptut", records);
```

To Read CSV file "sample.csv" with delimiter string "::" and comment string "##".

```
var csv_array = File.ReadCSV(csv_file_path, "::", "##");
```

ReadChar()

Description

Reads a single character from a file opened for reading by a File object.

Arguments

No arguments

Returns

character read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading characters from File object f.

```
var c;
while ( (c = f.ReadChar()) != undefined) { ... }
```

ReadLine()

Description

Reads a line from a file opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLine()) != undefined) { ... }
```

ReadLongLine()

Description

Reads a line from a file opened for reading by a File object. The line can be any length. If your file has lines shorter than 512 characters then you may want to use ReadLine instead which is faster.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLongLine()) != undefined) { ... }
```

Rename(oldname*[string]*, newname*[string]*) [static]

Description

Rename an existing file to have a different name.

Arguments

- **oldname** (string)

Existing filename you want to rename

- **newname** (string)

New filename you want to rename to

Returns

true if successful, false if not.

Return type

Boolean

Example

To rename the file "/data/test/file.key" to "/data/test/new_file.key"

```
var size = File.Rename("/data/test/file.key", "/data/test/new_file.key");
```

Seek(offset*[integer]*, origin (optional)*[constant]*)

Description

Set the current position for reading or writing in a File object.

Arguments

- **offset** (integer)

Offset to seek to in the file

- **origin (optional)** (constant)

Origin for offset. Must be one of File.START, File.END or File.CURRENT. If omitted File.START will be used.

Returns

no return value

Example

To seek to the end of File f:

```
f.Seek(0, File.END);
```

To seek to the beginning of File f:

```
f.Seek(0, File.START);
```

To move forward 10 characters in File f:

```
f.Seek(10, File.CURRENT);
```

Size(filename*[string]*) [static]

Description

Return the size of a file in bytes

Arguments

- **filename** (string)

Filename you want the size of.

Returns

size in bytes

Return type

Number

Example

To get the size of the file "/data/test/file.key"

```
var size = File.Size("/data/test/file.key");
```

Tell()

Description

Return the current file position for a File object. Note that on Windows when reading files if the file is not opened with File.BINARY this may not return the correct file position for files with unix line endings.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current file position for File f:

```
var pos = f.Tell();
```

Upload(filename*[string]*, url*[string]*, options (optional)*[object]*) [static]

Description

Uploads a file to a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **filename** (string)

Filename you want to upload.

- **url** (string)

URL (uniform resource locator) of the remote location you want to upload the file to. Currently only http is supported. Give the full address including the leading 'http://'. e.g. 'http://www.example.com/file.html'.

- **options (optional)** (object)

Options for upload. If both of these are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description
password (optional)	string	Password
username (optional)	string	Username

Returns

true if file was successfully uploaded, false otherwise.

Return type

Boolean

Example

To upload the file "C:\temp\file.txt" to "http://www.example.com/file.txt":

```
File.Upload("C:/temp/file.txt", "http://www.example.com/file.txt");
```

Write(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f

```
f.Write("Hello, world!\n");
```

To write the title of model m to File object f

```
f.Write("The title of model 2 is " + m.title + "\n");
```

WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)

Description

Writes binary data to a file opened for writing by a File object. The data to write is an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **buffer** (ArrayBuffer)

ArrayBuffer to write to file

- **length (optional)** (integer)

Number of bytes to write to the file. If omitted all the data in the ArrayBuffer will be written (buffer.byteLength bytes)

Returns

No return value

Example

To write ArrayBuffer ab to File object f.

```
f.WriteArrayBuffer(ab);
```

Writeln(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f automatically adding a carriage return

```
f.Writeln("Hello, world!");
```

To write the title of model m to File object f automatically adding a carriage return

```
f.Writeln("The title of model 2 is " + m.title);
```

GeometrySurface class

The GeometrySurface class gives you access to surfaces in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)

GeometrySurface properties

Name	Type	Description
exists (read only)	logical	true if gsrf exists, false if referred to but not defined.
id (read only)	integer	GeometrySurface number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the gsrf is in.
label (read only)	integer	GeometrySurface number. Also see the id property which is an alternative name for this.
model (read only)	integer	The Model number that the surface is in.

Detailed Description

The GeometrySurface class allows you to create, modify, edit and manipulate surfaces cards. See the documentation below for more details.

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a surface.

Arguments

- **Comment** (Comment)

Comment that will be attached to the surface

Returns

No return value

Example

To associate comment c to the surface s:

```
s.AssociateComment(c);
```

Blank()

Description

Blanks the surface

Arguments

No arguments

Returns

No return value

Example

To blank surface s:

```
s.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the surfaces in the model.

Arguments

- **Model** (Model)

Model that all surfaces will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the surfaces in model m:

```
GeometrySurface.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged surfaces in the model.

Arguments

- **Model** (Model)

Model that all the flagged surfaces will be blanked in

- **flag** (Flag)

Flag set on the surfaces that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the surfaces in model m flagged with f:

```
GeometrySurface.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the surface is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if surface s is blanked:

```
if (s.Blanked() ) do_something...
```

CalculateNormal(u*[real]*, y*[real]*)

Description

Calculate the normal vector for a parametric point on a surface.

Arguments

- **u** (real)

u parametric coordinate

- **y** (real)

v parametric coordinate

Returns

Array containing x, y and z values.

Return type

Array

Example

To obtain the surface normal at parametric point (0.2, 0.3) on surface s:

```
var coords = s.CalculateNormal(0.2, 0.3);
```

CalculatePoint(u*[real]*, v*[real]*)

Description

Calculate the X, Y and Z coordinates for a parametric point on a surface.

Arguments

- **u** (real)

u parametric coordinate

- **v** (real)

v parametric coordinate

Returns

Array containing x, y and z values.

Return type

Array

Example

To obtain the coordinates of parametric point (0.2, 0.3) on surface s:

```
var coords = s.CalculatePoint(0.2, 0.3);
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the surface.

Arguments

- **flag** (Flag)

Flag to clear on the surface

Returns

No return value

Example

To clear flag f for surface s:

```
s.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the surface. The target include of the copied surface can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

GeometrySurface object

Return type

GeometrySurface

Example

To copy surface s into surface z:

```
var z = s.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a surface.

Arguments

- **Comment** (Comment)

Comment that will be detached from the surface

Returns

No return value

Example

To detach comment c from the surface s:

```
s.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for surface. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for surface s:

```
s.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first surface in the model.

Arguments

- **Model** (Model)

Model to get first surface in

Returns

GeometrySurface object (or null if there are no surfaces in the model).

Return type

GeometrySurface

Example

To get the first surface in model m:

```
var s = GeometrySurface.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free surface label in the model. Also see GeometrySurface.LastFreeLabel(), GeometrySurface.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free surface label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

GeometrySurface label.

Return type

Number

Example

To get the first free surface label in model m:

```
var label = GeometrySurface.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the surfaces in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all surfaces will be flagged in

- **flag** (Flag)

Flag to set on the surfaces

Returns

No return value

Example

To flag all of the surfaces with flag f in model m:

```
GeometrySurface.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the surface is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the surface

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if surface s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each surface in the model.
Note that ForEach has been designed to make looping over surfaces as fast as possible and so has some limitations.
Firstly, a single temporary GeometrySurface object is created and on each function call it is updated with the current surface data. This means that you should not try to store the GeometrySurface object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new surfaces inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all surfaces are in

- **func** (function)

Function to call for each surface

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the surfaces in model m:

```
GeometrySurface.ForEach(m, test);
function test(s)
{
// s is GeometrySurface object
}
```

To call function test for all of the surfaces in model m with optional object:

```
var data = { x:0, y:0 };
GeometrySurface.ForEach(m, test, data);
function test(s, extra)
{
// s is GeometrySurface object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of GeometrySurface objects for all of the surfaces in a model in PRIMER

Arguments

- **Model** (Model)

Model to get surfaces from

Returns

Array of GeometrySurface objects

Return type

Array

Example

To make an array of GeometrySurface objects for all of the surfaces in model m

```
var s = GeometrySurface.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a surface.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the surface s:

```
var comm_array = s.GetComments();
```

GetEdgeIndices()

Description

Return an array of all the edge indices for a surface (in pairs).

Arguments

No arguments

Returns

Array of indices

Return type

Array

Example

To get edge indices for surface s

```
var edges = s.GetEdgeIndices();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of GeometrySurface objects for all of the flagged surfaces in a model in PRIMER

Arguments

- **Model** (Model)

Model to get surfaces from

- **flag** (Flag)

Flag set on the surfaces that you want to retrieve

Returns

Array of GeometrySurface objects

Return type

Array

Example

To make an array of GeometrySurface objects for all of the surfaces in model m flagged with f

```
var s = GeometrySurface.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the GeometrySurface object for a surface ID.

Arguments

- **Model** (Model)

Model to find the surface in

- **number** (integer)

number of the surface you want the GeometrySurface object for

Returns

GeometrySurface object (or null if surface does not exist).

Return type

GeometrySurface

Example

To get the GeometrySurface object for surface 100 in model m

```
var s = GeometrySurface.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a GeometrySurface property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the GeometrySurface.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

surface property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if GeometrySurface property s.example is a parameter:

```
Options.property_parameter_names = true;
if (s.GetParameter(s.example) ) do_something...
Options.property_parameter_names = false;
```

To check if GeometrySurface property s.example is a parameter by using the GetParameter method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

GetTriaIndices()

Description

Return an array of all the tria indices for a surface (in triplets).

Arguments

No arguments

Returns

Array of indices

Return type

Array

Example

To get tria indices for surface s

```
var trias = s.GetTriaIndices();
```

GetVertices()

Description

Return an array of all the vertex coordinates for a surface (in triplets).

Arguments

No arguments

Returns

Array of indices

Return type

Array

Example

To get vertex coordinates for surface s

```
var vertices = s.GetVertices();
```

Last(Model*[Model]*) [static]

Description

Returns the last surface in the model.

Arguments

- **Model** (Model)

Model to get last surface in

Returns

GeometrySurface object (or null if there are no surfaces in the model).

Return type

GeometrySurface

Example

To get the last surface in model m:

```
var s = GeometrySurface.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free surface label in the model. Also see GeometrySurface.FirstFreeLabel(), GeometrySurface.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free surface label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

GeometrySurface label.

Return type

Number

Example

To get the last free surface label in model m:

```
var label = GeometrySurface.LastFreeLabel(m);
```

Next()

Description

Returns the next surface in the model.

Arguments

No arguments

Returns

GeometrySurface object (or null if there are no more surfaces in the model).

Return type

GeometrySurface

Example

To get the surface in model m after surface s:

```
var s = s.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) surface label in the model. Also see GeometrySurface.FirstFreeLabel(), GeometrySurface.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free surface label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

GeometrySurface label.

Return type

Number

Example

To get the next free surface label in model m:

```
var label = GeometrySurface.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a surface.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only surfaces from that model can be picked. If the argument is a Flag then only surfaces that are flagged with *limit* can be selected. If omitted, or null, any surfaces from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

GeometrySurface object (or null if not picked)

Return type

GeometrySurface

Example

To pick a surface from model m giving the prompt 'Pick surface from screen':

```
var s = GeometrySurface.Pick('Pick surface from screen', m);
```

Previous()

Description

Returns the previous surface in the model.

Arguments

No arguments

Returns

GeometrySurface object (or null if there are no more surfaces in the model).

Return type

GeometrySurface

Example

To get the surface in model m before surface s:

```
var s = s.Previous();
```

ProjectPoint(x*[real]*, y*[real]*, z*[real]*)

Description

Project a point onto the surface.

Arguments

- **x** (real)

X coordinate of point to project

- **y** (real)

Y coordinate of point to project

- **z** (real)

Z coordinate of point to project

Returns

Array containing u and v values.

Return type

Array

Example

To obtain the projection of point (1, 2, 3) on to surface s:

```
var projection = s.ProjectPoint(1, 2, 3);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the surfaces in the model.

Arguments

- **Model** (Model)

Model that all surfaces will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the surfaces in model m, from 1000000:

```
GeometrySurface.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged surfaces in the model.

Arguments

- **Model** (Model)

Model that all the flagged surfaces will be renumbered in

- **flag** (Flag)

Flag set on the surfaces that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the surfaces in model m flagged with f, from 1000000:

```
GeometrySurface.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select surfaces using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting surfaces

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only surfaces from that model can be selected. If the argument is a Flag then only surfaces that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any surfaces can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of surfaces selected or null if menu cancelled

Return type

Number

Example

To select surfaces from model m, flagging those selected with flag f, giving the prompt ’Select surfaces’:

```
GeometrySurface.Select(f, ’Select surfaces’, m);
```

To select surfaces, flagging those selected with flag f but limiting selection to surfaces flagged with flag l, giving the prompt ’Select surfaces’:

```
GeometrySurface.Select(f, ’Select surfaces’, l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the surface.

Arguments

- **flag** (Flag)

Flag to set on the surface

Returns

No return value

Example

To set flag f for surface s:

```
s.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the surface. The surface will be sketched until you either call GeometrySurface.Unsketch(), GeometrySurface.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the surface is sketched. If omitted redraw is true. If you want to sketch several surfaces and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch surface s:

```
s.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged surfaces in the model. The surfaces will be sketched until you either call GeometrySurface.Unsketch(), GeometrySurface.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged surfaces will be sketched in

- **flag** (Flag)

Flag set on the surfaces that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the surfaces are sketched. If omitted redraw is true. If you want to sketch flagged surfaces several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all surfaces flagged with flag in model m:

```
GeometrySurface.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of surfaces in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing surfaces should be counted. If false or omitted referenced but undefined surfaces will also be included in the total.

Returns

number of surfaces

Return type

Number

Example

To get the total number of surfaces in model m:

```
var total = GeometrySurface.Total(m);
```

Unblank()

Description

Unblanks the surface

Arguments

No arguments

Returns

No return value

Example

To unblank surface s:

```
s.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the surfaces in the model.

Arguments

- **Model** (Model)

Model that all surfaces will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the surfaces in model m:

```
GeometrySurface.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged surfaces in the model.

Arguments

- **Model** (Model)

Model that the flagged surfaces will be unblanked in

- **flag** (Flag)

Flag set on the surfaces that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the surfaces in model m flagged with f:

```
GeometrySurface.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the surfaces in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all surfaces will be unset in

- **flag** (Flag)

Flag to unset on the surfaces

Returns

No return value

Example

To unset the flag f on all the surfaces in model m:

```
GeometrySurface.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the surface.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the surface is unsketched. If omitted redraw is true. If you want to unsketch several surfaces and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch surface s:

```
s.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all surfaces.

Arguments

- **Model** (Model)

Model that all surfaces will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the surfaces are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all surfaces in model m:

```
GeometrySurface.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged surfaces in the model.

Arguments

- **Model** (Model)

Model that all surfaces will be unsketched in

- **flag** (Flag)

Flag set on the surfaces that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the surfaces are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all surfaces flagged with flag in model m:

```
GeometrySurface.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

GeometrySurface object.

Return type

GeometrySurface

Example

To check if GeometrySurface property s.example is a parameter by using the GeometrySurface.GetParameter() method:

```
if (s.ViewParameters().GetParameter(s.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for surface. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for surface s:

```
s.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this surface.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for surface s:

```
var xrefs = s.Xrefs();
```

Graphics class

The Graphics class allows you to draw graphics in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- DepthTest(enable*[boolean]*)
- DrawingFunction(name*[function]*)
- FillColour(colour*[Colour]*)
- Finish()
- Line(x1*[real]*, y1*[real]*, z1*[real]*, x2*[real]*, y2*[real]*, z2*[real]*)
- LineColour(colour*[Colour]*)
- LineStyle(style*[constant]*)
- LineTo(x*[real]*, y*[real]*, z*[real]*)
- LineWidth(width*[Integer]*)
- MoveTo(x*[real]*, y*[real]*, z*[real]*)
- PolygonFinish()
- PolygonStart()
- Shape(shape*[constant]*, size*[integer]*)
- Start()
- Text(text*[String]*)
- TextColour(colour*[Colour]*)
- TextSize(size*[Integer]*)

Graphics constants

Name	Description
Graphics.CIRCLE	Circle shape. See Graphics.Shape() for use.
Graphics.DASHDOT_LINE	Dashed and dotted lines. See Graphics.LineStyle() for use.
Graphics.DASH_LINE	Dashed lines. See Graphics.LineStyle() for use.
Graphics.DIAMOND	Diamond shape. See Graphics.Shape() for use.
Graphics.DOT_LINE	Dotted lines. See Graphics.LineStyle() for use.
Graphics.FILLED_CIRCLE	Filled circle shape. See Graphics.Shape() for use.
Graphics.FILLED_DIAMOND	Filled diamond shape. See Graphics.Shape() for use.
Graphics.FILLED_HOURGLASS	Filled hourglass shape. See Graphics.Shape() for use.
Graphics.FILLED_SQUARE	Filled square shape. See Graphics.Shape() for use.
Graphics.HOURGLASS	Hourglass shape. See Graphics.Shape() for use.
Graphics.POINT	Point shape. See Graphics.Shape() for use.
Graphics.SOLID_LINE	Solid lines. See Graphics.LineStyle() for use.
Graphics.SQUARE	Square shape. See Graphics.Shape() for use.

Detailed Description

The Graphics class gives you access to functions to draw lines, shapes etc on the graphics screen in PRIMER. For example the following will draw a solid thick red line on the screen:

```
Graphics.Start();
Graphics.LineWidth(3);
Graphics.LineColour(Colour.RED);
Graphics.LineStyle(Graphics.SOLID_LINE);
Graphics.Line(0, 0, 0, 10, 20, 30);
Graphics.Finish();
```

The drawing commands must be between

```
Graphics.Start()
```

and

```
Graphics.Finish()
```

or else nothing will be seen. This is suitable for sketching but the line will disappear if the graphics are redrawn or any dynamic viewing is done. To draw graphics which will stay on the screen even if dynamic viewing or a redraw is done you have to register a function using Graphics.DrawingFunction() which will be called every time the graphics are redrawn by PRIMER. e.g:

```
var w = new Window("Graphics test", 0.8, 1.0, 0.5, 0.6);
var e = new Widget(w, Widget.BUTTON,  1, 21, 1, 7, "Exit");
e.onClick  = Exit;
do_draw();
Graphics.DrawingFunction(do_draw);
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_draw()
{
    Graphics.Start();
    Graphics.LineWidth(3);
    Graphics.LineColour(Colour.RED);
    Graphics.LineStyle(Graphics.SOLID_LINE);
    Graphics.Line(0, 0, 0, 10, 20, 30);
    Graphics.Finish();
}
```

See the documentation below for more details.

Details of functions

DepthTest(enable*[boolean]*) [static]

Description

Allows depth testing (hidden surface removal) to be turned on or off. Temporarily turning depth testing off may be used to ensure that an item (e.g. some text) is always drawn in front and will not be obscured.

Arguments

- **enable** (boolean)

Whether depth testing (hidden surface removal) is performed (true) or not (false)

Returns

No return value

Example

To turn off depth testing:

```
Graphics.DepthTest(false);
```

To turn depth testing back on:

```
Graphics.DepthTest(true);
```

DrawingFunction(name*[function]*) [static]

Description

Set the function to draw graphics from javaScript. This function will be called each time the graphics are redrawn after PRIMER has finished drawing everything else. This allows you to add extra items to the graphics.
To remove the graphics drawing function use Graphics.DrawingFunction(null).
It is the responsibility of the script developer to ensure that any objects or variables that are used in the drawing function do not refer to items in PRIMER that no longer exist. Not doing so may cause PRIMER to crash. For example, if you use some Node objects in the drawing function that refer to nodes in model 1 and you delete the model, when the graphics are redrawn PRIMER may crash as the nodes referred to by the Node objects no longer exist. You should either remove the drawing function by calling Graphics.DrawingFunction(null) or set the Node variables to null (and test that they exist before using them) in your drawing function **before** deleting the model.
If a drawing function is used in your script, you should reset it before the script terminates to avoid a "race condition" between the script terminating and the graphics function being called. Not doing so may cause PRIMER to crash.

Arguments

- **name** (function)

The name of the function (or null to remove a function)

Returns

No return value

Example

To set function MyRedrawFunction as the Graphics drawing function

```
Graphics.DrawingFunction(MyRedrawFunction);
```

FillColour(colour*[Colour]*) [static]

Description

Sets the colour for drawing polygons. See the Colour class for more details on colours.

Arguments

- **colour** (Colour)

The colour you want to fill polygons with

Returns

No return value

Example

To Set the current fill colour to red:

```
Graphics.FillColour(Colour.RED);
```

or

```
Graphics.FillColour( Colour.RGB(255, 0, 0) );
```

Finish() [static]

Description

Finish any graphics. See also Graphics.Start(). This **must** be used to finish drawing.

Arguments

No arguments

Returns

No return value

Example

To finish any graphics operations:

```
Graphics.Finish();
```

Line(x1*[real]*, y1*[real]*, z1*[real]*, x2*[real]*, y2*[real]*, z2*[real]*) [static]

Description

Draws a line from (x1, y1, z1) to (x2, y2, z2). See also Graphics.LineTo() and Graphics.MoveTo()

Arguments

- **x1** (real)

X coordinate of point 1

- **y1** (real)

Y coordinate of point 1

- **z1** (real)

Z coordinate of point 1

- **x2** (real)

X coordinate of point 2

- **y2** (real)

Y coordinate of point 2

- **z2** (real)

Z coordinate of point 2

Returns

No return value

Example

To draw a line from (0.0, 0.0, 0.0) to (10.0, 20.0, 30.0)

```
Graphics.Line(0.0, 0.0, 0.0, 10.0, 20.0, 30.0);
```

LineColour(colour*[Colour]*) [static]

Description

Sets the colour for drawing lines. See the Colour class for more details on colours.

Arguments

- **colour** (Colour)

The colour you want to draw lines with

Returns

No return value

Example

To Set the current drawing colour to red:

```
Graphics.LineColour(Colour.RED);
```

or

```
Graphics.LineColour( Colour.RGB(255, 0, 0) );
```

LineStyle(style*[constant]*) [static]

Description

Sets the style for drawing lines.

Arguments

- **style** (constant)

The style to draw lines with. Can be: Graphics.SOLID_LINE, Graphics.DASH_LINE, Graphics.DASHDOT_LINE or Graphics.DOT_LINE

Returns

No return value

Example

To Set the current line style to 3:

```
Graphics.LineStyle(3);
```

LineTo(x*[real]*, y*[real]*, z*[real]*) [static]

Description

Draws a line from the current point to (x, y, z). After drawing the line the current point will be (x, y, z). See also Graphics.Line() and Graphics.MoveTo()

Arguments

- **x** (real)

X coordinate

- **y** (real)

Y coordinate

- **z** (real)

Z coordinate

Returns

No return value

Example

To draw a line from the current point to (10.0, 20.0, 30.0):

```
Graphics.LineTo(10.0, 20.0, 30.0);
```

LineWidth(width*[Integer]*) [static]

Description

Sets the width for drawing lines.

Arguments

- **width** (Integer)

The width to draw lines with

Returns

No return value

Example

To Set the current line width to 3:

```
Graphics.LineWidth(3);
```

MoveTo(x*[real]*, y*[real]*, z*[real]*) [static]

Description

Sets the current point to (x, y, z). See also Graphics.Line() and Graphics.LineTo()

Arguments

- **x** (real)

X coordinate

- **y** (real)

Y coordinate

- **z** (real)

Z coordinate

Returns

No return value

Example

To set the current point to (10.0, 20.0, 30.0):

```
Graphics.MoveTo(10.0, 20.0, 30.0);
```

PolygonFinish() [static]

Description

Ends drawing a polygon. See also Graphics.PolygonStart()

Arguments

No arguments

Returns

No return value

Example

To draw a red square:

```
Graphics.FillColour(Colour.RED);
Graphics.MoveTo(0.0, 0.0, 0.0);
Graphics.PolygonStart();
Graphics.MoveTo(10.0, 0.0, 0.0);
Graphics.MoveTo(10.0, 10.0, 0.0);
Graphics.MoveTo(0.0, 10.0, 0.0);
Graphics.PolygonFinish();
```

PolygonStart() [static]

Description

Starts drawing a polygon. See also Graphics.PolygonFinish()

Arguments

No arguments

Returns

No return value

Example

To draw a red square:

```
Graphics.FillColour(Colour.RED);
Graphics.MoveTo(0.0, 0.0, 0.0);
Graphics.PolygonStart();
Graphics.MoveTo(10.0, 0.0, 0.0);
Graphics.MoveTo(10.0, 10.0, 0.0);
Graphics.MoveTo(0.0, 10.0, 0.0);
Graphics.PolygonFinish();
```

Shape(shape*[constant]*, size*[integer]*) [static]

Description

Draws a simple shape.

Arguments

- **shape** (constant)

The style to draw lines with. Can be: Graphics.POINT, Graphics.SQUARE, Graphics.CIRCLE, Graphics.DIAMOND, Graphics.HOURGLASS, Graphics.FILLED_SQUARE, Graphics.FILLED_CIRCLE, Graphics.FILLED_DIAMOND or Graphics.FILLED_HOURGLASS

- **size** (integer)

Size the shape should be drawn at.

Returns

No return value

Example

To draw a filled square at (10, 20, 30) at size 10:

```
Graphics.MoveTo(10, 20, 30);
Graphics.Shape(Graphics.FILLED_SQUARE, 10);
```

Start() [static]

Description

Start any graphics. See also Graphics.Finish(). This **must** be used before any drawing is done.

Arguments

No arguments

Returns

No return value

Example

To start drawing graphics:

```
Graphics.Start();
```

Text(text*[String]*) [static]

Description

Draws text at current position. See Graphics.MoveTo() to set the current position.

Arguments

- **text** (String)

The text to write

Returns

No return value

Example

To write "Example" at (10, 20, 30):

```
Graphics.MoveTo(10, 20, 30);
Graphics.Text("Example");
```

TextColour(colour*[Colour]*) [static]

Description

Sets the colour for drawing text. See the Colour class for more details on colours.

Arguments

- **colour** (Colour)

The colour you want to draw text with

Returns

No return value

Example

To Set the current text drawing colour to red:

```
Graphics.TextColour(Colour.RED);
```

or

```
Graphics.TextColour( Colour.RGB(255, 0, 0) );
```

TextSize(size*[Integer]*) [static]

Description

Sets the size for drawing text.

Arguments

- **size** (Integer)

The size to draw text with

Returns

No return value

Example

To Set the current text size to 30:

```
Graphics.TextSize(30);
```

Group class

The Group class gives you access to groups in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(Model*[Model]*, redraw (optional)*[boolean]*)
- BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*)
- Create(Model*[Model]*, modal (optional)*[boolean]*)
- First(Model*[Model]*)
- FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*)
- FlagAll(Model*[Model]*, flag*[Flag]*)
- ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*)

Group constants

Name	Description
Group.ADD	Add contents to group
Group.REMOVE	Remove contents from group

Group properties

Name	Type	Description
exists (read only)	logical	true if group exists, false if referred to but not defined
include	integer	The Include file number that the group is in
label	integer	Group number
lock	logical	Whether Group contents are locked against deletion.
model (read only)	integer	The Model number that the group is in.
numtypes (read only)	integer	Number of types in the group.
title	string	Group title

Detailed Description

The Group class allows you to create, modify, edit and manipulate groups. See the documentation below for more details.

Constructor

new Group(Model*[Model]*, label*[integer]*, title (optional)*[string]*)

Description

Create a new Group object.

Arguments

- **Model** (Model)

Model that Group will be created in

- **label** (integer)

Group number.

- **title (optional)** (string)

Title for the group

Returns

Group object

Return type

Group

Example

To create a new group 99 in model m with title "Example":

```
var g = new Group(m, 99, "Example");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a group.

Arguments

- **Comment** (Comment)

Comment that will be attached to the group

Returns

No return value

Example

To associate comment c to the group g:

```
g.AssociateComment(c);
```

Blank()

Description

Blanks the group

Arguments

No arguments

Returns

No return value

Example

To blank group g:

```
g.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the groups in the model.

Arguments

- **Model** (Model)

Model that all groups will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the groups in model m:

```
Group.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged groups in the model.

Arguments

- **Model** (Model)

Model that all the flagged groups will be blanked in

- **flag** (Flag)

Flag set on the groups that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the groups in model m flagged with f:

```
Group.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the group is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if group g is blanked:

```
if (g.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse group g:

```
g.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the group.

Arguments

- **flag** (Flag)

Flag to clear on the group

Returns

No return value

Example

To clear flag f for group g:

```
g.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the group. The target include of the copied group can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Group object

Return type

Group

Example

To copy group g into group z:

```
var z = g.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a group.

Arguments

- **Model** (Model)

Model that the group will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

Group object (or null if not made)

Return type

Group

Example

To start creating a group g in model m:

```
var g = Group.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a group.

Arguments

- **Comment** (Comment)

Comment that will be detached from the group

Returns

No return value

Example

To detach comment c from the group g:

```
g.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit group g:

```
g.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for group. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for group g:

```
g.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first group in the model.

Arguments

- **Model** (Model)

Model to get first group in

Returns

Group object (or null if there are no groups in the model).

Return type

Group

Example

To get the first group in model m:

```
var g = Group.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free group label in the model. Also see Group.LastFreeLabel(), Group.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free group label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Group label.

Return type

Number

Example

To get the first free group label in model m:

```
var label = Group.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the groups in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all groups will be flagged in

- **flag** (Flag)

Flag to set on the groups

Returns

No return value

Example

To flag all of the groups with flag f in model m:

```
Group.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the group is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the group

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if group g has flag f set on it:

```
if (g.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each group in the model.
Note that ForEach has been designed to make looping over groups as fast as possible and so has some limitations. Firstly, a single temporary Group object is created and on each function call it is updated with the current group data. This means that you should not try to store the Group object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new groups inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all groups are in

- **func** (function)

Function to call for each group

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the groups in model m:

```
Group.ForEach(m, test);
function test(g)
{
// g is Group object
}
```

To call function test for all of the groups in model m with optional object:

```
var data = { x:0, y:0 };
Group.ForEach(m, test, data);
function test(g, extra)
{
// g is Group object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of Group objects for all of the groups in a model in PRIMER

Arguments

- **Model** (Model)

Model to get groups from

Returns

Array of Group objects

Return type

Array

Example

To make an array of Group objects for all of the groups in model m

```
var g = Group.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a group.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the group g:

```
var comm_array = g.GetComments();
```

GetDataAll(type*[string]*, index*[integer]*)

Description

Returns 'all' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'all' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalAll()

Returns

An array containing data [Group.ADD or Group.REMOVE, BOX (if defined)].

Return type

Array

Example

To get the data for the 3rd SHELL 'all' row in group g:

```
var data = g.GetDataAll("SHELL", 2);
```

GetDataList(type*[string]*, index*[integer]*)

Description

Returns 'list' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'list' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalList()

Returns

An array containing data [Group.ADD or Group.REMOVE, ITEM1 (if defined), ITEM2 (if defined), ITEM3 (if defined), ITEM4 (if defined), ITEM5 (if defined), BOX (if defined)].

Return type

Array

Example

To get the data for the 3rd SHELL 'list' row in group g:

```
var data = g.GetDataList("SHELL", 2);
```

GetDataRange(type*[string]*, index*[integer]*)

Description

Returns 'range' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'range' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalRange()

Returns

An array containing data [Group.ADD or Group.REMOVE, START, END, BOX (if defined)].

Return type

Array

Example

To get the data for the 3rd SHELL 'range' row in group g:

```
var data = g.GetDataRange("SHELL", 2);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Group objects for all of the flagged groups in a model in PRIMER

Arguments

- **Model** (Model)

Model to get groups from

- **flag** (Flag)

Flag set on the groups that you want to retrieve

Returns

Array of Group objects

Return type

Array

Example

To make an array of Group objects for all of the groups in model m flagged with f

```
var g = Group.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Group object for a group ID.

Arguments

- **Model** (Model)

Model to find the group in

- **number** (integer)

number of the group you want the Group object for

Returns

Group object (or null if group does not exist).

Return type

Group

Example

To get the Group object for group 100 in model m

```
var g = Group.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Group property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Group.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

group property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Group property g.example is a parameter:

```
Options.property_parameter_names = true;
if (g.GetParameter(g.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Group property g.example is a parameter by using the GetParameter method:

```
if (g.ViewParameters().GetParameter(g.example) ) do_something...
```

GetTotalAll(type*[string]*)

Description

Returns the total number of 'all' rows for a type in a group

Arguments

- **type** (string)

The type of the item

Returns

The number of ’all’ rows defined

Return type

Number

Example

To get the total number of shell ’all’ rows in group g:

```
var nrow = g.GetTotalAll("SHELL");
```

GetTotalList(type*[string]*)

Description

Returns the total number of ’list’ rows for a type in a group

Arguments

- **type** (string)

The type of the item

Returns

The number of ’list’ rows defined

Return type

Number

Example

To get the total number of shell ’list’ rows in group g:

```
var nrow = g.GetTotalList("SHELL");
```

GetTotalRange(type*[string]*)

Description

Returns the total number of ’range’ rows for a type in a group

Arguments

- **type** (string)

The type of the item

Returns

The number of ’range’ rows defined

Return type

Number

Example

To get the total number of shell ’range’ rows in group g:

```
var nrow = g.GetTotalRange("SHELL");
```

GetTotals(type*[string]*)

Description

Returns the total number of ’all’, ’list’ and ’range’ rows for a type in a group

Arguments

- **type** (string)

The type of the item

Returns

Array containing number of ’all’, ’list’ and ’range’ rows defined or null if type not in group.

Return type

Array

Example

To get the total number of shell ’all’, ’list’ and ’range’ rows in group g:

```
var totals = g.GetTotals("SHELL");
var nall   = totals[0];
var nlist  = totals[1];
var nrange = totals[2];
```

GetType(row*[integer]*)

Description

Returns the type for an entry in a group

Arguments

- **row** (integer)

The entry in the group types that you want the type for. **Note that entries start at 0, not 1**

Returns

The type of the item (string)

Return type

String

Example

To list the types that are present in group g:

```
for (var t=0; t<g.numtypes; t++)
{
    var type = g.GetType(t);
    Message(type);
}
```

Keyword()

Description

Returns the keyword for this group. **Note that a carriage return is not added**. See also Group.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for goup g:

```
var key = g.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the Group. **Note that a carriage return is not added**. See also Group.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for Group g:

```
var cards = g.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last group in the model.

Arguments

- **Model** (Model)

Model to get last group in

Returns

Group object (or null if there are no groups in the model).

Return type

Group

Example

To get the last group in model m:

```
var g = Group.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free group label in the model. Also see Group.FirstFreeLabel(), Group.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free group label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Group label.

Return type

Number

Example

To get the last free group label in model m:

```
var label = Group.LastFreeLabel(m);
```

Next()

Description

Returns the next group in the model.

Arguments

No arguments

Returns

Group object (or null if there are no more groups in the model).

Return type

Group

Example

To get the group in model m after group g:

```
var g = g.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) group label in the model. Also see Group.FirstFreeLabel(), Group.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free group label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Group label.

Return type

Number

Example

To get the next free group label in model m:

```
var label = Group.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a group.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only groups from that model can be picked. If the argument is a Flag then only groups that are flagged with *limit* can be selected. If omitted, or null, any groups from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Group object (or null if not picked)

Return type

Group

Example

To pick a group from model m giving the prompt 'Pick group from screen':

```
var g = Group.Pick('Pick group from screen', m);
```

Previous()

Description

Returns the previous group in the model.

Arguments

No arguments

Returns

Group object (or null if there are no more groups in the model).

Return type

Group

Example

To get the group in model m before group g:

```
var g = g.Previous();
```

RemoveDataAll(type*[string]*, index*[integer]*)

Description

Removes ’all’ data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of ’all’ row you want to Remove. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalAll()

Returns

No return value

Example

To remove the data for the 3rd SHELL ’all’ row in group g:

```
g.RemoveDataAll("SHELL", 2);
```

RemoveDataList(type*[string]*, index*[integer]*)

Description

Removes ’list’ data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of ’list’ row you want to Remove. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalList()

Returns

No return value

Example

To remove the data for the 3rd SHELL ’list’ row in group g:

```
g.RemoveDataList("SHELL", 2);
```

RemoveDataRange(type*[string]*, index*[integer]*)

Description

Removes 'range' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'range' row you want to Remove. **Note that indices start at 0, not 1**.
0 <= index < Group.GetTotalRange()

Returns

No return value

Example

To remove the data for the 3rd SHELL 'range' row in group g:

```
g.RemoveDataRange("SHELL", 2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the groups in the model.

Arguments

- **Model** (Model)

Model that all groups will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the groups in model m, from 1000000:

```
Group.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged groups in the model.

Arguments

- **Model** (Model)

Model that all the flagged groups will be renumbered in

- **flag** (Flag)

Flag set on the groups that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the groups in model m flagged with f, from 1000000:

```
Group.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select groups using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting groups

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only groups from that model can be selected. If the argument is a Flag then only groups that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any groups can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of groups selected or null if menu cancelled

Return type

Number

Example

To select groups from model m, flagging those selected with flag f, giving the prompt 'Select groups':

```
Group.Select(f, 'Select groups', m);
```

To select groups, flagging those selected with flag f but limiting selection to groups flagged with flag l, giving the prompt 'Select groups':

```
Group.Select(f, 'Select groups', l);
```

SetDataAll(type*[string]*, index*[integer]*, data*[Array of data]*)

Description

Sets 'all' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'all' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index <= Group.GetTotalAll()

- **data** (Array of data)

An array containing data [Group.ADD or Group.REMOVE, BOX (if defined)].

Returns

No return value

Example

To set the data for the 3rd SHELL 'all' row in group g to 'add box 10':

```
var data = [Group.ADD, 10];
g.SetDataAll("SHELL", 2, data);
```

SetDataList(type*[string]*, index*[integer]*, data*[Array of data]*)

Description

Sets 'list' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'list' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index <= Group.GetTotalList()

- **data** (Array of data)

An array containing data [Group.ADD or Group.REMOVE, ITEM1 (if defined), ITEM2 (if defined), ITEM3 (if defined), ITEM4 (if defined), ITEM5 (if defined), BOX (if defined)].

Returns

No return value

Example

To set the data for the 3rd SHELL 'list' row in group g to 'add 1 2 box 10':

```
var data = [Group.ADD, 1, 2, 0, 0, 0, 10];
g.SetDataList("SHELL", 2, data);
```

SetDataRange(type*[string]*, index*[integer]*, data*[Array of data]*)

Description

Sets 'range' data for a given row number and type in the group.

Arguments

- **type** (string)

The type of the item

- **index** (integer)

Index of 'all' row you want the data for. **Note that indices start at 0, not 1**.
0 <= index <= Group.GetTotalRange()

- **data** (Array of data)

An array containing data [Group.ADD or Group.REMOVE, START, END, BOX (if defined)].

Returns

No return value

Example

To set the data for the 3rd SHELL 'range' row in group g to 'add 100 200 box 10':

```
var data = [Group.ADD, 100, 200, 10];
g.SetDataRange("SHELL", 2, data);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the group.

Arguments

- **flag** (Flag)

Flag to set on the group

Returns

No return value

Example

To set flag f for group g:

```
g.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the group. The group will be sketched until you either call Group.Unsketch(), Group.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the group is sketched. If omitted redraw is true. If you want to sketch several groups and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch group g:

```
g.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged groups in the model. The groups will be sketched until you either call Group.Unsketch(), Group.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged groups will be sketched in

- **flag** (Flag)

Flag set on the groups that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the groups are sketched. If omitted redraw is true. If you want to sketch flagged groups several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all groups flagged with flag in model m:

```
Group.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of groups in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing groups should be counted. If false or omitted referenced but undefined groups will also be included in the total.

Returns

number of groups

Return type

Number

Example

To get the total number of groups in model m:

```
var total = Group.Total(m);
```

Unblank()

Description

Unblanks the group

Arguments

No arguments

Returns

No return value

Example

To unblank group g:

```
g.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the groups in the model.

Arguments

- **Model** (Model)

Model that all groups will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the groups in model m:

```
Group.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged groups in the model.

Arguments

- **Model** (Model)

Model that the flagged groups will be unblanked in

- **flag** (Flag)

Flag set on the groups that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the groups in model m flagged with f:

```
Group.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the groups in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all groups will be unset in

- **flag** (Flag)

Flag to unset on the groups

Returns

No return value

Example

To unset the flag f on all the groups in model m:

```
Group.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the group.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the group is unsketched. If omitted redraw is true. If you want to unsketch several groups and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch group g:

```
g.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all groups.

Arguments

- **Model** (Model)

Model that all groups will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the groups are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all groups in model m:

```
Group.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged groups in the model.

Arguments

- **Model** (Model)

Model that all groups will be unsketched in

- **flag** (Flag)

Flag set on the groups that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the groups are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all groups flagged with flag in model m:

```
Group.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Group object.

Return type

Group

Example

To check if Group property g.example is a parameter by using the Group.GetParameter() method:

```
if (g.ViewParameters().GetParameter(g.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for group. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for group g:

```
g.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this group.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for group g:

```
var xrefs = g.Xrefs();
```

---

toString()

Description

Creates a string containing the Group data in keyword format. Note that this contains the keyword header and the keyword cards. See also Group.Keyword() and Group.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for Group g in keyword format

```
var s = g.toString();
```

Image class

The Image class enables writing bitmaps to file. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- WriteBMP(filename*[string]*, resolution (optional)*[constant]*, 8bit (optional)*[boolean]*, options (optional)*[constant]*)
- WriteGIF(filename*[string]*, resolution (optional)*[constant]*, palette (optional)*[constant]*)
- WriteJPEG(filename*[string]*, resolution (optional)*[constant]*, quality (optional)*[integer]*)
- WritePNG(filename*[string]*, resolution (optional)*[constant]*, 8bit (optional)*[boolean]*, palette (optional)*[constant]*)

Image constants

Name	Description
Image.COMPRESS	If compression is done for 8 bit bmp images.
Image.DITHER	If dithering is done for 8 bit images.
Image.OPTIMISE	If palette optimisation is done for 8 bit images.
Image.SCREEN	Image will be created at screen resolution.
Image.X2	Image will be created at 2x screen resolution.
Image.X4	Image will be created at 4x screen resolution.

Detailed Description

The Image class enables you to write BMP, GIF, JPEG or PNG images from PRIMER. See the documentation below for more details.

Details of functions

WriteBMP(filename*[string]*, resolution (optional)*[constant]*, 8bit (optional)*[boolean]*, options (optional)*[constant]*) [static]

Description

Create a bmp image of the current screen image

Arguments

- **filename** (string)

Filename you want to write. The file will be overwritten if it already exists.

- **resolution (optional)** (constant)

The resolution to write the image at. Can be Image.SCREEN, Image.X2 or Image.X4. If omitted screen resolution will be used

- **8bit (optional)** (boolean)

BMP images can be written using either 8 bit (256 colours) or 24 bit (16 million colours). If this is true then an 8 bit image will be written. If false (or omitted) a 24 bit image will be written.

- **options (optional)** (constant)

For 8 bit images (see '8bit' argument) the palette can be optimised (Image.OPTIMISE) and/or dithered (Image.DITHER) and/or compressed (Image.COMPRESS) If 0 (or omitted) no palette optimising, dithering or compression will be done.

Returns

No return value

Example

To create a 24 bit png file "/data/test/image.png" at 2x screen resolution

```
Image.WriteBMP("/data/test/image.bmp", Image.X2);
```

WriteGIF(filename*[string]*, resolution (optional)*[constant]*, palette (optional)*[constant]*) [static]

Description

Create a gif image of the current screen image

Arguments

- **filename** (string)

Filename you want to write. The file will be overwritten if it already exists.

- **resolution (optional)** (constant)

The resolution to write the image at. Can be Image.SCREEN, Image.X2 or Image.X4. If omitted screen resolution will be used

- **palette (optional)** (constant)

The palette can be optimised (Image.OPTIMISE) and/or dithered (Image.DITHER). If 0 (or omitted) no palette optimising or dithering will be done.

Returns

No return value

Example

To create a gif file "/data/test/image.gif" at 2x screen resolution

```
Image.WriteGIF("/data/test/image.gif", Image.X2);
```

WriteJPEG(filename*[string]*, resolution (optional)*[constant]*, quality (optional)*[integer]*) [static]

Description

Create a jpeg image of the current screen image

Arguments

- **filename** (string)

Filename you want to write. The file will be overwritten if it already exists.

- **resolution (optional)** (constant)

The resolution to write the image at. Can be Image.SCREEN, Image.X2 or Image.X4. If omitted screen resolution will be used

- **quality (optional)** (integer)

Quality of the image in percent. Can be in the range [10,100]. If omitted, the quality is 90.

Returns

No return value

Example

To create a jpeg file "/data/test/image.jpg" at 2x screen resolution

```
Image.WriteJPEG("/data/test/image.jpg", Image.X2);
```

WritePNG(filename*[string]*, resolution (optional)*[constant]*, 8bit (optional)*[boolean]*, palette (optional)*[constant]*) [static]

Description

Create a png image of the current screen image

Arguments

- **filename** (string)

Filename you want to write. The file will be overwritten if it already exists.

- **resolution (optional)** (constant)

The resolution to write the image at. Can be Image.SCREEN, Image.X2 or Image.X4. If omitted screen resolution will be used

- **8bit (optional)** (boolean)

PNG images can be written using either 8 bit (256 colours) or 24 bit (16 million colours). If this is true then an 8 bit image will be written. If false (or omitted) a 24 bit image will be written.

- **palette (optional)** (constant)

For 8 bit images (see '8bit' argument) the palette can be optimised (Image.OPTIMISE) and/or dithered (Image.DITHER). If 0 (or omitted) no palette optimising or dithering will be done.

Returns

No return value

Example

To create a 24 bit png file "/data/test/image.png" at 2x screen resolution

```
Image.WritePNG("/data/test/image.png", Image.X2);
```

Mechanism class

The Mechanism class gives you access to mechanism cards in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- Xrefs()

Mechanism constants

Constants for Connection types

Name	Description
Mechanism.COUPLER	Coupler mechanism connection
Mechanism.HINGE	Hinge mechanism connection
Mechanism.LINE	Line mechanism connection
Mechanism.PIN	Pin mechanism connection

Constants for Coupler modes

Name	Description
Mechanism.ROTATION	Rotational coupling on mechanism coupler
Mechanism.TRANSLATION	Translational coupling on mechanism coupler

Mechanism properties

Name	Type	Description
assemblies (read only)	integer	Number of assemblies defined.
connections (read only)	integer	Number of connections defined.
exists (read only)	logical	true if mechanism exists, false if referred to but not defined.
id (read only)	integer	Mechanism number. Also see the label property which is an alternative name for this.
include	integer	The Include file number that the mechanism is in.
label (read only)	integer	Mechanism number. Also see the id property which is an alternative name for this.
model (read only)	integer	The Model number that the mechanism is in.
points (read only)	integer	Number of reference points defined.
title	string	Mechanism title.

Detailed Description

The Mechanism class allows you to create, modify, edit and manipulate mechanism cards. See the documentation below for more details.

Details of functions

AddNodeSetToAssembly(index*[integer]*, nsid*[integer]*)

Description

Add node set to assembly

Arguments

- **index** (integer)

The index of the assembly in which you want to add node set. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **nsid** (integer)

The node set ID that you want to add.

Returns

No return value

Example

To add node set 3 in 3rd assembly in mechanism m:

```
m.AddNodeSetToAssembly(2,3);
```

AddPartSetToAssembly(index*[integer]*, psid*[integer]*)

Description

Add part set to assembly

Arguments

- **index** (integer)

The index of the assembly in which you want to add part set. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **psid** (integer)

The part set ID that you want to add.

Returns

No return value

Example

To add part set 3 in 3rd assembly in mechanism m:

```
m.AddPartSetToAssembly(2,3);
```

AddPartToAssembly(index*[integer]*, pid*[integer]*)

Description

Add part to assembly

Arguments

- **index** (integer)

The index of the assembly in which you want to add part. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **pid** (integer)

The part ID that you want to add.

Returns

No return value

Example

To add part 3 in 3rd assembly in mechanism m:

```
m.AddPartToAssembly(2,3);
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a mechanism.

Arguments

- **Comment** (Comment)

Comment that will be attached to the mechanism

Returns

No return value

Example

To associate comment c to the mechanism m:

```
m.AssociateComment(c);
```

Blank()

Description

Blanks the mechanism

Arguments

No arguments

Returns

No return value

Example

To blank mechanism m:

```
m.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the mechanisms in the model.

Arguments

- **Model** (Model)

Model that all mechanisms will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the mechanisms in model m:

```
Mechanism.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged mechanisms in the model.

Arguments

- **Model** (Model)

Model that all the flagged mechanisms will be blanked in

- **flag** (Flag)

Flag set on the mechanisms that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the mechanisms in model m flagged with f:

```
Mechanism.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the mechanism is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if mechanism m is blanked:

```
if (m.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the mechanism.

Arguments

- **flag** (Flag)

Flag to clear on the mechanism

Returns

No return value

Example

To clear flag f for mechanism m:

```
m.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the mechanism. The target include of the copied mechanism can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

Mechanism object

Return type

Mechanism

Example

To copy mechanism m into mechanism z:

```
var z = m.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a mechanism.

Arguments

- **Comment** (Comment)

Comment that will be detached from the mechanism

Returns

No return value

Example

To detach comment c from the mechanism m:

```
m.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for mechanism. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for mechanism m:

```
m.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first mechanism in the model.

Arguments

- **Model** (Model)

Model to get first mechanism in

Returns

Mechanism object (or null if there are no mechanisms in the model).

Return type

Mechanism

Example

To get the first mechanism in model m:

```
var m = Mechanism.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free mechanism label in the model. Also see Mechanism.LastFreeLabel(), Mechanism.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free mechanism label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

Mechanism label.

Return type

Number

Example

To get the first free mechanism label in model m:

```
var label = Mechanism.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the mechanisms in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all mechanisms will be flagged in

- **flag** (Flag)

Flag to set on the mechanisms

Returns

No return value

Example

To flag all of the mechanisms with flag f in model m:

```
Mechanism.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the mechanism is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the mechanism

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if mechanism m has flag f set on it:

```
if (m.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each mechanism in the model.
Note that ForEach has been designed to make looping over mechanisms as fast as possible and so has some limitations.
Firstly, a single temporary Mechanism object is created and on each function call it is updated with the current mechanism data. This means that you should not try to store the Mechanism object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new mechanisms inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all mechanisms are in

- **func** (function)

Function to call for each mechanism

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the mechanisms in model m:

```
Mechanism.ForEach(m, test);
function test(m)
{
// m is Mechanism object
}
```

To call function test for all of the mechanisms in model m with optional object:

```
var data = { x:0, y:0 };
Mechanism.ForEach(m, test, data);
function test(m, extra)
{
// m is Mechanism object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of Mechanism objects for all of the mechanisms in a model in PRIMER

Arguments

- **Model** (Model)

Model to get mechanisms from

Returns

Array of Mechanism objects

Return type

Array

Example

To make an array of Mechanism objects for all of the mechanisms in model m

```
var m = Mechanism.GetAll(m);
```

GetAssembly(index*[integer]*)

Description

Returns the information for an assembly

Arguments

- **index** (integer)

The index of the assembly you want the coordinates for. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

Returns

Object with the following properties:

Name	Type	Description
label	integer	Assembly label
parent	integer	Parent assembly label
title	string	Assembly title

Return type

object

Example

To get the information for the 3rd assembly for mechanism m:

```
var info = m.GetAssembly(2);
```

GetComments()

Description

Extracts the comments associated to a mechanism.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the mechanism m:

```
var comm_array = m.GetComments();
```

GetConnection(index*[integer]*)

Description

Returns the information for a connection

Arguments

- **index** (integer)

The index of the connection you want the information for. **Note that connections start at 0, not 1**. 0 <= index < connections

Returns

Object with the following properties:

Name	Type	Description
angle	real	Current angle in degrees (for Mechanism.LINE and Mechanism.HINGE)
assembly1	integer	Assembly 1 label
assembly2	integer	Assembly 2 label
assembly3	integer	Assembly 3 label
coefficient1	real	Coefficient for linear coupler equation for connection 1 (for Mechanism.COUPLER)
coefficient2	real	Coefficient for linear coupler equation for connection 2 (for Mechanism.COUPLER)
coefficient3	real	Coefficient for linear coupler equation for connection 3 (for Mechanism.COUPLER)
connection1	integer	Connection 1 label (for Mechanism.COUPLER)
connection2	integer	Connection 2 label (for Mechanism.COUPLER)
connection3	integer	Connection 3 label (for Mechanism.COUPLER)
distance	real	Current distance (for Mechanism.LINE)
factor1	real	Factor 1 on Assembly 3 (Mechanism.LINE only)
factor2	real	Factor 2 on Assembly 3 (Mechanism.LINE only)
label	integer	Connection label
locked	integer	1 if locked (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
mode1	integer	Coupling mode for connection 1. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
mode2	integer	Coupling mode for connection 2. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
mode3	integer	Coupling mode for connection 3. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
node1	integer	Node 1 label (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
node2	integer	Node 2 label (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
nrotation	real	-ve rotation limit in degrees (for Mechanism.LINE and Mechanism.HINGE)
nslide	real	-ve slide translation (for Mechanism.LINE)

protation	real	+ve rotation limit in degrees (for Mechanism.LINE and Mechanism.HINGE)
pslide	real	+ve slide translation (for Mechanism.LINE)
title	string	Connection label
type	integer	Mechanism type (Mechanism.COUPLER, Mechanism.HINGE, Mechanism.LINE, Mechanism.PIN)
x1	real	X1 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
x2	real	X2 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
y1	real	Y1 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
y2	real	Y2 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
z1	real	Z1 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
z2	real	Z2 coordinates (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)

Return type

object

Example

To get the information for the 3rd connection for mechanism m:

```
var info = m.GetConnection(2);
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of Mechanism objects for all of the flagged mechanisms in a model in PRIMER

Arguments

- **Model** (Model)

Model to get mechanisms from

- **flag** (Flag)

Flag set on the mechanisms that you want to retrieve

Returns

Array of Mechanism objects

Return type

Array

Example

To make an array of Mechanism objects for all of the mechanisms in model m flagged with f

```
var m = Mechanism.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the Mechanism object for a mechanism ID.

Arguments

- **Model** (Model)

Model to find the mechanism in

- **number** (integer)

number of the mechanism you want the Mechanism object for

Returns

Mechanism object (or null if mechanism does not exist).

Return type

Mechanism

Example

To get the Mechanism object for mechanism 100 in model m

```
var m = Mechanism.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a Mechanism property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the Mechanism.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

mechanism property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if Mechanism property m.example is a parameter:

```
Options.property_parameter_names = true;
if (m.GetParameter(m.example) ) do_something...
Options.property_parameter_names = false;
```

To check if Mechanism property m.example is a parameter by using the GetParameter method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

GetPoint(index*[integer]*)

Description

Returns the information for a reference point

Arguments

- **index** (integer)

The index of the reference point you want the information for. **Note that reference points start at 0, not 1**. 0 <= index < points

Returns

Object with the following properties:

Name	Type	Description
assembly	integer	Assembly label
csys	integer	Coordinate system
hpt	boolean	If point has been automatically created by PRIMER at the H-point
label	integer	Point label
node	integer	Node label (0 if coordinate)
rx	boolean	Point restrained rotationally in X
ry	boolean	Point restrained rotationally in Y
rz	boolean	Point restrained rotationally in Z
title	string	Point title
tx	boolean	Point restrained translationally in X
ty	boolean	Point restrained translationally in Y
tz	boolean	Point restrained translationally in Z
x	real	Node/point x coordinate
y	real	Node/point y coordinate
z	real	Node/point z coordinate

Return type

object

Example

To get the information for the 3rd reference point for mechanism m:

```
var info = m.GetPoint(2);
```

GetPointData(rpt*[integer]*)

Description

Returns the coordinates of a reference point

Arguments

- **rpt** (integer)

The reference point you want the coordinates for. **Note that reference points start at 0, not 1**.

Returns

Array containing the reference point coordinates

Return type

Array

Example

To get the coordinates of the 3rd reference point for mechanism mec:

```
var c = mec.GetPointData(2)
```

GetPointTitle(rpt*[integer]*)

Description

Returns the title of a reference point

Arguments

- **rpt** (integer)

The reference point you want the title for. **Note that reference points start at 0, not 1**.

Returns

The reference point title

Return type

String

Example

To get the title of the 3rd reference point for mechanism mec:

```
var c = mec.GetPointTitle(2)
```

Last(Model*[Model]*) [static]

Description

Returns the last mechanism in the model.

Arguments

- **Model** (Model)

Model to get last mechanism in

Returns

Mechanism object (or null if there are no mechanisms in the model).

Return type

Mechanism

Example

To get the last mechanism in model m:

```
var m = Mechanism.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free mechanism label in the model. Also see Mechanism.FirstFreeLabel(), Mechanism.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free mechanism label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

Mechanism label.

Return type

Number

Example

To get the last free mechanism label in model m:

```
var label = Mechanism.LastFreeLabel(m);
```

Next()

Description

Returns the next mechanism in the model.

Arguments

No arguments

Returns

Mechanism object (or null if there are no more mechanisms in the model).

Return type

Mechanism

Example

To get the mechanism in model m after mechanism m:

```
var m = m.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) mechanism label in the model. Also see Mechanism.FirstFreeLabel(), Mechanism.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free mechanism label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

Mechanism label.

Return type

Number

Example

To get the next free mechanism label in model m:

```
var label = Mechanism.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a mechanism.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only mechanisms from that model can be picked. If the argument is a Flag then only mechanisms that are flagged with *limit* can be selected. If omitted, or null, any mechanisms from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

Mechanism object (or null if not picked)

Return type

Mechanism

Example

To pick a mechanism from model m giving the prompt 'Pick mechanism from screen':

```
var m = Mechanism.Pick('Pick mechanism from screen', m);
```

Previous()

Description

Returns the previous mechanism in the model.

Arguments

No arguments

Returns

Mechanism object (or null if there are no more mechanisms in the model).

Return type

Mechanism

Example

To get the mechanism in model m before mechanism m:

```
var m = m.Previous();
```

RemoveConnection(index*[integer]*)

Description

Removes a connection from a mechanism

Arguments

- **index** (integer)

The index of the connection you want to remove. **Note that connections start at 0, not 1**. 0 <= index < connections

Returns

no return value

Example

To remove the 3rd connection for mechanism m:

```
m.RemoveConnection(2);
```

RemoveNodeSetFromAssembly(index*[integer]*, nsid*[integer]*)

Description

Remove node set from assembly

Arguments

- **index** (integer)

The index of the assembly from which you want to remove the node set. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **nsid** (integer)

The node set ID that you want to remove.

Returns

No return value

Example

To remove node set 3 from 3rd assembly in mechanism m:

```
m.RemoveNodeSetFromAssembly(2,3);
```

RemovePartFromAssembly(index*[integer]*, pid*[integer]*)

Description

Remove part from assembly

Arguments

- **index** (integer)

The index of the assembly from which you want to remove the part. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **pid** (integer)

The part ID that you want to remove.

Returns

No return value

Example

To remove part 3 from 3rd assembly in mechanism m:

```
m.RemovePartFromAssembly(2,3);
```

RemovePartSetFromAssembly(index*[integer]*, psid*[integer]*)

Description

Remove part set from assembly

Arguments

- **index** (integer)

The index of the assembly from which you want to remove the part set. **Note that reference points start at 0, not 1**. 0 <= index < assemblies

- **psid** (integer)

The part set ID that you want to remove.

Returns

No return value

Example

To remove part set 3 from 3rd assembly in mechanism m:

```
m.RemovePartSetFromAssembly(2,3);
```

RemovePoint(index*[integer]*)

Description

Removes a reference point from a mechanism

Arguments

- **index** (integer)

The index of the reference point you want to remove. **Note that reference points start at 0, not 1**. 0 <= index < points

Returns

no return value

Example

To remove the 3rd reference point for mechanism m:

```
m.RemovePoint(2);
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the mechanisms in the model.

Arguments

- **Model** (Model)

Model that all mechanisms will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the mechanisms in model m, from 1000000:

```
Mechanism.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged mechanisms in the model.

Arguments

- **Model** (Model)

Model that all the flagged mechanisms will be renumbered in

- **flag** (Flag)

Flag set on the mechanisms that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the mechanisms in model m flagged with f, from 1000000:

```
Mechanism.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select mechanisms using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting mechanisms

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only mechanisms from that model can be selected. If the argument is a Flag then only mechanisms that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any mechanisms can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of mechanisms selected or null if menu cancelled

Return type

Number

Example

To select mechanisms from model m, flagging those selected with flag f, giving the prompt 'Select mechanisms':

```
Mechanism.Select(f, 'Select mechanisms', m);
```

To select mechanisms, flagging those selected with flag f but limiting selection to mechanisms flagged with flag l, giving the prompt 'Select mechanisms':

```
Mechanism.Select(f, 'Select mechanisms', l);
```

SetConnection(index*[integer]*, data*[object]*)

Description

Sets the data for a connection in a mechanism

Arguments

- **index** (integer)

The index of the connection you want to set. **Note that connections start at 0, not 1**. To add a new connection use index connections

- **data** (object)

Object containing the connection data. The properties can be:

Object has the following properties:

Name	Type	Description
angle (optional)	real	Current angle in degrees (for Mechanism.LINE and Mechanism.HINGE)
assembly1 (optional)	integer	Assembly 1 label (required for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)

assembly2 (optional)	integer	Assembly 2 label (required for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
assembly3	integer	Assembly 3 label (required for Mechanism.LINE)
coefficient1 (optional)	real	Coefficient for linear coupler equation for connection 1 (for Mechanism.COUPLER)
coefficient2 (optional)	real	Coefficient for linear coupler equation for connection 2 (for Mechanism.COUPLER)
coefficient3 (optional)	real	Coefficient for linear coupler equation for connection 3 (for Mechanism.COUPLER)
connection1 (optional)	integer	Connection 1 label (for Mechanism.COUPLER)
connection2 (optional)	integer	Connection 2 label (for Mechanism.COUPLER)
connection3 (optional)	integer	Connection 3 label (for Mechanism.COUPLER)
distance (optional)	real	Current distance (for Mechanism.LINE)
factor1 (optional)	real	Factor 1 on Assembly 3 (Mechanism.LINE only)
factor2 (optional)	real	Factor 2 on Assembly 3 (Mechanism.LINE only)
locked (optional)	integer	1 if locked (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE)
mode1 (optional)	integer	Coupling mode for connection 1. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
mode2 (optional)	integer	Coupling mode for connection 2. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
mode3 (optional)	integer	Coupling mode for connection 3. 0 = translational coupling, 1 = rotational coupling (for Mechanism.COUPLER)
node1 (optional)	integer	Node 1 label (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using x1, y1 and z1)
node2 (optional)	integer	Node 2 label (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using x2, y2 and z2)
nrotation (optional)	real	-ve rotation limit in degrees (for Mechanism.LINE and Mechanism.HINGE)
nslide (optional)	real	-ve slide translation (for Mechanism.LINE)
protation (optional)	real	+ve rotation limit in degrees (for Mechanism.LINE and Mechanism.HINGE)
pslide (optional)	real	+ve slide translation (for Mechanism.LINE)
title (optional)	string	Title
type	integer	Connection type. Can be one of: Mechanism.PIN, Mechanism.LINE, Mechanism.HINGE or Mechanism.COUPLER]
x1 (optional)	real	x1 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node1)
x2 (optional)	real	x2 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node2)
y1 (optional)	real	y1 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node1)
y2 (optional)	real	y2 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node2)
z1 (optional)	real	z1 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node1)
z2 (optional)	real	z2 coordinate (for Mechanism.LINE, Mechanism.PIN and Mechanism.HINGE, not required if using node2)

Returns

no return value

Example

To add a new pin connection to mechanism m between assemblies 5 and 6 at node 1000 with title "Example connection":

```
var data = { type:Mechanism.PIN, assembly1:5, assembly2:6, node1:1000,
title:"Example connection" };
m.SetConnection(m.connections, data);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the mechanism.

Arguments

- **flag** (Flag)

Flag to set on the mechanism

Returns

No return value

Example

To set flag f for mechanism m:

```
m.SetFlag(f);
```

SetPoint(index*[integer]*, data*[object]*)

Description

Sets the data for a reference point in a mechanism

Arguments

- **index** (integer)

The index of the reference point you want to set. **Note that reference points start at 0, not 1**. To add a new point use index points

- **data** (object)

Object containing the reference point data. The properties can be:

Object has the following properties:

Name	Type	Description
assembly	integer	Assembly label
csys (optional)	integer	Coordinate system label
node (optional)	integer	Node label (not required if using x, y and z)
rx (optional)	boolean	Point restrained rotationally in X
ry (optional)	boolean	Point restrained rotationally in Y
rz (optional)	boolean	Point restrained rotationally in Z
title (optional)	string	Point title

tx (optional)	boolean	Point restrained translationally in X
ty (optional)	boolean	Point restrained translationally in Y
tz (optional)	boolean	Point restrained translationally in Z
x (optional)	real	x coordinate (not required if using node)
y (optional)	real	y coordinate (not required if using node)
z (optional)	real	z coordinate (not required if using node)

Returns

no return value

Example

To add a new reference point to mechanism m assembly 5 at node 1000 with title "Example point" restrained in x:

```
var data = { assembly:5, node:1000, title:"Example point", tx:true };
m.SetPoint(m.points, data);
```

To add a new reference point to mechanism m assembly 5 at (10, 20, 30) with title "Example point":

```
var data = { assembly:5, x:10, y:20, z:30, title:"Example point" };
m.SetPoint(m.points, data);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the mechanism. The mechanism will be sketched until you either call Mechanism.Unsketch(), Mechanism.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mechanism is sketched. If omitted redraw is true. If you want to sketch several mechanisms and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch mechanism m:

```
m.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged mechanisms in the model. The mechanisms will be sketched until you either call Mechanism.Unsketch(), Mechanism.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged mechanisms will be sketched in

- **flag** (Flag)

Flag set on the mechanisms that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mechanisms are sketched. If omitted redraw is true. If you want to sketch

flagged mechanisms several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all mechanisms flagged with flag in model m:

```
Mechanism.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of mechanisms in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing mechanisms should be counted. If false or omitted referenced but undefined mechanisms will also be included in the total.

Returns

number of mechanisms

Return type

Number

Example

To get the total number of mechanisms in model m:

```
var total = Mechanism.Total(m);
```

Unblank()

Description

Unblanks the mechanism

Arguments

No arguments

Returns

No return value

Example

To unblank mechanism m:

```
m.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the mechanisms in the model.

Arguments

- **Model** (Model)

Model that all mechanisms will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the mechanisms in model m:

```
Mechanism.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged mechanisms in the model.

Arguments

- **Model** (Model)

Model that the flagged mechanisms will be unblanked in

- **flag** (Flag)

Flag set on the mechanisms that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the mechanisms in model m flagged with f:

```
Mechanism.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the mechanisms in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all mechanisms will be unset in

- **flag** (Flag)

Flag to unset on the mechanisms

Returns

No return value

Example

To unset the flag f on all the mechanisms in model m:

```
Mechanism.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the mechanism.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mechanism is unsketched. If omitted redraw is true. If you want to unsketch several mechanisms and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch mechanism m:

```
m.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all mechanisms.

Arguments

- **Model** (Model)

Model that all mechanisms will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mechanisms are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all mechanisms in model m:

```
Mechanism.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged mechanisms in the model.

Arguments

- **Model** (Model)

Model that all mechanisms will be unsketched in

- **flag** (Flag)

Flag set on the mechanisms that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the mechanisms are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all mechanisms flagged with flag in model m:

```
Mechanism.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

Mechanism object.

Return type

Mechanism

Example

To check if Mechanism property m.example is a parameter by using the Mechanism.GetParameter() method:

```
if (m.ViewParameters().GetParameter(m.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for mechanism. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for mechanism m:

```
m.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this mechanism.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for mechanism m:

```
var xrefs = m.Xrefs();
```

Model class

The Model class gives you access to models in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll()
- DeleteAll()
- First()

- PopulateInitialVelocities()
- PropagateFlag(flag*[Flag]*)
- RenumberAll(start*[integer]*)
- RenumberFlagged(flag*[Flag]*, start*[integer]*, mode (optional)*[constant]*)
- SetColour(colour*[colour from Colour class.]*)
- SetFlag(flag*[Flag]*)
- Show()

- Unblank()
- UnblankFlagged(flag*[Flag]*, redraw (optional)*[boolean]*)
- UnsketchAll(redraw (optional)*[boolean]*)
- UpdateGraphics()
- UsesLargeLabels()
- Write(filename*[string]*, options (optional)*[object]*)
- Write(filename*[string]*, method (optional)*[constant]*, path (optional)*[constant]*, separator (optional)*[constant]*, version (optional)*[string]*, large (optional)*[boolean]*) [deprecated]

Model constants

Constants for compress mode

Name	Description
Model.INDIVIDUAL_GZIP	Each file 'name.key' is 'gzipped' to become the individual file 'name.key.gz'
Model.INDIVIDUAL_ZIP	Each file 'name.key' is 'zipped' to become the individual file 'name.key.zip'
Model.KEEP_ORIGINAL	Each file 'name.key' is written using its original compression: uncompressed, '.gz. or '.zip' format
Model.PACKAGED_ZIP	Suitable for models with include files where the entire model is packed into a single .zip file, preserving its directory structure.

Constants for compress switch

Name	Description
Model.COMPRESS_KEEP	Keeps the keyout compression format same as that of what was read in.
Model.COMPRESS_OFF	Switches off compression during keyout.
Model.COMPRESS_ON	Switches on compression during keyout.

Constants for filetype

Name	Description
Model.ABAQUS	ABAQUS input file
Model.IGES	IGES 5.3 geometry file
Model.LSDYNA	LS-DYNA keyword file
Model.NASTRAN	NASTRAN bulk data file
Model.RADIOSS	RADIOSS block format file

Constants for include deletion

Name	Description
Model.REMOVE_FROM_SETS	Only deletes items within the include selected but may remove items from sets in other includes.
Model.REMOVE_INCLUDE_ONLY	Only deletes items within the include selected without removing items from sets in other includes.
Model.REMOVE_JUNIOR	Delete items in other includes if they 'belong' to items in this include file but are considered to be 'junior' in the standard PRIMER hierarchy.

Constants for mass_properties_calculation

Name	Description

Model.CENTRE_AT_COFG	Uses the centre at centre of gravity in calculation of inertia properties.
Model.GLOBAL_AXES	GLOBAL AXES
Model.LOCAL_AXES	LOCAL AXES
Model.PRINCIPAL_AXES	PRINCIPAL AXES
Model.USER_DEFINED_CENTRE	Uses the user defined centre in calculation of inertia properties.

Constants for merge

Name	Description
Model.DISCARD_PRIMARY_CLASH	Merge option - discard primary items only on clash
Model.DISCARD_SECONDARY_CLASH	Merge option - discard secondary items only on clash
Model.INCREASE_PRIMARY_ALWAYS	Merge option - increase primary items always
Model.INCREASE_PRIMARY_CLASH	Merge option - increase primary items only on clash
Model.INCREASE_SECONDARY_ALWAYS	Merge option - increase secondary items always
Model.INCREASE_SECONDARY_CLASH	Merge option - increase secondary items only on clash

Constants for renumber

Name	Description
Model.IGNORE_CLASH	Renumber option - Ignore clashes.
Model.MOVE_CLASH_UP	Renumber option - Move clashing > highest label.
Model.RENUMBER_TO_FREE	Renumber option - Renumber to next free label.
Model.SHIFT_ALL_UP	Renumber option - Shift upwards to make space.

Constants for write hook

Name	Description
Model.WRITE_DIALOGUE	Flag that triggers the write hook script from the dialogue box
Model.WRITE_INCLUDE_TREE	Flag that triggers the write hook script from the include file tree
Model.WRITE_MODEL	Flag that triggers the write hook script from the model tab
Model.WRITE_SELECT_INCLUDES	Flag that triggers the write hook script from the select include files panel

Model class properties

Name	Type	Description
highest (read only)	integer	The highest model number present in PRIMER

Model properties

Name	Type	Description
binary (read only)	boolean	If model is in binary then it will be 1(true) else 0(false).
comments	string	Comments stored at the top of the primary model file.
compress (read only)	boolean	If model is compressed then it will be 1(true) else 0(false).

compressMode (read only)	integer	This option can be used to know the mode of compression. Can be Model.INDIVIDUAL_GZIP or Model.INDIVIDUAL_ZIP or Model.PACKAGED_ZIP
control (read only)	Control object	Control cards for model. See Control for more details.
damping (read only)	Damping object	Damping cards for model. See Damping for more details.
database (read only)	Database object	Database cards for model. See Database for more details.
fileStartAscii (read only)	boolean	If the beginning of the master file (*CONTROL etc) is in ascii then 1(true) else 0(false)(NOTE: If master file is ascii then fileStartAscii won't be checked and show 0(false)).
filename (read only)	string	Name of file that model was read from (blank if model created)
id	logical	If ID flag set for *KEYWORD card
layer	integer	The current layer for the model. This is the label of the Include file or 0 for the main file. See also Include.MakeCurrentLayer()
loadBody (read only)	LoadBody object	LoadBody cards for model. See LoadBody for more details.
masterAscii (read only)	boolean	If master file is in ascii then 1(true) else 0(false).
num	string	Model num (for _ID)
number	integer	Model number
path (read only)	string	Path that model was read from (blank if model created)
project	string	Model project (for _ID)
readlog	string	Full path of the readlog file
stage	string	Model stage (for _ID)
title	string	Model title
visible	logical	Model visibility flag

Detailed Description

The Model class allows you to do various operations on models in PRIMER. There are various methods available that allow you do create, read, blank models etc. See the documentation below for more details.

Constructor

new Model(number (optional)*[integer]*)

Description

Create a new model in PRIMER

Arguments

- **number (optional)** (integer)

Model number to create. If omitted the next free model number will be used.

Returns

Model object

Return type

Model

Example

To create a new model

```
var m = new Model();
```

To create model 10

```
var m = new Model(10);
```

Details of functions

AreaVolumeFlagged(flag*[Flag]*)

Description

Calculates the Area/Volume of the selected items.
Note: The area calculation is based only on shell elements, and the volume calculation is based only on solid elements.

Arguments

- **flag** (Flag)

Flag set on entities you wish to calculate area/volume for

Returns

Object with the following properties:

Name	Type	Description
area	real	Area of flagged items
volume	real	Volume of flagged items

Return type

object

Example

To calculate the area/volume properties of the items flagged by flag f.

```
var props = m.AreaVolumeFlagged(f);
var area = props.area;
var volume = props.volume;
```

Attached(flag*[Flag]*, redraw (optional)*[boolean]*)

Description

Finds attached items to flagged items. The attached items are flagged with the same flag.

Arguments

- **flag** (Flag)

Flag set on items that you want to find attached to

- **redraw (optional)** (boolean)

If true, the display will be updated to display only the original flagged items and the attached items.

Returns

No return value

Example

To find items attached to items flagged with flag f in model m:

```
m.Attached(f);
```

Autofix()

Description

Autofix option does a model check and autofixes all the fixable errors in the model

Arguments

No arguments

Returns

No return value

Example

To autofix fixable errors of the model 'm'

```
m.Autofix();
```

Blank()

Description

Blanks a model in PRIMER

Arguments

No arguments

Returns

No return value

Example

To blank model object m

```
m.Blank();
```

BlankAll() [static]

Description

Blanks all models

Arguments

No arguments

Returns

No return value

Example

To blank all models

```
Model.BlankAll();
```

BlankFlagged(flag*[Flag]*, redraw (optional)*[boolean]*)

Description

Blanks all of the flagged items in the model.

Arguments

- **flag** (Flag)

Flag set on items that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank everything in model m flagged with flag f:

```
m.BlankFlagged(f);
```

CentreOfGravity()

Description

Returns the centre of gravity for a model

Arguments

No arguments

Returns

An array containing the x, y and z coordinates for the CofG.

Return type

Array

Example

To get the centre of gravity for model m:

```
var cofg = m.CentreOfGravity();
var x = cofg[0];
var y = cofg[1];
var z = cofg[2];
```

Check(filename*[string]*, detailed (optional)*[boolean]*, json (optional)*[boolean]*, include (optional)*[boolean]*)

Description

Checks a model, writing any errors to file.

Arguments

- **filename** (string)

Name of file to write errors to

- **detailed (optional)** (boolean)

If set to "true", detailed error messages are given.

- **json (optional)** (boolean)

If set, output in filename will be written in JSON format. If omitted json will be set to false. If JSON format is written then detailed will automatically be set. Note that when writing JSON format the labels produced can be strings instead of integers in some rare cases. If you are writing a script to read a JSON file, it must be able to cope with this. Specifically if the item is a character label the label will be a string. For child collect sets the label will be a string of the format 'X_Y' where X is the parent set label and Y will be the child set number (1, 2, 3 ...). In this case use Set.GetCollectChild() to get the object.

- **include (optional)** (boolean)

If set, error messages will be written in include by include layout. This option is not applicable if JSON is set.

Returns

No return value

Example

To check model m, writing detailed errors to file 'errors.txt' in include layout:

```
m.Check('errors.txt', true, false, true);
```

To check a model writing the warnings/errors as JSON to file 'errors.json', parse it and write them to the dialogue box:

```
m.Check('errors.json', true, true);
var f = new File('errors.json', File.READ);
var json = f.ReadAll();
f.Close();
var o = JSON.parse(json);
for (var e in o)                                    // "error" or "warning"
{
    Message(e);
    for (var t in o[e])                             // type
    {
        Message("  "+t);
        for (var m in o[e][t])                      // message
        {
            Message("    "+m);
            for (var i=0; i<o[e][t][m].length; i++)  // Array of objects
containing label and include
            {
                Message("        "+o[e][t][m][i].label+" (include
"+o[e][t][m][i].include+")");
            }
        }
    }
}
```

ClearFlag(flag*[Flag]*)

Description

Clears the flagging for a model in PRIMER. See also Model.PropagateFlag(), Model.SetFlag(), global.AllocateFlag() and global.ReturnFlag().

Arguments

- **flag** (Flag)

Flag to clear

Returns

No return value

Example

To clear flag f for everything in model m:

```
m.ClearFlag(f);
```

Copy(update (optional)*[boolean]*)

Description

Copy model to the next free model in PRIMER

Arguments

- **update (optional)** (boolean)

If the graphics should be updated after the model is copied. If omitted update will be set to false

Returns

Model object for new model.

Return type

Model

Example

To copy model m to the next free model in PRIMER.

```
var mnew = m.Copy();
```

CopyFlagged(flag*[Flag]*, update (optional)*[boolean]*)

Description

Copy flagged items in a model to the next free model in PRIMER

Arguments

- **flag** (Flag)

Flag set on items that you want to copy

- **update (optional)** (boolean)

If the graphics should be updated after the model is copied. If omitted update will be set to false

Returns

Model object for new model.

Return type

Model

Example

To copy everything in model m flagged with flag f to the next free model in PRIMER.

```
var mnew = m.CopyFlagged(f);
```

Delete()

Description

Deletes a model in PRIMER
Do not use the Model object after calling this method.

Arguments

No arguments

Returns

No return value

Example

To delete model m in PRIMER

```
m.Delete();
```

DeleteAll() [static]

Description

Deletes all existing models from PRIMER

Arguments

No arguments

Returns

No return value

Example

To delete all models

```
Model.DeleteAll();
```

DeleteFlagged(flag*[Flag]*, recursive (optional)*[boolean]*)

Description

Deletes all of the flagged items in the model. Note that this may not actually delete all of the items. For example if a node is flagged but the node is used in a shell which is not flagged then the node will not be deleted.

Arguments

- **flag** (Flag)

Flag set on items that you want to delete

- **recursive (optional)** (boolean)

If deletion is recursive (for example, if a shell is deleted with recursion on the shell nodes will be deleted if possible). If omitted recursive will be set to true.

Returns

No return value

Example

To delete everything in model m flagged with flag f:

```
m.DeleteFlagged(f);
```

DeleteInclude(Include label*[integer]*, method (optional)*[constant]*, force (optional)*[boolean]*)

Description

Tries to delete an include file from the model. Note that this may not actually delete the include file. For example if some of the items in the include file are required by other things in different includes then the include file will not be deleted.

Arguments

- **Include label** (integer)

label of include file that you want to delete

- **method (optional)** (constant)

Method for deleting items. Must be Model.REMOVE_FROM_SETS (default), Model.REMOVE_JUNIOR or Model.REMOVE_INCLUDE_ONLY.
Model.REMOVE_FROM_SETS will only delete items within the include selected but may remove items from sets in other includes.
Model.REMOVE_JUNIOR may delete items in other includes - this will happen if they 'belong' to items in this include and are considered 'junior'
Model.REMOVE_INCLUDE_ONLY does the same as Model.REMOVE_FROM_SETS but will **not** remove items from sets in other includes.

- **force (optional)** (boolean)

Forcible deletion option (for example, a node is deleted even when it is referenced by a shell which is not deleted). This will remove the include file (not just the contents) from the model. If this argument is omitted, force will be set to false.

Returns

true if include successfully deleted, false otherwise

Return type

Boolean

Example

To delete include file number 5 in model m removing items from sets in other includes if required:

```
m.DeleteInclude(5, 1);
```

FindElemEnd() [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Tidy internal flag used by functions which find elements within a box. This function is only required if there has been a previous call to Model.FindElemInit() with a flag defined. This usage is deprecated for v20.0 where the flag should be applied in Beam.FindBeamInBox() Shell.FindShellInBox() Solid.FindSolidInBox() Tshell.FindTShellInBox() and there is no need to use FindElemInit or FindElemEnd

Arguments

No arguments

Returns

No return value

Example

```
m.FindElemEnd();
```

FindElemInit(flag (optional)*[Flag]*) [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

In v20.0 this function is obsolete. FindXXXInBox() is called without it. Refinement of element selection is now done with optional flagging argument in Beam.FindBeamInBox() Shell.FindShellInBox() Solid.FindSolidInBox() Tshell.FindTShellInBox() If you do use this function with flagging bit (not recommended), PRIMER copies flagging to another allocated flag, so you will need on completion to call FindElemEnd() to return this flag.

Arguments

- **flag (optional)** (Flag)

Optional flag that has been set on the elements, if 0 all elements considered

Returns

No return value

Example

To initialize find setup for flagged elements in model m:

```
m.FindElemInit(flag);
```

First() [static]

Description

Returns the Model object for the first model in PRIMER (or null if there are no models)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the Model object for the first model:

```
var m = Model.First();
```

FirstFreeItemLabel(type*[string]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free label for an item type in the model. Also see Model.LastFreeItemLabel() and Model.NextFreeItemLabel().

Arguments

- **type** (string)

The type of the item (for a list of types see Appendix I of the PRIMER manual).

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

integer

Return type

Number

Example

To get the first free node label in model m:

```
var label = m.FirstFreeItemLabel("NODE");
```

FlagDuplicate(flag*[Flag]*)

Description

Flag all nodes referenced in two different includes

Arguments

- **flag** (Flag)

Flag which will be used to flag the "duplicate" nodes

Returns

No return value

Example

To Flag with flag f all the nodes referenced in different includes from model m

```
m.FlagDuplicate(f);
```

GetAll() [static]

Description

Returns an array of Model objects for all the models in PRIMER

Arguments

No arguments

Returns

Array of Model objects

Return type

Array

Example

To make an array of Model objects for all of the models in PRIMER

```
var m = Model.GetAll();
```

GetFromID(model number*[integer]*) [static]

Description

Returns the Model object for a model ID or null if model does not exist

Arguments

- **model number** (integer)

number of the model you want the Model object for

Returns

Model object

Return type

Model

Example

To get the Model object for model number 1

```
var m = Model.GetFromID(1);
```

GetIncludeTransformOffsets()

Description

Looks at all of the items in the model and determines values for IDNOFF, IDEOFF, IDPOFF etc that could be used with Model.ImportIncludeTransform to guarantee that there would not be any clashes with existing items in the model.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
iddoff	integer	Offset to define id
ideoff	integer	Offset to element id
idfoff	integer	Offset to function id
idmoff	integer	Offset to material id
idnoff	integer	Offset to node id
idpoff	integer	Offset to part id

idroff	integer	Offset to section, hourglass, EOS id
idsoff	integer	Offset to set id

Return type

object

Example

To determine offsets for model m and then import an include transform "test.inc":

```
var o = m.GetIncludeTransformOffsets();
if (o)
{
    var success = m.ImportIncludeTransform("test.inc", o.idnoff, o.ideoff,
o.idpoff, o.idmoff, o.idsoff, o.idfoff, o.iddoff, o.idroff);
}
```

Hide()

Description

Hides a model in PRIMER

Arguments

No arguments

Returns

No return value

Example

To hide model m in PRIMER

```
m.Hide();
```

Import(filename*[string]*)

Description

Imports a file into model m. The model can already contain items. However, **note that if the file cannot be imported because of a label clash or other problem PRIMER may delete the model and the script will terminate**. Note prior to v17 of PRIMER imported data would always be imported to the master model, irrespective of the current layer. From v17 onwards this has been corrected and the current layer is used to determine the destination of imported data.

Arguments

- **filename** (string)

Filename of the LS-DYNA keyword file you want to import

Returns

0: No errors/warnings.
> 0: This number of errors occurred.
< 0: Absolute number is the number of warnings that occurred.

Return type

Number

Example

To import file "test.key" into model m

```
m.Import("test.key");
```

ImportInclude(source*[String OR Include Object]*, target (optional)*[Include Object]*)

Description

Imports a keyword file or an Include object from different model as a new include or into an existing include file for model m. The labels of any items in the imported include contents that clash with existing labels will automatically be renumbered with one exception. The behaviour for *SET_COLLECT cards can be controlled with Options.merge_set_collect.

Arguments

- **source** (String OR Include Object)

Can either be a Filename of the LS-DYNA include file you want to import, OR Include object of another model you want to import

- **target (optional)** (Include Object)

Include file object of current model if the Import has to be done in an existing include .

Returns

Include object for include file

Return type

Include

Example

To import include file "include.key" into model m:

```
m.ImportInclude("include.key");
```

To import include file "include.key" into existing include incl in model m:

```
m.ImportInclude("include.key", incl);
```

To import include number 5 from model m2 into model m:

```
var incl = Include.GetFromID(m2, 5);
m.ImportInclude(incl);
```

ImportIncludeTransform(filename*[string]*, idnoff*[integer]*, ideoff*[integer]*, idpoff*[integer]*, idmoff*[integer]*, idsoff*[integer]*, idfoff*[integer]*, iddoff*[integer]*, idroff*[integer]*)

Description

Imports a file as an include transform file for model m. The labels of any items in the include file will be renumbered by idnoff, ideoff etc.

Arguments

- **filename** (string)

Filename of the LS-DYNA include file you want to import

- **idnoff** (integer)

Offset for nodes in the file

- **ideoff** (integer)

Offset for elements in the file

- **idpoff** (integer)

Offset for parts in the file

- **idmoff** (integer)

Offset for materials in the file

- **idsoff** (integer)

Offset for sets in the file

- **idfoff** (integer)

Offset for functions and tables in the file

- **iddoff** (integer)

Offset for defines in the file

- **idroff** (integer)

Offset for other labels in the file

Returns

Include object if successful, null if not

Return type

Include

Example

To import include transform file "include.key" into model m using 1000 for all offsets

```
m.ImportIncludeTransform("include.key", 1000, 1000, 1000, 1000, 1000, 1000,
1000, 1000);
```

Last() [static]

Description

Returns the Model object for the last model in PRIMER (or null if there are no models)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the Model object for the last model:

```
var m = Model.Last();
```

LastFreeItemLabel(type*[string]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free label for an item type in the model. Also see Model.FirstFreeItemLabel() and Model.NextFreeItemLabel().

Arguments

- **type** (string)

The type of the item (for a list of types see Appendix I of the PRIMER manual).

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

integer

Return type

Number

Example

To get the last free node label in model m:

```
var label = m.LastFreeItemLabel("NODE");
```

Mass()

Description

Returns the mass for a model

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the mass for model m:

```
var mass = m.Mass();
```

MassPropCalc(flag*[Flag]*)

Description

Calculates the Mass, CoG, and Intertia Tensor of the flagged items and returns an object with the above properties. See Properties for mass properties calculation under options class to configure inclusion of lumped mass, etc.

Arguments

- **flag** (Flag)

Calculate mass propetries of flagged items

Returns

Object with the following properties:

Name	Type	Description

cofgx	real	X coordinate of centre of gravity
cofgy	real	Y coordinate of centre of gravity
cofgz	real	Z coordinate of centre of gravity
inerxx	real	XX inertia
inerxy	real	XY inertia
inerxz	real	XZ inertia
ineryy	real	YY inertia
ineryz	real	YZ inertia
inerzz	real	ZZ inertia
mass	real	Mass

Return type

object

Example

To calculate the mass properties of the items flagged by flag f

```
var props = m.MassPropCalc(f);
```

Merge(Primary Model*[Model]*, Secondary Model*[Model]*, Option to fix clashes (optional)*[constant]*, Merge nodes flag (optional)*[boolean]*, dist (required if merge nodes flag used) (optional)*[real]*, label (optional)*[integer]*, position (optional)*[integer]*) [static]

Description

Merge 2 models together to make a new model.

Arguments

- **Primary Model** (Model)

Primary Model for merge.

- **Secondary Model** (Model)

Secondary Model for merge.

- **Option to fix clashes (optional)** (constant)

Type of fix. Can be Model.INCREASE_SECONDARY_ALWAYS, Model.INCREASE_SECONDARY_CLASH, Model.DISCARD_SECONDARY_CLASH, Model.INCREASE_PRIMARY_ALWAYS, Model.INCREASE_PRIMARY_CLASH or Model.DISCARD_PRIMARY_CLASH

- **Merge nodes flag (optional)** (boolean)

If this flag is set to true, PRIMER will merge nodes after the model merge.

- **dist (required if merge nodes flag used) (optional)** (real)

Nodes closer than dist will be potentially merged.

- **label (optional)** (integer)

Label to keep after merge. If > 0 then highest label kept. If <= 0 then lowest kept. If omitted the lowest label will be kept.

- **position (optional)** (integer)

Position to merge at. If > 0 then merged at highest label position. If < 0 then merged at lowest label position. If 0 then merged at midpoint. If omitted the merge will be done at the lowest label.

Returns

Model object (or null if the merge is unsuccessful)

Return type

Model

Example

To merge models m1 and m2 together:

```
var m = Model.Merge(m1, m2);
```

MergeNodes(flag*[Flag]*, dist*[real]*, label (optional)*[integer]*, position (optional)*[integer]*)

Description

Attempts to merge nodes on items flagged with flag for this model in PRIMER. Merging nodes on *AIRBAG_SHELL_REFERENCE_GEOMETRY can be controlled by using Options.node_replace_asrg. Also see Node.Merge().

Arguments

- **flag** (Flag)

Flag set on items to merge nodes

- **dist** (real)

Nodes closer than dist will be potentially merged.

- **label (optional)** (integer)

Label to keep after merge. If > 0 then highest label kept. If <= 0 then lowest kept. If omitted the lowest label will be kept.

- **position (optional)** (integer)

Position to merge at. If > 0 then merged at highest label position. If < 0 then merged at lowest label position. If 0 then merged at midpoint. If omitted the merge will be done at the lowest label.

Returns

The number of nodes merged

Return type

Number

Example

To (try to) merge nodes on everything in model m flagged with flag f, with a distance of 0.1:

```
m.MergeNodes(f, 0.1);
```

NextFreeItemLabel(type*[string]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free label for an item type in the model. Also see Model.FirstFreeItemLabel() and Model.LastFreeItemLabel().

Arguments

- **type** (string)

The type of the item (for a list of types see Appendix I of the PRIMER manual).

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

integer

Return type

Number

Example

To get the next free node label in model m:

```
var label = m.NextFreeItemLabel("NODE");
```

PopulateInitialVelocities()

Description

Populate the initial velocity field (nvels) for all nodes of the model

Arguments

No arguments

Returns

No return value

Example

```
m.PopulateInitialVelocities();
```

PropagateFlag(flag*[Flag]*)

Description

Propagates the flagging for a model in PRIMER. For example if a part in the model is flagged, this will flag the elements in the part, the nodes on those elements... See also Model.ClearFlag(), Model.SetFlag(), global.AllocateFlag() and global.ReturnFlag().

Arguments

- **flag** (Flag)

Flag to propagate

Returns

No return value

Example

To propagate the flagging in model m for flag f

```
m.PropagateFlag(f);
```

Read(filename*[string]*, filetype (optional)*[constant]*, number (optional)*[integer]*) [static]

Description

Reads a file into the first free model in PRIMER

Arguments

- **filename** (string)

Filename you want to read

- **filetype (optional)** (constant)

Filetype you want to read. Can be Model.LSDYNA, Model.ABAQUS, Model.NASTRAN, Model.RADIOSS or Model.IGES. If omitted the file is assumed to be a DYNA3D file. For Model.NASTRAN there are options that change how the model is read. See Options for details.

- **number (optional)** (integer)

Model number to read file into. If omitted the next free model number will be used.

Returns

Model object (or null if error)

Return type

Model

Example

To read the keyword file /data/test/file.key

```
Model.Read("/data/test/file.key");
```

To read the NASTRAN file /data/test/file.dat

```
Model.Read("/data/test/file.dat", Model.NASTRAN);
```

To read the keyword file /data/test/file.key into model 10

```
Model.Read("/data/test/file.key", Model.LSDYNA, 10);
```

RenumberAll(start*[integer]*)

Description

Renumbers all of the items in the model.

Arguments

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber everything in model m, starting at 1000000:

```
m.RenumberAll(1000000);
```

RenumberFlagged(flag*[Flag]*, start*[integer]*, mode (optional)*[constant]*)

Description

Renumbers all of the flagged items in the model.

Arguments

- **flag** (Flag)

Flag set on items that you want to renumber

- **start** (integer)

Start point for renumbering

- **mode (optional)** (constant)

Renumber mode. Can be Model.IGNORE_CLASH, Model.MOVE_CLASH_UP, Model.SHIFT_ALL_UP, or Model.RENUMBER_TO_FREE (default),

Returns

No return value

Example

To renumber everything in model m flagged with flag f, starting at 1000000, using mode MOVE_CLASH_UP:

```
m.RenumberFlagged(f, 1000000, Model.MOVE_CLASH_UP);
```

Select(prompt*[string]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select a model using standard PRIMER object menus. If there are no models in memory then Select returns null. If only one model is present then the model object is returned. If there is more than one model in memory then an object menu is mapped allowing the user to choose a model.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Model object (or null if no models present).

Return type

Model

Example

To select a model giving the prompt 'Select model':

```
var m = Model.Select('Select model');
```

SetColour(colour*[colour from Colour class.]*)

Description

Sets the colour of the model.

Arguments

- **colour** (colour from Colour class.)

The colour you want to set the model to

Returns

No return value

Example

To set the colour of model m to red:

```
m.SetColour(Colour.RED);
```

or

```
m.SetColour(Colour.RGB(255, 0, 0));
```

SetFlag(flag*[Flag]*)

Description

Sets the flagging for a model in PRIMER. See also Model.PropagateFlag(), Model.ClearFlag(), global.AllocateFlag() and global.ReturnFlag().

Arguments

- **flag** (Flag)

Flag to set

Returns

No return value

Example

To set flag f for everything in model m:

```
m.SetFlag(f);
```

Show()

Description

Shows a model in PRIMER

Arguments

No arguments

Returns

No return value

Example

To show model m in PRIMER

```
m.Show();
```

Total() [static]

Description

Returns the total number of models.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To find how many models there are in PRIMER:

```
var num = Model.Total();
```

Unblank()

Description

Unblanks a model in PRIMER

Arguments

No arguments

Returns

No return value

Example

To unblank model m

```
m.Unblank();
```

UnblankAll() [static]

Description

Unblanks all models

Arguments

No arguments

Returns

No return value

Example

To unblank all models

```
Model.UnblankAll();
```

UnblankFlagged(flag*[Flag]*, redraw (optional)*[boolean]*)

Description

Unblanks all of the flagged items in the model.

Arguments

- **flag** (Flag)

Flag set on items that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank everything in model m flagged with flag f:

```
m.UnblankFlagged(f);
```

UnsketchAll(redraw (optional)*[boolean]*)

Description

Unsketches all of the sketched items in the model.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the items are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all the sketched objects in model m:

```
m.UnsketchAll();
```

UpdateGraphics()

Description

Updates the graphics for a model in PRIMER

Arguments

No arguments

Returns

No return value

Example

To update the graphics for model m

```
m.UpdateGraphics();
```

UsesLargeLabels()

Description

Checks to see if a model uses large labels

Arguments

No arguments

Returns

logical, true if model uses large labels, false otherwise

Return type

Boolean

Example

To check if model m uses large labels:

```
var large = m.UsesLargeLabels();
```

Write(filename*[string]*, options (optional)*[object]*)

Description

Writes a model in PRIMER to file

Arguments

- **filename** (string)

Filename of the LS-DYNA keyword file you want to write

- **options (optional)** (object)

Options specifying how the file should be written out. If omitted the default values below will be used. The properties available are:

Object has the following properties:

Name	Type	Description
binary (optional)	boolean	If true then the entire output file will be written out in binary, if false then the entire file will be written in ascii. If not defined the default is for each file in the model to be written in its original format, or if this is a newly created model ascii will be used.
compress (optional)	boolean	If true then the output file will be compressed. If false (default) then an uncompressed file will be written.
compressLevel (optional)	integer	Compression level for .gz and .zip files. Must be in the range 1 to 9 with 1 being the least compression (fastest speed) to 9 being the greatest compression (slowest speed)
compressMode (optional)	integer	This option can be used to specify the mode of compression. Can be Include.KEEP_ORIGINAL or Include.INDIVIDUAL_GZIP or Include.INDIVIDUAL_ZIP
fileStartAscii (optional)	boolean	Only relevant if binary output format has been selected. If true then the beginning of the file (*CONTROL etc) file is written out in ascii. If false (default) then the entire file is converted to binary.

i10 (optional)	boolean	If true then i10 format will be used to write the file. If false (default) then the original LS-DYNA format in which the file was written will be used, or if this is a newly created model the smallest format which will contain it will be used. Note that large format is only available from version R9 and above. See also the large property.
kbyExt (optional)	boolean	If true then a binary format output file will be given the extension .kby, replacing the existing extension.
large (optional)	boolean	If true then large format will be used to write the file. If false (default) then the normal LS-DYNA format will be used. Note that large format is only available from version R7.1 and above.
masterAscii (optional)	boolean	Only relevant if binary output format has been selected. If true then the whole master file is written out in ascii. If false (default) then the master file is also converted to binary.
method (optional)	integer	The method used to write include files. Can be Include.MASTER_ONLY, Include.MERGE, Include.NOT_WRITTEN, Include.SUBDIR (default) or Include.SAME_DIR
parametersAsValues (optional)	boolean	If true then the underlying values of any parameters will be written when they are used in data fields rather than '&name'. If false then '&name' will be written. See also Options.keyout_parameter_values
path (optional)	integer	The method used to write include paths. Can be Include.ABSOLUTE (default) or Include.RELATIVE
separator (optional)	integer	The directory separator used when writing include files. Can be Include.NATIVE (default), Include.UNIX or Include.WINDOWS
version (optional)	string	The LS-DYNA version used to write the file. Can be "971R5", "971R4", "971R3", "970v6763" etc (see the version popup in Model->Write '>>> LS-DYNA output options' for a full list). See also Options.dyna_version

Returns

No return value

Example

To Write model m to file /data/test/file.key as a compressed gzip in version R10.0

```
var output_obj = new Object();
output_obj.version = "R10.0";
output_obj.compress = true;
output_obj.compressMode = Model.INDIVIDUAL_GZIP;
m.Write("/data/test/file.key", output_obj);
```

Write(filename*[string]*, method (optional)*[constant]*, path (optional)*[constant]*, separator (optional)*[constant]*, version (optional)*[string]*, large (optional)*[boolean]*) [deprecated]

This function is deprecated in version 15.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Writes a model in PRIMER to file

Arguments

- **filename** (string)

Filename of the LS-DYNA keyword file you want to write

- **method (optional)** (constant)

The method used to write include files. Can be Include.MASTER_ONLY, Include.MERGE, Include.NOT_WRITTEN, Include.SUBDIR (default) or Include.SAME_DIR

- **path (optional)** (constant)

The method used to write include paths. Can be Include.ABSOLUTE (default) or Include.RELATIVE

- **separator (optional)** (constant)

The directory separator used when writing include files. Can be Include.NATIVE (default), Include.UNIX or Include.WINDOWS

- **version (optional)** (string)

The LS-DYNA version used to write the file. Can be "971R5", "971R4", "971R3", "970v6763" etc (see the version popup in Model->Write '>>> LS-DYNA output options' for a full list). See also Options.dyna_version

- **large (optional)** (boolean)

If true then large format will be used to write the file. If false (default) then the original LS-DYNA format in which the file was written will be used, or if this is a newly created model the smallest format which will contain it will be used. Note that large format is only available from version R7.1 and above. See also the i10 property.

Returns

No return value

Example

To Write model m to file /data/test/file.key

```
m.Write("/data/test/file.key");
```

MorphBox class

The MorphBox class gives you access to morph boxes in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

MorphBox properties

Name	Type	Description
exists (read only)	logical	true if morph box exists, false if referred to but not defined.
include	integer	The Include file number that the morph box is in.
label	integer	MorphBox number.
model (read only)	integer	The Model number that the box is in.
nx (read only)	integer	Number of morph points in parametric X direction
ny (read only)	integer	Number of morph points in parametric Y direction
nz (read only)	integer	Number of morph points in parametric Z direction
setid (read only)	integer	ID for node set of nodes dragged with the box. This will be a *SET_NODE_COLUMN containing the nodes together with their parametric coordinates in X, Y, Z. It is strongly discouraged to edit the contents of this set or the column data manually.

Detailed Description

The MorphBox class allows you to create, modify and manipulate morph boxes. See the documentation below for more details.

Constructor

new MorphBox(Model*[Model]*, label*[integer]*, flag*[Flag]*, options (optional)*[object]*)

Description

Create a new MorphBox object around flagged items.

Arguments

- **Model** (Model)

Model that morph box will be created in

- **label** (integer)

MorphBox number

- **flag** (Flag)

Flag set on the entities (for example nodes, elements and/or parts) that you want to create the box around

- **options (optional)** (object)

Options to create the box.

Object has the following properties:

Name	Type	Description

csys (optional)	integer	Coordinate system for local coordinates. Leave undefined if using global coordinates or if local coordinate system defined with n1, n2 and n3.
n1 (optional)	integer	Node 1 label for local coordinate. Leave undefined if using global coordinates or if local coordinate system defined with csys.
n2 (optional)	integer	Node 2 label for local coordinate. Leave undefined if using global coordinates or if local coordinate system defined with csys.
n3 (optional)	integer	Node 3 label for local coordinate. Leave undefined if using global coordinates or if local coordinate system defined with csys.
nx (optional)	integer	Number of points in X direction of box (assumed to be 2 for linear box if omitted)
ny (optional)	integer	Number of points in Y direction of box (assumed to be 2 for linear box if omitted)
nz (optional)	integer	Number of points in Z direction of box (assumed to be 2 for linear box if omitted)
points (optional)	Array of integers	Array of integers of depth 3 containing the morph point IDs. This should be omitted in the (default) case of also creating new morph points together with the morph box at the locations based on the bounding box of the flagged items. If this array contains ’nx’ by ’ny’ by ’nz’ existing morph points, the morph box is attached to these points, and ’csys’, ’n1’, ’n2’, ’n3’ will be irrelevant. Each ’points[i][j][k]’ should contain the morph point ID to be added at index i in local X direction, index j in local Y direction and index k in local Z direction. The box will then still contain flagged nodes only, but nodes geometrically outside the volume of the morph points will not be included either.

Returns

MorphBox object

Return type

MorphBox

Example

To create a new morph box in model m with label 100 and 2 by 2 by 2 points (linear in each coordinate direction) around all items flagged with flag in global coordinates:

```
var box = new MorphBox(m, 100, flag);
```

To create a new morph box in model m with label 100 and 4 by 4 by 2 points (cubic in parametric X and Y directions and linear in Z direction) around all flagged items in local coordinates determined by nodes 11, 12 and 13:

```
var options = new Object();
options.nx = 4;
options.ny = 4;
options.nz = 2;
options.n1 = 11;
options.n2 = 12;
options.n3 = 13;
var box = new MorphBox(m, 100, flag, options);
```

Suppose there are already morph points 1, 2, 3, 4, 5, 6, 7, 8 in model m at coordinates (0, 0, 0), (0, 0, 100), (0, 100, 0), (0, 100, 100), (100, 0, 0), (100, 0, 100), (100, 100, 0), (100, 100, 100) respectively. To create a new linear morph box between these points containing flagged items inside their volume:

```
var options = new Object();
options.points = [[[1,2],[3,4]],[[5,6],[7,8]]];
var box = new MorphBox(m, 100, flag, options);
```

Details of functions

ApplyMorphing(redraw (optional)*[boolean]*)

Description

Recalculates the X, Y and Z coordinates of all nodes linked to the morph box by the *SET_NODE_COLUMN. This should be called when coordinates of morph points have changed and you wish to apply the morphing. If several morph point positions on the same box change, then it is more speed-efficient to call this function only once for the box.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to apply the morphing to several boxes and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using Model.UpdateGraphics().

Returns

No return value

Example

To calculate all global X, Y and Z coordinates for the morphed nodes for box b:

```
b.ApplyMorphing();
```

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a box.

Arguments

- **Comment** (Comment)

Comment that will be attached to the box

Returns

No return value

Example

To associate comment c to the box b:

```
b.AssociateComment(c);
```

Blank()

Description

Blanks the box

Arguments

No arguments

Returns

No return value

Example

To blank box b:

```
b.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boxs in model m:

```
MorphBox.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boxs will be blanked in

- **flag** (Flag)

Flag set on the boxs that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the boxs in model m flagged with f:

```
MorphBox.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the box is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if box b is blanked:

```
if (b.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the box.

Arguments

- **flag** (Flag)

Flag to clear on the box

Returns

No return value

Example

To clear flag f for box b:

```
b.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the box. The target include of the copied box can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

MorphBox object

Return type

MorphBox

Example

To copy box b into box z:

```
var z = b.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a box.

Arguments

- **Comment** (Comment)

Comment that will be detached from the box

Returns

No return value

Example

To detach comment c from the box b:

```
b.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for box. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for box b:

```
b.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first box in the model.

Arguments

- **Model** (Model)

Model to get first box in

Returns

MorphBox object (or null if there are no boxs in the model).

Return type

MorphBox

Example

To get the first box in model m:

```
var b = MorphBox.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free box label in the model. Also see MorphBox.LastFreeLabel(), MorphBox.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

MorphBox label.

Return type

Number

Example

To get the first free box label in model m:

```
var label = MorphBox.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the boxs in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all boxs will be flagged in

- **flag** (Flag)

Flag to set on the boxs

Returns

No return value

Example

To flag all of the boxs with flag f in model m:

```
MorphBox.FlagAll(m, f);
```

FlagAllMorphedConnections(model*[Model]*, flag*[integer]*) [static]

Description

Flags all connections, in a given model, that have been morphed since their last remake. This includes connections that have been morphed by a morph box that has since been deleted.

Arguments

- **model** (Model)

Model containing desired connections.

- **flag** (integer)

Flag to mark morphed connections.

Returns

true if successful, false if not.

Return type

Boolean

Example

To flag all morphed connections in Model m with flag.

```
var flag = AllocateFlag();
   MorphBox.FlagAllMorphedConnections(m, flag);
```

FlagMorphedConnections(flag*[integer]*)

Description

Flags all connections that have been morphed, by a givine morph box, since their last remake. A connection could be morphed by one morph box and not another, therefore calling this function on two boxes that share a connection may produce different results depending on which box the function is called for. E.g. morb1 and morb2 share conx1, morb1 gets morphed whereas morb2 remains unchanged. Calling this function for morb1 will flag conx1, however calling the function for morb2 won't flag conx1.

Arguments

- **flag** (integer)

Flag to mark morphed connections.

Returns

true if successful, false if not.

Return type

Boolean

Example

To flag all morphed connections in a MorphBox with flag.

```
var flag = AllocateFlag();
   box.FlagMorphedConnections(flag);
```

Flagged(flag*[Flag]*)

Description

Checks if the box is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the box

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if box b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each box in the model.
Note that ForEach has been designed to make looping over boxs as fast as possible and so has some limitations. Firstly, a single temporary MorphBox object is created and on each function call it is updated with the current box data. This means that you should not try to store the MorphBox object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new boxs inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all boxs are in

- **func** (function)

Function to call for each box

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the boxs in model m:

```
MorphBox.ForEach(m, test);
function test(b)
{
// b is MorphBox object
}
```

To call function test for all of the boxs in model m with optional object:

```
var data = { x:0, y:0 };
MorphBox.ForEach(m, test, data);
function test(b, extra)
{
// b is MorphBox object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of MorphBox objects for all of the boxs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boxs from

Returns

Array of MorphBox objects

Return type

Array

Example

To make an array of MorphBox objects for all of the boxs in model m

```
var b = MorphBox.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a box.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the box b:

```
var comm_array = b.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of MorphBox objects for all of the flagged boxs in a model in PRIMER

Arguments

- **Model** (Model)

Model to get boxs from

- **flag** (Flag)

Flag set on the boxs that you want to retrieve

Returns

Array of MorphBox objects

Return type

Array

Example

To make an array of MorphBox objects for all of the boxs in model m flagged with f

```
var b = MorphBox.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the MorphBox object for a box ID.

Arguments

- **Model** (Model)

Model to find the box in

- **number** (integer)

number of the box you want the MorphBox object for

Returns

MorphBox object (or null if box does not exist).

Return type

MorphBox

Example

To get the MorphBox object for box 100 in model m

```
var b = MorphBox.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a MorphBox property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the MorphBox.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

box property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if MorphBox property b.example is a parameter:

```
Options.property_parameter_names = true;
if (b.GetParameter(b.example) ) do_something...
Options.property_parameter_names = false;
```

To check if MorphBox property b.example is a parameter by using the GetParameter method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

GetPoint(xindex*[integer]*, yindex*[integer]*, zindex*[integer]*)

Description

Returns the morph point ID on the morph box at indices in X, Y and Z directions.

Arguments

- **xindex** (integer)

Index of the point in X direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric X coordinate and box.nx-1 for the points with the highest X.

- **yindex** (integer)

Index of the point in Y direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric Y coordinate and box.ny-1 for the points with the highest Y.

- **zindex** (integer)

Index of the point in Z direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric Z coordinate and box.nz-1 for the points with the highest Z.

Returns

A MorphPoint object for the point on the box at given indices.

Return type

MorphPoint

Example

To get the 2nd point on the edge along the local Y direction and at highest local X and lowest local Z coordinate:

```
var point = box.GetPoint(box.nx-1, 1, 0);
```

Keyword()

Description

Returns the keyword for this morph box (*MORPH_BOX or *MORPH_BOX_HIGH_ORDER). **Note that a carriage return is not added**. See also MorphBox.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for morph box b:

```
var key = b.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the morph box. **Note that a carriage return is not added**. See also MorphBox.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for morph box b:

```
var cards = b.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last box in the model.

Arguments

- **Model** (Model)

Model to get last box in

Returns

MorphBox object (or null if there are no boxs in the model).

Return type

MorphBox

Example

To get the last box in model m:

```
var b = MorphBox.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free box label in the model. Also see MorphBox.FirstFreeLabel(), MorphBox.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

MorphBox label.

Return type

Number

Example

To get the last free box label in model m:

```
var label = MorphBox.LastFreeLabel(m);
```

Next()

Description

Returns the next box in the model.

Arguments

No arguments

Returns

MorphBox object (or null if there are no more boxs in the model).

Return type

MorphBox

Example

To get the box in model m after box b:

```
var b = b.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) box label in the model. Also see MorphBox.FirstFreeLabel(), MorphBox.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free box label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

MorphBox label.

Return type

Number

Example

To get the next free box label in model m:

```
var label = MorphBox.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a box.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boxs from that model can be picked. If the argument is a Flag then only boxs that are flagged with *limit* can be selected. If omitted, or null, any boxs from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

MorphBox object (or null if not picked)

Return type

MorphBox

Example

To pick a box from model m giving the prompt 'Pick box from screen':

```
var b = MorphBox.Pick('Pick box from screen', m);
```

Previous()

Description

Returns the previous box in the model.

Arguments

No arguments

Returns

MorphBox object (or null if there are no more boxs in the model).

Return type

MorphBox

Example

To get the box in model m before box b:

```
var b = b.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boxs in model m, from 1000000:

```
MorphBox.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all the flagged boxs will be renumbered in

- **flag** (Flag)

Flag set on the boxs that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the boxs in model m flagged with f, from 1000000:

```
MorphBox.RenumberFlagged(m, f, 1000000);
```

Reset(redraw (optional)*[boolean]*)

Description

Resets the morph box to its initial position and updates the coordinates of all its nodes.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to reset several boxes and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using Model.UpdateGraphics().

Returns

No return value

Example

To reset box b:

```
b.Reset();
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select boxs using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting boxs

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only boxs from that model can be selected. If the argument is a Flag then only boxs that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any boxs can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of boxs selected or null if menu cancelled

Return type

Number

Example

To select boxs from model m, flagging those selected with flag f, giving the prompt 'Select boxs':

```
MorphBox.Select(f, 'Select boxs', m);
```

To select boxs, flagging those selected with flag f but limiting selection to boxs flagged with flag l, giving the prompt 'Select boxs':

```
MorphBox.Select(f, 'Select boxs', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the box.

Arguments

- **flag** (Flag)

Flag to set on the box

Returns

No return value

Example

To set flag f for box b:

```
b.SetFlag(f);
```

SetMorphConnections(status*[boolean]*) [static]

Description

Turns Morph Connections on/off.

Arguments

- **status** (boolean)

true turns Morph Connections on. false turns Morph Connections off.

Returns

No return value.

Example

To turn Morph Connections on.

```
MorphBox.SetMorphConnections(true);
```

SetPointID(xindex*[integer]*, yindex*[integer]*, zindex*[integer]*, id*[integer]*)

Description

Replaces the morph point ID on the array, whose size depends on the orders in X, Y and Z directions, with the given new ID.

Arguments

- **xindex** (integer)

Index of the point in X direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric X coordinate and box.nx-1 for the points with the highest X.

- **yindex** (integer)

Index of the point in Y direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric Y coordinate and box.ny-1 for the points with the highest Y.

- **zindex** (integer)

Index of the point in Z direction. Note that indices start at 0, so it should be 0 for the points with the smallest parameteric Z coordinate and box.nz-1 for the points with the highest Z.

- **id** (integer)

New MorphPoint id.

Returns

No return value

Example

To replace the 2nd point on the edge along the local X direction and at lowest local Y and highest local Z coordinate with point 101:

```
box.SetPointID(1, 0, box.nz-1, 101);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the box. The box will be sketched until you either call MorphBox.Unsketch(), MorphBox.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the box is sketched. If omitted redraw is true. If you want to sketch several boxs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch box b:

```
b.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged boxs in the model. The boxs will be sketched until you either call MorphBox.Unsketch(), MorphBox.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged boxs will be sketched in

- **flag** (Flag)

Flag set on the boxs that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are sketched. If omitted redraw is true. If you want to sketch flagged boxs several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all boxs flagged with flag in model m:

```
MorphBox.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of boxs in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing boxs should be counted. If false or omitted referenced but undefined boxs will also be included in the total.

Returns

number of boxs

Return type

Number

Example

To get the total number of boxs in model m:

```
var total = MorphBox.Total(m);
```

Unblank()

Description

Unblanks the box

Arguments

No arguments

Returns

No return value

Example

To unblank box b:

```
b.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boxs in model m:

```
MorphBox.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged boxs in the model.

Arguments

- **Model** (Model)

Model that the flagged boxs will be unblanked in

- **flag** (Flag)

Flag set on the boxs that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the boxs in model m flagged with f:

```
MorphBox.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the boxs in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all boxs will be unset in

- **flag** (Flag)

Flag to unset on the boxs

Returns

No return value

Example

To unset the flag f on all the boxs in model m:

```
MorphBox.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the box.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the box is unsketched. If omitted redraw is true. If you want to unsketch several boxs and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch box b:

```
b.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all boxs.

Arguments

- **Model** (Model)

Model that all boxs will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boxs in model m:

```
MorphBox.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged boxs in the model.

Arguments

- **Model** (Model)

Model that all boxs will be unsketched in

- **flag** (Flag)

Flag set on the boxs that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the boxs are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all boxs flagged with flag in model m:

```
MorphBox.UnsketchAll(m, flag);
```

UpdateParametricCoordinates()

Description

Recalculates parametric X, Y, Z coordinates for each node in the *SET_NODE_COLUMN associated with the morph box. This needs to be called whenever morph points on the box or their coordinates have been changed manually and you wish to keep all nodes at their intrinsic global X, Y, Z coordinates. Provided Morph Connections is on (see MorphBox.SetMorphConnections()), this will also force PRIMER to recalculate the parametric coordinates for any connections in the morph box next time one of its morph points is moved.

Arguments

No arguments

Returns

No return value

Example

To recalculate all X, Y and Z coordinates for box b:

```
b.UpdateParametricCoordinates();
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

MorphBox object.

Return type

MorphBox

Example

To check if MorphBox property b.example is a parameter by using the MorphBox.GetParameter() method:

```
if (b.ViewParameters().GetParameter(b.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for box. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for box b:

```
b.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this box.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for box b:

```
var xrefs = b.Xrefs();
```

---

toString()

Description

Creates a string containing the morph box data in keyword format. Note that this contains the keyword header and the keyword cards. See also MorphBox.Keyword() and MorphBox.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for morph box b in keyword format

```
var s = b.toString();
```

MorphFlow class

The MorphFlow class gives you access to morph flows in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

MorphFlow properties

Name	Type	Description
exists (read only)	logical	true if morph flow exists, false if referred to but not defined.
include	integer	The Include file number that the morph flow is in.
max	real	Maximum value for type set to "CONTINUOUS" or "STEP" when written as design variable for LS-OPT.
min	real	Minimum value for type set to "CONTINUOUS" or "STEP" when written as design variable for LS-OPT.
model (read only)	integer	The Model number that the flow is in.
name	string	Name of the morph flow. If the flow is used for applying LS-OPT variables, this should match the variable name in the listing file written by LS-OPT.
npoints (read only)	integer	Number of morph points referenced by the flow.
nvals (read only)	integer	Number of values in the list when type is set to "DISCRETE".
step	real	Step size for type set to "STEP" when written as design variable for LS-OPT.
type	string	Range type for the morph flow. This should be "CONTINUOUS", "STEP" or "DISCRETE" and may be used for LS-OPT when writing design variable files from morph flows.

Detailed Description

The MorphFlow class allows you to create, modify and manipulate morph flows. See the documentation below for more details.

Constructor

new MorphFlow(Model*[Model]*, name*[string]*)

Description

Create a new MorphFlow object.

Arguments

- **Model** (Model)

Model that morph flow will be created in

- **name** (string)

MorphFlow name

Returns

MorphFlow object

Return type

MorphFlow

Example

To create a new (empty) morph flow in model m with name ’depth’

```
var f = new MorphFlow(m, "depth");
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a flow.

Arguments

- **Comment** (Comment)

Comment that will be attached to the flow

Returns

No return value

Example

To associate comment c to the flow flow:

```
flow.AssociateComment(c);
```

Blank()

Description

Blanks the flow

Arguments

No arguments

Returns

No return value

Example

To blank flow flow:

```
flow.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flows in the model.

Arguments

- **Model** (Model)

Model that all flows will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the flows in model m:

```
MorphFlow.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged flows in the model.

Arguments

- **Model** (Model)

Model that all the flagged flows will be blanked in

- **flag** (Flag)

Flag set on the flows that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the flows in model m flagged with f:

```
MorphFlow.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the flow is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if flow flow is blanked:

```
if (flow.Blanked() ) do_something...
```

Browse(modal (optional)*[boolean]*)

Description

Starts an edit panel in Browse mode.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Browse flow flow:

```
flow.Browse();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the flow.

Arguments

- **flag** (Flag)

Flag to clear on the flow

Returns

No return value

Example

To clear flag f for flow flow:

```
flow.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the flow. The target include of the copied flow can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

MorphFlow object

Return type

MorphFlow

Example

To copy flow flow into flow z:

```
var z = flow.Copy();
```

Create(Model*[Model]*, modal (optional)*[boolean]*) [static]

Description

Starts an interactive editing panel to create a morph flow card.

Arguments

- **Model** (Model)

Model that the morph flow card will be created in

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

MorphFlow object (or null if not made)

Return type

MorphFlow

Example

To start creating a morph flow card in model m:

```
var f = MorphFlow.Create(m);
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a flow.

Arguments

- **Comment** (Comment)

Comment that will be detached from the flow

Returns

No return value

Example

To detach comment c from the flow flow:

```
flow.DetachComment(c);
```

Edit(modal (optional)*[boolean]*)

Description

Starts an interactive editing panel.

Arguments

- **modal (optional)** (boolean)

If this window is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the window will be modal.

Returns

no return value

Example

To Edit flow flow:

```
flow.Edit();
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for flow. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for flow flow:

```
flow.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first flow in the model.

Arguments

- **Model** (Model)

Model to get first flow in

Returns

MorphFlow object (or null if there are no flows in the model).

Return type

MorphFlow

Example

To get the first flow in model m:

```
var flow = MorphFlow.First(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the flows in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all flows will be flagged in

- **flag** (Flag)

Flag to set on the flows

Returns

No return value

Example

To flag all of the flows with flag f in model m:

```
MorphFlow.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the flow is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the flow

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if flow flow has flag f set on it:

```
if (flow.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each flow in the model.
Note that ForEach has been designed to make looping over flows as fast as possible and so has some limitations. Firstly, a single temporary MorphFlow object is created and on each function call it is updated with the current flow data. This means that you should not try to store the MorphFlow object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new flows inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all flows are in

- **func** (function)

Function to call for each flow

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the flows in model m:

```
MorphFlow.ForEach(m, test);
function test(flow)
{
// flow is MorphFlow object
}
```

To call function test for all of the flows in model m with optional object:

```
var data = { x:0, y:0 };
MorphFlow.ForEach(m, test, data);
function test(flow, extra)
{
// flow is MorphFlow object
// extra is data
}
```

GetAll(Model[*Model*]) [static]

Description

Returns an array of MorphFlow objects for all of the flows in a model in PRIMER

Arguments

- **Model** (Model)

Model to get flows from

Returns

Array of MorphFlow objects

Return type

Array

Example

To make an array of MorphFlow objects for all of the flows in model m

```
var flow = MorphFlow.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a flow.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the flow flow:

```
var comm_array = flow.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of MorphFlow objects for all of the flagged flows in a model in PRIMER

Arguments

- **Model** (Model)

Model to get flows from

- **flag** (Flag)

Flag set on the flows that you want to retrieve

Returns

Array of MorphFlow objects

Return type

Array

Example

To make an array of MorphFlow objects for all of the flows in model m flagged with f

```
var flow = MorphFlow.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the MorphFlow object for a flow ID.

Arguments

- **Model** (Model)

Model to find the flow in

- **number** (integer)

number of the flow you want the MorphFlow object for

Returns

MorphFlow object (or null if flow does not exist).

Return type

MorphFlow

Example

To get the MorphFlow object for flow 100 in model m

```
var flow = MorphFlow.GetFromID(m, 100);
```

GetFromName(Model*[Model]*, morph flow name*[string]*) [static]

Description

Returns the stored MorphFlow object for a morph flow name. WARNING: This assumes that there is at most one morph flow with a given name. Otherwise this function only returns the first occurrence.

Arguments

- **Model** (Model)

Model to find the morph flow in

- **morph flow name** (string)

name of the morph flow you want the MorphFlow object for

Returns

MorphFlow object (or null if morph flow does not exist).

Return type

MorphFlow

Example

To get the MorphFlow object for flow "depth" in model m

```
var f = MorphFlow.GetFromName(m, "depth");
```

GetParameter(prop*[string]*)

Description

Checks if a MorphFlow property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the MorphFlow.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

flow property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if MorphFlow property flow.example is a parameter:

```
Options.property_parameter_names = true;
if (flow.GetParameter(flow.example) ) do_something...
Options.property_parameter_names = false;
```

To check if MorphFlow property flow.example is a parameter by using the GetParameter method:

```
if (flow.ViewParameters().GetParameter(flow.example) ) do_something...
```

GetRow(row*[integer]*)

Description

Returns the data for a row in the morph flow.

Arguments

- **row** (integer)

The row you want the data for. **Note row indices start at 0**.

Returns

An array of numbers containing the morph point ID at index 0 and the vector components at indices 1, 2, 3.

Return type

Number

Example

To get the data for the 2nd row in morph flow f:

```
var data = f.GetRow(1);
var point_id = data[0];
var dx = data[1];
var dy = data[2];
var dz = data[3];
```

GetValue(index*[integer]*)

Description

Get the value at given index on the morph flow with type "DISCRETE".

Arguments

- **index** (integer)

The index where you are extracting the value. **Note row indices start at 0**.

Returns

real

Return type

Number

Example

To get the 2nd value for morph flow f with type "DISCRETE":

```
var value = f.GetValue(1);
```

To get the last value on the list of values on f:

```
var value = f.GetValue(f.nvals - 1);
```

Keyword()

Description

Returns the keyword for this morph flow (*MORPH_FLOW). **Note that a carriage return is not added**. See also MorphFlow.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for morph flow f:

```
var key = f.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the morph flow. **Note that a carriage return is not added**. See also MorphFlow.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for morph flow f:

```
var cards = f.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last flow in the model.

Arguments

- **Model** (Model)

Model to get last flow in

Returns

MorphFlow object (or null if there are no flows in the model).

Return type

MorphFlow

Example

To get the last flow in model m:

```
var flow = MorphFlow.Last(m);
```

Next()

Description

Returns the next flow in the model.

Arguments

No arguments

Returns

MorphFlow object (or null if there are no more flows in the model).

Return type

MorphFlow

Example

To get the flow in model m after flow flow:

```
var flow = flow.Next();
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a flow.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only flows from that model can be picked. If the argument is a Flag then only flows that are flagged with *limit* can be selected. If omitted, or null, any flows from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

MorphFlow object (or null if not picked)

Return type

MorphFlow

Example

To pick a flow from model m giving the prompt 'Pick flow from screen':

```
var flow = MorphFlow.Pick('Pick flow from screen', m);
```

Previous()

Description

Returns the previous flow in the model.

Arguments

No arguments

Returns

MorphFlow object (or null if there are no more flows in the model).

Return type

MorphFlow

Example

To get the flow in model m before flow flow:

```
var flow = flow.Previous();
```

RemoveRow(row*[integer]*)

Description

Removes the data (a morph point ID and its three vector components) for a row in *MORPH_FLOW.

Arguments

- **row** (integer)

The row you want to remove the data for. **Note that row indices start at 0**.

Returns

No return value.

Example

To remove the second row of data for morph flow f:

```
f.RemoveRow(1);
```

RemoveValue(index*[integer]*)

Description

Removes the value at given index in *MORPH_FLOW with type "DISCRETE".

Arguments

- **index** (integer)

The index where you are removing the value. **Note that indices start at 0**.

Returns

No return value.

Example

To remove the second value for morph flow f:

```
f.RemoveValue(1);
```

To remove the last value for f:

```
f.RemoveValue(f.nvals - 1);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select flows using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting flows

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only flows from that model can be selected. If the argument is a Flag then only flows that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any flows can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of flows selected or null if menu cancelled

Return type

Number

Example

To select flows from model m, flagging those selected with flag f, giving the prompt ’Select flows’:

```
MorphFlow.Select(f, ’Select flows’, m);
```

To select flows, flagging those selected with flag f but limiting selection to flows flagged with flag l, giving the prompt ’Select flows’:

```
MorphFlow.Select(f, ’Select flows’, l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the flow.

Arguments

- **flag** (Flag)

Flag to set on the flow

Returns

No return value

Example

To set flag f for flow flow:

```
flow.SetFlag(f);
```

SetRow(row*[integer]*, data*[Array of data]*)

Description

Sets the data for a row in *MORPH_FLOW.

Arguments

- **row** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **data** (Array of data)

The data you want to set the row to. It should be of length 4 having the morph point ID at index 0, and the vector components at indices 1, 2, 3.

Returns

No return value.

Example

To set the second point of the morph flow f to be morph point 11 with unit vector in X-direction:

```
var array = [11, 1.0, 0.0, 0.0];
f.SetRow(1, array);
```

To append a new row of data (using the same array of values):

```
f.SetRow(f.npoints, array);
```

SetValue(index*[integer]*, value*[real]*)

Description

Sets the value at given index in a *MORPH_FLOW with type "DISCRETE".

Arguments

- **index** (integer)

The row you want to set the data for. **Note that row indices start at 0**.

- **value** (real)

The new value to insert into the list.

Returns

No return value.

Example

To set the second value morph flow f to 20.0:

```
f.SetValue(1, 20.0);
```

To append the value 20.0 to the end of the list:

```
f.SetValue(f.nvals, 20.0);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the flow. The flow will be sketched until you either call MorphFlow.Unsketch(), MorphFlow.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the flow is sketched. If omitted redraw is true. If you want to sketch several flows and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch flow flow:

```
flow.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged flows in the model. The flows will be sketched until you either call MorphFlow.Unsketch(), MorphFlow.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged flows will be sketched in

- **flag** (Flag)

Flag set on the flows that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the flows are sketched. If omitted redraw is true. If you want to sketch flagged flows several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all flows flagged with flag in model m:

```
MorphFlow.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of flows in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing flows should be counted. If false or omitted referenced but undefined flows will also be included in the total.

Returns

number of flows

Return type

Number

Example

To get the total number of flows in model m:

```
var total = MorphFlow.Total(m);
```

Unblank()

Description

Unblanks the flow

Arguments

No arguments

Returns

No return value

Example

To unblank flow flow:

```
flow.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flows in the model.

Arguments

- **Model** (Model)

Model that all flows will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the flows in model m:

```
MorphFlow.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged flows in the model.

Arguments

- **Model** (Model)

Model that the flagged flows will be unblanked in

- **flag** (Flag)

Flag set on the flows that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the flows in model m flagged with f:

```
MorphFlow.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the flows in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all flows will be unset in

- **flag** (Flag)

Flag to unset on the flows

Returns

No return value

Example

To unset the flag f on all the flows in model m:

```
MorphFlow.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the flow.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the flow is unsketched. If omitted redraw is true. If you want to unsketch several flows and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch flow flow:

```
flow.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flows.

Arguments

- **Model** (Model)

Model that all flows will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the flows are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all flows in model m:

```
MorphFlow.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged flows in the model.

Arguments

- **Model** (Model)

Model that all flows will be unsketched in

- **flag** (Flag)

Flag set on the flows that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the flows are unsketched. If omitted redraw is true. If you want to unsketch

several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all flows flagged with flag in model m:

```
MorphFlow.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

MorphFlow object.

Return type

MorphFlow

Example

To check if MorphFlow property flow.example is a parameter by using the MorphFlow.GetParameter() method:

```
if (flow.ViewParameters().GetParameter(flow.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for flow. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for flow flow:

```
flow.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this flow.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for flow flow:

```
var xrefs = flow.Xrefs();
```

---

toString()

Description

Creates a string containing the morph flow data in keyword format. Note that this contains the keyword header and the keyword cards. See also MorphFlow.Keyword() and MorphFlow.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for morph flow f in keyword format

```
var s = f.toString();
```

MorphPoint class

The MorphPoint class gives you access to morph points in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

MorphPoint properties

Name	Type	Description
exists (read only)	logical	true if morph point exists, false if referred to but not defined.
include	integer	The Include file number that the morph point is in.
label	integer	MorphPoint number.
model (read only)	integer	The Model number that the point is in.
x	real	X coordinate
y	real	Y coordinate
z	real	Z coordinate

Detailed Description

The MorphPoint class allows you to create, modify and manipulate morph points. See the documentation below for more details.

Constructor

new MorphPoint(Model*[Model]*, label*[integer]*, x*[real]*, y*[real]*, z*[real]*)

Description

Create a new MorphPoint object.

Arguments

- **Model** (Model)

Model that morph point will be created in

- **label** (integer)

MorphPoint number

- **x** (real)

X coordinate

- **y** (real)

Y coordinate

- **z** (real)

Z coordinate

Returns

MorphPoint object

Return type

MorphPoint

Example

To create a new morph point in model m with label 100, at coordinates (20, 40, 10)

```
var n = new MorphPoint(m, 100, 20, 40, 10);
```

Details of functions

AssociateComment(Comment*[Comment]*)

Description

Associates a comment with a point.

Arguments

- **Comment** (Comment)

Comment that will be attached to the point

Returns

No return value

Example

To associate comment c to the point p:

```
p.AssociateComment(c);
```

Blank()

Description

Blanks the point

Arguments

No arguments

Returns

No return value

Example

To blank point p:

```
p.Blank();
```

BlankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the points in the model.

Arguments

- **Model** (Model)

Model that all points will be blanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the points in model m:

```
MorphPoint.BlankAll(m);
```

BlankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Blanks all of the flagged points in the model.

Arguments

- **Model** (Model)

Model that all the flagged points will be blanked in

- **flag** (Flag)

Flag set on the points that you want to blank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To blank all of the points in model m flagged with f:

```
MorphPoint.BlankFlagged(m, f);
```

Blanked()

Description

Checks if the point is blanked or not.

Arguments

No arguments

Returns

true if blanked, false if not.

Return type

Boolean

Example

To check if point p is blanked:

```
if (p.Blanked() ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on the point.

Arguments

- **flag** (Flag)

Flag to clear on the point

Returns

No return value

Example

To clear flag f for point p:

```
p.ClearFlag(f);
```

Copy(range (optional)*[boolean]*)

Description

Copies the point. The target include of the copied point can be set using Options.copy_target_include.

Arguments

- **range (optional)** (boolean)

If you want to keep the copied item in the range specified for the current include. Default value is false. To set current include, use Include.MakeCurrentLayer().

Returns

MorphPoint object

Return type

MorphPoint

Example

To copy point p into point z:

```
var z = p.Copy();
```

DetachComment(Comment*[Comment]*)

Description

Detaches a comment from a point.

Arguments

- **Comment** (Comment)

Comment that will be detached from the point

Returns

No return value

Example

To detach comment c from the point p:

```
p.DetachComment(c);
```

Error(message*[string]*, details (optional)*[string]*)

Description

Adds an error for point. For more details on checking see the Check class.

Arguments

- **message** (string)

The error message to give

- **details (optional)** (string)

An optional detailed error message

Returns

No return value

Example

To add an error message "My custom error" for point p:

```
p.Error("My custom error");
```

First(Model*[Model]*) [static]

Description

Returns the first point in the model.

Arguments

- **Model** (Model)

Model to get first point in

Returns

MorphPoint object (or null if there are no points in the model).

Return type

MorphPoint

Example

To get the first point in model m:

```
var p = MorphPoint.First(m);
```

FirstFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the first free point label in the model. Also see MorphPoint.LastFreeLabel(), MorphPoint.NextFreeLabel() and Model.FirstFreeItemLabel().

Arguments

- **Model** (Model)

Model to get first free point label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *First free in layer* in editing panels). If omitted the whole model will be used (Equivalent to *First free* in editing panels).

Returns

MorphPoint label.

Return type

Number

Example

To get the first free point label in model m:

```
var label = MorphPoint.FirstFreeLabel(m);
```

FlagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the points in the model with a defined flag.

Arguments

- **Model** (Model)

Model that all points will be flagged in

- **flag** (Flag)

Flag to set on the points

Returns

No return value

Example

To flag all of the points with flag f in model m:

```
MorphPoint.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the point is flagged or not.

Arguments

- **flag** (Flag)

Flag to test on the point

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if point p has flag f set on it:

```
if (p.Flagged(f) ) do_something...
```

ForEach(Model*[Model]*, func*[function]*, extra (optional)*[any]*) [static]

Description

Calls a function for each point in the model.
Note that ForEach has been designed to make looping over points as fast as possible and so has some limitations. Firstly, a single temporary MorphPoint object is created and on each function call it is updated with the current point data. This means that you should not try to store the MorphPoint object for later use (e.g. in an array) as it is temporary.
Secondly, you cannot create new points inside a ForEach loop.

Arguments

- **Model** (Model)

Model that all points are in

- **func** (function)

Function to call for each point

- **extra (optional)** (any)

An optional extra object/array/string etc that will appended to arguments when calling the function

Returns

No return value

Example

To call function test for all of the points in model m:

```
MorphPoint.ForEach(m, test);
function test(p)
{
// p is MorphPoint object
}
```

To call function test for all of the points in model m with optional object:

```
var data = { x:0, y:0 };
MorphPoint.ForEach(m, test, data);
function test(p, extra)
{
// p is MorphPoint object
// extra is data
}
```

GetAll(Model*[Model]*) [static]

Description

Returns an array of MorphPoint objects for all of the points in a model in PRIMER

Arguments

- **Model** (Model)

Model to get points from

Returns

Array of MorphPoint objects

Return type

Array

Example

To make an array of MorphPoint objects for all of the points in model m

```
var p = MorphPoint.GetAll(m);
```

GetComments()

Description

Extracts the comments associated to a point.

Arguments

No arguments

Returns

Array of Comment objects (or null if there are no comments associated to the node).

Return type

Array

Example

To get the array of comments associated to the point p:

```
var comm_array = p.GetComments();
```

GetFlagged(Model*[Model]*, flag*[Flag]*) [static]

Description

Returns an array of MorphPoint objects for all of the flagged points in a model in PRIMER

Arguments

- **Model** (Model)

Model to get points from

- **flag** (Flag)

Flag set on the points that you want to retrieve

Returns

Array of MorphPoint objects

Return type

Array

Example

To make an array of MorphPoint objects for all of the points in model m flagged with f

```
var p = MorphPoint.GetFlagged(m, f);
```

GetFromID(Model*[Model]*, number*[integer]*) [static]

Description

Returns the MorphPoint object for a point ID.

Arguments

- **Model** (Model)

Model to find the point in

- **number** (integer)

number of the point you want the MorphPoint object for

Returns

MorphPoint object (or null if point does not exist).

Return type

MorphPoint

Example

To get the MorphPoint object for point 100 in model m

```
var p = MorphPoint.GetFromID(m, 100);
```

GetParameter(prop*[string]*)

Description

Checks if a MorphPoint property is a parameter or not. Note that object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. For this function to work the JavaScript interpreter must use the parameter name instead of the value. This can be done by setting the Options.property_parameter_names option to true before calling the function and then resetting it to false afterwards.. This behaviour can also temporarily be switched by using the MorphPoint.ViewParameters() method and 'method chaining' (see the examples below).

Arguments

- **prop** (string)

point property to get parameter for

Returns

Parameter object if property is a parameter, null if not.

Return type

Parameter

Example

To check if MorphPoint property p.example is a parameter:

```
Options.property_parameter_names = true;
if (p.GetParameter(p.example) ) do_something...
Options.property_parameter_names = false;
```

To check if MorphPoint property p.example is a parameter by using the GetParameter method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Keyword()

Description

Returns the keyword for this morph point (*MORPH_POINT). **Note that a carriage return is not added**. See also MorphPoint.KeywordCards()

Arguments

No arguments

Returns

string containing the keyword.

Return type

String

Example

To get the keyword for morph point p:

```
var key = p.Keyword();
```

KeywordCards()

Description

Returns the keyword cards for the morph point. **Note that a carriage return is not added**. See also MorphPoint.Keyword()

Arguments

No arguments

Returns

string containing the cards.

Return type

String

Example

To get the cards for morph point p:

```
var cards = p.KeywordCards();
```

Last(Model[*Model*]) [static]

Description

Returns the last point in the model.

Arguments

- **Model** (Model)

Model to get last point in

Returns

MorphPoint object (or null if there are no points in the model).

Return type

MorphPoint

Example

To get the last point in model m:

```
var p = MorphPoint.Last(m);
```

LastFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the last free point label in the model. Also see MorphPoint.FirstFreeLabel(), MorphPoint.NextFreeLabel() and see Model.LastFreeItemLabel()

Arguments

- **Model** (Model)

Model to get last free point label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest free in layer* in editing panels). If omitted the whole model will be used.

Returns

MorphPoint label.

Return type

Number

Example

To get the last free point label in model m:

```
var label = MorphPoint.LastFreeLabel(m);
```

MoveFlagged(Model*[Model]*, flag*[Flag]*, dx*[real]*, dy*[real]*, dz*[real]*) [static]

Description

This function moves a selection of flagged morph points by a given vector and interpolates the movement of other morph points in the same way as this happens on the interactive morph panel. Note that the interpolation depends on the settings which can be switched on the interactive morph panel or by preferences. To apply the movement to the nodes in the box(es), you will need to call MorphBox.ApplyMorphing() at least for all relevant boxes or (if that is easier) for all morph boxes in the model.

Arguments

- **Model** (Model)

Model that the flagged morph points are in

- **flag** (Flag)

Flag set on the morph points explicitly selected to move

- **dx** (real)

X component of vector to be moved along

- **dy** (real)

Y component of vector to be moved along

- **dz** (real)

Z component of vector to be moved along

Returns

No return value

Example

To move all morph points in model m flagged with flag by 10 units in global Y direction while interpolating the other morph points as given by button settings or preferences:

```
MorphPoint.MoveFlagged(m, flag, 0.0, 10.0, 0.0);
```

Next()

Description

Returns the next point in the model.

Arguments

No arguments

Returns

MorphPoint object (or null if there are no more points in the model).

Return type

MorphPoint

Example

To get the point in model m after point p:

```
var p = p.Next();
```

NextFreeLabel(Model*[Model]*, layer (optional)*[Include number]*) [static]

Description

Returns the next free (highest+1) point label in the model. Also see MorphPoint.FirstFreeLabel(), MorphPoint.LastFreeLabel() and Model.NextFreeItemLabel()

Arguments

- **Model** (Model)

Model to get next free point label in

- **layer (optional)** (Include number)

Include file (0 for the main file) to search for labels in (Equivalent to *Highest+1 in layer* in editing panels). If omitted the whole model will be used (Equivalent to *Highest+1* in editing panels).

Returns

MorphPoint label.

Return type

Number

Example

To get the next free point label in model m:

```
var label = MorphPoint.NextFreeLabel(m);
```

Pick(prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*, button text (optional)*[string]*) [static]

Description

Allows the user to pick a point.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only points from that model can be picked. If the argument is a Flag then only points that are flagged with *limit* can be selected. If omitted, or null, any points from any model can be selected. from any model.

- **modal (optional)** (boolean)

If picking is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the pick will be modal.

- **button text (optional)** (string)

By default the window with the prompt will have a button labelled 'Cancel' which if pressed will cancel the pick and return null. If you want to change the text on the button use this argument. If omitted 'Cancel' will be used.

Returns

MorphPoint object (or null if not picked)

Return type

MorphPoint

Example

To pick a point from model m giving the prompt 'Pick point from screen':

```
var p = MorphPoint.Pick('Pick point from screen', m);
```

Previous()

Description

Returns the previous point in the model.

Arguments

No arguments

Returns

MorphPoint object (or null if there are no more points in the model).

Return type

MorphPoint

Example

To get the point in model m before point p:

```
var p = p.Previous();
```

RenumberAll(Model*[Model]*, start*[integer]*) [static]

Description

Renumbers all of the points in the model.

Arguments

- **Model** (Model)

Model that all points will be renumbered in

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the points in model m, from 1000000:

```
MorphPoint.RenumberAll(m, 1000000);
```

RenumberFlagged(Model*[Model]*, flag*[Flag]*, start*[integer]*) [static]

Description

Renumbers all of the flagged points in the model.

Arguments

- **Model** (Model)

Model that all the flagged points will be renumbered in

- **flag** (Flag)

Flag set on the points that you want to renumber

- **start** (integer)

Start point for renumbering

Returns

No return value

Example

To renumber all of the points in model m flagged with f, from 1000000:

```
MorphPoint.RenumberFlagged(m, f, 1000000);
```

Select(flag*[Flag]*, prompt*[string]*, limit (optional)*[Model or Flag]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select points using standard PRIMER object menus.

Arguments

- **flag** (Flag)

Flag to use when selecting points

- **prompt** (string)

Text to display as a prompt to the user

- **limit (optional)** (Model or Flag)

If the argument is a Model then only points from that model can be selected. If the argument is a Flag then only points that are flagged with *limit* can be selected (*limit* should be different to *flag*). If omitted, or null, any points can be selected. from any model.

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in PRIMER until this window is dismissed). If omitted the selection will be modal.

Returns

Number of points selected or null if menu cancelled

Return type

Number

Example

To select points from model m, flagging those selected with flag f, giving the prompt 'Select points':

```
MorphPoint.Select(f, 'Select points', m);
```

To select points, flagging those selected with flag f but limiting selection to points flagged with flag l, giving the prompt 'Select points':

```
MorphPoint.Select(f, 'Select points', l);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on the point.

Arguments

- **flag** (Flag)

Flag to set on the point

Returns

No return value

Example

To set flag f for point p:

```
p.SetFlag(f);
```

Sketch(redraw (optional)*[boolean]*)

Description

Sketches the point. The point will be sketched until you either call MorphPoint.Unsketch(), MorphPoint.UnsketchAll(), Model.UnsketchAll(), or delete the model

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the point is sketched. If omitted redraw is true. If you want to sketch several points and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch point p:

```
p.Sketch();
```

SketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Sketches all of the flagged points in the model. The points will be sketched until you either call MorphPoint.Unsketch(), MorphPoint.UnsketchFlagged(), Model.UnsketchAll(), or delete the model

Arguments

- **Model** (Model)

Model that all the flagged points will be sketched in

- **flag** (Flag)

Flag set on the points that you want to sketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the points are sketched. If omitted redraw is true. If you want to sketch flagged points several times and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To sketch all points flagged with flag in model m:

```
MorphPoint.SketchFlagged(m, flag);
```

Total(Model*[Model]*, exists (optional)*[boolean]*) [static]

Description

Returns the total number of points in the model.

Arguments

- **Model** (Model)

Model to get total for

- **exists (optional)** (boolean)

true if only existing points should be counted. If false or omitted referenced but undefined points will also be included in the total.

Returns

number of points

Return type

Number

Example

To get the total number of points in model m:

```
var total = MorphPoint.Total(m);
```

Unblank()

Description

Unblanks the point

Arguments

No arguments

Returns

No return value

Example

To unblank point p:

```
p.Unblank();
```

UnblankAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the points in the model.

Arguments

- **Model** (Model)

Model that all points will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the points in model m:

```
MorphPoint.UnblankAll(m);
```

UnblankFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unblanks all of the flagged points in the model.

Arguments

- **Model** (Model)

Model that the flagged points will be unblanked in

- **flag** (Flag)

Flag set on the points that you want to unblank

- **redraw (optional)** (boolean)

If model should be redrawn or not. If omitted redraw is false. If you want to do several (un)blanks and only redraw after the last one then use false for all redraws apart from the last one. Alternatively you can redraw using View.Redraw().

Returns

No return value

Example

To unblank all of the points in model m flagged with f:

```
MorphPoint.UnblankFlagged(m, f);
```

UnflagAll(Model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the points in the model.

Arguments

- **Model** (Model)

Model that the defined flag for all points will be unset in

- **flag** (Flag)

Flag to unset on the points

Returns

No return value

Example

To unset the flag f on all the points in model m:

```
MorphPoint.UnflagAll(m, f);
```

Unsketch(redraw (optional)*[boolean]*)

Description

Unsketches the point.

Arguments

- **redraw (optional)** (boolean)

If model should be redrawn or not after the point is unsketched. If omitted redraw is true. If you want to unsketch several points and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch point p:

```
p.Unsketch();
```

UnsketchAll(Model*[Model]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all points.

Arguments

- **Model** (Model)

Model that all points will be unblanked in

- **redraw (optional)** (boolean)

If model should be redrawn or not after the points are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all points in model m:

```
MorphPoint.UnsketchAll(m);
```

UnsketchFlagged(Model*[Model]*, flag*[Flag]*, redraw (optional)*[boolean]*) [static]

Description

Unsketches all flagged points in the model.

Arguments

- **Model** (Model)

Model that all points will be unsketched in

- **flag** (Flag)

Flag set on the points that you want to unsketch

- **redraw (optional)** (boolean)

If model should be redrawn or not after the points are unsketched. If omitted redraw is true. If you want to unsketch several things and only redraw after the last one then use false for redraw and call View.Redraw().

Returns

No return value

Example

To unsketch all points flagged with flag in model m:

```
MorphPoint.UnsketchAll(m, flag);
```

ViewParameters()

Description

Object properties that are parameters are normally returned as the integer or float parameter values as that is virtually always what the user would want. This function temporarily changes the behaviour so that if a property is a parameter the parameter name is returned instead. This can be used with 'method chaining' (see the example below) to make sure a property argument is correct.

Arguments

No arguments

Returns

MorphPoint object.

Return type

MorphPoint

Example

To check if MorphPoint property p.example is a parameter by using the MorphPoint.GetParameter() method:

```
if (p.ViewParameters().GetParameter(p.example) ) do_something...
```

Warning(message*[string]*, details (optional)*[string]*)

Description

Adds a warning for point. For more details on checking see the Check class.

Arguments

- **message** (string)

The warning message to give

- **details (optional)** (string)

An optional detailed warning message

Returns

No return value

Example

To add a warning message "My custom warning" for point p:

```
p.Warning("My custom warning");
```

Xrefs()

Description

Returns the cross references for this point.

Arguments

No arguments

Returns

Xrefs object.

Return type

Xrefs

Example

To get the cross references for point p:

```
var xrefs = p.Xrefs();
```

---

toString()

Description

Creates a string containing the morph point data in keyword format. Note that this contains the keyword header and the keyword cards. See also MorphPoint.Keyword() and MorphPoint.KeywordCards().

Arguments

No arguments

Returns

string

Return type

String

Example

To get data for morph point p in keyword format

```
var s = p.toString();
```

Options class

The Options class enables you to access several options in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Options class properties

Name	Type	Description
auto_confirm	logical	If true then PRIMER will automatically confirm (i.e. press the OK button) on (most) message boxes that are mapped. If false (default) then the message boxes will be shown and wait for the user to press a button. This option may be useful to help automate an operation where PRIMER would normally show a message box and wait for the user to press a button.
browse_ missing_ include_file	logical	If true (default) then PRIMER will popup a "BROWSE MISSING INCLUDE FILE" panel while reading the model. If false then it will throw an 'missing include file error' and continue reading the model.
copy_target_ include	integer	This option sets the target include files for copied keywords. If it is set to Include.COPY_ CURRENT (default) then copied keywords will go into the current layer. If it is set to Include.COPY_SOURCE, copied keywords will go into the include of the original element. An existing include file number can also be used if the copied keywords should go into a certain include.
dyna_version	string	The LS-DYNA version used to write keyword files. Can be "971R5", "971R4", "971R3", "970v6763" etc (use Utils.GetLSDYNAVersions() to get a full list, or see the version popup in Model->Write '>>> LS-Dyna output options'). See also Model.Write and Include.Write
edit_keep_ on_top	logical	If true edit panels created from the Edit() or Create() methods will be kept on top of other windows. If false (default) then they can be lowered.
exception_ messages	logical	If true (default) error messages will be printed to the dialogue box/stdout when an exception occurs in the API. If false they will not be printed. This option may be useful if you are using try/catch to manage exceptions and you do not want any error messages to be printed.
keyout_ binary	logical	If true then the output file will be written out in binary. If false (default) then an ascii file will be written.
keyout_ compress_ format	constant	This option can be used to specify the mode of compression. Can be Model.INDIVIDUAL_GZIP, Model.INDIVIDUAL_ZIP or Model.PACKAGED_ZIP
keyout_ compress_ level	integer	Compression level for .gz and .zip files. Must be in the range 1 to 9 with 1 being the least compression (fastest speed) to 9 being the greatest compression (slowest speed)
keyout_ compress_ switch	constant	Switch to set the compression during keyout. Can be Model.COMPRESS_KEEP (default), Model.COMPRESS_OFF or Model.COMPRESS_ON
keyout_i10	logical	If true then i10 format will be used to write the file. If false (default) then the normal LS-DYNA format will be used.

keyout_large	logical	If true then large format will be used to write the file. If false (default) then the normal LS-DYNA format will be used. Note that large format is only available from version R7.1 and above.
keyout_ method	constant	The method used to write include files. Can be Include.MASTER_ONLY, Include.MERGE, Include.SELECT, Include.NOT_WRITTEN, Include.SUBDIR (default) or Include.SAME_DIR
keyout_ parameter_ values	logical	This option can be used to specify how parameters are written. If true then the underlying values of any parameters will be written when they are used in data fields rather than '&name'. If false (default) then '&name' will be written.
keyout_path_ type	constant	The method used to write include paths. Can be Include.ABSOLUTE (default) or Include.RELATIVE
keyout_ separator	constant	The directory separator used when writing include files. Can be Include.NATIVE (default), Include.UNIX or Include.WINDOWS
merge_set_ collect	logical	If true then when merging models PRIMER will merge *SET_COLLECT cards which have the same label. If false (default) then they will be renumbered. This is also used with Model.ImportInclude. The default for this can be set using the primer*merge_set_collect preference.
model_tabs_ active	logical	If true (default) then PRIMER will show model tabs in the object selection menu. If false then PRIMER will hide model tabs in object selection menu.
node_ replace_asrg	logical	If true nodes in *AIRBAG_SHELL_REFERENCE_GEOMETRY can be replaced by node merge/replace. If false they will not be considered.
pick_ window_ position	constant or Window	Position that the pick window will be shown on the screen. It can be any combination (bitwise OR) of Window.LEFT, Window.CENTRE, Window.RIGHT, Window.TOP, Window.MIDDLE and Window.BOTTOM or a Window object. If a window obect is used the pick window will be shown in the middle of that window. The default is Window.RIGHT|Window.TOP.
property_ parameter_ names	logical	If true object properties which are parameters will be returned as parameter names. If false object properties which are parameters will be returned as parameter values.
reset_cwd	logical	If true then the current working directory will not be changed after selecting a file. If false (default) then the current working directory will be changed after selecting a file. This option only applies to Windows machines.

Properties for connections

Name	Type	Description
connection_angle_ tol	real	The angle tolerance used for spotwelds in the connections algorithm
connection_edge_ dist	real	The edge distance used in the connections algorithm
connection_file	string	The connection file to read/write
connection_max_ thickness	real	The maximum thickness used in the connections algorithm
connection_model	integer	The model number selected to make connections in
connection_part	integer	The part ID selected for connections
connection_write_ flag (read only)	integer	Flag that will be set on selected connections when writing. This can be used in the user JavaScript to write connections to find which are selected.
solid_spotweld_ diameter	real	The default diameter of solid spotwelds.

spotweld_element_type	integer	The default type of spotweld to make. can be: Conx.SPOTWELD_BEAM, Conx.SPOTWELD_SOLID1, Conx.SPOTWELD_SOLID4, Conx.SPOTWELD_SOLID8, Conx.SPOTWELD_SOLID12 or Conx.SPOTWELD_SOLID16

Properties for graphics

Name	Type	Description
airbag_colour	integer	Airbag symbol colour
background_colour	integer	Colour of the background
contacts_colour	integer	Contact surface colour
contour_text_pt_size	integer	Contour bar text size (in pts)
contour_text_size	integer	This property is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contour bar text size [deprecated]
date_size	integer	This property is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Size of date (clock) display [deprecated]
edge_angle	real	Feature edge critical angle
edges_ign_pt	integer	Option for choosing how to draw free edges (can be set to TRUE or FALSE)
extra_nodes_colour	integer	Constrained extra nodes colour
feature_line	integer	Switch ON/OFF feature line (can be set to TRUE or FALSE)
for_mom_colour	integer	Nodal force/moment colour
graticule_text_size	integer	Graticule text size
label_colour	integer	Colour of the label
label_pt_size	integer	Label size (in pts)
label_size	integer	This property is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Label size [deprecated]
node_colour	integer	Nodes colour
nrb_colour	integer	Nodal rigid body colour
overlay_colour	integer	Colour of the overlay
overlay_edges	integer	Option for setting the overlay edges value (can be set to 0,1 or 2)
rigid_bodies_colour	integer	Constrained rigid body colour
rot_vels_colour	integer	Rotational velocity colour
sketch_colour	integer	Colour of the sketch
spotweldbeam_colour_from_panels	integer	Spotweld beam/solid colour
spr_colour_from_node_sets	integer	Constrained SPR/SPR2/SPR3 colour
text_colour	integer	Colour of the text
timehist_blks_colour	integer	Time history block colour

title_date_pt_size	integer	Size of title & date (clock) display (in pts)
tracer_partl_colour	integer	Tracer particle colour
trans_vels_colour	integer	Translational velocity colour
x_sections_colour	integer	Cross-section colour

Properties for mass properties calculation

Name	Type	Description
mass_properties_centre_x	real	X-coordinate of user defined centre.
mass_properties_centre_y	real	Y-coordinate of user defined centre.
mass_properties_centre_z	real	Z-coordinate of user defined centre.
mass_properties_coordinate_system_type	integer	Coordinate system selection: Model.GLOBAL_AXES, Model.LOCAL_AXES, Model.PRINCIPAL_AXES.
mass_properties_include_attached_mass_deformable_elems	logical	Option to include lumped mass attached to the nodes of deformable elements. Default is FALSE.
mass_properties_include_attached_mass_rigid_elems	logical	Option to include lumped mass attached to the nodes of rigid elements. Default is FALSE.
mass_properties_include_timestep_mass	logical	Option to switch on/off inclusion of timestep addded mass. Default is FALSE.
mass_properties_inertia_center	integer	Option to set the centre used in inertia properties calculation. By default Centre at CofG is used. Available options are: Model.CENTRE_AT_COFG, Model.USER_DEFINED_CENTRE.
mass_properties_local_axes	integer	CSYS ID when using local axes.
mass_properties_rigid_part_constrained_parts	logical	Option to switch on/off mass of *CONSTRAINED_RIGID_BODIES associated with a rigid part. Default is FALSE.
mass_properties_rigid_part_extra_nodes	logical	Option to switch on/off mass of *CONSTRAINED_EXTRA_NODES associated with a rigid part. Default is FALSE.

Properties for nastran

Name	Type	Description
convert_rbe2_cnrb	logical	Convert all RBE2s to *CONSTRAINED_NODAL_RIGID_BODY
merge_rbe_nodes	logical	Merge duplicate RBE dependent nodes
retain_mid_nodes	logical	Retain mid-side nodes for higher order elements

Properties for ssh

Name	Type	Description
ssh_buffer_size	integer	The size of the buffer used (in kiloBytes) when transferring data to/from the remote machine in the Ssh class. Depending on your network and the size of the files you are transferring, changing this value may make file transfers quicker. The default value is 64(kB) but any value in the range 1(kB) to 1024(kB) is allowed.

Properties for widgets

Name	Type	Description
max_widgets	integer	The maximum number of Widgets that can be made for one Window. The default value is 1000
max_ window_ lines	integer	The maximum number of lines that can be made for a Window.Error(), Window.Information(), Window.Message(), Window.Question() or Window.Warning() window. The default value is 25

Detailed Description

The Options class is used to get/set options that PRIMER uses for certain functions. The options are available as **class** properties. See the documentation for more details. An example: Options.mass_properties_include_attached_mass_ deformable_elems=true

PopupWindow class

The PopupWindow class allows you to create popup windows for a graphical user interface. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Hide()

PopupWindow properties

Name	Type	Description
persistent	boolean	If the popup window will remain mapped when a button is pressed in it. By default (false) when a button is pressed in the popup window the popup will be unmapped. If set to true then the popup will remain mapped until the user clicks out of the window or hides it by calling Hide()

Detailed Description

The PopupWindow class allows you to make popup windows (that you can place Widgets in) and link them to Widgets. The popup window is then displayed by right clicking on the Widget the popup is linked to. The following very simple example shows how to create a popup window and link it to a label Widget.

```
// Create popup window
var pw = new PopupWindow();
// Create some widgets in the popup window
var pl = new Widget(pw, Widget.LABEL,   1, 30,  1,  7, "Label");
var pb = new Widget(pw, Widget.BUTTON,  1, 30,  7, 13, "Button");
var pt = new Widget(pw, Widget.TEXTBOX, 1, 30, 20, 26, "Textbox");
// Create window with title "Popup example" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Popup example", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 50, 1,  7, "Right click for popup...");
// link popup window to widget
l.popupWindow = pw;
// Assign the onPopup callback method to the function 'do_popup'
// This is only required if you want to make any changes before the popup
appears
l.onPopup  = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    Message("Showing popup");
}
```

See the documentation below and the Widget class for more details.

Constructor

new PopupWindow()

Description

Create a new PopupWindow object.

Arguments

No arguments

Returns

PopupWindow object

Return type

PopupWindow

Example

To create a PopupWindow containing the buttons "Create" and "Edit" and link it to button b:

```
var pw = new PopupWindow();
var c = new Widget(pw, Widget.BUTTON, 1, 30, 1, 7,  "Create");
var e = new Widget(pw, Widget.BUTTON, 1, 30, 7, 13, "Edit");
b.popupWindow = pw;
```

Details of functions

Hide()

Description

Hides (unmaps) the popup window.

Arguments

No arguments

Returns

No return value

Example

To hide popup window w:

```
w.Hide();
```

Ssh class

The Ssh class allows you to connect to a remote computer using ssh, scp and sftp commands. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Ssh constants

Constants for file bits

Name	Description
Ssh.SETGROUP_BIT	Set group bit
Ssh.SETUID_BIT	Set uid bit
Ssh.STICKY_BIT	sticky bit

Constants for file types

Name	Description
Ssh.DIRECTORY	Directory
Ssh.FILE	Regular file
Ssh.SOCKET	Socket
Ssh.SYMBOLIC_LINK	Symbolic link

Constants for permissions

Name	Description
Ssh.GROUP_EXECUTE	Group has execute permission
Ssh.GROUP_READ	Group has read permission
Ssh.GROUP_WRITE	Group has write permission
Ssh.OTHER_EXECUTE	Others have execute permission
Ssh.OTHER_READ	Others have read permission

Ssh.OTHER_WRITE	Others have write permission
Ssh.OWNER_EXECUTE	Owner has execute permission
Ssh.OWNER_READ	Owner has read permission
Ssh.OWNER_WRITE	Owner has write permission

Detailed Description

The Ssh class gives you simple functions to do secure connections to a remote computer using ssh. The Oasys Ltd LS-DYNA environment software is built with the OpenSSH library to support the ssh, scp and sftp protocols. The basic workflow is to create a connection using the Ssh constructor, authenticate the connection either by using a password and AuthenticateWithPassword or with a public key and AuthenticateWithPublicKey then the method Execute can be used to execute commands on the remote machine, the methods Get and Put can be used to copy files to and from the remote machine using scp, and the commands SftpGet, SftpList, SftpMkdir, SftpPut and SftpRmdir can be used to perform secure file transfer commands.
ssh uses a public and private key pair to do communication. The software uses RSA for the private and public keys and stores them in the files id_rsa and id_rsa.pub in the .oasys_ssh directory of your home directory (C:\Users\your.name\.oasys_ssh on Windows by default). A key length of 2048 bits is recommended. You keep your private key secure in your .oasys_ssh directory but the public key can be copied to the authorized_keys file on remote machines so that authentication can be done etc. The software also maintains fingerprints for the machines you connect to to ensure that you are connecting to the machine that you think you are. The first time you connect to a machine you are asked to confirm the remote machine is correct and the software stores the fingerprint for it in the known_hosts file in your .oasys_ssh directory. For second and subsequent connections the software checks the fingerprint of the remote machine against the one it has stored and will only connect if it matches.
When creating a new ssh connection to a remote machine and transferring files a small 'buffer' is required to transfer the data. The size of this buffer can be controlled using the Options.ssh_buffer_size property **before** the Ssh object is created.

Constructor

new Ssh(hostname*[string]*, username*[string]*)

Description

Create a new Ssh object for secure communication to a remote computer.

Arguments

- **hostname** (string)

The hostname of the machine that you want to connect to

- **username** (string)

The username on the machine that you want to connect to

Returns

Ssh object

Return type

Ssh

Example

To create a connection to machine "example" as user "username"

```
var s = new Ssh("example", "username");
```

Details of functions

AuthenticateWithPassword(password*[string]*)

Description

Authenticate the connection using password.

Arguments

- **password** (string)

The password for the username on the remote machine

Returns

no return value

Example

To prompt the user for a password and authenticate using it in SSH connection s:

```
var password = Window.GetPassword("Enter Password to connect", "Password");
s.AuthenticateWithPassword(password);
```

AuthenticateWithPublicKey(passphrase (optional)*[string]*)

Description

Authenticate the connection using your public key. Your public key from the file .oasys_ssh/id_rsa.pub must be in the file .oasys_ssh/authorized_keys on the remote machine.

Arguments

- **passphrase (optional)** (string)

The passphrase for authentication on the remote machine if required

Returns

no return value

Example

Authenticate using your public key in SSH connection s:

```
s.AuthenticateWithPublicKey();
```

Execute(data*[object]*)

Description

Execute a command in the ssh session and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to the command

command	string	The command you want to run

Returns

Object with the following properties:

Name	Type	Description
status	integer	The exit code from the command
stderr	string	The standard error output from the command
stdout	string	The standard output from the command

Return type

object

Example

To run command "example.bat" with arguments "foo" and "bar" in SSH connection s:

```
var output = s.Execute( { command: 'example.bat', arguments: [ 'foo', 'bar' ]}
);
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Get(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "/path/to/file.txt", creating local file "C:\path\to\file.txt" in SSH connection s:

```
s.Get("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

Put(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "/path/to/file.txt" in SSH connection s:

```
s.Put("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

SftpGet(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "file.txt", creating local file "C:\path\to\file.txt" in SSH connection s using sftp:

```
s.SftpGet("file.txt", "C:\\path\\to\\file.txt");
```

SftpList(remote*[string]*)

Description

Gets a listing from the ssh connection using sftp.

Arguments

- **remote** (string)

The remote path to get the listing from

Returns

Array of objects. Each object contains the following information for a file/directory:

Name	Type	Description
atime	integer	Access time for the file (seconds since epoch)
gid	integer	The group ID
info	constant	Bitwise information for the file/directory. See the permissions, file types and file bits constants
mtime	integer	Modification time for the file (seconds since epoch)
name	string	The name of the file/directory
size	integer	The size of the file
uid	integer	The user ID

Return type

object

Example

To get listing from the the remote path "temp" in SSH connection s using sftp:

```
var listing = s.SftpList("temp");
for (l=0; l<listing.length; l++)
{
    Message(listing[l].name + ":" + listing[l].size;
}
```

SftpMkdir(remote*[string]*, mode*[constant]*)

Description

Creates a directory in the remote ssh connection using sftp.

Arguments

- **remote** (string)

The remote directory to create

- **mode** (constant)

The mode/permissions for the directory. See the permissions constants for details. Note that the user's file-creation mask (umask) value will also be taken into account when creating the directory.

Returns

true if successful, false if not

Return type

Boolean

Example

To create the remote path "temp" with, create, write and execute permissions for only the owner, in SSH connection s using sftp:

```
var success = s.SftpMkdir("temp", Ssh.OWNER_READ|Ssh.OWNER_WRITE|Ssh.OWNER_
EXECUTE);
```

SftpPut(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "file.txt" in SSH connection s:

```
s.SftpPut("file.txt", "C:\\path\\to\\file.txt");
```

SftpRmdir(remote*[string]*)

Description

Deletes a directory in the remote ssh connection using sftp. If this fails it is probably because the directory is not empty.

Arguments

- **remote** (string)

The remote directory to delete

Returns

true if successful, false if not

Return type

Boolean

Example

To delete the remote path "temp" in SSH connection s using sftp:

```
var success = s.SftpRmdir("temp");
```

Utils class

The Utils class contains various useful utility functions. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Ascii85Decode(encoded*[string]*)
- Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*)
- Build()
- CallPromiseHandlers()
- CheckinLicense(feature*[string]*)
- CheckoutLicense(feature*[string]*)
- GarbageCollect()
- GetLSDYNAVersions()
- HTMLBrowser()
- HiResTimer()
- PdfReader()
- TimerResolution()
- Version()

Detailed Description

The Utils class is used to provide various useful functions.

Details of functions

Ascii85Decode(encoded*[string]*) [static]

Description

Decodes an ASCII85 encoded string. See Utils.Ascii85Encode() for details on the method.

Arguments

- **encoded** (string)

An ASCII85 encoded string

Returns

ArrayBuffer object

Return type

ArrayBuffer

Example

To decode an ASCII85 encoded string:

```
var decoded = Utils.Ascii85Decode(encoded);
```

Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*) [static]

Description

Encodes an ASCII85 encoded string. This enables binary data to be represented by ASCII characters using five ASCII characters to represent four bytes of binary data (making the encoded size 1/4 larger than the original). By doing this binary data can be stored in JavaScript strings. Note that the method used by PRIMER to encode and decode strings differs from the standard ASCII85 encoding as that uses the ASCII characters ", ’ and \ which cannot be used in JavaScript strings as they have special meanings. The method in PRIMER uses
0-84 are !-u (ASCII codes 33-117) (i.e. 33 is added to it) with the following exceptions
v is used instead of " (ASCII code 118 instead of 34)
w is used instead of ’ (ASCII code 119 instead of 39)
x is used instead of \ (ASCII code 120 instead of 92)
If all five digits are 0 they are represented by a single character z instead of !!!!!

Arguments

- **data** (ArrayBuffer)

ArrayBuffer containing the data

- **length (optional)** (integer)

Length of data in array buffer to encode. If omitted the whole array buffer will be encoded

Returns

string

Return type

String

Example

To encode ArrayBuffer data:

```
var encoded = Utils.Ascii85Encode(data);
```

Build() [static]

Description

Returns the build number

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current build number

```
var build = Utils.Build();
```

CallPromiseHandlers() [static]

Description

Manually call any promise handlers/callbacks in the job queue

Arguments

No arguments

Returns

no return value

Example

To run any queued promise handlers/callbacks:

```
Utils.CallPromiseHandlers();
```

CheckinLicense(feature*[string]*) [static]

Description

Checks a license for a feature back in

Arguments

- **feature** (string)

feature to check license back in for

Returns

no return value

Example

To check in a license for "EXAMPLE":

```
Utils.CheckinLicense("EXAMPLE");
```

CheckoutLicense(feature*[string]*) [static]

Description

Checks out a license for a feature

Arguments

- **feature** (string)

feature to check license for

Returns

true if license available, false if not

Return type

Boolean

Example

To checkout a license for "EXAMPLE":

```
var got = Utils.CheckoutLicense("EXAMPLE");
if (got == false) Exit();
```

GarbageCollect() [static]

Description

Forces garbage collection to be done. This should not normally need to be called but in exceptional circumstances it can be called to ensure that garbage collection is done to return memory.

Arguments

No arguments

Returns

no return value

Example

To force garbage collection to be done:

```
Utils.GarbageCollect();
```

GetLSDYNAVersions() [static]

Description

Returns an array of all LS-DYNA output version names available in PRIMER.

Arguments

No arguments

Returns

An array of LS-DYNA version names

Return type

Array

Example

To get all LS-DYNA version names in PRIMER and set the output version to the latest version:

```
var versions = Utils.GetLSDYNAVersions();
      var latest = versions.length-1;

      Options.dyna_version = versions[latest];
```

HTMLBrowser() [static]

Description

Returns the path to the default HTML browser

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default HTML browser

```
var path = Utils.HTMLBrowser();
```

HiResTimer() [static]

Description

A high resolution timer that can be used to time how long things take. The first time this is called the timer will start and return 0. Subsequent calls will return the time in nanoseconds since the first call. Note that the timer will almost certainly not have 1 nanosecond precision but, depending on the platform, should should have a resolution of at least 1 microsecond. The resolution can be found by using Utils.TimerResolution()

Arguments

No arguments

Returns

number

Return type

number

Example

To time how long something takes to nanosecond precision:

```
var start = Utils.HiResTimer();
do something that takes some time...
var end = Utils.HiResTimer();
Message("it took " + (end-start) + "nanoseconds");
```

PdfReader() [static]

Description

Returns the path to the executable of the default pdf reader

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default pdf reader

```
var path = Utils.PdfReader();
```

TimerResolution() [static]

Description

Returns the resolution (precision) of the Utils.HiResTimer() timer in nanoseconds

Arguments

No arguments

Returns

number

Return type

number

Example

To find the resolution of the timer in nanoseconds:

```
var resolution = Utils.TimerResolution();
```

Version() [static]

Description

Returns the version number

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the current version number

```
var version = Utils.Version();
```

View class

The View class allows you to control the view and plotting modes in PRIMER. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Ac()
- Ct()
- Hi()
- Li()
- Redraw()
- SetContourType(View type*[constant]*, View subtype*[constant]*, View subtype2*[constant]*)
- Sh()
- Show(View type*[constant]*)
- Si()
- Vec()

View constants

Constants for SetContourType - argument 1 (Type)

Name	Description
View.ELEMPROPS	Type Element Properties
View.ELEMQUAL	Type Element Quality
View.INITVELS	Type Initial Velocities
View.LOADSHELLDIRECTION	Type Load Shell Direction
View.MASSSCALE	Type Mass Scale
View.MATLPROPS	Type Material Properties
View.PARTMASS	Type Part Mass
View.SHELLNORMALS	Type Shell Normals
View.SHELLTHICKNESS	Type Shell Thickness
View.TIMESTEP	Type TimeStep

Constants for SetContourType - argument 2 (Subtype)

Name	Description
View.ABSOLUTE	Subtype Absolute (of type Shell Thickness)
View.ADDEDMASS	Subtype Added Mass (of type Mass Scale)
View.ADDEDMASSPART	Subtype Added Mass #Part (of type Mass Scale)
View.AREA	Subtype Area (2d only) (of type Element Property)
View.ASPECTRATIO	Subtype Aspect Ratio (of type Element Quality)

View.CONTOUR	Subtype Contour (of type Shell Normals)
View.DENSITY	Subtype Density (of type Material Property)
View.EMPFINALMASS	Subtype (*)Final Mass (of type (*)EMP Parts Only)
View.EMPNSMASS	Subtype (*)NS Mass (of type (*)EMP Parts Only)
View.EMPSTRUCTMASS	Subtype (*)Struct Mass (of type (*)EMP Parts Only)
View.FAILEDCRITERIA	Subtype Failed Criteria (of type Element Quality)
View.FINALMASS	Subtype Final Mass (of type (*)EMP Parts Only)
View.FORM	Subtype Form (native) (of type Element Property)
View.FORMULATION	Subtype Formulation (of type Element Property)
View.INITVELRES	Subtype Init Vel-Res (of type Init Vel Component)
View.INITVELX	Subtype Init Vel-X (of type Init Vel Component)
View.INITVELY	Subtype Init Vel-Y (of type Init Vel Component)
View.INITVELZ	Subtype Init Vel-Z (of type Init Vel Component)
View.INTPOINTS	Subtype Integration Points (of type Element Property)
View.JACOBIAN	Subtype Jacobian (of type Element Quality)
View.MATERIALNUMBER	Subtype Material Number (of type Material Property)
View.MAXINTANGLE	Subtype Max Internal Angle (of type Element Quality)
View.MININTANGLE	Subtype Min Internal Angle (of type Element Quality)
View.MINLENGTH	Subtype Min Length (of type Element Quality)
View.PERCENTADDEDMASS	Subtype % Added Mass (of type Mass Scale)
View.PERCENTADDEDMASSPART	Subtype % Added Mass #Part (of type Mass Scale)
View.PLASTICSTRAIN	Subtype Plastic Strain (of type Element Property)
View.POISSONRATIO	Subtype Poisson’s Ratio (of type Material Property)
View.QUALIMPERF	Subtype Tet Collapse (of type Element Quality)
View.REMAINING	Subtype % remaining (of type Shell Thickness)
View.SKEW	Subtype Skew (native) (of type Element Quality)
View.STRUCTMASS	Subtype Struct Mass (of type (*)EMP Parts Only)
View.TAPER	Subtype Taper (of type Element Quality)
View.TETCOLLAPSE	Subtype Formulation (of type Element Quality)
View.THINNING	Subtype % thinning (of type Shell Thickness)
View.VECTOR	Subtype Vector (of type Shell Normals)
View.VOLUME	Subtype Volume (of type Element Property)
View.WARPAGE	Subtype Warpage (of type Element Quality)
View.YIELDSTRESS	Subtype Yield Stress (of type Material Property)
View.YOUNGMODULUS	Subtype Young’s Modulus (of type Material Property)

Constants for SetContourType - argument 3 (Subtype)

Name	**Description**
View.INTPOINT	Subtype Integration point (of type Element Property)

View.MAXSTRAIN	Subtype Maximum Strain (of type Element Property)
View.MINSTRAIN	Subtype Minimum Strain (of type Element Property)
View.PARAMETRICCOORD	Subtype Parametric coordinate (of type Element Property)

Constants for Show

Name	Description
View.ISO	Isometric projection
View.XY	XY axis projection
View.XZ	XZ axis projection
View.YZ	YZ axis projection

Detailed Description

The View class gives you access to the different plotting modes and views. See the documentation below for more details.

Details of functions

Ac() [static]

Description

Autoscales the view

Arguments

No arguments

Returns

No return value

Example

To autoscale

```
View.Ac();
```

Ct() [static]

Description

Does a contour plot

Arguments

No arguments

Returns

No return value

Example

To do a contour plot

```
View.Ct();
```

Hi() [static]

Description

Does a Hidden line plot

Arguments

No arguments

Returns

No return value

Example

To do a hidden line plot

```
View.Hi();
```

Li() [static]

Description

Does a line (wireframe) plot

Arguments

No arguments

Returns

No return value

Example

To do a line plot

```
View.Li();
```

Redraw() [static]

Description

Redraws the plot using the current plot mode.

Arguments

No arguments

Returns

No return value

Example

To redraw

```
View.Redraw();
```

SetContourType(View type*[constant]*, View subtype*[constant]*, View subtype2*[constant]*) [static]

Description

Sets a contour type (and subtype)

Arguments

- **View type** (constant)

The type of contour to plot. Can be:
View.TIMESTEP
View.SHELLTHICKNESS
View.SHELLNORMALS
View.LOADSHELLDIRECTION
View.ELEMPROPS
View.ELEMQUAL
View.MASSSCALE
View.MATLPROPS
View.INITVELS
View.PARTMASS

- **View subtype** (constant)

The subtype of contour to plot.
Note: This second argument is NOT required for types TIMESTEP and LOADSHELLDIRECTION.
Subtypes for Type TIMESTEP:
No subtypes
Subtypes for Type SHELLTHICKNESS:
View.ABSOLUTE
View.THINNING
View.REMAINING
Subtypes for SHELLNORMALS:
View.CONTOUR
View.VECTOR
Subtypes for Type LOADSHELLDIRECTION:
No subtypes
Subtypes for Type ELEMPROPS:
View.FORMULATION
View.INTPOINTS
View.PLASTICSTRAIN
View.FORM
View.AREA
View.VOLUME
Subtypes for Type ELEMQUAL:
View.MINLENGTH
View.ASPECTRATIO
View.WARPAGE
View.SKEW
View.MININTANGLE
View.MAXINTANGLE
View.JACOBIAN
View.TAPER
View.TETCOLLAPSE
View.QUALIMPERF
View.FAILEDCRITERIA
Subtypes for Type MASSSCALE:
View.PERCENTADDEDMASS
View.ADDEDMASS
View.PERCENTADDEDMASSPART
View.ADDEDMASSPART
Subtypes for Type MATLPROPS:
View.DENSITY
View.YIELDSTRESS
View.POISSONRATIO
View.YOUNGMODULUS
View.MATERIALNUMBER
Subtypes for Type INITVELS:
View.INITVELX
View.INITVELY

View.INITVELZ
View.INITVELRES
Subtypes for Type PARTMASS:
View.STRUCTMASS
View.EMPSTRUCTMASS
View.EMPNSMASS
View.FINALMASS
View.EMPFINALMASS

- **View subtype2** (constant)

The subtype of contour to plot.
Note: This third argument is required only for ELEMENTPROP ->PLASTICSTRAIN/FORM/AREA/VOLUME.
The default is PARAMETRIC COORDINATE.
Subtypes for Type ELEMENTPROP -> PLASTICSTRAIN/FORM/AREA/VOLUME:
View.PARAMETRICCOORD
View.INTEGRATIONPOINT
View.MINSTRAIN
View.MAXSTRAIN

Returns

No return value

Example

To set a contour plot of Load Shell Direction (no subtype):

```
View.SetContourType(View.LOADSHELLDIRECTION);
```

To set a contour plot of Element Formulation (type: Elem Props, subtype: Formulation):

```
View.SetContourType(View.ELEMPROPS, View.FORMULATION);
```

Sh() [static]

Description

Does a shaded plot

Arguments

No arguments

Returns

No return value

Example

To do a shaded plot

```
View.Sh();
```

Show(View type*[constant]*) [static]

Description

Redraws using one of the standard views

Arguments

- **View type** (constant)

The view to show. Can be +/-View.XY, +/-View.YZ, +/-View.XZ or +/-View.ISO

Returns

No return value

Example

To do an isometric view from the negative direction:

```
View.Show(-View.ISO);
```

Si() [static]

Description

Does a shaded image contour plot

Arguments

No arguments

Returns

No return value

Example

To do a shaded image contour plot

```
View.Si();
```

Vec() [static]

Description

Does a vector plot

Arguments

No arguments

Returns

No return value

Example

To do a vector plot

```
View.Vec();
```

Widget class

The Widget class allows you to create components for a graphical user interface. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- CtrlPressed()
- PixelsPerUnit()
- ShiftPressed()
- StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*)

Member functions

- AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)
- AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)
- Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)
- Clear()
- ClearSelection()
- Cross(colour (optional)*[constant]*)
- Delete()
- DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)
- DumpImageString(filename*[string]*, format (optional)*[constant]*)
- Hide()
- ItemAt(index*[integer]*)
- Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)
- Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)
- Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]
- ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- RemoveAllWidgetItems()
- RemoveWidgetItem(item*[WidgetItem]*)
- Scroll(scroll*[constant or WidgetItem object]*)
- Show()
- Static()
- Tick(colour (optional)*[constant]*)
- TotalItems()
- WidgetItems()

Widget constants

Name	Description
Widget.BUTTON	Button widget
Widget.CHECKBOX	Checkbox widget
Widget.COMBOBOX	Combobox widget
Widget.LABEL	Label widget
Widget.LISTBOX	Listbox widget

Widget.RADIOBUTTON	Radiobutton widget
Widget.SLIDER	Slider widget
Widget.TEXTBOX	Text input widget
Widget.TREE	Tree widget

Constants for Colour

Name	Description
Widget.BLACK	Colour black
Widget.BLUE	Colour blue
Widget.COLOUR_CONTRAST	A contrasting colour in the 3 user interface themes (Green, Purple, and Blue in the Dark, Light, and Classic themes respectively). Blue in the legacy theme.
Widget.COLOUR_CONTRAST_2	Another contrasting colour in the 3 user interface themes (Yellow, Red, and Red in the Dark, Light, and Classic themes respectively). Red in the legacy theme.
Widget.COLOUR_INVERSE	Inverse colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_LABEL	Label text colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_LATENT	Latent colour in the 3 user interface themes (Different shade of Cyan in every theme). Light Cyan in the legacy theme.
Widget.COLOUR_NEUTRAL	Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme.
Widget.COLOUR_SAFE	Safe colour in the 3 user interface themes (Different shade of green in every theme). Dark green in the legacy theme.
Widget.COLOUR_TITLE	Title colour in the 3 user interface themes (Different shade of grey in every theme). Dark blue in the legacy theme.
Widget.COLOUR_WARNING	Warning colour in the 3 user interface themes (Different shade of red in every theme). Dark red in the legacy theme.
Widget.CYAN	Colour cyan
Widget.DARKBLUE	Colour dark blue
Widget.DARKGREEN	Colour dark green
Widget.DARKGREY	Colour dark grey
Widget.DARKGREY_NEUTRAL	Only valid in the function 'Line'. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Dark grey in the legacy theme
Widget.DARKRED	Colour dark red
Widget.DEFAULT	Default colour for widgets
Widget.GREEN	Colour green
Widget.GREY	Colour grey
Widget.LIGHTGREY	Colour light grey
Widget.LIGHTGREY_NEUTRAL	Only valid in the function 'Line'. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme
Widget.MAGENTA	Colour magenta
Widget.ORANGE	Colour orange

Widget.RED	Colour red
Widget.WHITE	Colour white
Widget.YELLOW	Colour yellow

Constants for Image RGB format

Name	Description
Widget.RGB24	24 bits for RGB data in widget images
Widget.RGB8	8 bits for RGB data in widget images

Constants for Justification

Name	Description
Widget.BOTTOM	Bottom justification
Widget.CENTRE	Centre (horizontal) justification
Widget.LEFT	Left justification
Widget.MIDDLE	Middle (vertical) justification
Widget.RIGHT	Right justification
Widget.SCALE	Image will be scaled to fit widget
Widget.TOP	Top justification

Constants for Orientation

Name	Description
Widget.HORIZONTAL	Horizontal orientation (for sliders)
Widget.VERTICAL	Vertical orientation (for sliders)

Constants for Selection

Name	Description
Widget.SELECT_ENHANCED	Multiple WidgetItems in a ListBox or tree Widget can be selected. When the user selects a WidgetItem the selection is cleared and the new WidgetItem selected. However, if the user presses the Ctrl key when clicking on a WidgetItem, the clicked WidgetItem gets toggled and all other WidgetItems are left untouched. If the user presses the Shift key while clicking on a WidgetItem, all WidgetItems between the last selected WidgetItem and the clicked WidgetItem are selected or unselected, depending on the state of the clicked WidgetItem.
Widget.SELECT_MULTIPLE	Multiple WidgetItems in a ListBox Widget can be selected. When the user selects a WidgetItem, the selection status of that WidgetItem is toggled and the other WidgetItems are left alone. Not valid for tree widgets. Widget.SELECT_ENHANCED will be used.
Widget.SELECT_NONE	No WidgetItem in a ListBox or tree Widget can be selected
Widget.SELECT_SINGLE	A single WidgetItem in a ListBox or tree Widget can be selected. When the user selects a WidgetItem, any already-selected WidgetItem becomes unselected, and the user cannot unselect the selected WidgetItem by clicking on it.

Constants for Tree relations

Name	Description

Widget.AFTER	Add a WidgetItem after the existing WidgetItem for a tree widget.
Widget.BEFORE	Add a WidgetItem before the existing WidgetItem for a tree widget.
Widget.CHILD	Add a WidgetItem as a child of the existing WidgetItem for a tree widget.

Constants for Tree scrolling

Name	Description
Widget.SCROLL_BOTTOM	Scroll tree widget to bottom.
Widget.SCROLL_DOWN	Scroll tree widget down one.
Widget.SCROLL_PAGE_DOWN	Scroll tree widget down one page.
Widget.SCROLL_PAGE_UP	Scroll tree widget up one page.
Widget.SCROLL_TOP	Scroll tree widget to top.
Widget.SCROLL_UP	Scroll tree widget up one.

Constants for User interface categories

Name	Description
Widget.CATEGORY_APPLY	Apply buttons
Widget.CATEGORY_BUTTON_BOX	A button box panel that contains other widgets
Widget.CATEGORY_CANCEL	Buttons which cancel the current operation
Widget.CATEGORY_DATA_ ENTRY_HEADER	Header for data entry cells, e.g. PRIMER create panels
Widget.CATEGORY_DISMISS	Buttons to close or dismiss panels
Widget.CATEGORY_ENTITY	Entity types in T/HIS
Widget.CATEGORY_GENERIC	A generic button that isn’t a special category
Widget.CATEGORY_GENERIC_2	An alternative to the generic category that has a complementary colour
Widget.CATEGORY_HELP	Help buttons
Widget.CATEGORY_KEYWORD	A PRIMER keyword button
Widget.CATEGORY_LABEL	A text label
Widget.CATEGORY_LABEL_BOX	Text label with a border
Widget.CATEGORY_LABEL_ POPUP	Text label with a popup that blends into the background
Widget.CATEGORY_MENU_BOX	A menu box
Widget.CATEGORY_MESSAGE	For displaying a temporary warning message
Widget.CATEGORY_OPERATE	Operate buttons in T/HIS
Widget.CATEGORY_POPUP_BOX	A popup box that can contain buttons and plain text
Widget.CATEGORY_SAFE_ ACTION	Buttons (usually green) to indicate a safe action
Widget.CATEGORY_SEL_ALL	Select all

Widget.CATEGORY_TAB	Tab
Widget.CATEGORY_TABLE_HEADER	Table (column) header
Widget.CATEGORY_TABLE_ROW	Table row
Widget.CATEGORY_TEXT_BOX	A text box
Widget.CATEGORY_TICKBOX	A tick box
Widget.CATEGORY_TITLE	Title text
Widget.CATEGORY_TOGGLE	Buttons that can be toggled, e.g. On/Off
Widget.CATEGORY_TOOL	Buttons within the tools area
Widget.CATEGORY_UNDO	Buttons which undo the last operation
Widget.CATEGORY_UNSEL_ALL	Unselect/deslect all
Widget.CATEGORY_UPDATE	Update buttons which update the screen but leave the panel open
Widget.CATEGORY_WARNING_ACTION	Buttons (usually red) to indicate a dangerous action
Widget.NO_CATEGORY	No styling is applied. Widget colour controlled by foreground/background properties and is the same in all themes

Widget properties

Name	Type	Description
active	logical	If widget is active (true) or disabled (false)
arrows	boolean	Whether arrows will be shown for a slider (default is true). Slider Widgets only.
background	constant	Widget background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, ,or a colour returned by Colour.RGB(). Note, background colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the background colour. To override this behaviour and use this background colour first set the widget category to Widget.NO_CATEGORY.
bottom	integer	Widget bottom coordinate
category	constant	The button category which determines the button's appearance when using the new user interface, see Window.Theme()
currentItem	WidgetItem object	The current WidgetItem for a tree Widget. The current WidgetItem in a tree is shown with a dashed border.
fontSize	integer	Widget font size in points. Currently only supports the following sizes: 6, 7, 8, 10, 12, 14, 18, 24. Can be used only with Widget.LABEL and Widget.BUTTON. Both LATIN1 and UTF-8 encoding is supported on Windows but Linux only supports LATIN1 encoding at the moment.

foreground	constant	Widget foreground colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_LABEL, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, ,or a colour returned by Colour.RGB(). Note, foreground colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the foreground colour. To override this behaviour and use this foreground colour first set the widget category to Widget.NO_CATEGORY.
hover	string	Widget hover text
imageHeight (read only)	integer	Height of widget image (pixels)
imageWidth (read only)	integer	Width of widget image (pixels)
justify	constant	Widget justification. Can be: Widget.LEFT, Widget.RIGHT or Widget.CENTRE (default).
left	integer	Widget left coordinate
lineWidth	integer	Width of lines when drawing graphics (initially 1; values 1-100 allowed).
macroTag	string	Tag to use for this widget when recording a macro. If empty then the text property value will be used.
maximum	integer	The maximum value allowed for a slider (default is 100). Slider Widgets only.
minimum	integer	The minimum value allowed for a slider (default is 0). Slider Widgets only.
monospace	boolean	true if the widget uses a monospace font instead of a proportional width font (default). Label and button Widgets only.
onChange	function	Function to call when the text in a TEXTBOX widget, the selection in a COMBOBOX widget or the value of a SLIDER is changed. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually types something into the textbox, selects an item in the combobox or moves the slider, NOT when the Widget.text or Widget.value property changes**.
onClick	function	Function to call when a BUTTON, CHECKBOX, COMBOBOX, LABEL, RADIOBUTTON or TREE widget is clicked. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually clicks on the button, NOT when the Widget.pushed property changes**. For the COMBOBOX widget the function is called **before** the list of items is mapped.
onPopup	function	Function to call when a BUTTON, LABEL, TEXTBOX or TREE widget is right clicked to map a popup. The Widget object is accessible in the function using the 'this' keyword. The PopupWindow can then be found by using the popupWindow property of the Widget. The function is called **before** the popup is mapped so you can change the widgets in the popup as required.
onTimer	function	Function to call for a widget when timerDelay ms have elapsed after setting this. Additionally if timerRepeat is set this function will be called repetitively, every timerDelay ms. The Widget object is accessible in the function using the 'this' keyword. To unset the function set the property to null. **Note that as soon as this property is set the timer starts!**

orientation	constant	The orientation of a slider. Can be: Widget.VERTICAL or Widget.HORIZONTAL (default). Slider Widgets only.
popupDirection	constant	How PopupWindow will be mapped relative to this widget. Can be Widget.LEFT, Widget.RIGHT, Widget.TOP or Widget.BOTTOM (default). For tree widgets this will be ignored as the popup is always shown on the WidgetItem that is right clicked.
popupSymbol	logical	TRUE (default) if a symbol will be shown for a PopupWindow.
popupWindow	PopupWindow object	PopupWindow for this Widget. Only available for Button, Label and Textbox Widgets. To remove a PopupWindow from a Widget set to null.
pushed	logical	If widget is pushed (true) or not (false). This only affects Widget.BUTTON with the Widget.toggle property set, and Widget.CHECKBOX widgets.
right	integer	Widget right coordinate
select	constant	Selection method for ListBox and tree Widgets. Can be: Widget.SELECT_NONE, Widget.SELECT_SINGLE or Widget.SELECT_MULTIPLE or Widget.SELECT_ENHANCED (default).
selectedItem	WidgetItem object	WidgetItem that is currently selected for a ComboBox or Radiobutton, Widget. If null no WidgetItem is selected. For a ListBox Widget this property contains the last WidgetItem that was (de)selected. To get a list of all of the selected WidgetItems use WidgetItems() to return all of the WidgetItems and inspect the WidgetItem selected property.
shown (read only)	boolean	true if the widget is visible. To alter the visibility of a widget use the Show() and Hide() methods.
step	integer	The step value of a slider (default is 1). Slider Widgets only.
text	string	Widget text. For a ComboBox Widget this will be the text for the currently selected WidgetItem
textHidden	boolean	true if the widget text is hidden and replaced by asterisks. This may be used to create textboxes to type passwords in. TextBox Widgets only.
timerDelay	integer	Delay in ms before the function set for onTimer will be called. The initial value is 1000 (ms). Also see timerRepeat.
timerRepeat	logical	If the function set for onTimer will be called once (false) or repeatedly (true). The initial value is false. Also see timerDelay.
toggle	logical	If widget can be toggled (true) or not (false). This only affects Widget.BUTTON widgets.
top	integer	Widget top coordinate
type (read only)	integer	Type of the widget. The widget type could be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE
value	integer	The current value of a slider (initially will be the minimum value). Slider Widgets only.
window (read only)	Window object	The Window that this widget is defined in
xResolution	integer	X resolution of button when drawing lines, circles, polygons and rectangles (initially 100). X coordinates on the Widget can be from 0 (on the left of the widget) to xResolution (on the right of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.
yResolution	integer	Y resolution of button when drawing lines, circles, polygons and rectangles (initially 100). Y coordinates on the Widget can be from 0 (on the top of the widget) to yResolution (on the bottom of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.

Detailed Description

The Widget class allows you to create Widgets (buttons, textboxes etc) in a Window for a graphical user interface. Callback functions can be declared for widgets to give actions when a button is pressed or the text in a textbox is selected etc. The following example displays various widgets in a window. Several callback methods are used. The exit button allows the user to exit the script but the button is only made active if the checkbox widget is ticked. If the button widgets are pressed feedback is given to the user

```
var count = 0;
// Create window
var w = new Window("Test", 0.8, 1.0, 0.5, 0.6);
// Create all of the widgets
var l = new Widget(w, Widget.LABEL,    1, 30, 1, 7, "Text:");
var t = new Widget(w, Widget.TEXTBOX, 31, 80, 1, 7, "Enter text");
var b = new Widget(w, Widget.BUTTON,   1, 30, 8, 14, "Press me");
var b2= new Widget(w, Widget.BUTTON,  31, 61, 8, 14, "Don't press me");
var c = new Widget(w, Widget.CHECKBOX,62, 68, 8, 14);
var l2= new Widget(w, Widget.LABEL,    1, 80, 15, 21, "You haven't pressed the
button yet...");
var e = new Widget(w, Widget.BUTTON,   1, 21, 22, 28, "Exit");
// Allow button widget b2 to toggle
b2.toggle = true;
// The exit button is initially inactive
e.active = false;
// Assign the callback functions
b.onClick  = clicked;
b2.onClick = clicked;
c.onClick  = clicked;
t.onChange = changed;
e.onClick  = confirm_exit;
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If checkbox is clicked then set the state of the exit button
    if (this === c)
    {
        Message("Checkbox clicked");
        e.active = c.pushed;
    }
// If the "Don't press me' button is pressed then change the colour if the
button is pressed in.
    else if (this === b2)
    {
        Message("I said don't press!!!");
        if (b2.pushed) b2.background = Widget.WHITE;
        else           b2.background = Widget.DEFAULT;
    }
// If the "Press me" button is pressed then update the text in the label widget
// with how many times the button has been pressed.
    else
    {
        Message("You pressed...");
        count++;
        l2.text = "Button pressed " + count + " times";
    }
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If the user has changed the text in the textbox then give a message in
// the dialogue box
    Message("Text has changed to " + this.text);
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
```

```
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

In version 20 a tree widget was added. A simple tree widget example is shown below.

```
Window.Theme(Window.THEME_CURRENT);
let wi, cwi;
// Create a popup window and some widgets
let pw = new PopupWindow();
let pw_l1 = new Widget(pw, Widget.LABEL, 1, 61,  1,  7, "");
let pw_l2 = new Widget(pw, Widget.LABEL, 1, 61,  7, 13, "");
let pw_l3 = new Widget(pw, Widget.LABEL, 1, 61, 13, 19, "");
let pw_l4 = new Widget(pw, Widget.LABEL, 1, 61, 19, 25, "");
let pw_l5 = new Widget(pw, Widget.LABEL, 1, 61, 25, 31, "");
let pw_l6 = new Widget(pw, Widget.LABEL, 1, 61, 31, 37, "");
// Create window
let w = new Window("JavaScript Tree widget test", 0.85, 1.0, 0.75, 1.0);
// Create tree widget
let t = new Widget(w, Widget.TREE, 1, 61, 1, 51, "Suite");
// Add a root node to tree
let env_wi = new WidgetItem(t, "Oasys Ltd LS_DYNA Environment");
// Add a child to the root node
wi  = new WidgetItem(t, "PRIMER", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Prepare", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Efficient, reliable model setup with support for all of the latest
LS-DYNA features";
wi  = new WidgetItem(t, "LS-DYNA", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Analyse", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
// Add a sibling node after LS-DYNA
wi  = new WidgetItem(t, "REPORTER", Widget.AFTER, wi);
cwi = new WidgetItem(t, "Report", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Automatic report generation for LS-DYNA simulations";

// Add a sibling node before REPORTER
wi  = new WidgetItem(t, "T/HIS", Widget.BEFORE, wi);
cwi = new WidgetItem(t, "Process", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Plot, manipulate and process XY data from LS-DYNA";

// Alternatively, create WidgetItem without parent and add
let d3plot_wi   = new WidgetItem(null, "D3PLOT");
t.AddWidgetItem(d3plot_wi, Widget.BEFORE, wi);
cwi = new WidgetItem(null, "Visualise");
t.AddWidgetItem(cwi, Widget.CHILD, d3plot_wi);
d3plot_wi.onMouseOver = wi_onmouseover;
cwi.hover = " In-depth 3D visualisation of LS-DYNA results";
// Expand root node
env_wi.expanded = true;
// Link popup to tree widget
t.popupWindow = pw;
// Assign callbacks
t.onClick = click_tree;
t.onPopup = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    pw_l1.text = this.currentItem.text;
    if (this.currentItem.selected) pw_l2.text = "Selected";
    else                           pw_l2.text = "Not selected";
    if (this.currentItem.Parent())
        pw_l3.text = "Parent: " + this.currentItem.Parent().text;
    else
        pw_l3.text = "No parent";
    if (this.currentItem.FirstChild())
        pw_l4.text = "First child: " + this.currentItem.FirstChild().text;
    else
```

```
        pw_l4.text = "No children";
    if (this.currentItem.PreviousSibling())
        pw_l5.text = "Previous: " + this.currentItem.PreviousSibling().text;
    else
        pw_l5.text = "No previous";
    if (this.currentItem.NextSibling())
        pw_l6.text = "Next: " + this.currentItem.NextSibling().text;
    else
        pw_l6.text = "No next";
}
////////////////////////////////////////////////////////////////////////////
function click_tree()
{
    Message("Clicked on "+this.currentItem.text+" in tree");
}
////////////////////////////////////////////////////////////////////////////
function wi_onmouseover()
{
    Message("Called onMouseOver for WidgetItem "+this.text+" in tree");
}
```

Graphics (lines, circles, rectangles etc) can be drawn on Widget.LABEL and Widget.BUTTON widgets. If these methods are used the resolution of the widget is 100 units in x and y and the origin is at the top left of the widget. See the documentation below and the WidgetItem and Window classes for more details.

Constructor

new Widget(window*[Window or PopupWindow]*, type*[constant]*, left*[integer]*, right*[integer]*, top*[integer]*, bottom*[integer]*, text (optional)*[string]*)

Description

Create a new Widget object.

Arguments

- **window** (Window or PopupWindow)

Window or PopupWindow that widget will be created in

- **type** (constant)

Widget type. Can be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE

- **left** (integer)

left coordinate of widget

- **right** (integer)

right coordinate of widget

- **top** (integer)

top coordinate of widget

- **bottom** (integer)

bottom coordinate of widget

- **text (optional)** (string)

Text to show on widget (optional for LABEL, BUTTON, TEXTBOX and TREE, not required for CHECKBOX, COMBOBOX, LISTBOX, RADIOBUTTON and SLIDER). For a TREE widget the text will be used as a macroTag.

Returns

Widget object

Return type

Widget

Details of functions

AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)

Description

Adds a WidgetItem to a ComboBox ListBox or Radiobutton Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **position (optional)** (integer)

Position on Widget to add the WidgetItem. Any existing WidgetItems will be shifted down as required. If omitted the WidgetItem will be added to the end of the existing ones. **Note that positions start at 0**.

Returns

No return value

Example

To add WidgetItem wi to widget w:

```
w.AddWidgetItem(wi);
```

AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)

Description

Adds a WidgetItem to a Tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **relationship** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem** (WidgetItem)

Existing WidgetItem to add item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be added to the root node of the tree.

Returns

No return value

Example

To add WidgetItem wi to tree widget w after existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.AFTER, ewi);
```

To add WidgetItem wi to tree widget w as a child of existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.CHILD, ewi);
```

Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)

Description

Draws a circle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of circle. See foreground for colours.

- **fill** (boolean)

If circle should be filled or not.

- **xc** (integer)

x coordinate of centre of circle.

- **yc** (integer)

y coordinate of centre of circle.

- **radius** (integer)

radius of circle.

Returns

no return value

Example

To draw a red filled circle, radius 25, at (50, 50) on widget w:

```
w.Circle(Widget.RED, true, 50, 50, 25);
```

Clear()

Description

Clears any graphics on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

No arguments

Returns

no return value

Example

To clear any graphics for widget w:

```
w.Clear();
```

ClearSelection()

Description

Clears selection of any WidgetItems on the widget. Only possible for Widget.COMBOBOX, Widget.LISTBOX, Widget.RADIOBUTTON and Widget.TREE widgets.

Arguments

No arguments

Returns

no return value

Example

To clear selection of any WidgetItems for widget w:

```
w.ClearSelection();
```

Cross(colour (optional)*[constant]*)

Description

Draws a cross symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of cross symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red cross symbol on widget w:

```
w.Cross(Widget.RED);
```

CtrlPressed() [static]

Description

Check to see if the Ctrl key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Ctrl key pressed:

```
if (Widget.CtrlPressed()) { ... }
```

Delete()

Description

Deletes the widget from PRIMER (removing it from the window it is defined in) and returns any memory/resources used for the widget. This function should not normally need to be called. However, sometimes a script may want to recreate widgets in a window many times and unless the old widgets are deleted PRIMER will reach the maximum number of widgets for a window (Options.max_widgets). To avoid this problem this method can be used to force PRIMER to delete and return the resources for a widget. **Do not use the Widget object after calling this method**.

Arguments

No arguments

Returns

no return value

Example

To delete widget w:

```
w.Delete();
```

DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)

Description

Draws a directory icon on the widget. Only possible for Widget.BUTTON widgets.

Arguments

- **line_colour** (constant)

Colour of lines of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

- **fill_colour** (constant)

Colour of fill of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

Returns

no return value

Example

To draw a directory icon on widget btn:

```
btn.DirectoryIcon(Widget.BLACK, Widget.YELLOW);
```

DumpImageString(filename*[string]*, format (optional)*[constant]*)

Description

Dumps a string representation of an image for a widget to a file in a form that can be used by Widget.ReadImageString(). Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **filename** (string)

Filename to dump string representation to

- **format (optional)** (constant)

Can be Widget.RGB8 or Widget.RGB24. Before version 15 PRIMER only used 8 bits to store RGB (red, green and

blue) colour information for widget images. In version 15 widget images have been changed to use 24 bits to store RGB information (8 bits for red, 8 bits for green and 8 bits for blue). Both formats are supported. If omitted the new Widget.RGB24 format will be used. See Widget.ReadImageString() for more details.

Returns

no return value

Example

To dump the image data to file 'image_data' for widget w with the old 8 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB8);
```

To dump the image data to file 'image_data' for widget w with 24 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB24);
```

Hide()

Description

Hides the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To hide widget *w*

```
w.Hide();
```

ItemAt(index*[integer]*)

Description

Returns the WidgetItem object used at *index* in this Widget. See also Widget.TotalItems() and Widget.WidgetItems(). Note that for tree Widgets the items will not be returned in the order that they are displayed in, they will be returned in the order they were added to the tree.

Arguments

- **index** (integer)

index to return WidgetItem for. **Note that indices start at 0**.

Returns

WidgetItem object.

Return type

WidgetItem

Example

To loop over the WidgetItems used in Widget *w*

```
for (i=0; i<w.TotalItems(); i++)
{
    wi = w.ItemAt(i);
}
```

Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a line on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of line. See foreground for colours.

- **x1** (integer)

x coordinate of start of line.

- **y1** (integer)

y coordinate of start of line.

- **x2** (integer)

x coordinate of end of line.

- **y2** (integer)

y coordinate of end of line.

Returns

no return value

Example

To draw a red line from (10, 90) to (90, 10) on widget w:

```
w.Line(Widget.RED, 10, 90, 90, 10);
```

MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)

Description

Moves an existing WidgetItem in a tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to move

- **relationship** (constant)

What relationship (relative to relitem) to use when moving item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.AFTER.

- **relitem** (WidgetItem or null)

Existing WidgetItem to move item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be moved to the root node of the tree.

Returns

No return value

Example

To move WidgetItem wi in tree widget w after existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.AFTER, ewi);
```

To move WidgetItem wi in tree widget w as a child of existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.CHILD, ewi);
```

PixelsPerUnit() [static]

Description

Returns the number of pixels per unit coordinate. This will vary depending on the monitor PRIMER is running on.

Arguments

No arguments

Returns

pixels/unit (real)

Return type

Number

Example

To return how many pixels there are per unit coordinate:

```
var ppu = Widget.PixelsPerUnit();
```

Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **points** (array)

Array of point coordinates

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
var a = new Array(20, 20, 50, 80, 80, 20);
w.Polygon(Widget.RED, true, a);
```

Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **x1** (integer)

x coordinate of point 1.

- **y1** (integer)

y coordinate of point 1.

- **x2** (integer)

x coordinate of point 2.

- **y2** (integer)

y coordinate of point 2.

- **... xn** (integer)

x coordinate of point n.

- **... yn** (integer)

y coordinate of point n.

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
w.Polygon(Widget.RED, true, 20, 20, 50, 80, 80, 20);
```

ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a file to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text. Note that due to the way that colours are used for menus in PRIMER only a small number of colours are available for Widget images. Black and white images will display without any issues but colour images will be displayed with a reduced set of colours.

Arguments

- **filename** (string)

Image file (BMP, GIF, JPEG or PNG) to read. To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in PRIMER. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255).
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image example.png for widget w and place it at the top left:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT);
```

To read image example.png for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image example.png for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageFile(null);
```

ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a JavaScript string previously created by Widget.DumpImageString() to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text.
Note, prior to version 15 of PRIMER only a small number of colours were available for Widget images. In version 14 and earlier the RGB (red, green and blue) information for each pixel in the image was packed into a single byte (8 bits) with 3 bits for red, 3 for green and 2 for blue. Widget.DumpImageString() always returned the string beginning with "RRRGGGBB_RLE" which is this 8 bit format with run length encoding. This is format Widget.RGB8.
In version 15 support for Widget images was enhanced to give 24bit support for colours. The RGB information for each pixel has 8 bits for red, 8 bits for green and 8 bits for blue. This is format Widget.RGB24.
From version 15 Widget.DumpImageString() can either return the the old 8 bit format Widget.RGB8 (string beginning with "RRRGGGBB_RLE") or return the the new 24bit format Widget.RGB24 (string beginning with "RGB24_Z"). ReadImageString supports both formats.

Arguments

- **string** (string)

String containing the image data previously created by Widget.DumpImageString(). To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in PRIMER. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255). Only used for the new 24bit format Widget.RGB24 (strings beginning with "RGB24_Z"). Ignored for the old 8 bit format Widget.RGB8 (strings beginning with "RRRGGGBB_RLE").
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image data from string s for widget w and place it at the top left:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT);
```

To read image data from string s for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image data from string s for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageString(null);
```

Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a rectangle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of rectangle. See foreground for colours.

- **fill** (boolean)

If rectangle should be filled or not.

- **x1** (integer)

x coordinate of first corner of rectangle.

- **y1** (integer)

y coordinate of first corner of rectangle.

- **x2** (integer)

x coordinate of second (opposite) corner of rectangle.

- **y2** (integer)

y coordinate of second (opposite) corner of rectangle.

Returns

no return value

Example

To draw a red filled rectangle with corners (20, 20) and (80, 80) on widget w:

```
w.Rectangle(Widget.RED, true, 20, 20, 80, 80);
```

RemoveAllWidgetItems()

Description

Removes any WidgetItems from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveWidgetItem.

Arguments

No arguments

Returns

No return value

Example

To remove all WidgetItems from widget w:

```
w.RemoveAllWidgetItems();
```

RemoveWidgetItem(item*[WidgetItem]*)

Description

Removes a WidgetItem from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveAllWidgetItems.

Arguments

- **item** (WidgetItem)

WidgetItem to remove

Returns

No return value

Example

To remove WidgetItem wi from widget w:

```
w.RemoveWidgetItem(wi);
```

Scroll(scroll*[constant or WidgetItem object]*)

Description

Scrolls a tree widget

Arguments

- **scroll** (constant or WidgetItem object)

How to scroll the tree widget. Can be: Widget.SCROLL_TOP, Widget.SCROLL_BOTTOM, Widget.SCROLL_UP, Widget.SCROLL_DOWN, Widget.SCROLL_PAGE_UP or Widget.SCROLL_PAGE_DOWN in which case the tree widget will be scrolled by that value or a WidgetItem, in which case the tree will be scrolled to make the WidgetItem visible, expanding any branches as necessary to do so..

Returns

No return value

Example

To scroll tree widget w to the top:

```
w.Scroll(Widget.SCROLL_TOP);
```

To scroll tree widget w so that WidgetItem wi is visible in the tree:

```
w.Scroll(wi);
```

ShiftPressed() [static]

Description

Check to see if the Shift key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Shift key pressed:

```
if (Widget.ShiftPressed()) { ... }
```

Show()

Description

Shows the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To show widget w:

```
w.Show();
```

Static()

Description

Windows have two different regions for Widgets. A 'normal' region which can be scrolled if required (if the window is made smaller scrollbars will be shown which can be used to scroll the contents) and a 'static' region at the top of the Window which is fixed and does not scroll. For an example of a static region in a Window see any of the keyword editing panels. The 'Dismiss', 'Create', 'Reset' etc buttons are in the static region. By default Widgets are put into the normal region of the Window. This method puts the Widget to the static region of the Window.

Arguments

No arguments

Returns

No return value

Example

To put widget w in the static part of the window:

```
w.Static();
```

StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*) [static]

Description

Returns the length of a string in Widget units. This can be used to find what size a Widget must be to be able to display the string.

Arguments

- **text** (string)

Text to find the width of

- **monospace (optional)** (boolean)

If true then width will be calculated using a monospace font. If false (default) then the normal proportional width font will be used

- **fontSize (optional)** (integer)

Calculation can be based on a defined font size, at the moment support is added only for font sizes of 6, 7, 8, 10, 12, 14, 18 and 24.

Returns

integer

Return type

Number

Example

To get the width of string 'Example':

```
var len = Widget.StringLength('Example');
```

Tick(colour (optional)*[constant]*)

Description

Draws a tick symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of tick symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red tick symbol on widget w:

```
w.Tick(Widget.RED);
```

TotalItems()

Description

Returns the number of the WidgetItem objects used in this Widget (or 0 if none used). See also Widget.ItemAt() and Widget.WidgetItems().

Arguments

No arguments

Returns

integer

Return type

Number

Example

To return the total number of WidgetItems used for Widget *w*

```
var total = w.TotalItems();
```

WidgetItems()

Description

Returns an array of the WidgetItem objects used in this Widget (or null if none used). See also Widget.ItemAt() and Widget.TotalItems().

Arguments

No arguments

Returns

Array of WidgetItem objects

Return type

Array

Example

To return WidgetItems used for Widget *w*

```
var wi = w.WidgetItems();
```

WidgetItem class

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- FirstChild()
- NextSibling()
- Parent()
- PreviousSibling()

WidgetItem properties

Name	Type	Description
background	constant	Widget background colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
expanded	logical	If the widget item is expanded (true) or not (false) in a tree. Only available for widgetitems used in TREE widgets.
foreground	constant	Widget foreground colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
hover	string	WidgetItem's hover text. Not used for RADIOBUTTON widgets.
index (read only)	integer	The index of this widgetitem in the parent widget (undefined if widgetitem is not assigned to a widget).
monospace	boolean	true if the widgetitem uses a monospace font instead of a proportional width font (default). Not used for RADIOBUTTON and TREE widgets.
onClick	function	Function to call when a widget item in a COMBOBOX, LISTBOX or TREE widget is clicked. The Widgetitem object is accessible in the function using the 'this' keyword.
onMouseOver	function	Function to call when the mouse moves over a widget item in a COMBOBOX, LISTBOX or TREE widget. The Widgetitem object is accessible in the function using the 'this' keyword.
selectable	logical	If the widget item can be selected (true) or not (false). Not used for RADIOBUTTON and TREE widgets.
selected	logical	If the widget item is selected (true) or not (false).
text	string	Widget text. If the WidgetItem is used in a tree widget then the tree will not automatically redraw (this is in case you want to change lots of tree nodes at once). In this case, use the Window Redraw method to redraw the window.
visible	logical	If the widget item is visible (true) or not (false) in a tree. A widgetitem will not be visible if it is a child of a widgetitem that is not expanded. Only available for widgetitems used in TREE widgets.

widget (read only)	Widget object	The widget that this item is defined for (null if not set)

Detailed Description

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets in a Window for a graphical user interface. The following example shows how WidgetItems are used to create a Combobox Widget and how to assign callbacks to determine when the selection has been changed.

```
var items = ["D3PLOT", "PRIMER", "SHELL", "REPORTER", "T/HIS"]
// Create window
var w = new Window("Combobox example", 0.8, 1.0, 0.5, 0.6);
// A simple combobox with a few items
var cl= new Widget(w, Widget.LABEL,   1, 30, 1, 7, "Programs:");
var cb= new Widget(w, Widget.COMBOBOX,  31, 61, 1, 7);
// Add WidgetItems to Combobox
for (i=0; i<items.length; i++)
    var wi = new WidgetItem(cb, items[i]);
// A combobox with many items showing a slider.
var li= new Widget(w, Widget.LABEL,   1, 30, 8, 14, "Long list:");
var ci= new Widget(w, Widget.COMBOBOX,  31, 61, 8, 14);
// Add WidgetItems to Combobox
// As an example we also make some of the WidgetItems unselectable and
// change the background colour
for (i=1; i<=100; i++)
{
    var wi = new WidgetItem(ci, "Item "+i);
    if ( (i % 10) == 5)
    {
        wi.selectable = false;
        wi.background = Widget.WHITE;
    }
}
var e = new Widget(w, Widget.BUTTON,   1, 21, 15, 21, "Exit");
// Assign callbacks
cb.onClick  = clicked;
cb.onChange = changed;
ci.onClick  = clicked;
ci.onChange = changed;
e.onClick   = confirm_exit
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If combobox is clicked then print the current selection
    if (this.selectedItem)
        Message("selection is currently '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If combobox selection is changed then print the new selection
    if (this.selectedItem)
        Message("selection is now '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Window and Widget classes for more details.

Constructor

new WidgetItem(widget*[Widget]*, text*[string]*, selectable (optional)*[boolean]*)

Description

Create a new WidgetItem object for a combobox, listbox or radio button widget.

Arguments

- **widget** (Widget)

Combobox, listbox or radio button Widget that the widget item will be created in. This can be null in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned later by using Widget.AddWidgetItem().

- **text** (string)

Text to show on widget item

- **selectable (optional)** (boolean)

If the widget item can be selected. If omitted the widget item will be selectable. Not used for RADIOBUTTON and TREE widgets.

Returns

WidgetItem object

Return type

WidgetItem

new WidgetItem(widget*[Widget]*, text*[string]*, relationship (optional)*[constant]*, relitem (optional)*[WidgetItem]*)

Description

Create a new WidgetItem object for a tree widget. If the widget argument is given and the relationship and relitem arguments are omitted then the widget item will be added as a root node in the tree. If the relationship and relitem arguments are also used then the item can be added at a specific location in the tree. Alternatively, the widget argument can be null, and the relationship and relitem arguments omitted, in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned to the tree later using Widget.AddWidgetItem()

Arguments

- **widget** (Widget)

Tree Widget that the widget item will be created in or null (if the relationship and relitem arguments are omitted)

- **text** (string)

Text to show on widget item

- **relationship (optional)** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem (optional)** (WidgetItem)

Existing WidgetItem to add item relative to

Returns

WidgetItem object

Return type

WidgetItem

Details of functions

FirstChild()

Description

Returns the first child WidgetItem or null if the WidgetItem has no children. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the first child widget item in a tree widget for widget item wi:

```
var cwi = wi.FirstChild();
```

NextSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the next sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.NextSibling();
```

Parent()

Description

Returns the parent WidgetItem or null if the WidgetItem has no parent. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the parent widget item in a tree widget for widget item wi:

```
var pwi = wi.Parent();
```

PreviousSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the previous sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.PreviousSibling();
```

Window class

The Window class allows you to create windows for a graphical user interface. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BottomBorder()
- BuildGUIFromString(guistring*[string]*)
- EndLoop()
- Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*)
- GetDirectory(initial (optional)*[string]*)
- GetFile(extension (optional)*[string]*, save (optional)*[boolean]*, initial (optional)*[string]*)
- GetFilename(title*[string]*, message*[string]*, extension (optional)*[string]*, initial (optional)*[string]*, save (optional)*[boolean]*)
- GetFiles(extension (optional)*[string]*)
- GetGraphicsWindowPosition()
- GetInteger(title*[string]*, message*[string]*, initial (optional)*[integer]*)
- GetNumber(title*[string]*, message*[string]*, initial (optional)*[real]*)
- GetPassword(title*[string]*, message*[string]*)
- GetString(title*[string]*, message*[string]*, initial (optional)*[string]*)
- Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*)
- MasterResolution()
- Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*)
- MiddleBorder()
- Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*)
- RightBorder()
- SetGraphicsWindowPosition(left*[real]*, right*[real]*, bottom*[real]*, top*[real]*)
- SetGraphicsWindowSize(width*[integer]*, height*[integer]*)
- StartLoop()
- Theme(theme (optional)*[constant]*)
- TopBorder()
- UpdateGUI()
- Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*)

Member functions

- Delete()
- Hide()
- Recompute()
- Redraw()
- Show(modal (optional)*[boolean]*)

Window constants

Name	Description
Window.CANCEL	Show CANCEL button
Window.NO	Show NO button
Window.NONMODAL	Allow Window.Error, Window.Question, Window.Warning etc windows to be non modal
Window.OK	Show OK button
Window.YES	Show YES button

Constants for Resizing/positioning

Name	Description
Window.BOTTOM	Bottom resizing/positioning of window
Window.CENTRE	Centre (horizontal) positioning of window
Window.LEFT	Left resizing/positioning of window
Window.MIDDLE	Middle (vertical) positioning of window
Window.REDUCE	Window is allowed to reduce in size when resizing
Window.RIGHT	Right resizing/positioning of window
Window.TOP	Top resizing/positioning of window

Constants for Themes

Name	Description
Window.THEME_CLASSIC	Use the Classic theme (Note: Not only the script will use this theme, the whole interface of the program will switch to classic)
Window.THEME_CURRENT	Use the current theme
Window.THEME_DARK	Use the Dark theme (Note: Not only the script will use this theme, the whole interface of the program will switch to dark)
Window.THEME_LIGHT	Use the Light theme (Note: Not only the script will use this theme, the whole interface of the program will switch to light)
Window.USE_OLD_UI_JS	Use the original, pre v17, theme (default). (Note:The interface of the program will NOT switch to old)

Window properties

Name	Type	Description
active	boolean	If true (default) then the window then the window is active and widgets in the window can be used. If false then the window is inactive and the widgets cannot be used.
background	constant	Window background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT ,or a colour returned by Colour.RGB().
bottom	real	bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)
height	real	height of window
keepOnTop	boolean	If true then the window will be kept "on top" of other windows. If false (default) then the window stacking order can be changed.
left	real	left coordinate of window in range 0.0 (left) to 1.0 (right)
maxWidgets (read only)	integer	The maximum number of widgets that can be made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see totalWidgets
onAfterShow	function	Function to call **after** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that certain actions are done after the window is shown. It can also be used to show another window so this enables multiple windows to be shown. To unset the function set the property to null.

onBeforeShow	function	Function to call **before** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that buttons are shown/hidden etc before the window is shown. Note that it cannot be used to show another window. Use onAfterShow for that. To unset the function set the property to null.
onClose	function	Function to call when a Window is closed by pressing the X on the top right of the window. This may be useful to ensure that certain actions are done after the window is closed. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
onHide	function	Function to call when a Window is hidden by calling Hide(). This may be useful to ensure that certain actions are done after the window is hidden. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
resize	constant	Window resizing. By default when a Window is shown it is allowed to resize on all sides (left, right, top and bottom) to try to make enough room to show the Widgets. The behaviour can be changed by using this property. It can be any combination (bitwise OR) of Window.LEFT, Window.RIGHT, Window.TOP or Window.BOTTOM or 0. In addition Window.REDUCE can also be added to allow the window to reduce in size when resizing. Note that when Window.Show is called this property is set to 0 (i.e. not to resize on any side).
right	real	right coordinate of window in range 0.0 (left) to 1.0 (right)
showClose	boolean	If true (default) then a close (X) button will automatically be added on the top right of the window. If false then no close button will be shown.
shown (read only)	boolean	true if window is currently shown, false if not
title	string	Window title
top	real	top coordinate of window in range 0.0 (bottom) to 1.0 (top)
totalWidgets (read only)	integer	The total number of widgets that have been made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see maxWidgets
width	real	width of window

Detailed Description

The Window class allows you to make windows that you can place Widgets in to create a graphical user interface. The Widget class also gives a number of static methods for convenience. e.g. Window.GetInteger(). The following very simple example displays some text in a window with a button that unmaps the window when it is pressed and the user confirms that they want to exit.

```
// Create window with title "Text" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Text", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 40, 1,  7, "Press OK to exit");
// Create button widget
var e = new Widget(w, Widget.BUTTON, 11, 30, 8, 14, "OK");
// Assign the onClick callback method to the function confirm_exit'
e.onClick  = confirm_exit;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm window
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered Yes then exit.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Widget class for more details.

Constructor

new Window(title*[string]*, left*[real]*, right*[real]*, bottom*[real]*, top*[real]*)

Description

Create a new Window object.

Arguments

- **title** (string)

Window title to show in title bar

- **left** (real)

left coordinate of window in range 0.0 (left) to 1.0 (right)

- **right** (real)

right coordinate of window in range 0.0 (left) to 1.0 (right)

- **bottom** (real)

bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)

- **top** (real)

top coordinate of window in range 0.0 (bottom) to 1.0 (top)

Returns

Window object

Return type

Window

Example

To create a Window 'Example' in the top right half of the screen:

```
var w = new Window('Example', 0.5, 1.0, 0.5, 1.0);
```

Details of functions

BottomBorder() [static]

Description

Returns the vertical position of the bottom border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the bottom border:

```
var b = Window.BottomBorder();
```

BuildGUIFromString(guistring*[string]*) [static]

Description

Builds a GUI from a JSON string created by the GUI builder.

Arguments

- **guistring** (string)

The string to create the GUI from

Returns

object containing the GUI

Return type

Object

Example

To create a GUI from the string json_string:

```
var gui = Window.BuildGUIFromString(json_string);
```

Delete()

Description

Deletes the window from PRIMER and returns any memory/resources used for the window. **This function should not normally need to be called**. However, in exceptional circumstances if a script recreates windows many times PRIMER may run out of USER objects on Microsoft Windows because of the way PRIMER creates and shows windows. To avoid this problem this method can be used to force PRIMER to return the resources for a window. **Do not use the Window object after calling this method**.

Arguments

No arguments

Returns

No return value

Example

To delete window w:

```
w.Delete();
```

EndLoop() [static]

Description

Ends an event loop started by Window.StartLoop()

Arguments

No arguments

Returns

No return value

Example

To end a blocking event loop started by Window.StartLoop():

```
Window.EndLoop();
```

Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*) [static]

Description

Show an error message in a window.

Arguments

- **title** (string)

Title for window.

- **error** (string)

Error message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show error *Critical error!\nAbort?* in window with title *Error* with Yes and No buttons:

```
var answer = Window.Error("Error", "Critical error!\nAbort?", Window.YES |
Window.NO);
if (answer == Window.YES) Exit();
```

GetDirectory(initial (optional)*[string]*) [static]

Description

Map the directory selector box native to your machine, allowing you to choose a directory. On Unix this will be a Motif selector. Windows will use the standard windows directory selector.

Arguments

- **initial (optional)** (string)

Initial directory to start from.

Returns

directory (string), (or null if cancel pressed).

Return type

String

Example

To select a directory:

```
var dir = Window.GetDirectory();
```

GetFile(extension (optional)*[string]*, save (optional)*[boolean]*, initial (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose a file. See also Window.GetFiles() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

- **initial (optional)** (string)

Initial directory to start from.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To select a file using extension '.key':

```
var file = Window.GetFile(".key");
```

GetFilename(title*[string]*, message*[string]*, extension (optional)*[string]*, initial (optional)*[string]*, save (optional)*[boolean]*) [static]

Description

Map a window allowing you to input a filename (or select it using a file selector). OK and Cancel buttons are shown. See also Window.GetFile().

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **extension (optional)** (string)

Extension to filter by.

- **initial (optional)** (string)

Initial value.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native

operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To create an file input window with title *Choose file* and message *Choose the file to open* and return the filename input:

```
var filename = Window.GetFilename("Choose file", "Choose the file to open");
```

GetFiles(extension (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose multiple files. See also Window.GetFile() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

Returns

Array of filenames (strings), or null if cancel pressed.

Return type

String

Example

To select multiple files using extension '.key':

```
var files = Window.GetFiles(".key");
```

GetGraphicsWindowPosition() [static]

Description

This function returns the current position of the graphics window.

Arguments

No arguments

Returns

Array of numbers containing the left, right, bottom and top positions (in the range 0.0 to 1.0)

Return type

Number

Example

To get the current position of the graphics window:

```
var pos = Window.GetGraphicsWindowPosition();
var l = pos[0];
var r = pos[1];
var b = pos[2];
var t = pos[3];
```

GetInteger(title*[string]*, message*[string]*, initial (optional)*[integer]*) [static]

Description

Map a window allowing you to input an integer. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (integer)

Initial value.

Returns

value input (integer), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input integer* and return the value input:

```
var value = Window.GetInteger("Input", "Input integer");
```

GetNumber(title*[string]*, message*[string]*, initial (optional)*[real]*) [static]

Description

Map a window allowing you to input a number. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (real)

Initial value.

Returns

value input (real), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input number* and return the value input:

```
var value = Window.GetNumber("Input", "Input number");
```

GetPassword(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input a password. OK and Cancel buttons are shown.
This is identical to Window.GetString except the string is hidden and no initial value can be given.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns

value input (string), or null if cancel pressed.

Return type

String

Example

To create an input window with title *Input* and message *Input password* and return the value input:

```
var value = Window.GetPassword("Input", "Input password");
```

GetString(title*[string]*, message*[string]*, initial (optional)*[string]*) [static]

Description

Map a window allowing you to input a string. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (string)

Initial value.

Returns

value input (string), or null if cancel pressed.

Return type

String

Example

To create an input window with title *Input* and message *Input string* and return the value input:

```
var value = Window.GetString("Input", "Input string");
```

Hide()

Description

Hides (unmaps) the window. Also see the Window onHide property.

Arguments

No arguments

Returns

No return value

Example

To hide window w:

```
w.Hide();
```

Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*) [static]

Description

Show information in a window.

Arguments

- **title** (string)

Title for window.

- **info** (string)

Information to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show information *Information* in window with title *Example* with OK and Cancel buttons:

```
var answer = Window.Information("Example", "Information", Window.OK |
Window.CANCEL);
if (answer == Window.CANCEL) Message("You pressed the Cancel button");
```

MasterResolution() [static]

Description

Returns the resolution of the master programme window in pixels

Arguments

No arguments

Returns

Array of numbers containing x and y resolution in pixels

Return type

Number

Example

To get the resolution of the main window:

```
var res = Window.MasterResolution();
```

Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a message in a window.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show message *Press YES or NO* in window with title *Example* with YES and NO buttons:

```
var answer = Window.Message("Example", "Press YES or NO", Window.YES |
Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

MiddleBorder() [static]

Description

Returns the vertical position of the middle border (in range 0-1). The middle border is the border between the tools/keywords window and the docked windows. This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the middle border:

```
var b = Window.MiddleBorder();
```

Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a question in a window.

Arguments

- **title** (string)

Title for window.

- **question** (string)

Question to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted Yes and No button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show question *Do you want to continue?* in window with title *Question*:

```
var answer = Window.Question("Question", "Do you want to continue?");
if (answer == Window.NO) Message("You pressed No");
```

Recompute()

Description

Recomputes the positions of widgets in the window. If you have static widgets and 'normal' widgets in a window and you show and/or hide widgets the window needs to be recomputed to refresh the graphics, scroll bars etc. Calling this method will recompute and redraw the window.

Arguments

No arguments

Returns

No return value

Example

To recompute window w:

```
w.Recompute();
```

Redraw()

Description

Redraws the window. Sometimes if you show, hide or draw graphics on widgets the window needs to be redrawn to refresh the graphics. Calling this method will redraw the window refreshing the graphics.

Arguments

No arguments

Returns

No return value

Example

To redraw window w:

```
w.Redraw();
```

RightBorder() [static]

Description

Returns the horizontal position of the right border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the right border:

```
var b = Window.RightBorder();
```

SetGraphicsWindowPosition(left*[real]*, right*[real]*, bottom*[real]*, top*[real]*) [static]

Description

This function allows you to move or resize the graphics window.

Arguments

- **left** (real)

left coordinate of graphics window in range 0.0 (left) to 1.0 (right)

- **right** (real)

right coordinate of graphics window in range 0.0 (left) to 1.0 (right)

- **bottom** (real)

bottom coordinate of graphics window in range 0.0 (bottom) to 1.0 (top)

- **top** (real)

top coordinate of graphics window in range 0.0 (bottom) to 1.0 (top)

Returns

No return value

Example

To move/resize the graphics window to be in the top left half of the screen:

```
Window.SetGraphicsWindowPosition(0.0, 0.5, 0.5, 1.0);
```

SetGraphicsWindowSize(width*[integer]*, height*[integer]*) [static]

Description

This function allows you to resize the graphics window.

Arguments

- **width** (integer)

Width of the graphics window in pixels

- **height** (integer)

Height of the graphics window in pixels

Returns

No return value

Example

To resize the graphics window to be 400 pixels wide and 300 pixels high:

```
Window.SetGraphicsWindowSize(400, 300);
```

Show(modal (optional)*[boolean]*)

Description

Shows (maps) the window and waits for user input.

Arguments

- **modal (optional)** (boolean)

If this window is modal (true) then the user is blocked from doing anything else in PRIMER until this window is dismissed). If non-modal (false) then the user can still use other functions in PRIMER.
If omitted the window will be modal.
Note that making a window modal will stop interaction in all other windows and may prevent operations such as picking from working in any macros that are run from scripts.
Before version 21 PRIMER would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In PRIMER version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in PRIMER. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. In this case use Window.StartLoop().

Returns

No return value

Example

To show window w:

```
w.Show();
```

To show window w allowing the user to use other functions in PRIMER:

```
w.Show(false);
```

StartLoop() [static]

Description

Starts a blocking event loop in PRIMER. Before version 21 PRIMER would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In PRIMER version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in PRIMER. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. An example of this is using a keyout hook script, or if you want to give aprompt/question similarly to Window.Message() where you do **not** want to return to the main event loop. You want to block until the user has specified the action.
Window.StartLoop() can be used to start a local blocking, event loop. To terminate the event loop and resume execution of the script use Window.EndLoop()
Note that only a single loop can be active in PRIMER at any one time. i.e. they cannot be nested. Window.StartLoop() should be used as sparingly as possible and only used for specific short events (e.g. something like the equivalent of Window.Message() where you really do need to block) as if it is used in one script it will prevent it from being used in another script.

Arguments

No arguments

Returns

No return value

Example

To start a blocking event loop:

```
Window.StartLoop();
```

Theme(theme (optional)*[constant]*) [static]

Description

Set or get a user interface theme.

Arguments

- **theme (optional)** (constant)

If it is provided it is used to set the current theme. Can be either Window.USE_OLD_UI_JS, Window.THEME_CURRENT, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC.

Returns

Integer. When getting the theme one of: Window.USE_OLD_UI_JS, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC

Return type

Number

Example

To determine the current theme:

```
var ui = Window.Theme();
      if(ui == Window.THEME_DARK)
      {
          print("Theme is dark\n");
      }
      else if(ui == Window.THEME_LIGHT)
      {
          print("Theme is light\n");
      }
      else if(ui == Window.THEME_CLASSIC)
      {
          print("Theme is classic\n");
      }
      else
      {
          print("Theme is not set\n");
      }
```

To keep the original (pre v17) appearance of your JavaScript (default):

```
Window.Theme(Window.USE_OLD_UI_JS);
```

To use the current user interface theme:

```
Window.Theme(Window.THEME_CURRENT);
```

To use the dark user interface theme:

```
Window.Theme(Window.THEME_DARK);
```

TopBorder() [static]

Description

Returns the vertical position of the top border (in range 0-1). This can be used to help position windows on the screen. This is no longer used in PRIMER and will always be 1 but is left for backwards compatibility.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the top border:

```
var b = Window.TopBorder();
```

UpdateGUI() [static]

Description

Force GUI to be updated. This function is not normally needed but if you are doing a computationally expensive operation and want to update the GUI it may be necessary as the GUI update requests are cached until there is spare time to update them. Calling this function forces any outstanding requests to be flushed.

Arguments

No arguments

Returns

No return value

Example

To force update of GUI:

```
Window.UpdateGUI();
```

Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a warning message in a window.

Arguments

- **title** (string)

Title for window.

- **warning** (string)

Warning message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show warning *Title is blank\nSet to ID?* in window with title *Warning* with Yes and No buttons:

```
var answer = Window.Warning("Warning", "Title is blank\nSet to ID?", Window.YES
| Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

Workflow class

The Workflow class allows you to read and write workflow files. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- NumberOfModels(workflow_name (optional)*[string]*)
- Refresh()
- WorkflowDefinitionFilename(workflow_name (optional)*[string]*)
- WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*)
- WriteToModel(user_data*[object]*, model*[Model]*, workflow_definition_filename*[string]*, extra (optional)*[object]*)

Workflow constants

Constants for UnitSystem

Name	Description
Workflow.UNIT_SYSTEM_NONE	No unit system
Workflow.UNIT_SYSTEM_U1	U1 unit system (m, kg, s)
Workflow.UNIT_SYSTEM_U2	U2 unit system (mm, t, s)
Workflow.UNIT_SYSTEM_U3	U3 unit system (mm, kg, ms)
Workflow.UNIT_SYSTEM_U4	U4 unit system (mm, g, ms)
Workflow.UNIT_SYSTEM_U5	U5 unit system (ft, slug, s)
Workflow.UNIT_SYSTEM_U6	U6 unit system (m, t, s)

Detailed Description

The Workflow class gives you simple functions to read and write workflow files

Details of functions

ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the id of a model that has data for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the id for.

- **workflow_name (optional)** (string)

If defined the id of the model that has data for the named workflow is returned. If it is not specified it uses the name of the workflow selected by the user from the workflow menu.

Returns

integer

Return type

Number

Example

To get the id of the first model that has data for the workflow selected by the user

```
var id = Workflow.ModelIdFromIndex(0);
```

To get the id of the first model that has data for the specified workflow "Automotive Assessment"

```
var id = Workflow.ModelIdFromIndex(0, "Automotive Assessment");
```

ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the unit system of a model that has data for the selected workflow by index (starting at 0). Will be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Arguments

- **model_index** (integer)

The index of the model to return the unit system for.

- **workflow_name (optional)** (string)

The workflow name to return the unit system for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the first workflow unit system associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

integer

Return type

Number

Example

To get the unit system of the first model that has data for the workflow selected by the user

```
var unit_system = Workflow.ModelUnitSystemFromIndex(0);
```

To get the unit system of the second model that has data for the "Automotive Assessment" workflow

```
var unit_system = Workflow.ModelUnitSystemFromIndex(1, "Automotive Assessment");
```

ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the build number of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program build number for.

- **workflow_name (optional)** (string)

The workflow name to return the build number for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the build number for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the build number of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var build = Workflow.ModelUserDataBuildFromIndex(0);
```

To get the build number of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var build = Workflow.ModelUserDataBuildFromIndex(1, "Automotive Assessment");
```

ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the user data associated with a model that has data for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the user data for.

- **workflow_name (optional)** (string)

The workflow name to return the user data for. If it is not specified it uses the name of the workflow selected by the user from the workflow menu.

Returns

object

Return type

Object

Example

To get the user data for the first model that has data for the workflow selected by the user

```
var user_data = Workflow.ModelUserDataFromIndex(0);
```

To get the user data for the second model that has data for the "Automotive Assessment" workflow

```
var user_data = Workflow.ModelUserDataFromIndex(1, "Automotive Assessment");
```

ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the name of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program name for.

- **workflow_name (optional)** (string)

The workflow name to return the program name for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the program name for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

string

Return type

String

Example

To get the name of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var program = Workflow.ModelUserDataProgramFromIndex(0);
```

To get the name of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var program = Workflow.ModelUserDataProgramFromIndex(1, "Automotive
Assessment");
```

ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the version of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program version for.

- **workflow_name (optional)** (string)

The workflow name to return the version for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the version for the first user data associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the version of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var version = Workflow.ModelUserDataVersionFromIndex(0);
```

To get the version of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var version = Workflow.ModelUserDataVersionFromIndex(1, "Automotive
Assessment");
```

NumberOfModels(workflow_name (optional)*[string]*) [static]

Description

Returns the number of models that have data for the workflow selected by the user.

Arguments

- **workflow_name (optional)** (string)

If defined the number of models that have data for the named workflow is returned. If not defined the number of models that have data for the workflow selected by the user on the workflow menu is returned

Returns

integer

Return type

Number

Example

To get the number of models that have data

```
var n = Workflow.NumberOfModels();
```

Refresh() [static]

Description

Scan for fresh workflow data

Arguments

No arguments

Returns

No return value

Example

```
Workflow.Refresh();
```

WorkflowDefinitionFilename(workflow_name (optional)*[string]*) [static]

Description

Returns the workflow definition filename

Arguments

- **workflow_name (optional)** (string)

The workflow name to return the workflow defintion filename for. If it is not specified it uses the name of the workflow selected by the user from the workflow menu.

Returns

string

Return type

String

Example

To get the worklow definition filename that the script has been run with

```
var workflow_definition_filename = Workflow.WorkflowDefinitionFilename();
```

WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*) [static]

Description

Writes a workflow to a JSON file. If the file already exists the workflow is added to the file (or updated if it is already in the file).

Arguments

- **user_data** (object)

Object containing user data required for the workflow.

- **output_filename** (string)

Filename to write to.

- **workflow_definition_filename** (string)

Filename of the workflow definition file.

- **extra (optional)** (object)

Extra workflow information

Object has the following properties:

Name	Type	Description

model_unit_system (optional)	integer	The model unit system. Can be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Returns

No return value

Example

To write the file "C:\my_workflow.json" with some user data and the contents of the workflow definition file "C:\workflows\my_workflow_definition.json"

```
      var user_data = { part_ids: [1, 2, 10, 100], node_ids: [12, 23, 24] };
      Workflow.WriteToFile(user_data, "C:\\my_workflow.json",
"C:\\workflows\\my_workflow_definition.json");
```

WriteToModel(user_data*[object]*, model*[Model]*, workflow_definition_filename*[string]*, extra (optional)*[object]*) [static]

Description

Writes a workflow to a model (updating it if it already exists)

Arguments

- **user_data** (object)

Object containing user data required for the workflow.

- **model** (Model)

Model to write to.

- **workflow_definition_filename** (string)

Filename of the workflow definition file.

- **extra (optional)** (object)

Extra workflow information

Object has the following properties:

Name	Type	Description
model_unit_system (optional)	integer	The model unit system. Can be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Returns

No return value

Example

To write the workflow to the first model with some user data and the contents of the workflow definition file "C:\workflows\my_workflow_definition.json"

```
      var user_data = { part_ids: [1, 2, 10, 100], node_ids: [12, 23, 24] };
      var m = Model.First();
      Workflow.WriteToModel(user_data, m, "C:\\workflows\\my_workflow_
definition.json");
```

XlsxWorkbook class

The XlsxWorkbook class enables writing xlsx files. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Close()

XlsxWorkbook properties

Name	Type	Description
filename (read only)	string	Name of the xlsx file

Detailed Description

The XlsxWorkbook class provides functions to enable you to create xlsx files. The following simple example shows how to write a xlsx file:

```
 var workbook = new XlsxWorkbook("C:/temp/test.xlsx");
var worksheet = new XlsxWorksheet(workbook);
worksheet.AddText(0, 0, "Hello world!");
worksheet.AddNumber(1, 0, 1.2345);
worksheet.AddImage(2, 0, "image.png");
workbook.Close();
```

Constructor

new XlsxWorkbook(filename*[string]*)

Description

Create a new XlsxWorkbook object for writing xlsx files.

Arguments

- **filename** (string)

Filename of the xlsx file you want to write. The file will be overwritten (if it exists).

Returns

XlsxWorkbook object

Return type

XlsxWorkbook

Example

To create a new XlsxWorkbook object to write Xlsx file "/data/test/file.xlsx"

```
var workbook = new XlsxWorkbook("/data/test/file.xlsx");
```

Details of functions

Close()

Description

Close a Xlsx file

Arguments

No arguments

Returns

No return value

Example

To close Xlsx file workbook:

```
workbook.Close();
```

XlsxWorksheet class

Member functions

- AddImage(row*[integer]*, column*[integer]*, filename*[string]*)
- AddNumber(row*[integer]*, column*[integer]*, value*[number]*)
- AddText(row*[integer]*, column*[integer]*, text*[string]*)
- SetColumnProperties(column*[integer]*, width*[number]*)
- SetRowProperties(row*[integer]*, height*[number]*)

Constructor

new XlsxWorksheet(workbook*[XlsxWorkbook object]*, name (optional)*[string]*)

Description

Create a new XlsxWorksheet object for writing xlsx files.

Arguments

- **workbook** (XlsxWorkbook object)

The workbook to create the worksheet in.

- **name (optional)** (string)

The name of the worksheet. If omitted the default names 'Sheet1', 'Sheet2' etc will be used.

Returns

XlsxWorksheet object

Return type

XlsxWorksheet

Example

To create a new worksheet in workbook

```
var worksheet = new XlsxWorksheet(workbook);
```

Details of functions

AddImage(row*[integer]*, column*[integer]*, filename*[string]*)

Description

Add an image to the Xlsx file. Note that the image will not actually be read/inserted until the workbook is written by calling XlsxWorkbook.Close so you must make sure the image file exists until then.

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **filename** (string)

Name of the image file you want to add to the xlsx file. The image can be in png or jpeg format.

Returns

No return value

Example

To add image 'C:/temp/test.png' to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddImage(1, 2, 'C:/temp/test.png');
```

AddNumber(row*[integer]*, column*[integer]*, value*[number]*)

Description

Add number to the Xlsx file

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **value** (number)

Number you want to add to the xlsx file

Returns

No return value

Example

To add number 1.2345 to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddNumber(1, 2, 1.2345);
```

AddText(row*[integer]*, column*[integer]*, text*[string]*)

Description

Add text to the Xlsx file

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **text** (string)

Text you want to add to the xlsx file

Returns

No return value

Example

To add text 'test' to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddText(1, 2, 'test');
```

SetColumnProperties(column*[integer]*, width*[number]*)

Description

Set the column properties in the worksheet

Arguments

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **width** (number)

Width of the column to set

Returns

No return value

Example

To set the width of the third column in XlsxWorksheet worksheet to 30:

```
worksheet.SetColumnProperties(2, 30);
```

SetRowProperties(row*[integer]*, height*[number]*)

Description

Set the row properties in the worksheet

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **height** (number)

Height of the row to set

Returns

No return value

Example

To set the height of the third row in XlsxWorksheet worksheet to 20:

```
worksheet.SetRowProperties(2, 20);
```

XMLParser class

The XMLParser class enables reading data from XML files. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Parse(filename*[string]*)

XMLParser properties

Name	Type	Description
characterDataHandler	function	Function to call when character data is found. The function will be called with 1 argument which is a string containing the character data
commentHandler	function	Function to call when a comment is found. The function will be called with 1 argument which is a string containing the text inside the comment
endCDATAHandler	function	Function to call at the end of a CDATA section. The function does not have any arguments.
endElementHandler	function	Function to call when an element end tag is found. The function will be called with 1 argument which is a string containing the name of the element
startCDATAHandler	function	Function to call at the start of a CDATA section. The function does not have any arguments.
startElementHandler	function	Function to call when an element start tag is found. The function will be called with 2 arguments. Argument 1 is a string containing the name of the element. Argument 2 is an object containing the element attributes

Detailed Description

The XMLParser class provides a stream-oriented parser to enable you to read XML files. You register callback (or handler) functions with the parser and then parse the document. As the parser recognizes parts of the document, it will call the appropriate handler for that part (if you've registered one.) The document is fed to the parser in pieces. This allows you to parse really huge documents that won't fit into memory.
There are currently 6 handlers which can be set: XMLParser.startElementHandler, XMLParser.endElementHandler, XMLParser.characterDataHandler, XMLParser.commentHandler, XMLParser.startCDATAHandler and XMLParser.endCDATAHandler.
The following simple example shows how the parser could be used.

```
// Create a new parser object
var p = new XMLParser();
// assign handlers
p.startElementHandler  = startElem;
p.endElementHandler    = endElem;
p.characterDataHandler = text;
p.commentHandler       = comment;
// parse the file
p.Parse("/data/test.xml");
////////////////////////////////////////////////////////////////////////
function startElem(name, attr)
{
// handler to be called when a start element is found
// Print element name
```

```
    Println("START: " + name);
// Print attributes
    for (n in attr)
    {
        Println(" attr: " + n + "=" + attr[n]);
    }
}
function endElem(name)
{
// handler to be called when an end element is found
// Print element name
    Println("END: " + name);
}
function text(str)
{
// handler to be called when text is found
// Print text
    Println("TEXT: '" + str + "'");
}
function comment(str)
{
// handler to be called when a comment is found
// Print comment
    Println("COMMENT: '" + str + "'");
}
```

See the documentation below for more details.

Constructor

new XMLParser()

Description

Create a new XMLParser object for reading XML files.

Arguments

No arguments

Returns

XMLParser object

Return type

XMLParser

Example

To create a new XMLParser object

```
var p = new XMLParser();
```

Details of functions

Parse(filename*[string]*)

Description

starts parsing an XML file

Arguments

- **filename** (string)

XML file to parse

Returns

No return value

Example

To parse XML file "/data/test.xml"

```
var p = new XMLParser();
p.Parse("/data/test.xml");
```

Xrefs class

The Xrefs class gives you access to cross references. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- GetID(type*[string]*, pos*[integer]*) [deprecated]
- GetItemID(type*[string]*, pos*[integer]*)
- GetItemType(type*[string]*, pos*[integer]*)
- GetTotal(type*[string]*)
- GetType(n*[integer]*)

Xrefs properties

Name	Type	Description
numtypes (read only)	integer	The number of different types that this item is referenced by.
total (read only)	integer	The total number of cross references of all types to this item.

Detailed Description

The Xrefs class allows you to look at what things use an item. e.g. a node may be used on several shells. See the documentation below for more details.

Details of functions

GetID(type*[string]*, pos*[integer]*) [deprecated]

This function is deprecated in version 10.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Use Xrefs.GetItemID() instead.

Arguments

- **type** (string)

Use Xrefs.GetItemID() instead.

- **pos** (integer)

Use Xrefs.GetItemID() instead.

Returns

No return value

GetItemID(type*[string]*, pos*[integer]*)

Description

Returns the ID of the item in the reference list.

Arguments

- **type** (string)

The type of the item in the reference list (for a list of types see Appendix I of the PRIMER manual).

- **pos** (integer)

The position in the list for this item. **Note that positions start at 0, not 1**

Returns

ID of item

Return type

Number

Example

To list all of the xrefs for node n:

```
var xrefs = n.Xrefs();
for (var t=0; t<xrefs.numtypes; t++)
{
    var type = xrefs.GetType(t);
    var num  = xrefs.GetTotal(type);
    for (var ref=0; ref<num; ref++)
    {
        var id = xrefs.GetItemID(type, ref);
        Message(type + " " + id + "\n");
    }
}
```

GetItemType(type*[string]*, pos*[integer]*)

Description

Returns the type of the item in the reference list. This function is only required when trying to look at cross references to *DEFINE_CURVE items. These items are used in a slightly different way in PRIMER (each time a curve is used a 'LOADCURVE REFERENCE' structure is created to store things like the units and descriptions of each axis for the curve). If you try to get the cross references for a curve all the references will be of type 'LOADCURVE REFERENCE' and numtypes will be 1. GetItemID() will correctly return the ID of the item from the 'LOADCURVE REFERENCE' structure but to get the type of the item this function is required.

Arguments

- **type** (string)

The type of the item in the reference list (for a list of types see Appendix I of the PRIMER manual).

- **pos** (integer)

The position in the list for this item. **Note that positions start at 0, not 1**

Returns

type of item (String). For every item apart from *DEFINE_CURVE items this will be the same as the *type* argument.

Return type

String

Example

To list all of the xrefs for Curve c:

```
var xrefs = c.Xrefs();
for (var t=0; t<xrefs.numtypes; t++)
{
    var type = xrefs.GetType(t);
    var num  = xrefs.GetTotal(type);
    for (var ref=0; ref<num; ref++)
    {
        var id = xrefs.GetItemID(type, ref);
        var itype = xrefs.GetItemType(type, ref);
        Message(itype + " " + id + "\n");
    }
}
```

GetTotal(type*[string]*)

Description

Returns the total number of references of a type.

Arguments

- **type** (string)

The type of the item in the reference list (for a list of types see Appendix I of the PRIMER manual).

Returns

Number of refs (integer)

Return type

Number

Example

To find the total number of shell references that node n has:

```
var xrefs = n.Xrefs();
    var num  = xrefs.GetTotal("SHELL");
```

GetType(n*[integer]*)

Description

Returns the type for

Arguments

- **n** (integer)

The entry in the reference types that you want the type for. **Note that entries start at 0, not 1**

Returns

The type of the item (string)

Return type

String

Example

To list the types of items that have cross references for node n:

```
var xrefs = n.Xrefs();
for (var t=0; t<xrefs.numtypes; t++)
{
    var type = xrefs.GetType(t);
    var num  = xrefs.GetTotal(type);
    Message(num + " references of type " + type + "\n");
}
```

Zip class

The Zip class enables reading/writing/creating zip files. More...

The PRIMER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- AddFile(filename*[string]*, zipname*[string]*)
- Close()
- Information()
- Next()
- ReadFile(filename*[string]*)

Zip constants

Name	Description
Zip.APPEND	Flag to open zip file for appending
Zip.READ	Flag to open zip file for reading
Zip.WRITE	Flag to open zip file for writing

Zip properties

Name	Type	Description
filename (read only)	string	Name of the zip file
mode (read only)	constant	Mode the zip file was opened with (Zip.READ, Zip.WRITE or Zip.APPEND)

Detailed Description

The Zip class provides functions to enable you to read, write and create zip files. The following simple example shows how to write a zip file and then read it again:

```
Message("Creating zip file");
var z = new Zip("C:/temp/test.zip", Zip.WRITE);
z.AddFile("C:/temp/bpost.key",   "bpost/bpost.key");
z.AddFile("C:/temp/door.key",    "door/door.key");
z.AddFile("C:/temp/barrier.key", "other.key");
z.Close();
Message("Done");
var entry = 0;
Message("Reading zip file");
var z = new Zip("C:/temp/test.zip", Zip.READ);
while (true)
{
    entry++;
    Message("Entry "+entry);
    var info = z.Information();
    for (var x in info)
        Message("    "+x+"="+info[x]);
    z.ReadFile(entry+".txt");
    if (!z.Next()) break;
```

```
}
z.Close();
Message("Done")
```

Constructor

new Zip(filename*[string]*, mode*[constant]*)

Description

Create a new Zip object for reading/writing zip files.

Arguments

- **filename** (string)

Filename of the zip file you want to read/write. If reading (Zip.READ) or appending (Zip.APPEND), the file must exist. If writing (Zip.WRITE) the file will be overwritten (if it exists).

- **mode** (constant)

The mode to open the file with. Can be Zip.READ, Zip.WRITE or Zip.APPEND.

Returns

Zip object

Return type

Zip

Example

To create a new Zip object to read Zip file "/data/test/file.zip"

```
var p = new Zip("/data/test/file.zip");
```

Details of functions

AddFile(filename*[string]*, zipname*[string]*)

Description

Add a file to the Zip file

Arguments

- **filename** (string)

Name of the file you want to add to the zip file

- **zipname** (string)

Name to give the file in the zip file

Returns

No return value

Example

To add file 'C:/temp/test.key' to Zip file z with zip name 'test.key':

```
z.AddFile('C:/temp/test.key', 'test.key');
```

Close()

Description

Close a Zip file

Arguments

No arguments

Returns

No return value

Example

To close Zip file z:

```
z.Close();
```

Information()

Description

Gets information for the current entry in the Zip file such as name, size etc

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
compressedSize	integer	Compressed size
crc	integer	Cyclic redundancy check
name	string	Filename
uncompressedSize	integer	Uncompressed size

Return type

object

Example

To get the information:

```
var info = z.Information();
for (var x in info) Println(x + '=' + info[x]);
```

Next()

Description

Go to the next entry in the Zip file

Arguments

No arguments

Returns

true if there is a next entry, false if there are no more entries

Return type

Boolean

Example

To go to the next entry in zip file z:

```
var next = z.Next();
```

ReadFile(filename*[string]*)

Description

Reads the current entry to a file from the Zip file

Arguments

- **filename** (string)

Name of the file you want to create

Returns

No return value

Example

To read the current entry in Zip file z to a file 'test.key':

```
z.ReadFile('test.key');
```

---

global class

The following pages list global class functions from PRIMER which can be used in D3PLOT.

Most of the D3PLOT functions are also in the global scope, but to make them easier to locate, they are presented in different categories (e.g. Contacts, CutSection, Data) in subsequent sections. They are also listed below in alphabetical order.

Class functions

- AllocateFlag()
- DialogueInput(command*[string]*)
- DialogueInputNoEcho(command*[string]*)
- ErrorMessage(string*[Any valid javascript type]*)
- Execute(data*[object]*)
- Exit(write hook interrupt (optional)*[boolean]*)
- ExitTHisLink()
- GetCurrentDirectory()
- GetInstallDirectory()
- GetPreferenceValue(program*[string]*, name*[string]*)
- GetStartInDirectory()
- Getenv(name*[string]*)
- Message(string*[Any valid javascript type]*)
- MilliSleep(time*[integer]*)
- NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*)
- OpenManual(program*[string]*, page*[string]*)
- Print(string*[Any valid javascript type]*)
- Println(string*[Any valid javascript type]*)
- ReturnFlag(flag*[Flag]*)
- SetCurrentDirectory(directory path*[string]*)
- Sleep(time*[integer]*)
- StartTHisLink()
- System(string*[Any valid javascript type]*)
- Unix()
- WarningMessage(string*[Any valid javascript type]*)
- Windows()

D3PLOT functions

- Blank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*)
- CreateUbinComponent(component_name*[string]*, component_type*[integer]*, data_type*[integer]*, if_existing*[integer]*, dispose (optional)*[integer]*, location (optional)*[integer or string]*)
- CreateWindow(model_list*[Array of integers|integer]*)
- DeleteUbinComponent(handle*[integer]*)
- DeleteWindow(window_list*[Array of numbers|number]*, dispose_flag (optional)*[integer]*)
- GetConditionParts(component*[integer]*, value*[real]*, mode*[integer]*, int_pt (optional)*[object|integer]*, extra (optional)*[integer]*)
- GetContourLimit(mode*[integer]*, component (optional)*[string]*)
- GetCutCoords(options*[object]*)
- GetCutCoords_#deprecated(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [deprecated]
- GetCutForces(options*[object]*)
- GetCutForces_#deprecated(window_id*[integer]*, include_blanked (optional)*[integer]*, part_id (optional)*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [deprecated]
- GetCutSection(options*[object]*)
- GetCutSection_#deprecated(window_id*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [deprecated]
- GetData(component*[integer]*, type_code*[integer]*, item*[integer]*, int_pt (optional)*[object|integer]*, extra (optional)*[integer]*, fr_of_ref (optional)*[integer]*, state_id (optional)*[integer]*, dda (optional)*[integer]*, consider_blanking (optional)*[integer]*, mag_or_cur (optional)*[integer]*)
- GetElemAxes(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- GetElemBetaAngle(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, int_pnt (optional)*[integer]*, state_id (optional)*[integer]*)
- GetElemsAtNode(node*[integer]*, type_code*[integer]*, state_id (optional)*[integer]*)
- GetElemsInPart(part_id*[integer]*, state_id (optional)*[integer]*)
- GetElemsInPly(ply_id*[integer]*, state_id (optional)*[integer]*)
- GetGroupInfo(group_id*[integer]*)
- GetIncludeInfo(include_id*[integer]*)
- GetItemsInSet(set_type*[integer]*, set_id*[integer]*)
- GetLabel(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)

- GetMid(type_code*[integer]*, item*[integer]*, layer_id (optional)*[integer]*, state_id (optional)*[integer]*)
- GetModelInfo(model_id (optional)*[integer]*, family_id (optional)*[integer]*)
- GetMultipleData(component*[integer]*, type_code*[integer]*, item_1*[integer]*, item_2*[integer]*, int_pt (optional)*[object|integer]*, extra (optional)*[integer]*, fr_of_ref (optional)*[integer]*, state_id (optional)*[integer]*, dda (optional)*[integer]*, consider_blanking (optional)*[integer]*, mag_or_cur (optional)*[integer]*)
- GetNumOnPlanIntPts(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- GetNumberOf(type_code*[integer]*, options (optional)*[object]*)
- GetNumberOf_#deprecated(type_code*[integer]*, state_id (optional)*[integer]*) [deprecated]
- GetPartInfo(part_id*[integer]*)
- GetPid(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- GetPlyIntPoint(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, state_id (optional)*[integer]*)
- GetPlysInLayup(layup_id*[integer]*, state_id (optional)*[integer]*)
- GetSegmsInSurface(surface_id*[integer]*)
- GetSetInfo(set_type*[integer]*, set_id*[integer]*)
- GetTime(state_id (optional)*[integer]*)
- GetTopology(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- GetUbinData(handle*[integer]*, item_type*[integer]*, item*[integer]*, int_pt*[object|integer]*, state_id (optional)*[integer]*)
- GetWindowFrame(window_id*[integer]*)
- GetWindowMaxFrame(window_id*[integer]*)
- GetWindowModels(window_id*[integer]*)
- IsBlanked(type_code*[integer]*, item*[integer]*, window_id (optional)*[integer]*)
- IsDeleted(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- IsSelected(type_code*[integer]*, item*[integer]*)
- IsVisible(type_code*[integer]*, item*[integer]*, window_id*[integer]*, state_id (optional)*[integer]*)
- LocateUbinComponent(component_name*[string]*)
- LockState(state_id*[integer]*)
- ModelExists(model_id*[integer]*)
- NumDeleted(type_code*[integer]*, state_id (optional)*[integer]*)
- Pick(type_code*[integer]*, number*[integer]*)
- PutUbinData(handle*[integer]*, item_type*[integer]*, item*[integer]*, int_pt*[object|integer]*, data*[real|array of reals]*, state_id (optional)*[integer]*)
- QueryDataPresent(component*[integer]*, type_code (optional)*[integer]*)
- RemoveCutDirection_#deprecated(options*[object]*) [deprecated]
- Select(type_code*[integer]*)
- SetCurrentModel(model_id*[integer]*)
- SetCurrentState(state_id*[integer]*)
- SetCutSection(options*[object]*)
- SetCutSection_#deprecated(window_id*[integer]*, attribute*[integer]*, value*[integer | array of reals | array of integers]*) [deprecated]
- SetWindowActive(window_id*[integer]*, active_flag*[integer]*)
- SetWindowFrame(window_id*[integer]*, frame_number*[integer]*)
- SpoolNodesInSurface(surface_id*[integer]*, index*[integer]*, side*[integer]*)
- Unblank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*)
- UnlockState(state_id*[integer]*)

Details of functions

AllocateFlag() [static]

Description

Allocate a flag for use in the script. See also ReturnFlag(). Once allocated the flag is automatically cleared for all the models currently in D3PLOT.

Arguments

No arguments

Returns

Flag to use

Return type

Flag

Example

To allocate a flag

```
var flag = AllocateFlag();
```

DialogueInput(command*[string]*) [static]

Description

Executes one or more command-line syntax commands. There is no limit to the number of lines that may be specified in a single call. See Dialogue Command Syntax for a full list of command-line commands

The DialogueInputNoEcho variant is identical, except that it suppresses the echo of the commands to the dialogue box.

D3PLOT provides a full command-line syntax as an alternative to graphical user interface commands, and a sequence of such commands may be provided here.

Note that:

- Each call to DialogueInput starts at the top of the D3PLOT command-line "tree", at the D3PLOT_MANAGER>>> prompt
- Each call is autonomous, there is no "memory" of where in the command-line tree previous commands finished.
- However within a single call the current command-line tree is remembered from one line to the next.
- Commands are not case-sensitive, although filenames and titles in command strings are.

Therefore commands which require more than one line of input to complete must be specified in a single call; and it makes sense to group a sequence of related commands together in a single call, although this is not mandatory.

If this succeeds it returns true, otherwise false.

Arguments

- **command** (string)

Command to be executed (as if it had been typed into the dialogue box)

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value

Example

```
// Blanks all solids.
// Unblanks solids 1 to 10.
// Performs a hidden line plot.
// All commands are echoed to the dialogue box
DialogueInput("BLANK SOLID ALL", "UNBLANK SOLID 1 to 10", "HIDDEN");
```

DialogueInputNoEcho(command*[string]*) [static]

Description

Executes one or more command-line syntax commands. There is no limit to the number of lines that may be specified in a single call. See Dialogue Command Syntax for a full list of command-line commands

This does not echo the commands to the dialogue box.

See DialogueInput for more information.

Arguments

- **command** (string)

Command to be executed (as if it had been typed into the dialogue box)

This argument can be repeated if required

Alternatively a single array argument containing the multiple values can be given

Returns

No return value

Example

```
// Read state 10
// Performed a shaded ("greyscale" in command-line syntax)plot
// Create a JPEG format file "image.jpg"
// Command is not echoed to the dialogue box.
DialogueInputNoEcho("STATE10", "/GREY GO", "/IMAGE jpeg image.jpg");
```

ErrorMessage(string*[Any valid javascript type]*) [static]

Description

Print an error message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as an error to the dialogue box

```
ErrorMessage("The title is " + m.title);
```

Execute(data*[object]*) [static]

Description

Execute a program or script outside D3PLOT and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to program
program	string	The program you want to run. Note that on Linux this will consider PATH when resolving executable filenames without an absolute path. If you want to run something from the current directory and you do not have '.' in your PATH then you will need to write './something' as the program.

Returns

Object with the following properties:

Name	Type	Description

status	integer	The exit code from the program/script
stderr	string	The standard error output from the program/script
stdout	string	The standard output from the program/script

Return type

object

Example

To run script "example.bat" with arguments "foo" and "bar":

```
var output = Execute( { program: 'example.bat', arguments: [ 'foo', 'bar' ]} );
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Exit(write hook interrupt (optional)*[boolean]*) [static]

Description

Exit script

Arguments

- **write hook interrupt (optional)** (boolean)

If Exit() is called from a write_hook.js script, the first argument will be processed as in the following: If the argument is provided and set to "true", it is used to interrupt the write out of the model, so that the script exits without anything being written out. An argument value of "false" exits the script and allows the model to be written out as normal. An example of this function's use in a Write Hook script can be found at $OA_INSTALL/primer_library/scripts/hooks/example_write_hook.js.

Returns

No return value

Example

Exit with

```
Exit();
```

ExitTHisLink() [static]

Description

Exits the T/HIS link from D3PLOT

Arguments

No arguments

Returns

No return value

GetCurrentDirectory() [static]

Description

Get the current working directory

Arguments

No arguments

Returns

String containing current working directory

Return type

String

Example

To get the current directory:

```
var cwd = GetCurrentDirectory();
```

GetInstallDirectory() [static]

Description

Get the directory in which executables are installed. This is the OA_INSTALL environment variable, or if that is not set the directory in which the current executable is installed. Returns NULL if not found

Arguments

No arguments

Returns

string

Return type

String

Example

To get the install directory:

```
var install_dir = GetInstallDirectory();
```

GetPreferenceValue(program*[string]*, name*[string]*) [static]

Description

Get the Preference value with the given string in the any of admin ("OA_ADMIN") or install ("OA_INSTALL") or home ("OA_HOME") directory oa_pref

Arguments

- **program** (string)

The program name string : Valid values are ’All’, ’D3PLOT’, ’PRIMER’, ’REPORTER’, ’SHELL’, ’T/HIS’

- **name** (string)

The preference name string

Returns

: String containing preference value or null if preference string is not present in any oa_pref. Also if none of the above environment variables are not present, then API simply returns null. While returning preference value, locked preference value in admin and then install oa_pref takes precedence over home oa_pref. If preference is not locked in any of these oa_pref, preference in home directory oa_pref is returned.

Return type

String

Example

To get the preference value:

```
var pref_list = GetPreferenceValue('All', "font_size");
```

GetStartInDirectory() [static]

Description

Get the directory passed to D3PLOT by the -start_in command line argument

Arguments

No arguments

Returns

String containing start_in directory or NULL if not set

Return type

String

Example

To get the start_in directory:

```
var start_in = GetStartInDirectory();
```

Getenv(name*[string]*) [static]

Description

Get the value of an environment variable

Arguments

- **name** (string)

The environment variable name

Returns

String containing variable value or null if variable does not exist

Return type

String

Example

To get the value for environment variable HOME

```
var home = Getenv("HOME");
```

Message(string*[Any valid javascript type]*) [static]

Description

Print a message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print. If '\r' is added to the end of the string then instead of automatically adding a carriage return in the dialogue box, the next message will overwrite the current one. This may be useful for giving feedback to the dialogue box when doing an operation.

Returns

No return value

Example

To print the title of model object m as a message to the dialogue box

```
Message("The title is " + m.title);
```

MilliSleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* milliseconds. See also Sleep()

Arguments

- **time** (integer)

Number of milliseconds to pause for

Returns

No return value

Example

To pause for 500 milliseconds

```
MilliSleep(500);
```

NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*) [static]

Description

Formats a number to a string with the specified width.

Arguments

- **number** (integer/real)

The number you want to format.

- **width** (integer)

The width of the string you want to format it to (must be less than 80).

- **pref_int (optional)** (boolean)

By default only integer values inside the single precision 32 bit signed integer limit of approximately +/-2e9 are formatted as integers, all other numeric values are formatted as floats. With this argument set to TRUE then integer values up to the mantissa precision of a 64 bit float, approximately +/-9e15, will also be formatted as integers.

Returns

String containing the number

Return type

String

Example

To write the number 1.2345e+6 to a string 10 characters wide

```
var str = NumberToString(1.2345e+6, 10);
```

OpenManual(program*[string]*, page*[string]*) [static]

Description

Open the Oasys manuals at a requested page

Arguments

- **program** (string)

The program manual to open. Can be "primer", "d3plot" or "this"

- **page** (string)

The page to open in the manual, e.g. "running-this.html"

Returns

true if successful, false if not

Return type

Boolean

Example

To open the T/HIS manual on the running-this.html page

```
OpenManual("this", "running-this.html");
```

Print(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!"

```
Print("Hello, world!");
```

To print the title of model object m with a carriage return

```
print("The title is " + m.title + "\n");
```

Println(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!" automatically adding a carriage return

```
Println("Hello, world!");
```

To print the title of model object m, automatically adding a carriage return

```
Println("The title is " + m.title);
```

ReturnFlag(flag*[Flag]*) [static]

Description

Return a flag used in the script. See also AllocateFlag().

Arguments

- **flag** (Flag)

The flag to return

Returns

No return value

Example

To return flag f:

```
ReturnFlag(f);
```

SetCurrentDirectory(directory path*[string]*) [static]

Description

Sets the current working directory.

Arguments

- **directory path** (string)

Path to the directory you would like to change into.

Returns

true if successful, false if not

Return type

Boolean

Example

To change into the directory "/data/test" exists

```
SetCurrentDirectory("/data/test")
```

Sleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* seconds. See also MilliSleep()

Arguments

- **time** (integer)

Number of seconds to pause for

Returns

No return value

Example

To pause for 2 seconds

```
Sleep(2);
```

StartTHisLink() [static]

Description

Starts the T/HIS link from D3PLOT

Arguments

No arguments

Returns

No return value

System(string*[Any valid javascript type]*) [static]

Description

Do a system command outside D3PLOT. To run an external command and get the output then please use Execute() instead.

Arguments

- **string** (Any valid javascript type)

The system command that you want to do

Returns

integer (probably zero if command successful but is implementation-dependant)

Return type

Number

Example

To make the directory "example"

```
System("mkdir example");
```

Unix() [static]

Description

Test whether script is running on a Unix/Linux operating system. See also Windows()

Arguments

No arguments

Returns

true if Unix/Linux, false if not

Return type

Boolean

Example

To test if the OS is Unix

```
if ( Unix() )
```

WarningMessage(string*[Any valid javascript type]*) [static]

Description

Print a warning message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as a warning to the dialogue box

```
WarningMessage("The title is " + m.title);
```

Windows() [static]

Description

Test whether script is running on a Windows operating system. See also Unix()

Arguments

No arguments

Returns

true if Windows, false if not

Return type

Boolean

Example

To test if the OS is Windows

```
if ( Windows() )
```

Beam class

The Beam class gives you access to beam elements in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(window*[GraphicsWindow]*, model*[Model]*)
- BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*)
- Last(model*[Model]*)
- Pick()
- Select(flag*[Flag]*)
- Total(model*[Model]*)
- TotalDeleted(model*[Model]*)
- UnblankAll(window*[GraphicsWindow]*, model*[Model]*)
- UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- Blank(window*[GraphicsWindow]*)
- Blanked(window*[GraphicsWindow]*)
- ClearFlag(flag*[Flag]*)
- Deleted()
- Flagged(flag*[Flag]*)
- ForceMoment(options (optional)*[object]*)
- GetData(component*[constant]*, options (optional)*[object]*)
- LocalAxes()
- Next()
- Previous()
- SetFlag(flag*[Flag]*)
- Topology()
- Unblank(window*[GraphicsWindow]*)

Beam properties

Name	Type	Description
data	real|array	Component data for a beam passed as an argument to GetMultipleData. Note that data will only exist for the instance of the beam passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the beam is in
index	integer	The internal index for the beam in D3PLOT
integrationPoints	integer	The number of integration points that the beam has
label	integer	The LS-DYNA label for the beam

material	Material	The Material the beam has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the beam is in
part	Part	The Part the beam is in
type	constant	The type for the beam (will be Type.BEAM)

Detailed Description

The Beam class allows you to inspect beam elements in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the beam in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the beam in

Returns

No return value

Example

To blank beam b in graphics window g:

```
b.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the beams in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the beams in

- **model** (Model)

Model that all the beams will be blanked in

Returns

No return value

Example

To blank all of the beams in model m, in graphics window gw:

```
Beam.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the beams in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the beams in

- **model** (Model)

Model that the flagged beams will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the beams to blank

Returns

No return value

Example

To blank all of the beams flagged with flag f in model m, in graphics window gw:

```
Beam.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the beam is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the beam is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if beam b is blanked in graphics window g:

```
if (b.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a beam

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the beam

Returns

No return value

Example

To clear flag f on beam b:

```
b.ClearFlag();
```

Deleted()

Description

Checks if the beam has been deleted or not

Arguments

No arguments

Returns

true if deleted, false if not

Return type

boolean

Example

To check if beam b has been deleted:

```
if (b.Deleted() ) do_something...
```

First(model*[Model]*) [static]

Description

Returns the first beam in the model (or null if there are no beams in the model)

Arguments

- **model** (Model)

Model to get first beam in

Returns

Beam object

Return type

Beam

Example

To get the first beam in model m:

```
var b = Beam.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the beams in the model with a defined flag

Arguments

- **model** (Model)

Model that all the beams will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the beams

Returns

No return value

Example

To flag all of the beams with flag f in model m:

```
Beam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the beam is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the beam

Returns

true if flagged, false if not

Return type

boolean

Example

To check if beam b has flag f set on it:

```
if (b.Flagged(f) ) do_something...
```

ForceMoment(options (optional)*[object]*)

Description

Returns the forces and moments for the beam

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1)

Returns

Array containing the forces and moments [Fx, Fy, Fz, Mxx, Myy, Mzz] (or null if the value cannot be calculated)

Return type

array

Example

To return the forces and moments of beam b:

```
var fm = b.ForceMoment();
if (fm !== null) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the beams in the model

Arguments

- **model** (Model)

Model that all the beams are in

Returns

Array of Beam objects

Return type

Array

Example

To get all of the beams in model m:

```
var b = Beam.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells

ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it's not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = b.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the beams in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged beams are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the beams to get

Returns

Array of Beam objects

Return type

Array

Example

To get all of the beams flagged with flag f in model m:

```
Beam.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Beam object for beam in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get beam in

- **label** (integer)

The LS-DYNA label for the beam in the model

Returns

Beam object

Return type

Beam

Example

To get the beam in model m with label 1000:

```
var b = Beam.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Beam object for beam in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get beam in

- **index** (integer)

The D3PLOT internal index in the model for beam

Returns

Beam object

Return type

Beam

Example

To get the beam in model m at index 50:

```
var b = Beam.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple beams. For each beam a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Beam objects to get the data for. All of the beams must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each beam with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for beams in array items and use the data property (note that in the example, the argument extra is optional):

```
Beam.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for beams in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Beam.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last beam in the model (or null if there are no beams in the model)

Arguments

- **model** (Model)

Model to get last beam in

Returns

Beam object

Return type

Beam

Example

To get the last beam in model m:

```
var b = Beam.Last(m);
```

LocalAxes()

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2D array. Beam elements must have 3 nodes to be able to return local axes.

Arguments

No arguments

Returns

array of arrays

Return type

Array

Example

To get the local axes for beam b:

```
var axes = b.LocalAxes();
var xAxis = [ axes[0][0], axes[0][1], axes[0][2] ];
var yAxis = [ axes[1][0], axes[1][1], axes[1][2] ];
var zAxis = [ axes[2][0], axes[2][1], axes[2][2] ];
```

Next()

Description

Returns the next beam in the model (or null if there is not one)

Arguments

No arguments

Returns

Beam object

Return type

Beam

Example

To get the next beam after beam b:

```
b = b.Next();
```

Pick() [static]

Description

Allows the user to pick a beam from the screen

Arguments

No arguments

Returns

Beam object or null if cancelled

Return type

Beam

Example

To pick a beam:

```
var b = Beam.Pick();
```

Previous()

Description

Returns the previous beam in the model (or null if there is not one)

Arguments

No arguments

Returns

Beam object

Return type

Beam

Example

To get the previous beam before beam b:

```
b = b.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects beams using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting beams

Returns

The number of beams selected or null if menu cancelled

Return type

integer

Example

To select beams, flagging those selected with flag f:

```
var total = Beam.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a beam

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the beam

Returns

No return value

Example

To set flag f on beam b:

```
b.SetFlag(f);
```

Topology()

Description

Returns the topology for the beam in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the topology for beam b:

```
var topology = b.Topology();
```

Total(model*[Model]*) [static]

Description

Returns the total number of beams in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of beams

Return type

integer

Example

To get the number of beams in model m:

```
var total = Beam.Total(m);
```

TotalDeleted(model*[Model]*) [static]

Description

Returns the total number of beams that have been deleted in a model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of beams that have been deleted

Return type

integer

Example

To get the number of beams in model m that have been deleted:

```
var total = Beam.TotalDeleted(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the beam in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the beam in

Returns

No return value

Example

To unblank beam b in graphics window g:

```
b.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the beams in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the beams in

- **model** (Model)

Model that all the beams will be unblanked in

Returns

No return value

Example

To unblank all of the beams in model m, in graphics window gw:

```
Beam.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the beams in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the beams in

- **model** (Model)

Model that the flagged beams will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the beams to unblank

Returns

No return value

Example

To unblank all of the beams flagged with flag f in model m, in graphics window gw:

```
Beam.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the beams in the model

Arguments

- **model** (Model)

Model that the defined flag for all beams will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the beams

Returns

No return value

Example

To unset flag f on all of the beams in model m:

```
Beam.UnflagAll(m, f);
```

Colour class

The Colour class contains constants relating to colours. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetFromName(name*[string]*)
- RGB(red*[integer]*, green*[integer]*, blue*[integer]*)

Colour constants

Name	Description
Colour.BLACK	Colour black
Colour.BLUE	Colour blue
Colour.CYAN	Colour cyan
Colour.DARK_ORANGE	Colour dark orange
Colour.DEFAULT	Default colour for objects
Colour.GREEN	Colour green
Colour.GREEN_CYAN	Colour green/cyan
Colour.GREY	Colour grey
Colour.LIGHT_BLUE	Colour light blue
Colour.MAGENTA	Colour magenta
Colour.MEDIUM_BLUE	Colour medium blue
Colour.ORANGE	Colour orange
Colour.RED	Colour red
Colour.RED_MAGENTA	Colour red/magenta
Colour.WHITE	Colour white
Colour.YELLOW	Colour yellow
Colour.YELLOW_GREEN	Colour yellow/green

Detailed Description

The Colour class is used to define colours, either by predefined colours or by RGB values. The easiest way to set the colour of something is to use the predefined colour constants. e.g. to set the colour of part p to red:

```
p.colour = Colour.RED;
```

For other colours use Colour.RGB().

Details of functions

GetFromName(name*[string]*) [static]

Description

Returns the colour for a given core or user colour name

Arguments

- **name** (string)

The name of the colour, for example red or user_green or green/cyan.

Returns

colour value (integer)

Return type

Number

RGB(red*[integer]*, green*[integer]*, blue*[integer]*) [static]

Description

Creates a colour from red, green and blue components

Arguments

- **red** (integer)

red component of colour (0-255).

- **green** (integer)

green component of colour (0-255).

- **blue** (integer)

blue component of colour (0-255).

Returns

colour value (integer)

Return type

Number

Component class

The Component class gives you access to user defined binary components in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First()
- GetFromID(number*[integer]*)
- GetFromName(name*[string]*)
- Last()
- Total()

Member functions

- Delete()
- GetData(item*[Node|Beam|Shell|Solid|Tshell]*, options (optional)*[object]*)
- Next()
- Previous()
- PutData(item*[Node|Beam|Shell|Solid|Tshell]*, data*[real|array]*, options (optional)*[object]*)

Component constants

Constants for ALE Data Components

Name	Description
Component.ADENS	ALE denisty
Component.ADOMF	ALE dominant fraction
Component.AMMG	ALE multi-material group id
Component.AMMS	ALE multi-material group mass

Constants for Basic and Integrated Beam Force/Moment Data Components

Name	Description
Component.BFMV	Force and moment vector [BFX, BFY, BFZ, BMXX, BMYY, BMZZ]
Component.BFR	Force magnitude
Component.BFX	X axial force
Component.BFY	Y axial force
Component.BFZ	Z axial force
Component.BMX	Extra beam data
Component.BMXX	XX torsional moment
Component.BMYY	YY bending moment
Component.BMZZ	ZZ bending moment

Component.BRM	Moment magnitude

Constants for Basic and Integrated Beam Strain Data Components

Name	Description
Component.BEAX	Axial strain
Component.BEP	Effective plastic strain

Constants for Basic and Integrated Beam Stress Data Components

Name	Description
Component.BSXX	Axial stress
Component.BSXY	XY shear stress
Component.BSZX	ZX shear stress

Constants for Belytschko-Schwer Resultant Beam Energy Data Components

Name	Description
Component.BAED	Axial energy density
Component.BAEN	Axial energy
Component.BBED	Bending energy density
Component.BIE	Internal energy
Component.BIED	Internal energy density

Constants for Belytschko-Schwer Resultant Beam Moment Data Components

Name	Description
Component.BMY1	Y moment at end 1
Component.BMY2	Y moment at end 2
Component.BMZ1	Z moment at end 1
Component.BMZ2	Z moment at end 2

Constants for Belytschko-Schwer Resultant Beam Rotation Data Components

Name	Description
Component.BRXX	Torsional rotation
Component.BRY1	Y rotation at end 1
Component.BRY2	Y rotation at end 2
Component.BRZ1	Z rotation at end 1
Component.BRZ2	Z rotation at end 2

Constants for Belytschko-Schwer Resultant Beam Strain Data Components

Name	Description

Component.BPE1	Plastic energy at end 1
Component.BPE2	Plastic energy at end 2
Component.BSAX	Total axial strain

Constants for Contact Surface Data Components (if a .ctf file has been read)

Name	Description
Component.CAREA	Contact segment area
Component.CFGX	Contact global X force
Component.CFGY	Contact global Y force
Component.CFGZ	Contact global Z force
Component.CFLX	Contact local X force
Component.CFLY	Contact local Y force
Component.CFLZ	Contact local Z force
Component.CFM	Contact force magnitude
Component.CSN	Contact normal stress
Component.CST	Contact tangential stress
Component.CSX	Contact local X stress
Component.CSY	Contact local Y stress

Constants for Element Plastic Strain Data Components

Name	Description
Component.EPL	Effective plastic strain
Component.ERATE	Strain rate
Component.PEMAG	Plastic strain magnitude

Constants for Element Plastic Strain Derived Data Components

Name	Description
Component.PEAV	Average plastic strain
Component.PEMAX	Max principal plastic strain
Component.PEMID	Middle principal plastic strain
Component.PEMIN	Min principal plastic strain
Component.PEMS	Max plastic shear strain

Constants for Element Plastic Strain Tensor Data Components

Name	Description
Component.PETEN	Plastic strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]
Component.PEXX	X Plastic strain
Component.PEXY	XY Plastic shear strain
Component.PEYY	Y Plastic strain

Component.PEYZ	XY Plastic shear strain
Component.PEZX	ZX Plastic shear strain
Component.PEZZ	Z Plastic strain

Constants for Element Strain Derived Data Components

Name	**Description**
Component.E2MAX	2D (in-plane) max principal strain
Component.E2MIN	2D (in-plane) min principal strain
Component.E2SHEAR	2D (in-plane) max shear strain
Component.EAV	Average strain
Component.EMAX	Max prinicipal strain
Component.EMID	Middle prinicipal strain
Component.EMIN	Min prinicipal strain
Component.EMS	Max shear strain
Component.ENGMAJ	Engineering Major strain
Component.ENGMIN	Engineering Minor strain
Component.ENGTHK	Engineering Thickness strain
Component.ERATIO	2D (in-plane) principal strain ratio
Component.EVON	von Mises strain
Component.SED	Strain energy density

Constants for Element Strain Tensor Data Components

Name	**Description**
Component.ETEN	Strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]
Component.EXX	X strain
Component.EXY	XY shear strain
Component.EYY	Y strain
Component.EYZ	YZ shear strain
Component.EZX	ZX shear strain
Component.EZZ	Z strain

Constants for Element Stress Derived Data Components

Name	**Description**
Component.LODE_A	Lode angle
Component.LODE_P	Lode parameter
Component.LODE_PA	Lode parameter alt
Component.S2MAX	2D (in-plane) max principal stress
Component.S2MIN	2D (in-plane) min principal stress
Component.S2SHEAR	2D (in-plane) max shear stress

Component.SAV	Average stress (pressure)
Component.SMAX	Max principal stress
Component.SMID	Middle principal stress
Component.SMIN	Min principal stress
Component.SMS	Max shear stress
Component.SVON	signed von Mises stress
Component.TRI	Triaxiality
Component.YUTF	Yield Utilisation Factor
Component.YUTP	Yield Utilisation Percentage

Constants for Element Stress Tensor Data Components

Name	**Description**
Component.STEN	Stress tensor [SXX, SYY, SZZ, SXY, SYZ, SZX]
Component.SXX	X stress
Component.SXY	XY stress
Component.SYY	Y stress
Component.SYZ	YZ stress
Component.SZX	ZX stress
Component.SZZ	Z stress

Constants for Element Thermal Strain Derived Data Components

Name	**Description**
Component.TEAV	Average thermal strain
Component.TEMAX	Max principal thermal strain
Component.TEMID	Middle principal thermal strain
Component.TEMIN	Min principal thermal strain
Component.TEMS	Max thermal shear strain

Constants for Element Thermal Strain Tensor Data Components

Name	**Description**
Component.TETEN	Thermal strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]
Component.TEXX	X Thermal strain
Component.TEXY	XY Thermal shear strain
Component.TEYY	Y Thermal strain
Component.TEYZ	XY Thermal shear strain
Component.TEZX	ZX Thermal shear strain
Component.TEZZ	Z Thermal strain

Constants for Global Energy Data Components

Name	Description
Component.GIE	Internal energy
Component.GKE	Kinetic energy
Component.GTE	Total energy

Constants for Global Mass Data Components

Name	Description
Component.GMASS	Mass

Constants for Global Momentum Data Components

Name	Description
Component.GMM	Momentum magnitude
Component.GMX	X Momentum
Component.GMY	Y Momentum
Component.GMZ	Z Momentum

Constants for Global Velocity Data Components

Name	Description
Component.GVM	Velocity magnitude
Component.GVX	X Velocity
Component.GVY	Y Velocity
Component.GVZ	Z Velocity

Constants for LSDA (binout) Database Cross Section Data Components

Name	Description
Component.XSEC_A	Database X-sect area
Component.XSEC_F	Database X-sect force (vector data)
Component.XSEC_M	Database X-sect moment (vector data)

Constants for LSDA (binout) Retractor Data Components

Name	Description
Component.RT_F	Retractor force
Component.RT_P	Retractor pull-out

Constants for LSDA (binout) SPC Data Components

Name	Description
Component.SPC_F	SPC force (vector data at nodes)
Component.SPC_M	SPC moment (vector data at nodes)

Constants for LSDA (binout) Seatbelt Data Components

Name	Description
Component.SB_F	Seatbelt axial force
Component.SB_L	Seatbelt length

Constants for LSDA (binout) Slipring Data Components

Name	Description
Component.SR_P	Slipring pull-through

Constants for LSDA (binout) Spotweld Data Components

Name	Description
Component.SW_F	Spotweld axial force
Component.SW_FAIL	Spotweld failure
Component.SW_S	Spotweld shear force
Component.SW_TIME	Spotweld failure time
Component.SW_TRSN	Spotweld torsion moment

Constants for LSDA (binout) Spring Data Components

Name	Description
Component.SP_E	Spring elongation
Component.SP_F	Spring axial force
Component.SP_M	Spring torsional moment
Component.SP_R	Spring rotation

Constants for Material Data Components for PARTs and Part-based elems (needs .ZTF file)

Name	Description
Component.DENS	Material density
Component.FSTRN	Failure strain
Component.PRAT	Poisson’s ratio
Component.YMOD	Young’s modulus
Component.YSTRS	Yield stress

Constants for Nastran OP2 Beam Data Components

Name	Description
Component.BENL	Energy loss
Component.BENLD	Energy loss density

Component.BENLP	Energy loss percentage
Component.BKEN	Kinetic energy
Component.BKEND	Kinetic energy density
Component.BKENP	Kinetic energy percentage
Component.BSEN	Strain energy
Component.BSEND	Strain energy density
Component.BSENP	Strain energy percentage

Constants for Nodal Data Components

Name	**Description**
Component.AM	Acceleration magnitude
Component.AV	Acceleration vector [AX, AY, AZ]
Component.AX	X acceleration
Component.AY	Y acceleration
Component.AZ	Z acceleration
Component.BV	Basic (undeformed) vector [BX, BY, BZ]
Component.BX	Basic (undeformed) X coordinate
Component.BY	Basic (undeformed) Y coordinate
Component.BZ	Basic (undeformed) Z coordinate
Component.CV	Current vector [CX, CY, CZ]
Component.CX	Current X coordinate
Component.CY	Current Y coordinate
Component.CZ	Current Z coordinate
Component.DM	Displacement magnitude
Component.DV	Displacement vector [DX, DY, DZ]
Component.DX	X displacement
Component.DY	Y displacement
Component.DZ	Z displacement
Component.RAM	Rotation acceleration magnitude
Component.RAV	Rotation acceleration vector [RAX, RAY, RAZ]
Component.RAX	X rotation acceleration
Component.RAY	Y rotation acceleration
Component.RAZ	Z rotation acceleration
Component.RDM	Rotation displacement magnitude
Component.RDV	Rotation displacement vector [RDX, RDY, RDZ]
Component.RDX	X rotation displacement
Component.RDY	Y rotation displacement
Component.RDZ	Z rotation displacement
Component.RVM	Rotation velocity magnitude

Component.RVV	Rotation velocity vector [RVX, RVY, RVZ]
Component.RVX	X rotation velocity
Component.RVY	Y rotation velocity
Component.RVZ	Z rotation velocity
Component.VM	Velocity magnitude
Component.VV	Velocity vector [VX, VY, VZ]
Component.VX	X velocity
Component.VY	Y velocity
Component.VZ	Z velocity

Constants for Shell and Solid Data Components

Name	**Description**
Component.AREA	Area
Component.DTDT	dTemp / dTime
Component.EDEN	Internal energy density
Component.EMASS	Mass
Component.ENL	Energy loss (Nastran OP2 results only)
Component.ENLD	Energy loss density (Nastran OP2 results only)
Component.ENLP	Energy loss percentage (Nastran OP2 results only)
Component.HGEN	Hourglass energy
Component.KEN	Kinetic energy (Nastran OP2 results only)
Component.KEND	Kinetic energy density (Nastran OP2 results only)
Component.KENP	Kinetic energy percentage (Nastran OP2 results only)
Component.MADD	Added mass
Component.RFX	X force resultant
Component.RFXY	XY force resultant
Component.RFY	Y force resultant
Component.RMX	MX moment resultant
Component.RMXY	MXY moment resultant
Component.RMY	MY moment resultant
Component.RQX	XZ shear force resultant
Component.RQY	YZ shear force resultant
Component.RVOL	Relative volume (solid)
Component.SEN	Strain energy (Nastran OP2 results only)
Component.SEND	Strain energy density (Nastran OP2 results only)
Component.SENP	Strain energy percentage (Nastran OP2 results only)
Component.SHX	Extra shell and thick shell data
Component.SOX	Extra solid data
Component.TBOT	Nodal (shell) bottom surface temperature

Component.TEMP	Nodal temperature
Component.TFM	Temperature magnitude
Component.TFV	Temperature vector [TFX, TFY, TFZ]
Component.TFX	X temperature flux
Component.TFY	Y temperature flux
Component.TFZ	Z temperature flux
Component.THK	Thickness
Component.TMID	Nodal (shell) middle surface temperature
Component.TSTP	Timestep
Component.TTOP	Nodal (shell) top surface temperature
Component.VOL	Volume (solid)

Constants for User defined binary component data type

Name	Description
Component.SCALAR	Scalar data (1 value)
Component.TENSOR	Tensor data (6 values)
Component.VECTOR	Vector data (3 values)

Constants for User defined binary component existing action

Name	Description
Component.RENAME	Renames the name of the component by adding a suffix to make it unique so any existing component of this name (and data) will be left unchanged and the new one will not clash with it
Component.REPLACE	Replaces any existing component, replacing it with this definition. This means that any existing data for the user-defined component of this name is deleted and the component is re-initialised

Constants for User defined binary component location

Name	Description
Component.IN_CORE	held in memory

Constants for User defined binary component type

Name	Description
Component.BEAM	User-defined beam component
Component.NODE	User-defined nodal component
Component.OTHER	User-defined other (LSDA) component
Component.SOLID_SHELL_TSHELL	User-defined solid, shell and thick shell component

Constants for user

Name	Description
Component.UBMS	Beam scalar

Component.UBMV	Beam vector
Component.UNOS	Node scalar
Component.UNOV	Node vector
Component.USSS	Solid and shell scalar
Component.USST	Solid and shell tensor

Component properties

Name	Type	Description
componentType	constant	The type of component stored in the user defined binary component. Either Component.NODE, Component.BEAM, Component.SOLID_SHELL_TSHELL or Component.OTHER
dataType	constant	The type of data stored in the user defined binary component. Either Component.SCALAR, Component.TENSOR or Component.VECTOR
dispose	boolean	If .ubd files for components will be disposed of (deleted) when a model is closed or D3PLOT exits or not. The default is not to delete files.
location	constant|string	Where the user defined binary component will be written to disk. This can be an absolute or relative pathname. If a relative path is used, this is relative to the LS-DYNA results files. This is done by giving a pathname beginning with "JOBDIR". For example "JOBDIR/.." refers to the parent directory where the results files are. The default, if location is null, is for .ubd files to be written in the same directory as the LS-DYNA output files. Alternatively, the data can just be kept in memory and not written to disk by using Component.IN_CORE.
name	string	The name for the user defined binary component

Detailed Description

The component class allows to to create, modify and delete user defined binary data components in D3PLOT. The class also gives access to various data component constants that are used in the D3PLOT API. They are defined in the Component class so the global namespace is not polluted. See the documentation below for more details.

Constructor

new Component(name*[string]*, component*[constant]*, data*[constant]*, options (optional)*[object]*)

Description

Creates a new user defined binary data component in D3PLOT

Arguments

- **name** (string)

Name for the component

- **component** (constant)

The type of component stored in the user defined binary component. Either Component.NODE, Component.BEAM, Component.SOLID_SHELL_TSHELL or Component.OTHER

- **data** (constant)

The type of data stored in the user defined binary component. Either Component.SCALAR, Component.TENSOR or Component.VECTOR

- **options (optional)** (object)

Object containing extra information. Can contain any of:

Object has the following properties:

Name	Type	Description
dispose	boolean	If .ubd files for components will be disposed of (deleted) when a model is closed or D3PLOT exits or not. The default is not to delete files.
exists	constant	Action to take if a component with this name already exists. Either Component.RENAME or Component.REPLACE (default)
location	constant|string|null	Location to store the .ubd files. See location for details. The default, if location is null, is for .ubd files to be written in the same directory as the LS-DYNA output files. This default can be changed with the d3plot*ubd_file_location preference.

Returns

Model object

Return type

Model

Example

To create a user defined binary data component in D3PLOT:

```
var ub = new Component("My component", Component.NODE, Component.SCALAR, {
dispose: true, exists: Component.RENAME, location: null });
```

Details of functions

Delete()

Description

Deletes the next user defined binary data component.
Do not use the component object after calling this method

Arguments

No arguments

Returns

Component object

Return type

Component

Example

To delete component c:

```
c.Delete();
```

First() [static]

Description

Returns the first user defined binary component in D3PLOT (or null if there are no components)

Arguments

No arguments

Returns

Component object

Return type

Component

Example

To get the first user defined binary component:

```
var c = Component.First();
```

GetData(item*[Node|Beam|Shell|Solid|Tshell]*, options (optional)*[object]*)

Description

Returns the user defined binary data component for an item

Arguments

- **item** (Node|Beam|Shell|Solid|Tshell)

The Node, Beam, Shell, Solid or Tshell the data should be retrieved for

- **options (optional)** (object)

Object containing extra information. Can contain any of:

Object has the following properties:

Name	Type	Description
ip	integer	The integration point to get the data for for shells and thick shells
op	integer	The on plan integration point to get the data for for fully integrated shells and thick shells. If omitted the first on plan integration point will be used

Returns

The component data

Return type

real|array

Example

To get the data for solid s, user defined component c:

```
var data = c.GetData(s);
```

GetFromID(number*[integer]*) [static]

Description

Returns the user defined binary component in D3PLOT by ID (or null if the component does not exist)

Arguments

- **number** (integer)

number of the component you want the Component object for

Returns

Component object

Return type

Component

Example

To get the Component object for user defined binary component number 1:

```
var c = Component.GetFromID(1);
```

GetFromName(name*[string]*) [static]

Description

Returns the user defined binary component in D3PLOT by name (or null if the component does not exist)

Arguments

- **name** (string)

name of the component you want the Component object for

Returns

Component object

Return type

Component

Example

To get the Component object for user defined binary component named test:

```
var c = Component.GetFromName("test");
```

Last() [static]

Description

Returns the last user defined binary component in D3PLOT (or null if there are no components)

Arguments

No arguments

Returns

Component object

Return type

Component

Example

To get the last user defined binary component:

```
var c = Component.Last();
```

Next()

Description

Returns the next user defined binary data component (or null if there is not one)

Arguments

No arguments

Returns

Component object

Return type

Component

Example

To get the component after component c:

```
c = c.Next();
```

Previous()

Description

Returns the previous user defined binary data component (or null if there is not one)

Arguments

No arguments

Returns

Component object

Return type

Component

Example

To get the component before component c:

```
c = c.Previous();
```

PutData(item*[Node|Beam|Shell|Solid|Tshell]*, data*[real|array]*, options (optional)*[object]*)

Description

Sets the user defined binary data component for an item

Arguments

- **item** (Node|Beam|Shell|Solid|Tshell)

The Node, Beam, Shell, Solid or Tshell the data should be set for

- **data** (real|array)

The data to set. If the component data property is Component.SCALAR this will be a single value. If the component data property is Component.VECTOR this is an array with length 3. If the component data property is Component.TESNOR this is an array with length 6

- **options (optional)** (object)

Object containing extra information. Can contain any of:

Object has the following properties:

Name	Type	Description
ip	integer	The integration point to set the data for for shells and thick shells
op	integer	The on plan integration point to set the data for for fully integrated shells and thick shells

Returns

No return value

Example

To Set the data for solid s, user defined component c to be 1.23:

```
c.PutData(s, 1.23);
```

Total() [static]

Description

Returns the total number of user defined binary components in D3PLOT.

Arguments

No arguments

Returns

Total number of user binary components

Return type

integer

Example

To get total number of components:

```
var total = Component.Total();
```

Constant class

The Constant class defines various constants. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Constant constants

Constants for Array indices

Name	Description
Constant.X	Index in a vector/coordinate array containing the X component
Constant.XX	Index in a tensor array containing the XX component
Constant.XY	Index in a tensor array containing the XY component
Constant.Y	Index in a vector/coordinate array containing the Y component
Constant.YY	Index in a tensor array containing the YY component
Constant.YZ	Index in a tensor array containing the YZ component
Constant.Z	Index in a vector/coordinate array containing the Z component
Constant.ZX	Index in a tensor array containing the ZX component
Constant.ZZ	Index in a tensor array containing the ZZ component

Constants for Cut section action

Name	Description
Constant.NORMAL	Positive or negative action Normal
Constant.OMIT	Positive or negative action Omit
Constant.OUTLINE	Positive or negative action Outline (wire drawing)
Constant.TRANSPARENT	Positive or negative action Transparent

Constants for Cut section combination

Name	Description
Constant.INTERSECTION	Intersection mode for multiple cut directions
Constant.UNION	Union mode for multiple cut directions

Constants for Cut section definition

Name	Description
Constant.CONST_X	Constant X definition method

Constant.CONST_Y	Constant Y definition method
Constant.CONST_Z	Constant Z definition method
Constant.LS_DYNA	LS-DYNA definition method
Constant.N3	3 nodes definition method
Constant.OR_AND_V	Origin and vectors definition method

Constants for Cut section space

Name	Description
Constant.BASIC	Basic (eulerian) space
Constant.DEFORMED	Deformed (lagrangian) space
Constant.SCREEN	Screen space

Constants for Dispose

Name	Description
Constant.DELETE	Delete
Constant.LEAVE	Leave behind (eg don’t delete)

Constants for Frame of Reference

Name	Description
Constant.CYLINDRICAL	Cylindrical coordinate system
Constant.GLOBAL	Global coordinate system
Constant.LOCAL	Element local coordinate system
Constant.MATERIAL	Material axes coordinate system
Constant.USER_DEFINED	User-defined coordinate system

Constants for General

Name	Description
Constant.ALL	All of a category
Constant.GT	Greater than (>)
Constant.GTEQ	Greater than or equals (>=)
Constant.LT	Less than (<)
Constant.LTEQ	Less than or equals (<=)
Constant.MAX	Maximum value
Constant.MIN	Minimum value
Constant.OFF	Switch off
Constant.ON	Switch on

Constants for GetNumberOf

Name	Description
Constant.CUT_SECTION	Number of non-parallel cut plane directions

Constant.FAMILY	Number of families
Constant.INCLUDE	Number of includes
Constant.MODEL	Number of models
Constant.NEIPH	Number of "Extra" Solid variables
Constant.NEIPS	Number of "Extra" Shell variables
Constant.NEIPT	Number of "Extra" Thick Shell variables
Constant.NIP_B	Number of Beam integration points
Constant.NIP_H	Number of Solid integration points
Constant.NIP_S	Number of Shell integration points
Constant.NIP_T	Number of Thick Shell integration points
Constant.N_ON_PLAN	Number of on-plan integration points written
Constant.N_UBMS	Number of user-defined beam scalar components
Constant.N_UBMV	Number of user-defined beam vector components
Constant.N_UNOS	Number of user-defined node scalar components
Constant.N_UNOV	Number of user-defined node vector components
Constant.N_USSS	Number of user-defined solid/shell scalar components
Constant.N_USST	Number of user-defined solid/shell tensor components
Constant.STATE	Number of states
Constant.USER	Number of user-defined components

Constants for Phase Angle Results

Name	**Description**
Constant.CURRENT_VAL	Current value result
Constant.MAGNITUDE	Magnitude result

Constants for Surface

Name	**Description**
Constant.BOTTOM	Bottom shell surface
Constant.MIDDLE	Middle shell surface
Constant.TOP	Top shell surface

Detailed Description

The Constant class gives you access to various constants that are used in the D3PLOT API. They are defined in the Constant class so the global namespace is not polluted. See the documentation below for more details.

Contact class

The Contact class gives you access to contacts in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Contact constants

Name	Description
Contact.SURFA	SURFA side of the contact
Contact.SURFB	SURFB side of the contact

Contact properties

Name	Type	Description
aNodes	integer	Total number of nodes on the SURFA side of the contact
aSegments	integer	Total number of segments on the SURFA side of the contact
bNodes	integer	Total number of nodes on the SURFB side of the contact

bSegments	integer	Total number of segments on the SURFB side of the contact
data	real|array	Component data for a contact passed as an argument to GetMultipleData. Note that data will only exist for the instance of the contact passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the contact is in
index	integer	The internal index for the contact in D3PLOT
label	integer	The LS-DYNA label for the contact
model	Model	The Model that the contact is in
name	string	The name of the contact type
title	string	The title of the contact
type	constant	The type for the contact (will be Type.CONTACT)

Detailed Description

The Contact class allows you to inspect contacts in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the contact in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the contact in

Returns

No return value

Example

To blank contact c in graphics window g:

```
c.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the contacts in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the contacts in

- **model** (Model)

Model that all the contacts will be blanked in

Returns

No return value

Example

To blank all of the contacts in model m, in graphics window gw:

```
Contact.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the contacts in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the contacts in

- **model** (Model)

Model that the flagged contacts will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the contacts to blank

Returns

No return value

Example

To blank all of the contacts flagged with flag f in model m, in graphics window gw:

```
Contact.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the contact is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the contact is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if contact c is blanked in graphics window g:

```
if (c.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a contact

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the contact

Returns

No return value

Example

To clear flag f on contact c:

```
c.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first contact in the model (or null if there are no contacts in the model)

Arguments

- **model** (Model)

Model to get first contact in

Returns

Contact object

Return type

Contact

Example

To get the first contact in model m:

```
var c = Contact.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the contacts in the model with a defined flag

Arguments

- **model** (Model)

Model that all the contacts will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the contacts

Returns

No return value

Example

To flag all of the contacts with flag f in model m:

```
Contact.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the contact is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the contact

Returns

true if flagged, false if not

Return type

boolean

Example

To check if contact c has flag f set on it:

```
if (c.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the contacts in the model

Arguments

- **model** (Model)

Model that all the contacts are in

Returns

Array of Contact objects

Return type

Array

Example

To get all of the contacts in model m:

```
var c = Contact.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it’s not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = c.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the contacts in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged contacts are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the contacts to get

Returns

Array of Contact objects

Return type

Array

Example

To get all of the contacts flagged with flag f in model m:

```
Contact.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Contact object for contact in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get contact in

- **label** (integer)

The LS-DYNA label for the contact in the model

Returns

Contact object

Return type

Contact

Example

To get the contact in model m with label 1000:

```
var c = Contact.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Contact object for contact in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get contact in

- **index** (integer)

The D3PLOT internal index in the model for contact

Returns

Contact object

Return type

Contact

Example

To get the contact in model m at index 50:

```
var c = Contact.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple contacts. For each contact a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Contact objects to get the data for. All of the contacts must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each contact with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for contacts in array items and use the data property (note that in the example, the argument extra is optional):

```
Contact.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for contacts in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Contact.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

GetNode(side*[constant]*, index*[integer]*)

Description

Gets a node for a contact

Arguments

- **side** (constant)

The side of the contact to get the node for. Either Contact.SURFA or Contact.SURFB

- **index** (integer)

index of the node to get.
0 <= index < aNodes for side SURFA
0 <= index < bNodes for side SURFB

Returns

Node object

Return type

Node

Example

To get the 10th node on SURFB side of contact c in D3PLOT

```
var node = c.GetNode(Contact.SURFB, 9);
```

GetSegment(side*[constant]*, index*[integer]*)

Description

Gets a segment for a contact

Arguments

- **side** (constant)

The side of the contact to get the segment for. Either Contact.SURFA or Contact.SURFB

- **index** (integer)

index of the segment to get.
0 <= index < aSegments for side SURFA
0 <= index < bSegments for side SURFB

Returns

Segment object

Return type

Segment

Example

To get the 10th segment on SURFB side of contact c in D3PLOT

```
var segm = c.GetSegment(Contact.SURFB, 9);
```

Last(model[*Model*]) [static]

Description

Returns the last contact in the model (or null if there are no contacts in the model)

Arguments

- **model** (Model)

Model to get last contact in

Returns

Contact object

Return type

Contact

Example

To get the last contact in model m:

```
var c = Contact.Last(m);
```

Next()

Description

Returns the next contact in the model (or null if there is not one)

Arguments

No arguments

Returns

Contact object

Return type

Contact

Example

To get the next contact after contact c:

```
c = c.Next();
```

Pick() [static]

Description

Allows the user to pick a contact from the screen

Arguments

No arguments

Returns

Contact object or null if cancelled

Return type

Contact

Example

To pick a contact:

```
var c = Contact.Pick();
```

Previous()

Description

Returns the previous contact in the model (or null if there is not one)

Arguments

No arguments

Returns

Contact object

Return type

Contact

Example

To get the previous contact before contact c:

```
c = c.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects contacts using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting contacts

Returns

The number of contacts selected or null if menu cancelled

Return type

integer

Example

To select contacts, flagging those selected with flag f:

```
var total = Contact.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a contact

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the contact

Returns

No return value

Example

To set flag f on contact c:

```
c.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of contacts in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of contacts

Return type

integer

Example

To get the number of contacts in model m:

```
var total = Contact.Total(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the contact in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the contact in

Returns

No return value

Example

To unblank contact c in graphics window g:

```
c.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the contacts in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the contacts in

- **model** (Model)

Model that all the contacts will be unblanked in

Returns

No return value

Example

To unblank all of the contacts in model m, in graphics window gw:

```
Contact.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the contacts in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the contacts in

- **model** (Model)

Model that the flagged contacts will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the contacts to unblank

Returns

No return value

Example

To unblank all of the contacts flagged with flag f in model m, in graphics window gw:

```
Contact.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the contacts in the model

Arguments

- **model** (Model)

Model that the defined flag for all contacts will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the contacts

Returns

No return value

Example

To unset flag f on all of the contacts in model m:

```
Contact.UnflagAll(m, f);
```

File class

The File class allows you to read and write text files. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Copy(source*[string]*, dest*[string]*)
- Delete(filename*[string]*)
- DriveMapFilename(filename*[string]*, format*[constant]*)
- Exists(filename*[string]*)
- FindFiles(directory*[string]*, type (optional)*[constant]*)
- Get(url*[string]*, filename*[string]*, options (optional)*[object]*)
- IsAbsolute(filename*[string]*)
- IsDirectory(filename*[string]*)
- IsFile(filename*[string]*)
- IsReadable(filename*[string]*)
- IsWritable(filename*[string]*)
- Mkdir(directory*[string]*)
- Mktemp()
- Proxy(name*[string]*)
- ProxyPassword(name*[string]*)
- ProxyUsername(username*[string]*)
- ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*)
- Rename(oldname*[string]*, newname*[string]*)
- Size(filename*[string]*)
- Upload(filename*[string]*, url*[string]*, options (optional)*[object]*)

Member functions

- Close()
- FindLineContaining(contain*[string]*)
- FindLineStarting(start*[string]*)
- Flush()
- ReadAll()
- ReadArrayBuffer(length (optional)*[integer]*)
- ReadChar()
- ReadLine()
- ReadLongLine()
- Seek(offset*[integer]*, origin (optional)*[constant]*)
- Tell()
- Write(string*[Any valid javascript type]*)
- WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)
- Writeln(string*[Any valid javascript type]*)

File constants

Name	Description
File.APPEND	Flag to open file for appending
File.BINARY	Flag to open file in binary mode. This will have no effect on unix/linux but for windows if a file is opened for writing with binary mode \n will not be translated to \r\n (CRLF), it will be written as \n (LF)
File.READ	Flag to open file for reading

File.UTF8	Flag to open file for reading as UTF-8 encoding.
File.WRITE	Flag to open file for writing

Constants for Find types

Name	Description
File.DIRECTORY	Find directories
File.FILE	Find files

Constants for Seek types

Name	Description
File.CURRENT	Seek relative to current file position
File.END	Seek relative to end of the file
File.START	Seek relative to start of the file

File properties

Name	Type	Description
filename (read only)	string	Name of the file
mode (read only)	constant	Mode the file was opened with (File.READ, File.WRITE etc)

Detailed Description

The File class gives you simple functions to read and write text files. The following simple example shows how to read from the file "/data/test/file.txt" and print each line read to the dialogue box:

```
var f, line;
f = new File("/data/test/file.txt", File.READ);
while ( (line = f.ReadLine()) != undefined)
{
    Message(line);
}
f.Close();
```

The following simple example shows how to write the numbers 1 to 10 to the file "/data/test/file.txt":

```
var n, line;
f = new File("/data/test/file.txt", File.WRITE);
for (n=1; n<=10; n++)
{
    f.Writeln(n);
}
f.Close();
```

See the documentation below for more details.

Constructor

new File(filename*[string]*, mode*[constant]*)

Description

Create a new File object for reading and writing text files.

Arguments

- **filename** (string)

Filename of the file you want to read/write. If reading, the file must exist. If writing, the file will be overwritten (if it exists) if mode is File.WRITE, or if mode is File.APPEND it will be appended to if it exists, or created if it does not. When reading a file the filename can also be a URL (uniform resource locator) in which case the file will be read from the remote site. See File.Get() for more details on the format of the URL.

- **mode** (constant)

The mode to open the file with. Can be File.READ, File.WRITE or File.APPEND. For File.WRITE or File.APPEND it can also be ORed with File.BINARY if required. By default text is read and written as ASCII. To read/write text in utf-8 mode can also be ORed with File.UTF8 if required.

Returns

File object

Return type

File

Example

To create a new file object to read file "/data/test/file.txt"

```
var f = new File("/data/test/file.txt", File.READ);
```

Details of functions

Close()

Description

Close a file opened by a File object.

Arguments

No arguments

Returns

No return value

Example

To close File object f.

```
f.Close();
```

Copy(source*[string]*, dest*[string]*) [static]

Description

Copies a file

Arguments

- **source** (string)

Source filename you want to copy.

- **dest** (string)

Destination filename you want to copy source file to.

Returns

true if copy successful, false otherwise.

Return type

Boolean

Example

To copy the file "/data/test/file.key" to "/data/test/file.key_backup"

```
var copied = File.Copy("/data/test/file.key", "/data/test/file.key_backup");
```

Delete(filename*[string]*) [static]

Description

Deletes a file

Arguments

- **filename** (string)

Filename you want to delete.

Returns

true if successful, false if not.

Return type

Boolean

Example

To delete the file "/data/test/file.key"

```
var deleted = File.Delete("/data/test/file.key");
```

DriveMapFilename(filename*[string]*, format*[constant]*) [static]

Description

Changes a filename or directory name to the correct format for a specific operating system using the directory mappings (if present)

Arguments

- **filename** (string)

Filename you want to drive map.

- **format** (constant)

The format for the file/directory name. Can be Include.NATIVE, Include.UNIX or Include.WINDOWS

Returns

string containing drive mapped filename

Return type

String

Example

If D3PLOT has drive S: mapped to "/data" (by using the primer*drive_s, this*drive_s, d3plot*drive_s or oasys*drive_s preference)

```
var mapped = File.DriveMapFilename("/data/test/file.key", Include.WINDOWS);
```

mapped will be "S:\test\file.key".

```
var mapped = File.DriveMapFilename("S:\\test\\file.key", Include.UNIX);
```

mapped will be "/data/test/file.key".

Exists(filename*[string]*) [static]

Description

Check if a file exists. See also File.IsDirectory() and See also File.IsFile().

Arguments

- **filename** (string)

Filename you want to check for existance.

Returns

true/false

Return type

Boolean

Example

To see if the file "/data/test/file.key" exists

```
if (File.Exists("/data/test/file.key")) { do something }
```

FindFiles(directory*[string]*, type (optional)*[constant]*) [static]

Description

Find any files and/or directories in a directory.

Arguments

- **directory** (string)

Directory to look for files/directories in.

- **type (optional)** (constant)

Type of things to find. Can be bitwise OR of File.FILE and File.DIRECTORY. If omitted only files will be returned.

Returns

Array of filenames/directories

Return type

Array

Example

To return the filenames in the directory /data/test:

```
var fileList = File.FindFiles("/data/test")
```

To return the directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.DIRECTORY)
```

To return the files and directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.FILE|File.DIRECTORY)
```

FindLineContaining(contain*[string]*)

Description

Reads a line from a file which contains **contain**, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must contain that string. If more than one argument is used then lines which contain any of the arguments will be returned

Arguments

- **contain** (string)

String which matching lines must contain

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which contain 'example'.

```
var line;
while ( (line = f.FindLineContaining("example") ) != undefined)
{
}
```

FindLineStarting(start*[string]*)

Description

Reads a line from a file which starts with start, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must start with that string. If more than one argument is used then lines which start with any of the arguments will be returned

Arguments

- **start** (string)

String which matching lines must start with

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which start 'example'.

```
var line;
while ( (line = f.FindLineStarting("example") ) != undefined)
{
}
```

Flush()

Description

Flushes a file opened for writing by a File object.

Arguments

No arguments

Returns

No return value

Example

To flush File object f.

```
f.Flush();
```

Get(url*[string]*, filename*[string]*, options (optional)*[object]*) [static]

Description

Get a file from a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **url** (string)

URL (uniform resource locator) of remote file you want to get. Currently http and ftp are supported. For http give the full address including the leading 'http://'. e.g.
'http://www.example.com/file.html'.
For ftp an optional username and password can be given. e.g.
'ftp://ftp.example.com' retrieves the directory listing for the root directory.
'ftp://ftp.example.com/readme.txt' downloads the file readme.txt from the root directory.
'ftp://user:password@ftp.example.com/readme.txt' retrieves the readme.txt file from the user's home directory.

- **filename** (string)

Filename you want to save the file to.

- **options (optional)** (object)

Options for get. If 'username' and 'password' are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description

password (optional)	string	Password
response (optional)	boolean	If set to true, then the response code will be returned instead of true/false. This can be used to retieve error messages and codes when the file is not returned successfully.
username (optional)	string	Username

Returns

true if file was successfully got, false otherwise.

Return type

Boolean

Example

To get the file "http://www.example.com/file.html" and save it to C:\temp:

```
File.Get("http://www.example.com/file.html", "C:\temp\file.html");
```

IsAbsolute(filename*[string]*) [static]

Description

Check if a filename is absolute or relative.

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is absolute (which it is!)

```
if (File.IsAbsolute("/data/test")) { do something }
```

IsDirectory(filename*[string]*) [static]

Description

Check if a filename is a directory. See also File.Exists(), File.IsFile(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a directory

```
if (File.IsDirectory("/data/test")) { do something }
```

IsFile(filename*[string]*) [static]

Description

Check if a filename is a file. See also File.Exists(), File.IsDirectory(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a file

```
if (File.IsFile("/data/test")) { do something }
```

IsReadable(filename*[string]*) [static]

Description

Check if a filename has read permissions. See also File.Exists(), File.IsDirectory() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is readable

```
if (File.IsReadable("/data/test")) { do something }
```

IsWritable(filename*[string]*) [static]

Description

Check if a filename has write permissions. If *filename* exists and it is a file then it is checked to see if it can be opened with write (File.APPEND permissions). If *filename* exists and it is a directory then the directory is checked for write permission (can files be created in the directory). If *filename* does not exist then it is assumed to be a file and is checked to see if it can be opened for writing (File.WRITE permissions). See also File.Exists(), File.IsDirectory() and File.IsReadable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is writable

```
if (File.IsWritable("/data/test")) { do something }
```

Mkdir(directory*[string]*) [static]

Description

Make a directory. If PRIMER preference 'directory_permission' is set e.g.755 then this will apply (same as if set by chmod 755) ignoring any setting of umask. If there is no preference then the users current setting of umask will control permissions (same as system mkdir)

Arguments

- **directory** (string)

The name of the directory you want to create.

Returns

true if successfully created, false if not.

Return type

Boolean

Example

To make the directory "/data/test"

```
var success = File.Mkdir("/data/test");
```

Mktemp() [static]

Description

Make a temporary filename for writing a temporary file.

Arguments

No arguments

Returns

String name of temporary filename that can be used.

Return type

String

Example

To get a temp filename"

```
var filename = File.Mktemp();
```

Proxy(name*[string]*) [static]

Description

Set a proxy for files opened by http, ftp etc. See also File.Get(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **name** (string)

The name of the proxy.

Returns

No return value

Example

To set the proxy to "http://example.proxy.com" using port 80:

```
File.Proxy("http://example.proxy.com:80");
```

ProxyPassword(name*[string]*) [static]

Description

Set a proxy password for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyUsername().

Arguments

- **name** (string)

Password for the proxy server.

Returns

No return value

Example

To set the proxy password to "password":

```
File.ProxyPassword("password");
```

ProxyUsername(username*[string]*) [static]

Description

Set a proxy username for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyPassword().

Arguments

- **username** (string)

The username for the proxy.

Returns

No return value

Example

To set the proxy username to "username":

```
File.ProxyUsername("username");
```

ReadAll()

Description

Reads **all** the remaining characters from a file opened for reading by a File object. As this function can read the entire file as a string be careful when reading large files as it will consume large amounts of memory.

Arguments

No arguments

Returns

String. Characters read from file or undefined if end of file

Return type

String

Example

Read all characters from File object f.

```
var c = f.ReadAll();
```

ReadArrayBuffer(length (optional)*[integer]*)

Description

Reads binary data from a file opened for reading by a File object. The data is returned as an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **length (optional)** (integer)

Number of bytes to try to read from the file. If omitted all the remaining data from the file will be read.

Returns

ArrayBuffer object or undefined if end of file

Return type

ArrayBuffer

Example

To read data as 32bit unsigned integers from File object f.

```
var ab = f.ReadArrayBuffer();
var u32 = new Uint32Array(ab);
for (var i=0; i<u32.length; i++
{
    var value = u32[i];
}
```

ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*) [static]

Description

Reads the input CSV file and returns an array of string arrays. If the CSV file has legitimate records the function returns an Array object containing sub-arrays of strings otherwise the function returns NULL. The lengths of all the sub-arrays are the same and equal to maximum number of fields in any of the records. For records in a CSV file having fewer fields, the respective sub-arrays are padded with NULL elements to the maximum array length.

Arguments

- **filename** (string)

Filename you want to read CSV options from.

- **delimiter (optional)** (string)

Delimiter string to be used. Default is a comma (",").

- **comment (optional)** (string)

Comment string to be used. Default is a dollar sign ("$").

Returns

Array object containing string arrays.

Return type

String

Example

To Read CSV file "sample.csv" and print all records to a Window.

```
var csv_file_path = "C:\\sample.csv";
var records = "";
if(!File.Exists(csv_file_path))
{
    Window.Information("CSV file %s not present", csv_file_path);
    Exit();
}
var csv_array = File.ReadCSV(csv_file_path);
if(csv_array != null)
{
    for(var i = 0; i < csv_array.length; i++)
    {
        var record_array = csv_array[i];
        for(var j = 0; j < record_array.length; j++)
        {
            if(record_array[j] != null)
                records = records + record_array[j] + " , ";
        }
        records = records + "\n";
    }
}
Options.max_window_lines = csv_array.length;
Window.Information("File.ReadCSV Ouptut", records);
```

To Read CSV file "sample.csv" with delimiter string "::" and comment string "##".

```
var csv_array = File.ReadCSV(csv_file_path, "::", "##");
```

ReadChar()

Description

Reads a single character from a file opened for reading by a File object.

Arguments

No arguments

Returns

character read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading characters from File object f.

```
var c;
while ( (c = f.ReadChar()) != undefined) { ... }
```

ReadLine()

Description

Reads a line from a file opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLine()) != undefined) { ... }
```

ReadLongLine()

Description

Reads a line from a file opened for reading by a File object. The line can be any length. If your file has lines shorter than 512 characters then you may want to use ReadLine instead which is faster.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLongLine()) != undefined) { ... }
```

Rename(oldname*[string]*, newname*[string]*) [static]

Description

Rename an existing file to have a different name.

Arguments

- **oldname** (string)

Existing filename you want to rename

- **newname** (string)

New filename you want to rename to

Returns

true if successful, false if not.

Return type

Boolean

Example

To rename the file "/data/test/file.key" to "/data/test/new_file.key"

```
var size = File.Rename("/data/test/file.key", "/data/test/new_file.key");
```

Seek(offset*[integer]*, origin (optional)*[constant]*)

Description

Set the current position for reading or writing in a File object.

Arguments

- **offset** (integer)

Offset to seek to in the file

- **origin (optional)** (constant)

Origin for offset. Must be one of File.START, File.END or File.CURRENT. If omitted File.START will be used.

Returns

no return value

Example

To seek to the end of File f:

```
f.Seek(0, File.END);
```

To seek to the beginning of File f:

```
f.Seek(0, File.START);
```

To move forward 10 characters in File f:

```
f.Seek(10, File.CURRENT);
```

Size(filename*[string]*) [static]

Description

Return the size of a file in bytes

Arguments

- **filename** (string)

Filename you want the size of.

Returns

size in bytes

Return type

Number

Example

To get the size of the file "/data/test/file.key"

```
var size = File.Size("/data/test/file.key");
```

Tell()

Description

Return the current file position for a File object. Note that on Windows when reading files if the file is not opened with File.BINARY this may not return the correct file position for files with unix line endings.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current file position for File f:

```
var pos = f.Tell();
```

Upload(filename*[string]*, url*[string]*, options (optional)*[object]*) [static]

Description

Uploads a file to a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **filename** (string)

Filename you want to upload.

- **url** (string)

URL (uniform resource locator) of the remote location you want to upload the file to. Currently only http is supported. Give the full address including the leading 'http://'. e.g. 'http://www.example.com/file.html'.

- **options (optional)** (object)

Options for upload. If both of these are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description
password (optional)	string	Password
username (optional)	string	Username

Returns

true if file was successfully uploaded, false otherwise.

Return type

Boolean

Example

To upload the file "C:\temp\file.txt" to "http://www.example.com/file.txt":

```
File.Upload("C:/temp/file.txt", "http://www.example.com/file.txt");
```

Write(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f

```
f.Write("Hello, world!\n");
```

To write the title of model m to File object f

```
f.Write("The title of model 2 is " + m.title + "\n");
```

WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)

Description

Writes binary data to a file opened for writing by a File object. The data to write is an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **buffer** (ArrayBuffer)

ArrayBuffer to write to file

- **length (optional)** (integer)

Number of bytes to write to the file. If omitted all the data in the ArrayBuffer will be written (buffer.byteLength bytes)

Returns

No return value

Example

To write ArrayBuffer ab to File object f.

```
f.WriteArrayBuffer(ab);
```

Writeln(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f automatically adding a carriage return

```
f.Writeln("Hello, world!");
```

To write the title of model m to File object f automatically adding a carriage return

```
f.Writeln("The title of model 2 is " + m.title);
```

GraphicsWindow class

The GraphicsWindow class gives you access to graphics windows in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First()
- GetFromID(graphics window number*[integer]*)
- Last()
- Total()

Member functions

- AddModel(model*[Model object]*)
- Delete()
- GetModelInfo(index*[integer]*)
- Next()
- Previous()
- Redraw()
- RemoveModel()
- SetModelInfo(index*[integer]*, info*[object]*)

GraphicsWindow constants

Name	Description
GraphicsWindow.NO_OFFSET	Model has no offset in the graphics window
GraphicsWindow.OFFSET_MODEL_SPACE	Model is offset in model space coordinates
GraphicsWindow.OFFSET_SCREEN_SPACE	Model is offset in screen space coordinates

GraphicsWindow properties

Name	Type	Description
active	boolean	Whether the graphics window is active or not (equivalent to turning the window off/on in the GUI)
models	integer	The total number of models in this graphics window
number	integer	The graphics window number
state	integer	The current state displayed in this graphics window. Also see the Model state.
states	integer	The highest state number from all models in this graphics window

Detailed Description

The GraphicsWindow class allows you to do various operations on graphics windows in D3PLOT. There are various methods and properties available that allow you do create, delete and modify thems. See the documentation below for more details.

Constructor

new GraphicsWindow(model*[Model object]*)

Description

Creates a new graphics window in D3PLOT

Arguments

- **model** (Model object)

The model to open in this graphics window

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To create a graphics window containing Model m in D3PLOT

```
var gw = new GraphicsWindow(m);
```

Details of functions

AddModel(model*[Model object]*)

Description

Adds a model to a graphics window

Arguments

- **model** (Model object)

The model to add to the graphics window

Returns

No return value

Example

To add model m to graphics window gw in D3PLOT

```
gw.AddModel(m);
```

Delete()

Description

Deletes a graphics window in D3PLOT
Do not use the GraphicsWindow object after calling this method.

Arguments

No arguments

Returns

No return value

Example

To delete graphics window gw in D3PLOT

```
gw.Delete();
```

First() [static]

Description

Returns the GraphicsWindow object for the first graphics window in D3PLOT (or null if there are no graphics windows)

Arguments

No arguments

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To get the GraphicsWindow object for the first graphics window:

```
var gw = GraphicsWindow.First();
```

GetFromID(graphics window number*[integer]*) [static]

Description

Returns the GraphicsWindow object for a graphics window ID (or null if graphics window does not exist)

Arguments

- **graphics window number** (integer)

number of the graphics window you want the GraphicsWindow object for

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To get the GraphicsWindow object for graphics window number 1

```
var gw = GraphicsWindow.GetFromID(1);
```

GetModelInfo(index*[integer]*)

Description

Gets the information for a model in a graphics window

Arguments

- **index** (integer)

index of the model in the graphics window you want information for (0 <= index < models)

Returns

Object with the following properties:

Name	Type	Description
colour	Colour	The colour for the model
mode	constant	How the model is model is displayed in the graphics window. One of View.WIRE, View.HIDDEN, View.SHADED or View.CURRENT
model	Model object	The model at the given index
offsetMode	constant	How the model is offset in the graphics window. One of GraphicsWindow.NO_OFFSET, GraphicsWindow.OFFSET_MODEL_SPACE or GraphicsWindow.OFFSET_SCREEN_SPACE
state	integer	The current state number for the model
visible	boolean	Whether the model is visible in the graphics window or not
xOffset	real	The X offset for the model
yOffset	real	The Y offset for the model
zOffset	real	The Z offset for the model

Return type

object

Example

To get the information for the second model in graphics window gw:

```
var info = gw.GetModelInfo(1);
```

Last() [static]

Description

Returns the GraphicsWindow object for the last graphics window in D3PLOT (or null if there are no graphics windows)

Arguments

No arguments

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To get the GraphicsWindow object for the last graphics window:

```
var gw = GraphicsWindow.Last();
```

Next()

Description

Returns the next graphics window (or null if there is not one)

Arguments

No arguments

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To get the graphics window after graphics window gw:

```
gw = gw.Next();
```

Previous()

Description

Returns the previous graphics window (or null if there is not one)

Arguments

No arguments

Returns

GraphicsWindow object

Return type

GraphicsWindow

Example

To get the graphics window before graphics window gw:

```
gw = gw.Previous();
```

Redraw()

Description

Redraws the graphics window

Arguments

No arguments

Returns

No return value

Example

To dedraw graphics window gw:

```
gw.Redraw();
```

RemoveModel()

Description

Removes a model from a graphics window

Arguments

No arguments

Returns

No return value

Example

To remove model m from graphics window gw in D3PLOT

```
gw.RemoveModel(m);
```

SetModelInfo(index*[integer]*, info*[object]*)

Description

Sets the information for a model in a graphics window

Arguments

- **index** (integer)

index of the model in the graphics window you want to set information for (0 <= index < models)

- **info** (object)

Object containing the information to set. Can be any of:

Object has the following properties:

Name	Type	Description
colour	Colour	The colour for the model
mode	constant	How the model is model is displayed in the graphics window. One of View.WIRE, View.HIDDEN, View.SHADED or View.CURRENT
offsetMode	constant	How the model is offset in the graphics window. One of GraphicsWindow.NO_OFFSET, GraphicsWindow.OFFSET_MODEL_SPACE or GraphicsWindow.OFFSET_SCREEN_SPACE
visible	boolean	Whether the model is visible in the graphics window or not
xOffset	real	The X offset for the model
yOffset	real	The Y offset for the model
zOffset	real	The Z offset for the model

Returns

No return value

Example

To set the second model in graphics window gw to have an offset of (100, 100, 0) in model space:

```
gw.SetModelInfo(1, { offsetMode: GraphicsWindow.OFFSET_MODEL_SPACE, xOffset:
100, yOffset:100, zOffset: 0 } );
```

Total() [static]

Description

Returns the total number of graphics windows in use in D3PLOT

Arguments

No arguments

Returns

Total number of graphics windows

Return type

integer

Example

To get total number of graphics windows:

```
var total = GraphicsWindow.Total();
```

Group class

The Group class gives you access to groups in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- GetFromID(model*[Model]*, label*[integer]*)
- Last(model*[Model]*)
- Total(model*[Model]*)

Member functions

- AddFlagged(flag*[Flag]*)
- Empty()
- FlagContents(flag*[Flag]*)
- Next()
- Previous()

Group properties

Name	Type	Description
label	integer	The group label
model	Model	The Model that the group is in
title	string	The group title
type	constant	The type for the group (will be Type.GROUP)

Detailed Description

The Group class allows you to inspect groups in a model. See the documentation below for more details.

Constructor

new Group(model*[Model object]*)

Description

Creates a new group in D3PLOT

Arguments

- **model** (Model object)

The model to create the group in

Returns

Group object

Return type

Group

Example

To create a group for Model m in D3PLOT

```
var g = new Group(m);
```

Details of functions

AddFlagged(flag*[Flag]*)

Description

Adds flagged items to the contents of the group

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) set on items to add to the group

Returns

No return value

Example

To add items flagged with flag f to group g:

```
g.AddFlagged(f);
```

Empty()

Description

Empties the group (removes everything from the group)

Arguments

No arguments

Returns

No return value

Example

To empty group g:

```
g.Empty();
```

First(model*[Model]*) [static]

Description

Returns the first group in the model (or null if there are no groups)

Arguments

- **model** (Model)

Model to get first group in

Returns

Group object

Return type

Group

Example

To get the first group in model m:

```
var g = Group.First(m);
```

FlagContents(flag*[Flag]*)

Description

Flags the contents of the group

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set for the group contents

Returns

No return value

Example

To flag the contents of group g with flag f:

```
g.FlagContents(f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Group object for group in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get group in

- **label** (integer)

The label for the group in the model

Returns

Group object

Return type

Group

Example

To get the group in model m with label 2:

```
var g = Group.GetFromID(m, 2);
```

Last(model[*Model*]) [static]

Description

Returns the last group in the model (or null if there are no groups)

Arguments

- **model** (Model)

Model to get last group in

Returns

Group object

Return type

Group

Example

To get the last group in model m:

```
var g = Group.Last(m);
```

Next()

Description

Returns the next group in the model (or null if there is not one)

Arguments

No arguments

Returns

Group object

Return type

Group

Example

To get the next group after group g:

```
g = g.Next();
```

Previous()

Description

Returns the previous group in the model (or null if there is not one)

Arguments

No arguments

Returns

Group object

Return type

Group

Example

To get the previous group before group g:

```
g = g.Previous();
```

Total(model[*Model*]) [static]

Description

Returns the total number of groups in a model

Arguments

- **model** (Model)

Model to get group in

Returns

The number of groups

Return type

integer

Example

To get the number of groups in model m:

```
var total = Group.Total(m);
```

Image class

The Image class allows you to write image and movie files from D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Write3D(name*[string]*, options (optional)*[object]*)
- WriteImage(name*[string]*, options (optional)*[object]*)
- WriteMovie(name*[string]*, options (optional)*[object]*)

Image constants

Constants for 3D (D3PLOT viewer types

Name	Description
Image.GLBU	Uncompressed GLB animation file

Constants for 3D (D3PLOT viewer) types

Name	Description
Image.GLB	GLB animation file

Constants for image types

Name	Description
Image.BMP	24-bit uncompressed BMP file
Image.BMP8	8-bit uncompressed BMP file
Image.BMP8C	8-bit compressed BMP file
Image.GIF	8-bit GIF file
Image.JPEG	JPEG file
Image.PNG	24-bit PNG file
Image.PNG8	8-bit PNG file
Image.PPM	PPM file

Constants for movie types

Name	Description
Image.AGIF	8-bit animated GIF file
Image.AVI	AVI movie file
Image.MP4	MP4 movie file

Constants for resolution

Name	Description
Image.SCREEN	Image will be created at screen resolution.
Image.X2	Image will be created at 2x screen resolution.
Image.X4	Image will be created at 4x screen resolution.

Constants for state selection

Name	Description
Image.ALL_STATES	Use all states

Detailed Description

The Image class gives you methods to be able to write images, animations and 3D models. See the documentation below for more details.

Details of functions

Write3D(name*[string]*, options (optional)*[object]*) [static]

Description

Writes a 3D (GLB) file

Arguments

- **name** (string)

Filename for the movie

- **options (optional)** (object)

Object containing options for writing movie. Can be any of:

Object has the following properties:

Name	Type	Description
anonymise	boolean	Anonymise part tree (default = false)
format	constant	The format for the 3D file. Either Image.GLB (default) or Image.GLBU
frameRate	integer	The frame rate if multiple states are written (default = 25)
graphicsWindow	GraphicsWindow	An individual GraphicsWindow to write 3D data for. If not given (default) all the windows on the current page will be written
state	integer	The state number to write or Image.ALL_STATES (default)

Returns

No return value

Example

To write a 3D file "example.glb" for graphics window gw:

```
Image.Write3D("example.glb", { 'graphicsWindow': gw } );
```

WriteImage(name*[string]*, options (optional)*[object]*) [static]

Description

Writes a static image file

Arguments

- **name** (string)

Filename for the image

- **options (optional)** (object)

Object containing options for writing image. Can be any of:

Object has the following properties:

Name	Type	Description
dither	boolean	Whether to dither 8 bit images or not (default is false)
format	constant	The format for the image. One of Image.BMP8C, Image.BMP8, Image.BMP, Image.JPEG, Image.PPM, Image.PNG (default), Image.PNG8 or Image.GIF
graphicsWindow	GraphicsWindow	An individual GraphicsWindow to write image for. If not given (default) all the windows on the current page will be written
optimise	boolean	Whether to optimise the colour palette for 8 bit images or not (default is true)
quality	integer	The quality for JPEG images (1 - 100) (default = 90)
resolution	constant	The resolution for the image. One of Image.SCREEN (default), Image.X2 or Image.X4

Returns

No return value

Example

To write an image "example.png"

```
Image.WriteImage("example.png");
```

WriteMovie(name*[string]*, options (optional)*[object]*) [static]

Description

Writes a movie file

Arguments

- **name** (string)

Filename for the movie

- **options (optional)** (object)

Object containing options for writing movie. Can be any of:

Object has the following properties:

Name	Type	Description
aviFormat	constant	The AVI format for the movie if writing an AVI file. One of Image.JPEG (default), Image.BMP8C, Image.BMP8 or Image.BMP
dither	boolean	Whether to dither 8 bit images or not (default is false)
format	constant	The format for the movie. One of Image.MP4 (default), Image.AVI or Image.AGIF

frameRate	integer	The frame rate (default = 25)
graphicsWindow	GraphicsWindow	An individual GraphicsWindow to write movie for. If not given (default) all the windows on the current page will be written
quality	integer	The quality for AVI MJPEG images (1 - 100) (default = 90)
repeat	integer	The number of repeats for the movie. 0 is infinite (default = 0)

Returns

No return value

Example

To write a movie "example.mp4":

```
Image.WriteMovie("example.mp4");
```

Include class

The Include class gives you access to include files in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- GetFromID(model*[Model]*, number*[integer]*)
- Last(model*[Model]*)
- Total(model*[Model]*)

Member functions

- Next()
- Previous()

Include constants

Constants for Directory separators

Name	Description
Include.NATIVE	Use directory separators native to this machine when writing directory names.
Include.UNIX	Use unix directory separators when writing directory names.
Include.WINDOWS	Use windows directory separators when writing directory names.

Include properties

Name	Type	Description
label	integer	The label for the include file
name	string	The name for the include file
parent	integer	The label for the include file parent (0 if main file)

Detailed Description

The Include class allows you to inspect include files that are used in a model. Note that for D3PLOT to be able to get include file data there must be a ztf file. See the documentation below for more details.

Details of functions

First(model*[Model]*) [static]

Description

Returns the first include file in the model (or null if there are no include files in the model)

Arguments

- **model** (Model)

Model to get first include file in

Returns

Include object

Return type

Include

Example

To get the first include file in model m:

```
var i = Include.First(m);
```

GetFromID(model*[Model]*, number*[integer]*) [static]

Description

Returns the include file in the model with number (or null if it does not exist)

Arguments

- **model** (Model)

Model to get include file in

- **number** (integer)

The number for the include file in the model. Note that include file numbers start at 1. 0 is the main file.

Returns

Include object

Return type

Include

Example

To get include file number 5 in model m:

```
var i = Include.GetFromID(m, 5);
```

Last(model*[Model]*) [static]

Description

Returns the last include file in the model (or null if there are no include files in the model)

Arguments

- **model** (Model)

Model to get last include file in

Returns

Include object

Return type

Include

Example

To get the last include file in model m:

```
var i = Include.Last(m);
```

Next()

Description

Returns the next include file in the model (or null if there is not one)

Arguments

No arguments

Returns

Include object

Return type

Include

Example

To get the next include file after include i:

```
var i = i.Next();
```

Previous()

Description

Returns the previous include file in the model (or null if there is not one)

Arguments

No arguments

Returns

Include object

Return type

Include

Example

To get the previous include file before include i:

```
var i = i.Previous();
```

Total(model*[Model]*) [static]

Description

Returns the total number of include files in the model

Arguments

- **model** (Model)

Model to get total in

Returns

Number of includes

Return type

int

Example

To get the number of include files in model m:

```
var t = Include.Total(m);
```

Material class

The Material class gives you access to materials in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- Last(model*[Model]*)
- Total(model*[Model]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- ClearFlag(flag*[Flag]*)
- Flagged(flag*[Flag]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)

Material properties

Name	Type	Description
include	integer	The include file number in the model that the material is in
index	integer	The internal index for the material in D3PLOT
label	integer	The LS-DYNA label for the material
model	Model	The Model that the material is in
name	string	The name for the material type (e.g. *MAT_RIGID)
title	string	The title for the material (or null if no title)
type	constant	The type for the material (will be Type.MATERIAL)

Detailed Description

The Material class allows you to inspect materials in a model. This information will only be available if a ztf file has been read for a model. See the documentation below for more details.

Details of functions

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a material

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the material

Returns

No return value

Example

To clear flag f on material m:

```
m.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first material in the model (or null if there are no materials in the model)

Arguments

- **model** (Model)

Model to get first material in

Returns

Material object

Return type

Material

Example

To get the first material in model m:

```
var m = Material.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the materials in the model with a defined flag

Arguments

- **model** (Model)

Model that all the materials will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the materials

Returns

No return value

Example

To flag all of the materials with flag f in model m:

```
Material.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the material is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the material

Returns

true if flagged, false if not

Return type

boolean

Example

To check if material m has flag f set on it:

```
if (m.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the materials in the model

Arguments

- **model** (Model)

Model that all the materials are in

Returns

Array of Material objects

Return type

Array

Example

To get all of the materials in model m:

```
var m = Material.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the materials in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged materials are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the materials to get

Returns

Array of Material objects

Return type

Array

Example

To get all of the materials flagged with flag f in model m:

```
Material.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Material object for material in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get material in

- **label** (integer)

The LS-DYNA label for the material in the model

Returns

Material object

Return type

Material

Example

To get the material in model m with label 1000:

```
var m = Material.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Material object for material in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get material in

- **index** (integer)

The D3PLOT internal index in the model for material

Returns

Material object

Return type

Material

Example

To get the material in model m at index 50:

```
var m = Material.GetFromIndex(m, 50);
```

Last(model[*Model*]) [static]

Description

Returns the last material in the model (or null if there are no materials in the model)

Arguments

- **model** (Model)

Model to get last material in

Returns

Material object

Return type

Material

Example

To get the last material in model m:

```
var m = Material.Last(m);
```

Next()

Description

Returns the next material in the model (or null if there is not one)

Arguments

No arguments

Returns

Material object

Return type

Material

Example

To get the next material after material m:

```
m = m.Next();
```

Previous()

Description

Returns the previous material in the model (or null if there is not one)

Arguments

No arguments

Returns

Material object

Return type

Material

Example

To get the previous material before material m:

```
m = m.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a material

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the material

Returns

No return value

Example

To set flag f on material m:

```
m.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of materials in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of materials

Return type

integer

Example

To get the number of materials in model m:

```
var total = Material.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the materials in the model

Arguments

- **model** (Model)

Model that the defined flag for all materials will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the materials

Returns

No return value

Example

To unset flag f on all of the materials in model m:

```
Material.UnflagAll(m, f);
```

Measure class

The Measure class allows you to create measurements between nodes and parts. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Delete(type*[integer]*)
- DeleteAll()
- GetFromIndex(type*[integer]*)

Member functions

- Data()

Measure constants

Constants for Measure type

Name	Description
Measure.NODE_ANGLE	Node angle measure type
Measure.NODE_ORIGIN	Node to origin measure type
Measure.NODE_TO_NODE	Node to node measure type
Measure.NODE_TO_PART	Node to part measure type
Measure.PART_TO_PART	Part to part measure type

Constants for display

Name	Description
Measure.LABEL	Display measure entity labels
Measure.MAGNITUDE	Display measurement magnitude
Measure.TRANSPARENT	Transparent display of measurements
Measure.VECTOR	Display measurement vector

Constants for line

Name	Description
Measure.HIDDEN	Hidden line style for measures
Measure.WIREFRAME	Wireframe line style for measures

Constants for number format

Name	Description
Measure.AUTOMATIC	Automatic number format
Measure.GENERAL	General number format, for example 123.4
Measure.SCIENTIFIC	Scientific number format, for example, 1.234E+2

Constants for offset

Name	Description
Measure.DEFORM	Consider Deform (Shift deform, Magnify etc.) coordinates for measure calculations
Measure.MODEL_SPACE	Consider model space offsets in the graphics window

Constants for show

Name	Description
Measure.SHOW_ALL	Show all measures
Measure.SHOW_CURRENT	Show only the current measure
Measure.SHOW_NONE	Show no measure

Measure class properties

Name	Type	Description
consider_ blanking	logical	true if calculations in Measure.Data() only consider unblanked elements, false (default) if they consider all elements.
current	integer	Index of the measure currently selected for display purposes, starting at 1.
display	constant	Display options for measurements. Can be any combination (bitwise OR) of Measure.MAGNITUDE, Measure.VECTOR, Measure.LABEL and Measure.TRANSPARENT.
format	constant	Number format for measures. Can be Measure.AUTOMATIC, Measure.SCIENTIFIC or Measure.GENERAL.
line	constant	Line style for measures. Can be Measure.HIDDEN or Measure.WIREFRAME.
offsets	constant	Whether or not to consider Deform (Shift deform, Magnify etc.) or model space offsets in the calculation of measures. Can be any combination (bitwise OR) of Measure.DEFORM, Measure.MODEL_SPACE.
precision	integer	Number of decimal places for scientific or general number format.
show	constant	Whether all, only the current or no measure is shown. Can be Measure.SHOW_NONE, Measure.SHOW_CURRENT or Measure.SHOW_ALL.
total (read only)	integer	Total number of measures in D3PLOT

Measure properties

Name	Type	Description
index (read only)	integer	Index where the measure appears on the interactive measure menu, starting at 1. Note that the index of a measure can change when measures with lower indices are deleted.
name	string	Measure name
type (read only)	constant	Measure type. Can be Measure.NODE_TO_NODE, Measure.NODE_ANGLE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART.

Detailed Description

The Measure class allows you to measure distances and angles between nodes and/or parts. The following example shows how Measures are used to get the distance between two parts.

```
// Create a measure between the parts with internal indices 11 and 12:
var m = new Measure(Measure.PART_TO_PART, { part1: 11, part2: 12});
// Get the distace between these parts at state 10:
SetCurrentState(10);
var data = m.Data();
var distance = data.mag;
// Show all measurements on the screen in state 20:
// Note that SetCurrentState would only affect model data handling, but
// here we are interested in the state on the screen, so we set it with
// SetWindowFrame instead.
SetWindowFrame(ALL, 20);
Measure.show = Measure.SHOW_ALL;
```

See the documentation below for more details.

Constructor

new Measure(type*[constant]*, options*[object]*)

Description

Create a new Measure object.

Arguments

- **type** (constant)

Measure type. Can be Measure.NODE_TO_NODE, Measure.NODE_ANGLE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART

- **options** (object)

Measure options.

Object has the following properties:

Name	Type	Description
model1	integer	Model ID for the first node or part for the measurement. If omitted, the current model will be used.
model2	integer	Model ID for the second node or part for the measurement. If omitted, the current model will be used.
model3	integer	Model ID for the third node for the measurement. If omitted, the current model will be used.
node1	integer	First node for the measurement. If +ve: internal node number starting at 1 (faster), if -ve: external node label.
node2	integer	Second node for the measurement. If +ve: internal node number starting at 1 (faster), if -ve: external node label.
node3	integer	Third node for the measurement. If +ve: internal node number starting at 1 (faster), if -ve: external node label.
part1	integer	First part for the measurement If +ve: internal part number starting at 1 (faster), if -ve: external part label.
part2	integer	Second part for the measurement. If +ve: internal part number starting at 1 (faster), if -ve: external part label.
window	integer	Graphics window ID where the measurement will be created. If omitted, it will be created in the first window.

Returns

Measure object

Return type

Measure

Example

To create a measure between the node with internal index 100 and the part with internal index 3:

```
var m = new Measure(Measure.NODE_TO_PART, { node1: 100, part2: 3 });
```

To create a measure between the node with external label 50 and the part with external label 10:

```
var m = new Measure(Measure.NODE_TO_PART, { node1: -50, part2: -10 });
```

Details of functions

Data()

Description

Returns an object with data for this measure.

Arguments

No arguments

Returns

Object with the following properties:

Name	Type	Description
dx	real	X component of the measurement (for types Measure.NODE_TO_NODE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART)
dy	real	Y component of the measurement (for types Measure.NODE_TO_NODE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART)
dz	real	Z component of the measurement (for types Measure.NODE_TO_NODE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART)
mag	real	magnitude of the measurement (length for types Measure.NODE_TO_NODE, Measure.NODE_ORIGIN, Measure.NODE_TO_PART or Measure.PART_TO_PART, angle in degrees for type Measure.NODE_ANGLE)
xy	real	Angle in the XY plane in degrees for type Measure.NODE_ANGLE
xz	real	Angle in the XZ plane in degrees for type Measure.NODE_ANGLE. The zx property is an alternative name for this.
yz	real	Angle in the YZ plane in degrees for type Measure.NODE_ANGLE
zx	real	Angle in the ZX plane in degrees for type Measure.NODE_ANGLE. The xz property is an alternative name for this.

Return type

object

Example

To get the X component of the measure object m:

```
var data = m.Data();
var dx = data.dx;
```

Delete(type*[integer]*) [static]

Description

Deletes the measure with the given index.

Arguments

- **type** (integer)

Index of the measure to be deleted, starting at 1.

Returns

No return value

Example

To delete measure m:

```
var index = m.index;
Measure.Delete(index);
```

DeleteAll() [static]

Description

Deletes all measures.

Arguments

No arguments

Returns

No return value

Example

To delete all measures:

```
Measure.DeleteAll();
```

GetFromIndex(type*[integer]*) [static]

Description

Gets the measure object for a given index.

Arguments

- **type** (integer)

Index of the measure, starting at 1.

Returns

Measure object for that index

Return type

Measure

Example

To get the object for the measure at index 3:

```
var m = Measure.GetFromIndex(3);
```

Model class

The Model class gives you access to models in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First()
- GetFromID(model number*[integer]*)
- Highest()
- Last()
- Read(filename*[string]*)
- Total()

Member functions

- ClearFlag(flag*[Flag]*)
- Delete()
- GraphicsWindows()
- Next()
- Previous()
- ReadPropertiesFile(filename*[string]*, info (optional)*[object]*)
- Reread()
- Rescan()
- Time(state*[integer]*)

Model properties

Name	Type	Description
filename	boolean	The model filename
number	integer	The model number
state	integer	The state in the model used for scripting methods. Note that this is **not** the state that is displayed for a model in a graphics window. This property is only used for scripting. Many of the methods in the API depend on which state the model is in and setting this property alters that state. To change the state that is displayed for a model in a graphics window use the GraphicsWindow state property
states	integer	The total number of states in the model
title	string	The model title

Detailed Description

The Model class allows you to do various operations on models in D3PLOT. There are various methods and properties available that allow you do read and operate models. See the documentation below for more details.

Constructor

new Model(filename*[string]*)

Description

Reads a file into the first free model in D3PLOT

Arguments

- **filename** (string)

Filename you want to read

Returns

Model object

Return type

Model

Example

To create a model in D3PLOT for the file /data/test/file.ptf

```
var m = new Model("/data/test/file.ptf");
```

Details of functions

ClearFlag(flag*[Flag]*)

Description

Clears a flag on all of the items in the model

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear

Returns

No return value

Example

To clear flag f on all items in model m:

```
m.ClearFlag(f);
```

Delete()

Description

Deletes a model in D3PLOT
Do not use the Model object after calling this method.

Arguments

No arguments

Returns

No return value

Example

To delete model m in D3PLOT

```
m.Delete();
```

First() [static]

Description

Returns the Model object for the first model in D3PLOT (or null if there are no models)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the Model object for the first model:

```
var m = Model.First();
```

GetFromID(model number*[integer]*) [static]

Description

Returns the Model object for a model ID (or null if model does not exist)

Arguments

- **model number** (integer)

number of the model you want the Model object for

Returns

Model object

Return type

Model

Example

To get the Model object for model number 1

```
var m = Model.GetFromID(1);
```

GraphicsWindows()

Description

Returns the graphics window(s) that the model exists in

Arguments

No arguments

Returns

Array of GraphicsWindow objects

Return type

array

Example

To get the graphics windows model m exists in:

```
var list = m.GraphicsWindows();
```

Highest() [static]

Description

Returns the highest model number in D3PLOT (or 0 if no models). Also see Total()

Arguments

No arguments

Returns

Highest model number

Return type

integer

Example

To get the highest model number:

```
var highest = Model.Highest();
```

Last() [static]

Description

Returns the Model object for the last model in D3PLOT (or null if there are no models)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the Model object for the last model:

```
var m = Model.Last();
```

Next()

Description

Returns the next model (or null if there is not one)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the model after model m:

```
m = m.Next();
```

Previous()

Description

Returns the previous model (or null if there is not one)

Arguments

No arguments

Returns

Model object

Return type

Model

Example

To get the model before model m:

```
m = m.Previous();
```

Read(filename*[string]*) [static]

Description

Reads a file into D3PLOT

Arguments

- **filename** (string)

Filename you want to read

Returns

Model object

Return type

Model

Example

To create a model in D3PLOT from the file /data/test/file.ptf

```
var m = Model.Read("/data/test/file.ptf");
```

ReadPropertiesFile(filename*[string]*, info (optional)*[object]*)

Description

Reads a properties file for the model

Arguments

- **filename** (string)

Filename for the properties file you want to read

- **info (optional)** (object)

Object containing the information to set. Can be any of:

Object has the following properties:

Name	Type	Description
ignoreElements	boolean	Ignore any element properties in the properties file and only process part based entries (default is false)
preBlank	boolean	Blank everything in the model before reading the properties file (default is false)

Returns

No return value

Example

To read the properties file /data/test/my_properties.prp for model m:

```
m.ReadPropertiesFile("/data/test/my_properties.prp");
```

Reread()

Description

Rereads the model

Arguments

No arguments

Returns

No return value

Example

To reread model m:

```
m.Reread();
```

Rescan()

Description

Rescans the model

Arguments

No arguments

Returns

No return value

Example

To rescan model m:

```
m.Rescan();
```

Time(state*[integer]*)

Description

Returns the analysis time for a particular state in the model

Arguments

- **state** (integer)

The state you want to get the time for (0 <= state <= states)

Returns

Analysis time

Return type

real

Example

To get the analysis time for state 10 in model m:

```
var time = m.Time(10);
```

Total() [static]

Description

Returns the total number of models in use in D3PLOT. Also see Highest()

Arguments

No arguments

Returns

Total number of models in use

Return type

integer

Example

To get total number of models:

```
var total = Model.Total();
```

Node class

The Node class gives you access to nodes in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(window*[GraphicsWindow]*, model*[Model]*)
- BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)

- UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- Acceleration()
- Blank(window*[GraphicsWindow]*)
- Blanked(window*[GraphicsWindow]*)
- ClearFlag(flag*[Flag]*)
- Coordinates()
- Displacement()
- Elements(type*[constant]*)
- Flagged(flag*[Flag]*)
- GetData(component*[constant]*, options (optional)*[object]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)
- Unblank(window*[GraphicsWindow]*)
- Velocity()

Node properties

Name	Type	Description
data	real|array	Component data for a node passed as an argument to GetMultipleData. Note that data will only exist for the instance of the node passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the node is in
index	integer	The internal index for the node in D3PLOT
label	integer	The LS-DYNA label for the node
model	Model	The Model that the node is in
type	constant	The type for the node (will be Type.NODE)

Detailed Description

The Node class allows you to inspect nodes in a model. See the documentation below for more details.

Details of functions

Acceleration()

Description

Returns the acceleration for the node

Arguments

No arguments

Returns

Array containing the nodal acceleration [Ax, Ay, Az] (or null if the value cannot be calculated)

Return type

array

Example

To return the acceleration of node n:

```
var acc = n.Acceleration();
if (acc !== null) do_something...
```

Blank(window*[GraphicsWindow]*)

Description

Blanks the node in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the node in

Returns

No return value

Example

To blank node n in graphics window g:

```
n.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the nodes in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the nodes in

- **model** (Model)

Model that all the nodes will be blanked in

Returns

No return value

Example

To blank all of the nodes in model m, in graphics window gw:

```
Node.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the nodes in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the nodes in

- **model** (Model)

Model that the flagged nodes will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the nodes to blank

Returns

No return value

Example

To blank all of the nodes flagged with flag f in model m, in graphics window gw:

```
Node.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the node is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the node is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if node n is blanked in graphics window g:

```
if (n.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a node

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the node

Returns

No return value

Example

To clear flag f on node n:

```
n.ClearFlag();
```

Coordinates()

Description

Returns the coordinates for the node

Arguments

No arguments

Returns

Array containing the nodal coordinates [Cx, Cy, Cz] (or null if the value cannot be calculated)

Return type

array

Example

To return the coordinates of node n:

```
var coords = n.Coordinates();
if (coords !== null) do_something...
```

Displacement()

Description

Returns the displacement for the node

Arguments

No arguments

Returns

Array containing the nodal displacement [Dx, Dy, Dz] (or null if the value cannot be calculated)

Return type

array

Example

To return the displacement of node n:

```
var disp = n.Displacement();
if (disp !== null) do_something...
```

Elements(type*[constant]*)

Description

Returns the elements using this node

Arguments

- **type** (constant)

The type of elements. Either Type.BEAM, Type.SHELL, Type.SOLID or Type.TSHELL

Returns

Array containing the elements or null if there are no elements

Return type

array

Example

To return the shell elements using node n:

```
var shells = n.Elements(Type.SHELL);
```

First(model*[Model]*) [static]

Description

Returns the first node in the model (or null if there are no nodes in the model)

Arguments

- **model** (Model)

Model to get first node in

Returns

Node object

Return type

Node

Example

To get the first node in model m:

```
var n = Node.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the nodes in the model with a defined flag

Arguments

- **model** (Model)

Model that all the nodes will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the nodes

Returns

No return value

Example

To flag all of the nodes with flag f in model m:

```
Node.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the node is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the node

Returns

true if flagged, false if not

Return type

boolean

Example

To check if node n has flag f set on it:

```
if (n.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the nodes in the model

Arguments

- **model** (Model)

Model that all the nodes are in

Returns

Array of Node objects

Return type

Array

Example

To get all of the nodes in model m:

```
var n = Node.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it's not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = n.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the nodes in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged nodes are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the nodes to get

Returns

Array of Node objects

Return type

Array

Example

To get all of the nodes flagged with flag f in model m:

```
Node.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Node object for node in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get node in

- **label** (integer)

The LS-DYNA label for the node in the model

Returns

Node object

Return type

Node

Example

To get the node in model m with label 1000:

```
var n = Node.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Node object for node in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get node in

- **index** (integer)

The D3PLOT internal index in the model for node

Returns

Node object

Return type

Node

Example

To get the node in model m at index 50:

```
var n = Node.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple nodes. For each node a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Node objects to get the data for. All of the nodes must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each node with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for nodes in array items and use the data property (note that in the example, the argument extra is optional):

```
Node.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for nodes in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Node.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last node in the model (or null if there are no nodes in the model)

Arguments

- **model** (Model)

Model to get last node in

Returns

Node object

Return type

Node

Example

To get the last node in model m:

```
var n = Node.Last(m);
```

Next()

Description

Returns the next node in the model (or null if there is not one)

Arguments

No arguments

Returns

Node object

Return type

Node

Example

To get the next node after node n:

```
n = n.Next();
```

Pick() [static]

Description

Allows the user to pick a node from the screen

Arguments

No arguments

Returns

Node object or null if cancelled

Return type

Node

Example

To pick a node:

```
var n = Node.Pick();
```

Previous()

Description

Returns the previous node in the model (or null if there is not one)

Arguments

No arguments

Returns

Node object

Return type

Node

Example

To get the previous node before node n:

```
n = n.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects nodes using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting nodes

Returns

The number of nodes selected or null if menu cancelled

Return type

integer

Example

To select nodes, flagging those selected with flag f:

```
var total = Node.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a node

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the node

Returns

No return value

Example

To set flag f on node n:

```
n.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of nodes in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of nodes

Return type

integer

Example

To get the number of nodes in model m:

```
var total = Node.Total(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the node in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the node in

Returns

No return value

Example

To unblank node n in graphics window g:

```
n.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the nodes in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the nodes in

- **model** (Model)

Model that all the nodes will be unblanked in

Returns

No return value

Example

To unblank all of the nodes in model m, in graphics window gw:

```
Node.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the nodes in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the nodes in

- **model** (Model)

Model that the flagged nodes will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the nodes to unblank

Returns

No return value

Example

To unblank all of the nodes flagged with flag f in model m, in graphics window gw:

```
Node.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the nodes in the model

Arguments

- **model** (Model)

Model that the defined flag for all nodes will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the nodes

Returns

No return value

Example

To unset flag f on all of the nodes in model m:

```
Node.UnflagAll(m, f);
```

Velocity()

Description

Returns the velocity for the node

Arguments

No arguments

Returns

Array containing the nodal velocity [Vx, Vy, Vz] (or null if the value cannot be calculated)

Return type

array

Example

To return the velocity of node n:

```
var vel = n.Velocity();
if (disp !== null) do_something...
```

Options class

The Options class enables you to access several options in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Options class properties

Name	Type	Description
auto_ confirm	logical	If true then D3PLOT will automatically confirm (i.e. press the OK button) on (most) message boxes that are mapped. If false (default) then the message boxes will be shown and wait for the user to press a button. This option may be useful to help automate an operation where D3PLOT would normally show a message box and wait for the user to press a button.

Properties for ssh

Name	Type	Description
ssh_ buffer_ size	integer	The size of the buffer used (in kiloBytes) when transferring data to/from the remote machine in the Ssh class. Depending on your network and the size of the files you are transferring, changing this value may make file transfers quicker. The default value is 64(kB) but any value in the range 1(kB) to 1024(kB) is allowed.

Properties for widgets

Name	Type	Description
max_widgets	integer	The maximum number of Widgets that can be made for one Window. The default value is 1000
max_ window_ lines	integer	The maximum number of lines that can be made for a Window.Error(), Window.Information(), Window.Message(), Window.Question() or Window.Warning() window. The default value is 25

Detailed Description

The Options class is used to get/set options that D3PLOT uses for certain functions. The options are available as **class** properties. See the documentation for more details. An example: Options.mass_properties_include_attached_mass_ deformable_elems=true

Page class

The Page class gives you access to pages in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First()
- GetFromID(page number*[integer]*)
- Last()
- Total()

Member functions

- Next()
- Previous()
- Show()

Page constants

Constants for Layout

Name	Description
Page.LAYOUT_1_1	Layout with 1x1 windows per page
Page.LAYOUT_2_2	Layout with 2x2 windows per page
Page.LAYOUT_3_3	Layout with 3x3 windows per page
Page.LAYOUT_CUSTOM	Custom layout with user defined numer of windows per page
Page.LAYOUT_TILE_TALL	Layout with tall tiles
Page.LAYOUT_TILE_WIDE	Layout with wide tiles

Page properties

Name	Type	Description
layout	constant	The page layout. See Page layout constants
number	integer	The page number
x	integer	The number of windows in X for the LAYOUT_CUSTOM case
y	integer	The number of windows in Y for the LAYOUT_CUSTOM case

Detailed Description

The Page class allows you to modify pages in D3PLOT. There are various methods and properties available that allow you do alter how windows are displayed on pages. See the documentation below for more details.

Details of functions

First() [static]

Description

Returns the Page object for the first page in D3PLOT

Arguments

No arguments

Returns

Page object

Return type

Page

Example

To get the Page object for the first page:

```
var p = Page.First();
```

GetFromID(page number*[integer]*) [static]

Description

Returns the Page object for a page ID

Arguments

- **page number** (integer)

number of the page you want the Page object for

Returns

Page object

Return type

Page

Example

To get the Page object for page number 1

```
var p = Page.GetFromID(1);
```

Last() [static]

Description

Returns the Page object for the last page in D3PLOT

Arguments

No arguments

Returns

Page object

Return type

Page

Example

To get the Page object for the last page:

```
var p = Page.Last();
```

Next()

Description

Returns the next page (or null if there is not one)

Arguments

No arguments

Returns

Page object

Return type

Page

Example

To get the page after page p:

```
p = p.Next();
```

Previous()

Description

Returns the previous page (or null if there is not one)

Arguments

No arguments

Returns

Page object

Return type

Page

Example

To get the page before page p:

```
p = p.Previous();
```

Show()

Description

Shows this page in D3PLOT

Arguments

No arguments

Returns

No return value

Example

To show page p:

```
p.Show();
```

Total() [static]

Description

Returns the total number of pages in D3PLOT.

Arguments

No arguments

Returns

Total number of pages

Return type

integer

Example

To get total number of pages:

```
var total = Page.Total();
```

Part class

The Part class gives you access to parts in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(window*[GraphicsWindow]*, model*[Model]*)
- BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*)
- Last(model*[Model]*)
- Pick()
- Select(flag*[Flag]*)
- Total(model*[Model]*)
- UnblankAll(window*[GraphicsWindow]*, model*[Model]*)
- UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- Blank(window*[GraphicsWindow]*)
- Blanked(window*[GraphicsWindow]*)
- ClearFlag(flag*[Flag]*)
- Elements()
- Flagged(flag*[Flag]*)
- GetCompositeData(ipt*[integer]*)
- GetData(component*[constant]*, options (optional)*[object]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)
- Unblank(window*[GraphicsWindow]*)

Part properties

Name	Type	Description
composite	logical	If this is a PART_COMPOSITE. Can be true or false. If there is no ztf file for the model this will be false.
data	real|array	Component data for a part passed as an argument to GetMultipleData. Note that data will only exist for the instance of the part passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
elementType	constant	The type of elements in the part. e.g. Type.SHELL, Type.SOLID etc
include	integer	The include file number in the model that the part is in
index	integer	The internal index for the part in D3PLOT
label	integer	The LS-DYNA label for the part

material	Material	The Material the part has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the part is in
nip	integer	Number of integration points (layers) present for _COMPOSITE parts
title	string	The title for the part (or null if no title)
type	constant	The type for the part (will be Type.PART)

Detailed Description

The Part class allows you to inspect parts in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the part in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the part in

Returns

No return value

Example

To blank part p in graphics window g:

```
p.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the parts in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the parts in

- **model** (Model)

Model that all the parts will be blanked in

Returns

No return value

Example

To blank all of the parts in model m, in graphics window gw:

```
Part.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the parts in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the parts in

- **model** (Model)

Model that the flagged parts will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the parts to blank

Returns

No return value

Example

To blank all of the parts flagged with flag f in model m, in graphics window gw:

```
Part.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the part is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the part is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if part p is blanked in graphics window g:

```
if (p.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a part

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the part

Returns

No return value

Example

To clear flag f on part p:

```
p.ClearFlag();
```

Elements()

Description

Returns an array containing the elements in the part

Arguments

No arguments

Returns

Array of element objects

Return type

array

Example

To return the elements for part p:

```
var elements = p.Elements();
```

First(model*[Model]*) [static]

Description

Returns the first part in the model (or null if there are no parts in the model)

Arguments

- **model** (Model)

Model to get first part in

Returns

Part object

Return type

Part

Example

To get the first part in model m:

```
var p = Part.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the parts in the model with a defined flag

Arguments

- **model** (Model)

Model that all the parts will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the parts

Returns

No return value

Example

To flag all of the parts with flag f in model m:

```
Part.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the part is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the part

Returns

true if flagged, false if not

Return type

boolean

Example

To check if part p has flag f set on it:

```
if (p.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the parts in the model

Arguments

- **model** (Model)

Model that all the parts are in

Returns

Array of Part objects

Return type

Array

Example

To get all of the parts in model m:

```
var p = Part.GetAll(m);
```

GetCompositeData(ipt*[integer]*)

Description

Returns the composite data for an integration point in *PART_COMPOSITE.

Arguments

- **ipt** (integer)

The integration point you want the data for. **Note that integration points start at 0, not 1**.

Returns

An array containing the material id and thickness values.

Return type

Array

Example

To get the composite data for the 3rd integration point for part p:

```
if (p.composite && p.nip >= 3)
{
    var ipt_data = p.GetCompositeData(2);
}
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])

referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it's not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = p.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the parts in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged parts are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the parts to get

Returns

Array of Part objects

Return type

Array

Example

To get all of the parts flagged with flag f in model m:

```
Part.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Part object for part in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get part in

- **label** (integer)

The LS-DYNA label for the part in the model

Returns

Part object

Return type

Part

Example

To get the part in model m with label 1000:

```
var p = Part.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Part object for part in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get part in

- **index** (integer)

The D3PLOT internal index in the model for part

Returns

Part object

Return type

Part

Example

To get the part in model m at index 50:

```
var p = Part.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple parts. For each part a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Part objects to get the data for. All of the parts must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each part with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for parts in array items and use the data property (note that in the example, the argument extra is optional):

```
Part.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for parts in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Part.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last part in the model (or null if there are no parts in the model)

Arguments

- **model** (Model)

Model to get last part in

Returns

Part object

Return type

Part

Example

To get the last part in model m:

```
var p = Part.Last(m);
```

Next()

Description

Returns the next part in the model (or null if there is not one)

Arguments

No arguments

Returns

Part object

Return type

Part

Example

To get the next part after part p:

```
p = p.Next();
```

Pick() [static]

Description

Allows the user to pick a part from the screen

Arguments

No arguments

Returns

Part object or null if cancelled

Return type

Part

Example

To pick a part:

```
var p = Part.Pick();
```

Previous()

Description

Returns the previous part in the model (or null if there is not one)

Arguments

No arguments

Returns

Part object

Return type

Part

Example

To get the previous part before part p:

```
p = p.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects parts using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting parts

Returns

The number of parts selected or null if menu cancelled

Return type

integer

Example

To select parts, flagging those selected with flag f:

```
var total = Part.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a part

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the part

Returns

No return value

Example

To set flag f on part p:

```
p.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of parts in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of parts

Return type

integer

Example

To get the number of parts in model m:

```
var total = Part.Total(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the part in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the part in

Returns

No return value

Example

To unblank part p in graphics window g:

```
p.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the parts in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the parts in

- **model** (Model)

Model that all the parts will be unblanked in

Returns

No return value

Example

To unblank all of the parts in model m, in graphics window gw:

```
Part.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the parts in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the parts in

- **model** (Model)

Model that the flagged parts will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the parts to unblank

Returns

No return value

Example

To unblank all of the parts flagged with flag f in model m, in graphics window gw:

```
Part.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the parts in the model

Arguments

- **model** (Model)

Model that the defined flag for all parts will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the parts

Returns

No return value

Example

To unset flag f on all of the parts in model m:

```
Part.UnflagAll(m, f);
```

PopupWindow class

The PopupWindow class allows you to create popup windows for a graphical user interface. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Hide()

PopupWindow properties

Name	Type	Description
persistent	boolean	If the popup window will remain mapped when a button is pressed in it. By default (false) when a button is pressed in the popup window the popup will be unmapped. If set to true then the popup will remain mapped until the user clicks out of the window or hides it by calling Hide()

Detailed Description

The PopupWindow class allows you to make popup windows (that you can place Widgets in) and link them to Widgets. The popup window is then displayed by right clicking on the Widget the popup is linked to. The following very simple example shows how to create a popup window and link it to a label Widget.

```
// Create popup window
var pw = new PopupWindow();
// Create some widgets in the popup window
var pl = new Widget(pw, Widget.LABEL,   1, 30,  1,  7, "Label");
var pb = new Widget(pw, Widget.BUTTON,  1, 30,  7, 13, "Button");
var pt = new Widget(pw, Widget.TEXTBOX, 1, 30, 20, 26, "Textbox");
// Create window with title "Popup example" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Popup example", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 50, 1,  7, "Right click for popup...");
// link popup window to widget
l.popupWindow = pw;
// Assign the onPopup callback method to the function 'do_popup'
// This is only required if you want to make any changes before the popup
appears
l.onPopup  = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    Message("Showing popup");
}
```

See the documentation below and the Widget class for more details.

Constructor

new PopupWindow()

Description

Create a new PopupWindow object.

Arguments

No arguments

Returns

PopupWindow object

Return type

PopupWindow

Example

To create a PopupWindow containing the buttons "Create" and "Edit" and link it to button b:

```
var pw = new PopupWindow();
var c = new Widget(pw, Widget.BUTTON, 1, 30, 1, 7,  "Create");
var e = new Widget(pw, Widget.BUTTON, 1, 30, 7, 13, "Edit");
b.popupWindow = pw;
```

Details of functions

Hide()

Description

Hides (unmaps) the popup window.

Arguments

No arguments

Returns

No return value

Example

To hide popup window w:

```
w.Hide();
```

Segment class

The Segment class gives you access to contact segments in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BlankAll(window*[GraphicsWindow]*, model*[Model]*)
- BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*)
- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*)
- Last(model*[Model]*)
- Pick()

- GetData(component*[constant]*, options (optional)*[object]*)
- LocalAxes()
- Next()
- Previous()
- SetFlag(flag*[Flag]*)
- Topology()
- Unblank(window*[GraphicsWindow]*)

Segment properties

Name	Type	Description
data	real|array	Component data for a segment passed as an argument to GetMultipleData. Note that data will only exist for the instance of the segment passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the segment is in
index	integer	The internal index for the segment in D3PLOT
label	integer	The LS-DYNA label for the segment
material	Material	The Material the segment has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the segment is in

part	Part	The Part the segment is in
type	constant	The type for the segment (will be Type.SEGMENT)

Detailed Description

The Segment class allows you to inspect contact segments in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the segment in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the segment in

Returns

No return value

Example

To blank segment s in graphics window g:

```
s.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the segments in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the segments in

- **model** (Model)

Model that all the segments will be blanked in

Returns

No return value

Example

To blank all of the segments in model m, in graphics window gw:

```
Segment.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the segments in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the segments in

- **model** (Model)

Model that the flagged segments will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the segments to blank

Returns

No return value

Example

To blank all of the segments flagged with flag f in model m, in graphics window gw:

```
Segment.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the segment is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the segment is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if segment s is blanked in graphics window g:

```
if (s.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a segment

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the segment

Returns

No return value

Example

To clear flag f on segment s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first segment in the model (or null if there are no segments in the model)

Arguments

- **model** (Model)

Model to get first segment in

Returns

Segment object

Return type

Segment

Example

To get the first segment in model m:

```
var s = Segment.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the segments in the model with a defined flag

Arguments

- **model** (Model)

Model that all the segments will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the segments

Returns

No return value

Example

To flag all of the segments with flag f in model m:

```
Segment.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the segment is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the segment

Returns

true if flagged, false if not

Return type

boolean

Example

To check if segment s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the segments in the model

Arguments

- **model** (Model)

Model that all the segments are in

Returns

Array of Segment objects

Return type

Array

Example

To get all of the segments in model m:

```
var s = Segment.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells

ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it's not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = s.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the segments in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged segments are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the segments to get

Returns

Array of Segment objects

Return type

Array

Example

To get all of the segments flagged with flag f in model m:

```
Segment.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Segment object for segment in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get segment in

- **label** (integer)

The LS-DYNA label for the segment in the model

Returns

Segment object

Return type

Segment

Example

To get the segment in model m with label 1000:

```
var s = Segment.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Segment object for segment in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get segment in

- **index** (integer)

The D3PLOT internal index in the model for segment

Returns

Segment object

Return type

Segment

Example

To get the segment in model m at index 50:

```
var s = Segment.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple segments. For each segment a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Segment objects to get the data for. All of the segments must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each segment with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for segments in array items and use the data property (note that in the example, the argument extra is optional):

```
Segment.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for segments in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Segment.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last segment in the model (or null if there are no segments in the model)

Arguments

- **model** (Model)

Model to get last segment in

Returns

Segment object

Return type

Segment

Example

To get the last segment in model m:

```
var s = Segment.Last(m);
```

LocalAxes()

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2D array. Beam elements must have 3 nodes to be able to return local axes.

Arguments

No arguments

Returns

array of arrays

Return type

Array

Example

To get the local axes for segment s:

```
var axes = s.LocalAxes();
var xAxis = [ axes[0][0], axes[0][1], axes[0][2] ];
var yAxis = [ axes[1][0], axes[1][1], axes[1][2] ];
var zAxis = [ axes[2][0], axes[2][1], axes[2][2] ];
```

Next()

Description

Returns the next segment in the model (or null if there is not one)

Arguments

No arguments

Returns

Segment object

Return type

Segment

Example

To get the next segment after segment s:

```
s = s.Next();
```

Pick() [static]

Description

Allows the user to pick a segment from the screen

Arguments

No arguments

Returns

Segment object or null if cancelled

Return type

Segment

Example

To pick a segment:

```
var s = Segment.Pick();
```

Previous()

Description

Returns the previous segment in the model (or null if there is not one)

Arguments

No arguments

Returns

Segment object

Return type

Segment

Example

To get the previous segment before segment s:

```
s = s.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects segments using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting segments

Returns

The number of segments selected or null if menu cancelled

Return type

integer

Example

To select segments, flagging those selected with flag f:

```
var total = Segment.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a segment

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the segment

Returns

No return value

Example

To set flag f on segment s:

```
s.SetFlag(f);
```

Topology()

Description

Returns the topology for the segment in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the topology for segment s:

```
var topology = s.Topology();
```

Total(model*[Model]*) [static]

Description

Returns the total number of segments in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of segments

Return type

integer

Example

To get the number of segments in model m:

```
var total = Segment.Total(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the segment in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the segment in

Returns

No return value

Example

To unblank segment s in graphics window g:

```
s.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the segments in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the segments in

- **model** (Model)

Model that all the segments will be unblanked in

Returns

No return value

Example

To unblank all of the segments in model m, in graphics window gw:

```
Segment.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the segments in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the segments in

- **model** (Model)

Model that the flagged segments will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the segments to unblank

Returns

No return value

Example

To unblank all of the segments flagged with flag f in model m, in graphics window gw:

```
Segment.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the segments in the model

Arguments

- **model** (Model)

Model that the defined flag for all segments will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the segments

Returns

No return value

Example

To unset flag f on all of the segments in model m:

```
Segment.UnflagAll(m, f);
```

SetBeam class

The SetBeam class gives you access to beam sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- SetFlag(flag*[Flag]*)

SetBeam properties

Name	Type	Description
include	integer	The include file number in the model that the beam set is in
index	integer	The internal index for the beam set in D3PLOT
label	integer	The LS-DYNA label for the beam set
model	Model	The Model that the beam set is in
title	string	The title for the beam set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of beam items in the beam set
type	constant	The type for the beam set (will be Type.SETBEAM)

Detailed Description

The SetBeam class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the beam items for the beam set in the model

Arguments

No arguments

Returns

array of Beam objects

Return type

Array

Example

To get the beam items in beam set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a beam set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the beam set

Returns

No return value

Example

To clear flag f on beam set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first beam set in the model (or null if there are no beam sets in the model)

Arguments

- **model** (Model)

Model to get first beam set in

Returns

SetBeam object

Return type

SetBeam

Example

To get the first beam set in model m:

```
var s = SetBeam.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the beam sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the beam sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the beam sets

Returns

No return value

Example

To flag all of the beam sets with flag f in model m:

```
SetBeam.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the beam set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the beam set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if beam set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the beam sets in the model

Arguments

- **model** (Model)

Model that all the beam sets are in

Returns

Array of SetBeam objects

Return type

Array

Example

To get all of the beam sets in model m:

```
var s = SetBeam.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the beam sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged beam sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the beam sets to get

Returns

Array of SetBeam objects

Return type

Array

Example

To get all of the beam sets flagged with flag f in model m:

```
SetBeam.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetBeam object for beam set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get beam set in

- **label** (integer)

The LS-DYNA label for the beam set in the model

Returns

SetBeam object

Return type

SetBeam

Example

To get the beam set in model m with label 1000:

```
var s = SetBeam.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetBeam object for beam set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get beam set in

- **index** (integer)

The D3PLOT internal index in the model for beam set

Returns

SetBeam object

Return type

SetBeam

Example

To get the beam set in model m at index 50:

```
var s = SetBeam.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a beam item from the beam set in the model

Arguments

- **index** (integer)

The index in the beam set to get the beam from (0 <= index < total)

Returns

Beam object

Return type

Beam

Example

To get the 10th beam in beam set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last beam set in the model (or null if there are no beam sets in the model)

Arguments

- **model** (Model)

Model to get last beam set in

Returns

SetBeam object

Return type

SetBeam

Example

To get the last beam set in model m:

```
var s = SetBeam.Last(m);
```

Next()

Description

Returns the next beam set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetBeam object

Return type

SetBeam

Example

To get the next beam set after beam set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous beam set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetBeam object

Return type

SetBeam

Example

To get the previous beam set before beam set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a beam set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the beam set

Returns

No return value

Example

To set flag f on beam set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of beam sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of beam sets

Return type

integer

Example

To get the number of beam sets in model m:

```
var total = SetBeam.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the beam sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all beam sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the beam sets

Returns

No return value

Example

To unset flag f on all of the beam sets in model m:

```
SetBeam.UnflagAll(m, f);
```

SetNode class

The SetNode class gives you access to node sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)

- Total(model*[Model]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- AllItems()
- ClearFlag(flag*[Flag]*)
- Flagged(flag*[Flag]*)
- Item(index*[integer]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)

SetNode properties

Name	Type	Description
include	integer	The include file number in the model that the node set is in
index	integer	The internal index for the node set in D3PLOT
label	integer	The LS-DYNA label for the node set
model	Model	The Model that the node set is in
title	string	The title for the node set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of node items in the node set
type	constant	The type for the node set (will be Type.SETNODE)

Detailed Description

The SetNode class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the node items for the node set in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the node items in node set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a node set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the node set

Returns

No return value

Example

To clear flag f on node set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first node set in the model (or null if there are no node sets in the model)

Arguments

- **model** (Model)

Model to get first node set in

Returns

SetNode object

Return type

SetNode

Example

To get the first node set in model m:

```
var s = SetNode.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the node sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the node sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the node sets

Returns

No return value

Example

To flag all of the node sets with flag f in model m:

```
SetNode.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the node set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the node set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if node set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the node sets in the model

Arguments

- **model** (Model)

Model that all the node sets are in

Returns

Array of SetNode objects

Return type

Array

Example

To get all of the node sets in model m:

```
var s = SetNode.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the node sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged node sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the node sets to get

Returns

Array of SetNode objects

Return type

Array

Example

To get all of the node sets flagged with flag f in model m:

```
SetNode.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetNode object for node set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get node set in

- **label** (integer)

The LS-DYNA label for the node set in the model

Returns

SetNode object

Return type

SetNode

Example

To get the node set in model m with label 1000:

```
var s = SetNode.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetNode object for node set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get node set in

- **index** (integer)

The D3PLOT internal index in the model for node set

Returns

SetNode object

Return type

SetNode

Example

To get the node set in model m at index 50:

```
var s = SetNode.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a node item from the node set in the model

Arguments

- **index** (integer)

The index in the node set to get the node from (0 <= index < total)

Returns

Node object

Return type

Node

Example

To get the 10th node in node set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last node set in the model (or null if there are no node sets in the model)

Arguments

- **model** (Model)

Model to get last node set in

Returns

SetNode object

Return type

SetNode

Example

To get the last node set in model m:

```
var s = SetNode.Last(m);
```

Next()

Description

Returns the next node set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetNode object

Return type

SetNode

Example

To get the next node set after node set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous node set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetNode object

Return type

SetNode

Example

To get the previous node set before node set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a node set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the node set

Returns

No return value

Example

To set flag f on node set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of node sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of node sets

Return type

integer

Example

To get the number of node sets in model m:

```
var total = SetNode.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the node sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all node sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the node sets

Returns

No return value

Example

To unset flag f on all of the node sets in model m:

```
SetNode.UnflagAll(m, f);
```

SetPart class

The SetPart class gives you access to part sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- Last(model*[Model]*)
- Total(model*[Model]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- AllItems()
- ClearFlag(flag*[Flag]*)
- Flagged(flag*[Flag]*)
- Item(index*[integer]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)

SetPart properties

Name	Type	Description
include	integer	The include file number in the model that the part set is in
index	integer	The internal index for the part set in D3PLOT
label	integer	The LS-DYNA label for the part set
model	Model	The Model that the part set is in
title	string	The title for the part set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of part items in the part set
type	constant	The type for the part set (will be Type.SETPART)

Detailed Description

The SetPart class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the part items for the part set in the model

Arguments

No arguments

Returns

array of Part objects

Return type

Array

Example

To get the part items in part set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a part set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the part set

Returns

No return value

Example

To clear flag f on part set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first part set in the model (or null if there are no part sets in the model)

Arguments

- **model** (Model)

Model to get first part set in

Returns

SetPart object

Return type

SetPart

Example

To get the first part set in model m:

```
var s = SetPart.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the part sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the part sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the part sets

Returns

No return value

Example

To flag all of the part sets with flag f in model m:

```
SetPart.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the part set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the part set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if part set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the part sets in the model

Arguments

- **model** (Model)

Model that all the part sets are in

Returns

Array of SetPart objects

Return type

Array

Example

To get all of the part sets in model m:

```
var s = SetPart.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the part sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged part sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the part sets to get

Returns

Array of SetPart objects

Return type

Array

Example

To get all of the part sets flagged with flag f in model m:

```
SetPart.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetPart object for part set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get part set in

- **label** (integer)

The LS-DYNA label for the part set in the model

Returns

SetPart object

Return type

SetPart

Example

To get the part set in model m with label 1000:

```
var s = SetPart.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetPart object for part set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get part set in

- **index** (integer)

The D3PLOT internal index in the model for part set

Returns

SetPart object

Return type

SetPart

Example

To get the part set in model m at index 50:

```
var s = SetPart.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a part item from the part set in the model

Arguments

- **index** (integer)

The index in the part set to get the part from (0 <= index < total)

Returns

Part object

Return type

Part

Example

To get the 10th part in part set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last part set in the model (or null if there are no part sets in the model)

Arguments

- **model** (Model)

Model to get last part set in

Returns

SetPart object

Return type

SetPart

Example

To get the last part set in model m:

```
var s = SetPart.Last(m);
```

Next()

Description

Returns the next part set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetPart object

Return type

SetPart

Example

To get the next part set after part set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous part set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetPart object

Return type

SetPart

Example

To get the previous part set before part set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a part set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the part set

Returns

No return value

Example

To set flag f on part set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of part sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of part sets

Return type

integer

Example

To get the number of part sets in model m:

```
var total = SetPart.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the part sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all part sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the part sets

Returns

No return value

Example

To unset flag f on all of the part sets in model m:

```
SetPart.UnflagAll(m, f);
```

SetShell class

The SetShell class gives you access to shell sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- Flagged(flag*[Flag]*)
- Item(index*[integer]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)

SetShell properties

Name	Type	Description
include	integer	The include file number in the model that the shell set is in
index	integer	The internal index for the shell set in D3PLOT
label	integer	The LS-DYNA label for the shell set
model	Model	The Model that the shell set is in
title	string	The title for the shell set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of shell items in the shell set
type	constant	The type for the shell set (will be Type.SETSHELL)

Detailed Description

The SetShell class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the shell items for the shell set in the model

Arguments

No arguments

Returns

array of Shell objects

Return type

Array

Example

To get the shell items in shell set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a shell set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the shell set

Returns

No return value

Example

To clear flag f on shell set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first shell set in the model (or null if there are no shell sets in the model)

Arguments

- **model** (Model)

Model to get first shell set in

Returns

SetShell object

Return type

SetShell

Example

To get the first shell set in model m:

```
var s = SetShell.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the shell sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the shell sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the shell sets

Returns

No return value

Example

To flag all of the shell sets with flag f in model m:

```
SetShell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the shell set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the shell set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if shell set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the shell sets in the model

Arguments

- **model** (Model)

Model that all the shell sets are in

Returns

Array of SetShell objects

Return type

Array

Example

To get all of the shell sets in model m:

```
var s = SetShell.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the shell sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged shell sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the shell sets to get

Returns

Array of SetShell objects

Return type

Array

Example

To get all of the shell sets flagged with flag f in model m:

```
SetShell.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetShell object for shell set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get shell set in

- **label** (integer)

The LS-DYNA label for the shell set in the model

Returns

SetShell object

Return type

SetShell

Example

To get the shell set in model m with label 1000:

```
var s = SetShell.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetShell object for shell set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get shell set in

- **index** (integer)

The D3PLOT internal index in the model for shell set

Returns

SetShell object

Return type

SetShell

Example

To get the shell set in model m at index 50:

```
var s = SetShell.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a shell item from the shell set in the model

Arguments

- **index** (integer)

The index in the shell set to get the shell from (0 <= index < total)

Returns

Shell object

Return type

Shell

Example

To get the 10th shell in shell set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last shell set in the model (or null if there are no shell sets in the model)

Arguments

- **model** (Model)

Model to get last shell set in

Returns

SetShell object

Return type

SetShell

Example

To get the last shell set in model m:

```
var s = SetShell.Last(m);
```

Next()

Description

Returns the next shell set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetShell object

Return type

SetShell

Example

To get the next shell set after shell set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous shell set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetShell object

Return type

SetShell

Example

To get the previous shell set before shell set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a shell set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the shell set

Returns

No return value

Example

To set flag f on shell set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of shell sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of shell sets

Return type

integer

Example

To get the number of shell sets in model m:

```
var total = SetShell.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the shell sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all shell sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the shell sets

Returns

No return value

Example

To unset flag f on all of the shell sets in model m:

```
SetShell.UnflagAll(m, f);
```

SetSolid class

The SetSolid class gives you access to solid sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

SetSolid properties

Name	Type	Description
include	integer	The include file number in the model that the solid set is in
index	integer	The internal index for the solid set in D3PLOT
label	integer	The LS-DYNA label for the solid set
model	Model	The Model that the solid set is in
title	string	The title for the solid set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of solid items in the solid set
type	constant	The type for the solid set (will be Type.SETSOLID)

Detailed Description

The SetSolid class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the solid items for the solid set in the model

Arguments

No arguments

Returns

array of Solid objects

Return type

Array

Example

To get the solid items in solid set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a solid set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the solid set

Returns

No return value

Example

To clear flag f on solid set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first solid set in the model (or null if there are no solid sets in the model)

Arguments

- **model** (Model)

Model to get first solid set in

Returns

SetSolid object

Return type

SetSolid

Example

To get the first solid set in model m:

```
var s = SetSolid.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the solid sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the solid sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the solid sets

Returns

No return value

Example

To flag all of the solid sets with flag f in model m:

```
SetSolid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the solid set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the solid set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if solid set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the solid sets in the model

Arguments

- **model** (Model)

Model that all the solid sets are in

Returns

Array of SetSolid objects

Return type

Array

Example

To get all of the solid sets in model m:

```
var s = SetSolid.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the solid sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged solid sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the solid sets to get

Returns

Array of SetSolid objects

Return type

Array

Example

To get all of the solid sets flagged with flag f in model m:

```
SetSolid.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetSolid object for solid set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get solid set in

- **label** (integer)

The LS-DYNA label for the solid set in the model

Returns

SetSolid object

Return type

SetSolid

Example

To get the solid set in model m with label 1000:

```
var s = SetSolid.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetSolid object for solid set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get solid set in

- **index** (integer)

The D3PLOT internal index in the model for solid set

Returns

SetSolid object

Return type

SetSolid

Example

To get the solid set in model m at index 50:

```
var s = SetSolid.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a solid item from the solid set in the model

Arguments

- **index** (integer)

The index in the solid set to get the solid from (0 <= index < total)

Returns

Solid object

Return type

Solid

Example

To get the 10th solid in solid set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last solid set in the model (or null if there are no solid sets in the model)

Arguments

- **model** (Model)

Model to get last solid set in

Returns

SetSolid object

Return type

SetSolid

Example

To get the last solid set in model m:

```
var s = SetSolid.Last(m);
```

Next()

Description

Returns the next solid set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetSolid object

Return type

SetSolid

Example

To get the next solid set after solid set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous solid set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetSolid object

Return type

SetSolid

Example

To get the previous solid set before solid set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a solid set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the solid set

Returns

No return value

Example

To set flag f on solid set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of solid sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of solid sets

Return type

integer

Example

To get the number of solid sets in model m:

```
var total = SetSolid.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the solid sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all solid sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the solid sets

Returns

No return value

Example

To unset flag f on all of the solid sets in model m:

```
SetSolid.UnflagAll(m, f);
```

SetTshell class

The SetTshell class gives you access to thick shell sets in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- First(model*[Model]*)
- FlagAll(model*[Model]*, flag*[Flag]*)
- GetAll(model*[Model]*)
- GetFlagged(model*[Model]*, flag*[Flag]*)
- GetFromID(model*[Model]*, label*[integer]*)
- GetFromIndex(model*[Model]*, index*[integer]*)
- Last(model*[Model]*)
- Total(model*[Model]*)
- UnflagAll(model*[Model]*, flag*[Flag]*)

Member functions

- AllItems()
- ClearFlag(flag*[Flag]*)
- Flagged(flag*[Flag]*)
- Item(index*[integer]*)
- Next()
- Previous()
- SetFlag(flag*[Flag]*)

SetTshell properties

Name	Type	Description
include	integer	The include file number in the model that the thick shell set is in
index	integer	The internal index for the thick shell set in D3PLOT
label	integer	The LS-DYNA label for the thick shell set
model	Model	The Model that the thick shell set is in
title	string	The title for the thick shell set (or null if no title). This is only available if there is a ztf file for the model. If not null will be returned.
total	integer	The total number of thick shell items in the thick shell set
type	constant	The type for the thick shell set (will be Type.SETTSHELL)

Detailed Description

The SetTshell class allows you to view sets in D3PLOT. There are various methods and properties available. This class requires a ztf file to be present for the model. See the documentation below for more details.

Details of functions

AllItems()

Description

Returns all of the thick shell items for the thick shell set in the model

Arguments

No arguments

Returns

array of Tshell objects

Return type

Array

Example

To get the thick shell items in thick shell set s:

```
var items = s.AllItems();
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a thick shell set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the thick shell set

Returns

No return value

Example

To clear flag f on thick shell set s:

```
s.ClearFlag();
```

First(model*[Model]*) [static]

Description

Returns the first thick shell set in the model (or null if there are no thick shell sets in the model)

Arguments

- **model** (Model)

Model to get first thick shell set in

Returns

SetTshell object

Return type

SetTshell

Example

To get the first thick shell set in model m:

```
var s = SetTshell.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the thick shell sets in the model with a defined flag

Arguments

- **model** (Model)

Model that all the thick shell sets will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the thick shell sets

Returns

No return value

Example

To flag all of the thick shell sets with flag f in model m:

```
SetTshell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the thick shell set is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the thick shell set

Returns

true if flagged, false if not

Return type

boolean

Example

To check if thick shell set s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the thick shell sets in the model

Arguments

- **model** (Model)

Model that all the thick shell sets are in

Returns

Array of SetTshell objects

Return type

Array

Example

To get all of the thick shell sets in model m:

```
var s = SetTshell.GetAll(m);
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the thick shell sets in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged thick shell sets are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the thick shell sets to get

Returns

Array of SetTshell objects

Return type

Array

Example

To get all of the thick shell sets flagged with flag f in model m:

```
SetTshell.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the SetTshell object for thick shell set in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get thick shell set in

- **label** (integer)

The LS-DYNA label for the thick shell set in the model

Returns

SetTshell object

Return type

SetTshell

Example

To get the thick shell set in model m with label 1000:

```
var s = SetTshell.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the SetTshell object for thick shell set in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get thick shell set in

- **index** (integer)

The D3PLOT internal index in the model for thick shell set

Returns

SetTshell object

Return type

SetTshell

Example

To get the thick shell set in model m at index 50:

```
var s = SetTshell.GetFromIndex(m, 50);
```

Item(index*[integer]*)

Description

Returns a thick shell item from the thick shell set in the model

Arguments

- **index** (integer)

The index in the thick shell set to get the thick shell from (0 <= index < total)

Returns

Tshell object

Return type

Tshell

Example

To get the 10th thick shell in thick shell set s:

```
var items = s.Item(9);
```

Last(model[*Model*]) [static]

Description

Returns the last thick shell set in the model (or null if there are no thick shell sets in the model)

Arguments

- **model** (Model)

Model to get last thick shell set in

Returns

SetTshell object

Return type

SetTshell

Example

To get the last thick shell set in model m:

```
var s = SetTshell.Last(m);
```

Next()

Description

Returns the next thick shell set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetTshell object

Return type

SetTshell

Example

To get the next thick shell set after thick shell set s:

```
s = s.Next();
```

Previous()

Description

Returns the previous thick shell set in the model (or null if there is not one)

Arguments

No arguments

Returns

SetTshell object

Return type

SetTshell

Example

To get the previous thick shell set before thick shell set s:

```
s = s.Previous();
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a thick shell set

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the thick shell set

Returns

No return value

Example

To set flag f on thick shell set s:

```
s.SetFlag(f);
```

Total(model*[Model]*) [static]

Description

Returns the total number of thick shell sets in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of thick shell sets

Return type

integer

Example

To get the number of thick shell sets in model m:

```
var total = SetTshell.Total(m);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the thick shell sets in the model

Arguments

- **model** (Model)

Model that the defined flag for all thick shell sets will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the thick shell sets

Returns

No return value

Example

To unset flag f on all of the thick shell sets in model m:

```
SetTshell.UnflagAll(m, f);
```

Shell class

The Shell class gives you access to shell elements in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Shell properties

Name	Type	Description
data	real|array	Component data for a shell passed as an argument to GetMultipleData. Note that data will only exist for the instance of the shell passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the shell is in
index	integer	The internal index for the shell in D3PLOT

integrationPoints	integer	The number of through thickness integration points that the shell has
label	integer	The LS-DYNA label for the shell
material	Material	The Material the shell has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the shell is in
onPlanIntegrationPoints	integer	The number of on plan integration points that the shell has
part	Part	The Part the shell is in
type	constant	The type for the shell (will be Type.SHELL)

Detailed Description

The Shell class allows you to inspect shell elements in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the shell in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the shell in

Returns

No return value

Example

To blank shell s in graphics window g:

```
s.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the shells in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the shells in

- **model** (Model)

Model that all the shells will be blanked in

Returns

No return value

Example

To blank all of the shells in model m, in graphics window gw:

```
Shell.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the shells in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the shells in

- **model** (Model)

Model that the flagged shells will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the shells to blank

Returns

No return value

Example

To blank all of the shells flagged with flag f in model m, in graphics window gw:

```
Shell.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the shell is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the shell is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if shell s is blanked in graphics window g:

```
if (s.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a shell

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the shell

Returns

No return value

Example

To clear flag f on shell s:

```
s.ClearFlag();
```

Deleted()

Description

Checks if the shell has been deleted or not

Arguments

No arguments

Returns

true if deleted, false if not

Return type

boolean

Example

To check if shell s has been deleted:

```
if (s.Deleted() ) do_something...
```

First(model*[Model]*) [static]

Description

Returns the first shell in the model (or null if there are no shells in the model)

Arguments

- **model** (Model)

Model to get first shell in

Returns

Shell object

Return type

Shell

Example

To get the first shell in model m:

```
var s = Shell.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the shells in the model with a defined flag

Arguments

- **model** (Model)

Model that all the shells will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the shells

Returns

No return value

Example

To flag all of the shells with flag f in model m:

```
Shell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the shell is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the shell

Returns

true if flagged, false if not

Return type

boolean

Example

To check if shell s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the shells in the model

Arguments

- **model** (Model)

Model that all the shells are in

Returns

Array of Shell objects

Return type

Array

Example

To get all of the shells in model m:

```
var s = Shell.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it’s not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = s.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the shells in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged shells are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the shells to get

Returns

Array of Shell objects

Return type

Array

Example

To get all of the shells flagged with flag f in model m:

```
Shell.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Shell object for shell in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get shell in

- **label** (integer)

The LS-DYNA label for the shell in the model

Returns

Shell object

Return type

Shell

Example

To get the shell in model m with label 1000:

```
var s = Shell.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Shell object for shell in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get shell in

- **index** (integer)

The D3PLOT internal index in the model for shell

Returns

Shell object

Return type

Shell

Example

To get the shell in model m at index 50:

```
var s = Shell.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple shells. For each shell a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Shell objects to get the data for. All of the shells must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used

user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each shell with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for shells in array items and use the data property (note that in the example, the argument extra is optional):

```
Shell.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for shells in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Shell.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last shell in the model (or null if there are no shells in the model)

Arguments

- **model** (Model)

Model to get last shell in

Returns

Shell object

Return type

Shell

Example

To get the last shell in model m:

```
var s = Shell.Last(m);
```

LocalAxes()

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2D array. Beam elements must have 3 nodes to be able to return local axes.

Arguments

No arguments

Returns

array of arrays

Return type

Array

Example

To get the local axes for shell s:

```
var axes = s.LocalAxes();
var xAxis = [ axes[0][0], axes[0][1], axes[0][2] ];
var yAxis = [ axes[1][0], axes[1][1], axes[1][2] ];
var zAxis = [ axes[2][0], axes[2][1], axes[2][2] ];
```

Next()

Description

Returns the next shell in the model (or null if there is not one)

Arguments

No arguments

Returns

Shell object

Return type

Shell

Example

To get the next shell after shell s:

```
s = s.Next();
```

Pick() [static]

Description

Allows the user to pick a shell from the screen

Arguments

No arguments

Returns

Shell object or null if cancelled

Return type

Shell

Example

To pick a shell:

```
var s = Shell.Pick();
```

PlasticStrain(options (optional)*[object]*)

Description

Returns the effective plastic strain for the shell

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])

Returns

Plastic strain (or null if the value cannot be calculated)

Return type

real

Example

To return the effective plastic strain of shell s:

```
var strain = s.PlasticStrain();
if (strain !== null) do_something...
```

Previous()

Description

Returns the previous shell in the model (or null if there is not one)

Arguments

No arguments

Returns

Shell object

Return type

Shell

Example

To get the previous shell before shell s:

```
s = s.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects shells using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting shells

Returns

The number of shells selected or null if menu cancelled

Return type

integer

Example

To select shells, flagging those selected with flag f:

```
var total = Shell.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a shell

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the shell

Returns

No return value

Example

To set flag f on shell s:

```
s.SetFlag(f);
```

StrainTensor(options (optional)*[object]*)

Description

Returns the strain tensor for the shell

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the strain tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the strain tensor of shell s:

```
var tensor = s.StrainTensor();
if (tensor !== null) do_something...
```

StressTensor(options (optional)*[object]*)

Description

Returns the stress tensor for the shell

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the stress tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the stress tensor of shell s:

```
var tensor = s.StressTensor();
if (tensor !== null) do_something...
```

Topology()

Description

Returns the topology for the shell in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the topology for shell s:

```
var topology = s.Topology();
```

Total(model[*Model*]) [static]

Description

Returns the total number of shells in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of shells

Return type

integer

Example

To get the number of shells in model m:

```
var total = Shell.Total(m);
```

TotalDeleted(model[*Model*]) [static]

Description

Returns the total number of shells that have been deleted in a model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of shells that have been deleted

Return type

integer

Example

To get the number of shells in model m that have been deleted:

```
var total = Shell.TotalDeleted(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the shell in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the shell in

Returns

No return value

Example

To unblank shell s in graphics window g:

```
s.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the shells in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the shells in

- **model** (Model)

Model that all the shells will be unblanked in

Returns

No return value

Example

To unblank all of the shells in model m, in graphics window gw:

```
Shell.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the shells in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the shells in

- **model** (Model)

Model that the flagged shells will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the shells to unblank

Returns

No return value

Example

To unblank all of the shells flagged with flag f in model m, in graphics window gw:

```
Shell.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the shells in the model

Arguments

- **model** (Model)

Model that the defined flag for all shells will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the shells

Returns

No return value

Example

To unset flag f on all of the shells in model m:

```
Shell.UnflagAll(m, f);
```

VonMisesStress(options (optional)*[object]*)

Description

Returns the von Mises stress for the shell (or null if the value cannot be calculated)

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])

Returns

von Mises stress

Return type

real

Example

To return the von Mises stress of shell s:

```
var svm = s.VonMisesStress();
if (svm !== null) do_something...
```

Solid class

The Solid class gives you access to solid elements in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Solid properties

Name	Type	Description
data	real|array	Component data for a solid passed as an argument to GetMultipleData. Note that data will only exist for the instance of the solid passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the solid is in
index	integer	The internal index for the solid in D3PLOT
label	integer	The LS-DYNA label for the solid

material	Material	The Material the solid has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the solid is in
part	Part	The Part the solid is in
type	constant	The type for the solid (will be Type.SOLID)

Detailed Description

The Solid class allows you to inspect solid elements in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the solid in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the solid in

Returns

No return value

Example

To blank solid s in graphics window g:

```
s.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the solids in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the solids in

- **model** (Model)

Model that all the solids will be blanked in

Returns

No return value

Example

To blank all of the solids in model m, in graphics window gw:

```
Solid.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the solids in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the solids in

- **model** (Model)

Model that the flagged solids will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the solids to blank

Returns

No return value

Example

To blank all of the solids flagged with flag f in model m, in graphics window gw:

```
Solid.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the solid is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the solid is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if solid s is blanked in graphics window g:

```
if (s.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a solid

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the solid

Returns

No return value

Example

To clear flag f on solid s:

```
s.ClearFlag();
```

Deleted()

Description

Checks if the solid has been deleted or not

Arguments

No arguments

Returns

true if deleted, false if not

Return type

boolean

Example

To check if solid s has been deleted:

```
if (s.Deleted() ) do_something...
```

First(model*[Model]*) [static]

Description

Returns the first solid in the model (or null if there are no solids in the model)

Arguments

- **model** (Model)

Model to get first solid in

Returns

Solid object

Return type

Solid

Example

To get the first solid in model m:

```
var s = Solid.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the solids in the model with a defined flag

Arguments

- **model** (Model)

Model that all the solids will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the solids

Returns

No return value

Example

To flag all of the solids with flag f in model m:

```
Solid.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the solid is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the solid

Returns

true if flagged, false if not

Return type

boolean

Example

To check if solid s has flag f set on it:

```
if (s.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the solids in the model

Arguments

- **model** (Model)

Model that all the solids are in

Returns

Array of Solid objects

Return type

Array

Example

To get all of the solids in model m:

```
var s = Solid.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it’s not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = s.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the solids in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged solids are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the solids to get

Returns

Array of Solid objects

Return type

Array

Example

To get all of the solids flagged with flag f in model m:

```
Solid.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Solid object for solid in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get solid in

- **label** (integer)

The LS-DYNA label for the solid in the model

Returns

Solid object

Return type

Solid

Example

To get the solid in model m with label 1000:

```
var s = Solid.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Solid object for solid in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get solid in

- **index** (integer)

The D3PLOT internal index in the model for solid

Returns

Solid object

Return type

Solid

Example

To get the solid in model m at index 50:

```
var s = Solid.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple solids. For each solid a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Solid objects to get the data for. All of the solids must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each solid with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for solids in array items and use the data property (note that in the example, the argument extra is optional):

```
Solid.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for solids in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Solid.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last solid in the model (or null if there are no solids in the model)

Arguments

- **model** (Model)

Model to get last solid in

Returns

Solid object

Return type

Solid

Example

To get the last solid in model m:

```
var s = Solid.Last(m);
```

LocalAxes()

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2D array. Beam elements must have 3 nodes to be able to return local axes.

Arguments

No arguments

Returns

array of arrays

Return type

Array

Example

To get the local axes for solid s:

```
var axes = s.LocalAxes();
var xAxis = [ axes[0][0], axes[0][1], axes[0][2] ];
var yAxis = [ axes[1][0], axes[1][1], axes[1][2] ];
var zAxis = [ axes[2][0], axes[2][1], axes[2][2] ];
```

Next()

Description

Returns the next solid in the model (or null if there is not one)

Arguments

No arguments

Returns

Solid object

Return type

Solid

Example

To get the next solid after solid s:

```
s = s.Next();
```

Pick() [static]

Description

Allows the user to pick a solid from the screen

Arguments

No arguments

Returns

Solid object or null if cancelled

Return type

Solid

Example

To pick a solid:

```
var s = Solid.Pick();
```

PlasticStrain(options (optional)*[object]*)

Description

Returns the effective plastic strain for the solid (or null if the value cannot be calculated)

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1)

Returns

Plastic strain

Return type

real

Example

To return the effective plastic strain of solid s:

```
var strain = s.PlasticStrain();
if (strain !== null) do_something...
```

Previous()

Description

Returns the previous solid in the model (or null if there is not one)

Arguments

No arguments

Returns

Solid object

Return type

Solid

Example

To get the previous solid before solid s:

```
s = s.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects solids using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting solids

Returns

The number of solids selected or null if menu cancelled

Return type

integer

Example

To select solids, flagging those selected with flag f:

```
var total = Solid.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a solid

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the solid

Returns

No return value

Example

To set flag f on solid s:

```
s.SetFlag(f);
```

StrainTensor(options (optional)*[object]*)

Description

Returns the strain tensor for the solid

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1)
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the strain tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the strain tensor of solid s:

```
var tensor = s.StrainTensor();
if (tensor !== null) do_something...
```

StressTensor(options (optional)*[object]*)

Description

Returns the stress tensor for the solid

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1)
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the stress tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the stress tensor of solid s:

```
var tensor = s.StressTensor();
if (tensor !== null) do_something...
```

Topology()

Description

Returns the topology for the solid in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the topology for solid s:

```
var topology = s.Topology();
```

Total(model*[Model]*) [static]

Description

Returns the total number of solids in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of solids

Return type

integer

Example

To get the number of solids in model m:

```
var total = Solid.Total(m);
```

TotalDeleted(model*[Model]*) [static]

Description

Returns the total number of solids that have been deleted in a model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of solids that have been deleted

Return type

integer

Example

To get the number of solids in model m that have been deleted:

```
var total = Solid.TotalDeleted(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the solid in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the solid in

Returns

No return value

Example

To unblank solid s in graphics window g:

```
s.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the solids in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the solids in

- **model** (Model)

Model that all the solids will be unblanked in

Returns

No return value

Example

To unblank all of the solids in model m, in graphics window gw:

```
Solid.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the solids in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the solids in

- **model** (Model)

Model that the flagged solids will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the solids to unblank

Returns

No return value

Example

To unblank all of the solids flagged with flag f in model m, in graphics window gw:

```
Solid.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the solids in the model

Arguments

- **model** (Model)

Model that the defined flag for all solids will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the solids

Returns

No return value

Example

To unset flag f on all of the solids in model m:

```
Solid.UnflagAll(m, f);
```

VonMisesStress(options (optional)*[object]*)

Description

Returns the von Mises stress for the solid (or null if the value cannot be calculated)

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1)

Returns

von Mises stress

Return type

real

Example

To return the von Mises stress of solid s:

```
var svm = s.VonMisesStress();
if (svm !== null) do_something...
```

Tshell class

The Tshell class gives you access to thick shell elements in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Tshell properties

Name	Type	Description
data	real|array	Component data for a tshell passed as an argument to GetMultipleData. Note that data will only exist for the instance of the tshell passed to GetMultipleData. i.e. it is a local property stored on the specific instance. It is not stored in the D3PLOT database
include	integer	The include file number in the model that the tshell is in
index	integer	The internal index for the tshell in D3PLOT

integrationPoints	integer	The number of through thickness integration points that the thick shell has
label	integer	The LS-DYNA label for the tshell
material	Material	The Material the tshell has. This is only available if there is a ztf file for the model. If not null will be returned. If this is a PART_COMPOSITE then null will be returned. Part.GetCompositeData should be used to get material data in this case
model	Model	The Model that the tshell is in
onPlanIntegrationPoints	integer	The number of on plan integration points that the thick shell has
part	Part	The Part the tshell is in
type	constant	The type for the tshell (will be Type.TSHELL)

Detailed Description

The Tshell class allows you to inspect thick shell elements in a model. See the documentation below for more details.

Details of functions

Blank(window*[GraphicsWindow]*)

Description

Blanks the tshell in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the tshell in

Returns

No return value

Example

To blank tshell t in graphics window g:

```
t.Blank(g);
```

BlankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Blanks all of the tshells in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the tshells in

- **model** (Model)

Model that all the tshells will be blanked in

Returns

No return value

Example

To blank all of the tshells in model m, in graphics window gw:

```
Tshell.BlankAll(gw, m);
```

BlankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Blanks all of the tshells in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to blank the tshells in

- **model** (Model)

Model that the flagged tshells will be blanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the tshells to blank

Returns

No return value

Example

To blank all of the tshells flagged with flag f in model m, in graphics window gw:

```
Tshell.BlankFlagged(gw, m, f);
```

Blanked(window*[GraphicsWindow]*)

Description

Checks if the tshell is blanked in a graphics window or not

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) in which to check if the tshell is blanked

Returns

true if blanked, false if not

Return type

boolean

Example

To check if tshell t is blanked in graphics window g:

```
if (t.Blanked(g) ) do_something...
```

ClearFlag(flag*[Flag]*)

Description

Clears a flag on a tshell

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to clear on the tshell

Returns

No return value

Example

To clear flag f on tshell t:

```
t.ClearFlag();
```

Deleted()

Description

Checks if the thick shell has been deleted or not

Arguments

No arguments

Returns

true if deleted, false if not

Return type

boolean

Example

To check if thick shell t has been deleted:

```
if (t.Deleted() ) do_something...
```

First(model[*Model*]) [static]

Description

Returns the first tshell in the model (or null if there are no tshells in the model)

Arguments

- **model** (Model)

Model to get first tshell in

Returns

Tshell object

Return type

Tshell

Example

To get the first tshell in model m:

```
var t = Tshell.First(m);
```

FlagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Flags all of the tshells in the model with a defined flag

Arguments

- **model** (Model)

Model that all the tshells will be flagged in

- **flag** (Flag)

Flag (see AllocateFlag) to set on the tshells

Returns

No return value

Example

To flag all of the tshells with flag f in model m:

```
Tshell.FlagAll(m, f);
```

Flagged(flag*[Flag]*)

Description

Checks if the tshell is flagged or not

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to test on the tshell

Returns

true if flagged, false if not

Return type

boolean

Example

To check if tshell t has flag f set on it:

```
if (t.Flagged(f) ) do_something...
```

GetAll(model*[Model]*) [static]

Description

Gets all of the tshells in the model

Arguments

- **model** (Model)

Model that all the tshells are in

Returns

Array of Tshell objects

Return type

Array

Example

To get all of the tshells in model m:

```
var t = Tshell.GetAll(m);
```

GetData(component*[constant]*, options (optional)*[object]*)

Description

Returns the value for a data component.
Also see GetMultipleData

Arguments

- **component** (constant)

Component constant to get data for

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM). If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used
user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Number if a scalar component, array if a vector or tensor component (or null if the value cannot be calculated because it’s not available in the model).
If requesting an invalid component it will throw an error (e.g. Component.AREA of a node).

Return type

real|array

Example

To calculate a component and check it has been calculated (note that in the example, the argument extra is optional):

```
var value = t.GetData(component, {extra: 1});
if (value !== null) do_something...
```

GetFlagged(model*[Model]*, flag*[Flag]*) [static]

Description

Gets all of the tshells in the model flagged with a defined flag

Arguments

- **model** (Model)

Model that the flagged tshells are in

- **flag** (Flag)

Flag (see AllocateFlag) set on the tshells to get

Returns

Array of Tshell objects

Return type

Array

Example

To get all of the tshells flagged with flag f in model m:

```
Tshell.GetFlagged(m, f);
```

GetFromID(model*[Model]*, label*[integer]*) [static]

Description

Returns the Tshell object for tshell in model with label (or null if it does not exist)

Arguments

- **model** (Model)

Model to get tshell in

- **label** (integer)

The LS-DYNA label for the tshell in the model

Returns

Tshell object

Return type

Tshell

Example

To get the tshell in model m with label 1000:

```
var t = Tshell.GetFromID(m, 1000);
```

GetFromIndex(model*[Model]*, index*[integer]*) [static]

Description

Returns the Tshell object for tshell in model with index (or null if it does not exist)

Arguments

- **model** (Model)

Model to get tshell in

- **index** (integer)

The D3PLOT internal index in the model for tshell

Returns

Tshell object

Return type

Tshell

Example

To get the tshell in model m at index 50:

```
var t = Tshell.GetFromIndex(m, 50);
```

GetMultipleData(component*[constant]*, items*[array]*, options (optional)*[object]*) [static]

Description

Returns the value for a data component for multiple tshells. For each tshell a local property called data will be created containing a number if a scalar component, or an array if a vector or tensor component (or null if the value cannot be calculated). The data is also returned as an object.
Also see GetData

Arguments

- **component** (constant)

Component constant to get data for

- **items** (array)

Array of Tshell objects to get the data for. All of the tshells must be in the same model.

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
extra	integer	The extra data component number if component Component.SOX for solids, Component.BMX for beams or Component.SHX for shells and thick shells
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used

user	integer	The user-defined component number if component Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS or Component.UBMV

Returns

Object containing the data. A property is created in the object for each tshell with the label. The value of the property is a number if a scalar component or an array if a vector or tensor component (or null if the value cannot be calculated)

Return type

object

Example

To calculate a component for tshells in array items and use the data property (note that in the example, the argument extra is optional):

```
Tshell.GetMultipleData(component, items, {extra: 1});
for (i=0; i<items.length; i++)
{
    if (items[i].data !== null) do_something...
}
```

To calculate a component for tshells in array items and use the return value (note that in the example, the argument extra is optional):

```
var data = Tshell.GetMultipleData(component, items, {extra: 1});
for (d in data)
{
    Message("Label is " + d);
    if (data[d] !== null) do_something...
}
```

Last(model[*Model*]) [static]

Description

Returns the last tshell in the model (or null if there are no tshells in the model)

Arguments

- **model** (Model)

Model to get last tshell in

Returns

Tshell object

Return type

Tshell

Example

To get the last tshell in model m:

```
var t = Tshell.Last(m);
```

LocalAxes()

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2D array. Beam elements must have 3 nodes to be able to return local axes.

Arguments

No arguments

Returns

array of arrays

Return type

Array

Example

To get the local axes for tshell t:

```
var axes = t.LocalAxes();
var xAxis = [ axes[0][0], axes[0][1], axes[0][2] ];
var yAxis = [ axes[1][0], axes[1][1], axes[1][2] ];
var zAxis = [ axes[2][0], axes[2][1], axes[2][2] ];
```

Next()

Description

Returns the next tshell in the model (or null if there is not one)

Arguments

No arguments

Returns

Tshell object

Return type

Tshell

Example

To get the next tshell after tshell t:

```
t = t.Next();
```

Pick() [static]

Description

Allows the user to pick a tshell from the screen

Arguments

No arguments

Returns

Tshell object or null if cancelled

Return type

Tshell

Example

To pick a tshell:

```
var t = Tshell.Pick();
```

PlasticStrain(options (optional)*[object]*)

Description

Returns the effective plastic strain for the thick shell (or null if the value cannot be calculated)

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])

Returns

Plastic strain

Return type

real

Example

To return the effective plastic strain of thick shell t:

```
var strain = t.PlasticStrain();
if (strain !== null) do_something...
```

Previous()

Description

Returns the previous tshell in the model (or null if there is not one)

Arguments

No arguments

Returns

Tshell object

Return type

Tshell

Example

To get the previous tshell before tshell t:

```
t = t.Previous();
```

Select(flag*[Flag]*) [static]

Description

Selects tshells using an object menu

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to use when selecting tshells

Returns

The number of tshells selected or null if menu cancelled

Return type

integer

Example

To select tshells, flagging those selected with flag f:

```
var total = Tshell.Select(f);
```

SetFlag(flag*[Flag]*)

Description

Sets a flag on a tshell

Arguments

- **flag** (Flag)

Flag (see AllocateFlag) to set on the tshell

Returns

No return value

Example

To set flag f on tshell t:

```
t.SetFlag(f);
```

StrainTensor(options (optional)*[object]*)

Description

Returns the strain tensor for the thick shell

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the strain tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the strain tensor of think shell t:

```
var tensor = t.StrainTensor();
if (tensor !== null) do_something...
```

StressTensor(options (optional)*[object]*)

Description

Returns the stress tensor for the thick shell

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])
referenceFrame	constant	The frame of reference to return values in. Either Constant.GLOBAL (default), Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED or Constant.MATERIAL

Returns

Array containing the stress tensor [Exx, Eyy, Ezz, Exy, Eyz, Ezx] (or null if the value cannot be calculated)

Return type

array

Example

To return the stress tensor of thick shell t:

```
var tensor = t.StressTensor();
if (tensor !== null) do_something...
```

Topology()

Description

Returns the topology for the tshell in the model

Arguments

No arguments

Returns

array of Node objects

Return type

Array

Example

To get the topology for tshell t:

```
var topology = t.Topology();
```

Total(model[*Model*]) [static]

Description

Returns the total number of tshells in the model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of tshells

Return type

integer

Example

To get the number of tshells in model m:

```
var total = Tshell.Total(m);
```

TotalDeleted(model[*Model*]) [static]

Description

Returns the total number of thick shells that have been deleted in a model

Arguments

- **model** (Model)

Model to get total in

Returns

The number of thick shells that have been deleted

Return type

integer

Example

To get the number of thick shells in model m that have been deleted:

```
var total = Tshell.TotalDeleted(m);
```

Unblank(window*[GraphicsWindow]*)

Description

Unblanks the tshell in a graphics window

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the tshell in

Returns

No return value

Example

To unblank tshell t in graphics window g:

```
t.Unblank(g);
```

UnblankAll(window*[GraphicsWindow]*, model*[Model]*) [static]

Description

Unblanks all of the tshells in the model

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the tshells in

- **model** (Model)

Model that all the tshells will be unblanked in

Returns

No return value

Example

To unblank all of the tshells in model m, in graphics window gw:

```
Tshell.UnblankAll(gw, m);
```

UnblankFlagged(window*[GraphicsWindow]*, model*[Model]*, flag*[Flag]*) [static]

Description

Unblanks all of the tshells in the model flagged with a defined flag

Arguments

- **window** (GraphicsWindow)

GraphicsWindow) to unblank the tshells in

- **model** (Model)

Model that the flagged tshells will be unblanked in

- **flag** (Flag)

Flag (see AllocateFlag) set on the tshells to unblank

Returns

No return value

Example

To unblank all of the tshells flagged with flag f in model m, in graphics window gw:

```
Tshell.UnblankFlagged(gw, m, f);
```

UnflagAll(model*[Model]*, flag*[Flag]*) [static]

Description

Unsets a defined flag on all of the tshells in the model

Arguments

- **model** (Model)

Model that the defined flag for all tshells will be unset in

- **flag** (Flag)

Flag (see AllocateFlag) to unset on the tshells

Returns

No return value

Example

To unset flag f on all of the tshells in model m:

```
Tshell.UnflagAll(m, f);
```

VonMisesStress(options (optional)*[object]*)

Description

Returns the von Mises stress for the thick shell (or null if the value cannot be calculated)

Arguments

- **options (optional)** (object)

Object containing options for getting data. Can be any of:

Object has the following properties:

Name	Type	Description
ip	integer	Integration point number to get the data at (ip >= 1 or one of the constants Constant.TOP, Constant.MIDDLE or Constant.BOTTOM)
op	integer	On plane integration point number for shells and thick shells (op >= 1 [default])

Returns

von Mises stress

Return type

real

Example

To return the von Mises stress of thick shell t:

```
var svm = t.VonMisesStress();
if (svm !== null) do_something...
```

Type class

The Type class defines constants for the types in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Type constants

Name	Description
Type.BEAM	Beam elements
Type.BOLT	Bolts (contributes to the count of total connections, but can't provide data or be visualised)
Type.BWLD	Beam spotwelds
Type.CONTACT	Contact surfaces
Type.CONX	All connection types
Type.CWLD	*CONSTRAINED_SPOTWELD spotwelds
Type.DES	Discrete Element Sphere
Type.ELEMENT	Generic elements
Type.GROUP	Groups
Type.GWLD	*CONSTRAINED_GENERALIZED spotwelds
Type.HSWA	Hex spotweld assemblies
Type.HWLD	Hex (Solid) spotwelds
Type.JOINT	Joints
Type.MASS	Lumped masses
Type.MATERIAL	Materials
Type.MIG	MIG welds (contributes to the count of total connections, but can't provide data or be visualised)
Type.MODEL	Model
Type.NODE	Nodes
Type.NRB	Nodal Rigid Bodies
Type.PART	Parts
Type.PRETENSIONER	Pretensioners
Type.RBOLT	Rigid bolts (contributes to the count of total connections, but can't provide data or be visualised)
Type.RETRACTOR	Retractors
Type.RIGIDWALL	Rigidwalls
Type.SBENT	Seatbelt types generally

Type.SEATBELT	Seatbelt elements
Type.SECTION	(Element) section definitions
Type.SEGMENT	Contact segments
Type.SET_BEAM	*SET_BEAM sets
Type.SET_DISCRETE	*SET_DISCRETE sets
Type.SET_NODE	*SET_NODE sets
Type.SET_PART	*SET_PART sets
Type.SET_SHELL	*SET_SHELL sets
Type.SET_SOLID	*SET_SOLID sets
Type.SET_TSHELL	*SET_TSHELL sets
Type.SHELL	Shell elements
Type.SLIPRING	Slip-rings
Type.SOLID	Solid elements
Type.SPC	Single Point Constraint
Type.SPH	Smoothed Particle Hydrodynamics
Type.SPRING	Springs (discrete elements)
Type.TSHELL	Thick shell elements
Type.WINDOW	D3PLOT window id
Type.XSEC	Database cross-sections

Detailed Description

The Type class gives you access to the different types that are used in the D3PLOT API. See the documentation below for more details.

View class

The View class allows you to control the view and plotting modes in D3PLOT. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Ac()
- Ct()
- Hi()
- Li()
- Redraw()
- Sh()
- Show(View type*[constant]*)
- Si()
- Vec()

View constants

Constants for Show

Name	Description
View.ISO	Isometric projection
View.XY	XY axis projection
View.XZ	XZ axis projection
View.YZ	YZ axis projection

Constants for plotting mode

Name	Description
View.CURRENT	current mode
View.HIDDEN	Hidden line
View.SHADED	Shaded view
View.WIRE	Wireframe

Detailed Description

The View class gives you access to the different plotting modes and views. See the documentation below for more details.

Details of functions

Ac() [static]

Description

Autoscales the view

Arguments

No arguments

Returns

No return value

Example

To autoscale

```
View.Ac();
```

Ct() [static]

Description

Does a contour plot

Arguments

No arguments

Returns

No return value

Example

To do a contour plot

```
View.Ct();
```

Hi() [static]

Description

Does a Hidden line plot

Arguments

No arguments

Returns

No return value

Example

To do a hidden line plot

```
View.Hi();
```

Li() [static]

Description

Does a line (wireframe) plot

Arguments

No arguments

Returns

No return value

Example

To do a line plot

```
View.Li();
```

Redraw() [static]

Description

Redraws the plot using the current plot mode.

Arguments

No arguments

Returns

No return value

Example

To redraw

```
View.Redraw();
```

Sh() [static]

Description

Does a shaded plot

Arguments

No arguments

Returns

No return value

Example

To do a shaded plot

```
View.Sh();
```

Show(View type*[constant]*) [static]

Description

Redraws using one of the standard views

Arguments

- **View type** (constant)

The view to show. Can be +/-View.XY, +/-View.YZ, +/-View.XZ or +/-View.ISO

Returns

No return value

Example

To do an isometric view from the negative direction:

```
View.Show(-View.ISO);
```

Si() [static]

Description

Does a shaded image contour plot

Arguments

No arguments

Returns

No return value

Example

To do a shaded image contour plot

```
View.Si();
```

Vec() [static]

Description

Does a vector plot

Arguments

No arguments

Returns

No return value

Example

To do a vector plot

```
View.Vec();
```

Widget class

The Widget class allows you to create components for a graphical user interface. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- CtrlPressed()
- PixelsPerUnit()
- ShiftPressed()
- StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*)

Member functions

- AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)
- AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)
- Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)
- Clear()
- ClearSelection()
- Cross(colour (optional)*[constant]*)
- Delete()
- DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)
- DumpImageString(filename*[string]*, format (optional)*[constant]*)
- Hide()
- ItemAt(index*[integer]*)
- Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)
- Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)
- Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]
- ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- RemoveAllWidgetItems()
- RemoveWidgetItem(item*[WidgetItem]*)
- Scroll(scroll*[constant or WidgetItem object]*)
- Show()
- Static()
- Tick(colour (optional)*[constant]*)
- TotalItems()
- WidgetItems()

Widget constants

Name	Description
Widget.BUTTON	Button widget
Widget.CHECKBOX	Checkbox widget
Widget.COMBOBOX	Combobox widget
Widget.LABEL	Label widget
Widget.LISTBOX	Listbox widget

Widget.RADIOBUTTON	Radiobutton widget
Widget.SLIDER	Slider widget
Widget.TEXTBOX	Text input widget
Widget.TREE	Tree widget

Constants for Colour

Name	**Description**
Widget.BLACK	Colour black
Widget.BLUE	Colour blue
Widget.COLOUR_ CONTRAST	A contrasting colour in the 3 user interface themes (Green, Purple, and Blue in the Dark, Light, and Classic themes respectively). Blue in the legacy theme.
Widget.COLOUR_ CONTRAST_2	Another contrasting colour in the 3 user interface themes (Yellow, Red, and Red in the Dark, Light, and Classic themes respectively). Red in the legacy theme.
Widget.COLOUR_ INVERSE	Inverse colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_LABEL	Label text colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_ LATENT	Latent colour in the 3 user interface themes (Different shade of Cyan in every theme). Light Cyan in the legacy theme.
Widget.COLOUR_ NEUTRAL	Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme.
Widget.COLOUR_SAFE	Safe colour in the 3 user interface themes (Different shade of green in every theme). Dark green in the legacy theme.
Widget.COLOUR_TITLE	Title colour in the 3 user interface themes (Different shade of grey in every theme). Dark blue in the legacy theme.
Widget.COLOUR_ WARNING	Warning colour in the 3 user interface themes (Different shade of red in every theme). Dark red in the legacy theme.
Widget.CYAN	Colour cyan
Widget.DARKBLUE	Colour dark blue
Widget.DARKGREEN	Colour dark green
Widget.DARKGREY	Colour dark grey
Widget.DARKGREY_ NEUTRAL	Only valid in the function ’Line’. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Dark grey in the legacy theme
Widget.DARKRED	Colour dark red
Widget.DEFAULT	Default colour for widgets
Widget.GREEN	Colour green
Widget.GREY	Colour grey
Widget.LIGHTGREY	Colour light grey
Widget.LIGHTGREY_ NEUTRAL	Only valid in the function ’Line’. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme
Widget.MAGENTA	Colour magenta
Widget.ORANGE	Colour orange

Widget.RED	Colour red
Widget.WHITE	Colour white
Widget.YELLOW	Colour yellow

Constants for Image RGB format

Name	Description
Widget.RGB24	24 bits for RGB data in widget images
Widget.RGB8	8 bits for RGB data in widget images

Constants for Justification

Name	Description
Widget.BOTTOM	Bottom justification
Widget.CENTRE	Centre (horizontal) justification
Widget.LEFT	Left justification
Widget.MIDDLE	Middle (vertical) justification
Widget.RIGHT	Right justification
Widget.SCALE	Image will be scaled to fit widget
Widget.TOP	Top justification

Constants for Orientation

Name	Description
Widget.HORIZONTAL	Horizontal orientation (for sliders)
Widget.VERTICAL	Vertical orientation (for sliders)

Constants for Selection

Name	Description
Widget.SELECT_ENHANCED	Multiple WidgetItems in a ListBox or tree Widget can be selected. When the user selects a WidgetItem the selection is cleared and the new WidgetItem selected. However, if the user presses the Ctrl key when clicking on a WidgetItem, the clicked WidgetItem gets toggled and all other WidgetItems are left untouched. If the user presses the Shift key while clicking on a WidgetItem, all WidgetItems between the last selected WidgetItem and the clicked WidgetItem are selected or unselected, depending on the state of the clicked WidgetItem.
Widget.SELECT_MULTIPLE	Multiple WidgetItems in a ListBox Widget can be selected. When the user selects a WidgetItem, the selection status of that WidgetItem is toggled and the other WidgetItems are left alone. Not valid for tree widgets. Widget.SELECT_ENHANCED will be used.
Widget.SELECT_NONE	No WidgetItem in a ListBox or tree Widget can be selected
Widget.SELECT_SINGLE	A single WidgetItem in a ListBox or tree Widget can be selected. When the user selects a WidgetItem, any already-selected WidgetItem becomes unselected, and the user cannot unselect the selected WidgetItem by clicking on it.

Constants for Tree relations

Name	Description

Widget.AFTER	Add a WidgetItem after the existing WidgetItem for a tree widget.
Widget.BEFORE	Add a WidgetItem before the existing WidgetItem for a tree widget.
Widget.CHILD	Add a WidgetItem as a child of the existing WidgetItem for a tree widget.

Constants for Tree scrolling

Name	Description
Widget.SCROLL_BOTTOM	Scroll tree widget to bottom.
Widget.SCROLL_DOWN	Scroll tree widget down one.
Widget.SCROLL_PAGE_DOWN	Scroll tree widget down one page.
Widget.SCROLL_PAGE_UP	Scroll tree widget up one page.
Widget.SCROLL_TOP	Scroll tree widget to top.
Widget.SCROLL_UP	Scroll tree widget up one.

Constants for User interface categories

Name	Description
Widget.CATEGORY_APPLY	Apply buttons
Widget.CATEGORY_BUTTON_BOX	A button box panel that contains other widgets
Widget.CATEGORY_CANCEL	Buttons which cancel the current operation
Widget.CATEGORY_DATA_ ENTRY_HEADER	Header for data entry cells, e.g. PRIMER create panels
Widget.CATEGORY_DISMISS	Buttons to close or dismiss panels
Widget.CATEGORY_ENTITY	Entity types in T/HIS
Widget.CATEGORY_GENERIC	A generic button that isn’t a special category
Widget.CATEGORY_GENERIC_2	An alternative to the generic category that has a complementary colour
Widget.CATEGORY_HELP	Help buttons
Widget.CATEGORY_KEYWORD	A PRIMER keyword button
Widget.CATEGORY_LABEL	A text label
Widget.CATEGORY_LABEL_BOX	Text label with a border
Widget.CATEGORY_LABEL_ POPUP	Text label with a popup that blends into the background
Widget.CATEGORY_MENU_BOX	A menu box
Widget.CATEGORY_MESSAGE	For displaying a temporary warning message
Widget.CATEGORY_OPERATE	Operate buttons in T/HIS
Widget.CATEGORY_POPUP_BOX	A popup box that can contain buttons and plain text
Widget.CATEGORY_SAFE_ ACTION	Buttons (usually green) to indicate a safe action
Widget.CATEGORY_SEL_ALL	Select all

Widget.CATEGORY_TAB	Tab
Widget.CATEGORY_TABLE_HEADER	Table (column) header
Widget.CATEGORY_TABLE_ROW	Table row
Widget.CATEGORY_TEXT_BOX	A text box
Widget.CATEGORY_TICKBOX	A tick box
Widget.CATEGORY_TITLE	Title text
Widget.CATEGORY_TOGGLE	Buttons that can be toggled, e.g. On/Off
Widget.CATEGORY_TOOL	Buttons within the tools area
Widget.CATEGORY_UNDO	Buttons which undo the last operation
Widget.CATEGORY_UNSEL_ALL	Unselect/deslect all
Widget.CATEGORY_UPDATE	Update buttons which update the screen but leave the panel open
Widget.CATEGORY_WARNING_ACTION	Buttons (usually red) to indicate a dangerous action
Widget.NO_CATEGORY	No styling is applied. Widget colour controlled by foreground/background properties and is the same in all themes

Widget properties

Name	Type	Description
active	logical	If widget is active (true) or disabled (false)
arrows	boolean	Whether arrows will be shown for a slider (default is true). Slider Widgets only.
background	constant	Widget background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, Note, background colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the background colour. To override this behaviour and use this background colour first set the widget category to Widget.NO_CATEGORY.
bottom	integer	Widget bottom coordinate
category	constant	The button category which determines the button's appearance when using the new user interface, see Window.Theme()
currentItem	WidgetItem object	The current WidgetItem for a tree Widget. The current WidgetItem in a tree is shown with a dashed border.
fontSize	integer	Widget font size in points. Currently only supports the following sizes: 6, 7, 8, 10, 12, 14, 18, 24. Can be used only with Widget.LABEL and Widget.BUTTON. Both LATIN1 and UTF-8 encoding is supported on Windows but Linux only supports LATIN1 encoding at the moment.

foreground	constant	Widget foreground colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_LABEL, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, Note, foreground colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the foreground colour. To override this behaviour and use this foreground colour first set the widget category to Widget.NO_CATEGORY.
hover	string	Widget hover text
imageHeight (read only)	integer	Height of widget image (pixels)
imageWidth (read only)	integer	Width of widget image (pixels)
justify	constant	Widget justification. Can be: Widget.LEFT, Widget.RIGHT or Widget.CENTRE (default).
left	integer	Widget left coordinate
lineWidth	integer	Width of lines when drawing graphics (initially 1; values 1-100 allowed).
macroTag	string	Tag to use for this widget when recording a macro. If empty then the text property value will be used.
maximum	integer	The maximum value allowed for a slider (default is 100). Slider Widgets only.
minimum	integer	The minimum value allowed for a slider (default is 0). Slider Widgets only.
monospace	boolean	true if the widget uses a monospace font instead of a proportional width font (default). Label and button Widgets only.
onChange	function	Function to call when the text in a TEXTBOX widget, the selection in a COMBOBOX widget or the value of a SLIDER is changed. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually types something into the textbox, selects an item in the combobox or moves the slider, NOT when the Widget.text or Widget.value property changes**.
onClick	function	Function to call when a BUTTON, CHECKBOX, COMBOBOX, LABEL, RADIOBUTTON or TREE widget is clicked. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually clicks on the button, NOT when the Widget.pushed property changes**. For the COMBOBOX widget the function is called **before** the list of items is mapped.
onPopup	function	Function to call when a BUTTON, LABEL, TEXTBOX or TREE widget is right clicked to map a popup. The Widget object is accessible in the function using the 'this' keyword. The PopupWindow can then be found by using the popupWindow property of the Widget. The function is called **before** the popup is mapped so you can change the widgets in the popup as required.
onTimer	function	Function to call for a widget when timerDelay ms have elapsed after setting this. Additionally if timerRepeat is set this function will be called repetitively, every timerDelay ms. The Widget object is accessible in the function using the 'this' keyword. To unset the function set the property to null. **Note that as soon as this property is set the timer starts!**

orientation	constant	The orientation of a slider. Can be: Widget.VERTICAL or Widget.HORIZONTAL (default). Slider Widgets only.
popupDirection	constant	How PopupWindow will be mapped relative to this widget. Can be Widget.LEFT, Widget.RIGHT, Widget.TOP or Widget.BOTTOM (default). For tree widgets this will be ignored as the popup is always shown on the WidgetItem that is right clicked.
popupSymbol	logical	TRUE (default) if a symbol will be shown for a PopupWindow.
popupWindow	PopupWindow object	PopupWindow for this Widget. Only available for Button, Label and Textbox Widgets. To remove a PopupWindow from a Widget set to null.
pushed	logical	If widget is pushed (true) or not (false). This only affects Widget.BUTTON with the Widget.toggle property set, and Widget.CHECKBOX widgets.
right	integer	Widget right coordinate
select	constant	Selection method for ListBox and tree Widgets. Can be: Widget.SELECT_NONE, Widget.SELECT_SINGLE or Widget.SELECT_MULTIPLE or Widget.SELECT_ENHANCED (default).
selectedItem	WidgetItem object	WidgetItem that is currently selected for a ComboBox or Radiobutton, Widget. If null no WidgetItem is selected. For a ListBox Widget this property contains the last WidgetItem that was (de)selected. To get a list of all of the selected WidgetItems use WidgetItems() to return all of the WidgetItems and inspect the WidgetItem selected property.
shown (read only)	boolean	true if the widget is visible. To alter the visibility of a widget use the Show() and Hide() methods.
step	integer	The step value of a slider (default is 1). Slider Widgets only.
text	string	Widget text. For a ComboBox Widget this will be the text for the currently selected WidgetItem
textHidden	boolean	true if the widget text is hidden and replaced by asterisks. This may be used to create textboxes to type passwords in. TextBox Widgets only.
timerDelay	integer	Delay in ms before the function set for onTimer will be called. The initial value is 1000 (ms). Also see timerRepeat.
timerRepeat	logical	If the function set for onTimer will be called once (false) or repeatedly (true). The initial value is false. Also see timerDelay.
toggle	logical	If widget can be toggled (true) or not (false). This only affects Widget.BUTTON widgets.
top	integer	Widget top coordinate
type (read only)	integer	Type of the widget. The widget type could be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE
value	integer	The current value of a slider (initially will be the minimum value). Slider Widgets only.
window (read only)	Window object	The Window that this widget is defined in
xResolution	integer	X resolution of button when drawing lines, circles, polygons and rectangles (initially 100). X coordinates on the Widget can be from 0 (on the left of the widget) to xResolution (on the right of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.
yResolution	integer	Y resolution of button when drawing lines, circles, polygons and rectangles (initially 100). Y coordinates on the Widget can be from 0 (on the top of the widget) to yResolution (on the bottom of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.

Detailed Description

The Widget class allows you to create Widgets (buttons, textboxes etc) in a Window for a graphical user interface. Callback functions can be declared for widgets to give actions when a button is pressed or the text in a textbox is selected etc. The following example displays various widgets in a window. Several callback methods are used. The exit button allows the user to exit the script but the button is only made active if the checkbox widget is ticked. If the button widgets are pressed feedback is given to the user

```
var count = 0;
// Create window
var w = new Window("Test", 0.8, 1.0, 0.5, 0.6);
// Create all of the widgets
var l = new Widget(w, Widget.LABEL,    1, 30, 1, 7, "Text:");
var t = new Widget(w, Widget.TEXTBOX, 31, 80, 1, 7, "Enter text");
var b = new Widget(w, Widget.BUTTON,   1, 30, 8, 14, "Press me");
var b2= new Widget(w, Widget.BUTTON,  31, 61, 8, 14, "Don't press me");
var c = new Widget(w, Widget.CHECKBOX,62, 68, 8, 14);
var l2= new Widget(w, Widget.LABEL,    1, 80, 15, 21, "You haven't pressed the
button yet...");
var e = new Widget(w, Widget.BUTTON,   1, 21, 22, 28, "Exit");
// Allow button widget b2 to toggle
b2.toggle = true;
// The exit button is initially inactive
e.active = false;
// Assign the callback functions
b.onClick  = clicked;
b2.onClick = clicked;
c.onClick  = clicked;
t.onChange = changed;
e.onClick  = confirm_exit;
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If checkbox is clicked then set the state of the exit button
    if (this === c)
    {
        Message("Checkbox clicked");
        e.active = c.pushed;
    }
// If the "Don't press me' button is pressed then change the colour if the
button is pressed in.
    else if (this === b2)
    {
        Message("I said don't press!!!");
        if (b2.pushed) b2.background = Widget.WHITE;
        else           b2.background = Widget.DEFAULT;
    }
// If the "Press me" button is pressed then update the text in the label widget
// with how many times the button has been pressed.
    else
    {
        Message("You pressed...");
        count++;
        l2.text = "Button pressed " + count + " times";
    }
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If the user has changed the text in the textbox then give a message in
// the dialogue box
    Message("Text has changed to " + this.text);
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
```

```
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

In version 20 a tree widget was added. A simple tree widget example is shown below.

```
Window.Theme(Window.THEME_CURRENT);
let wi, cwi;
// Create a popup window and some widgets
let pw = new PopupWindow();
let pw_l1 = new Widget(pw, Widget.LABEL, 1, 61,  1,  7, "");
let pw_l2 = new Widget(pw, Widget.LABEL, 1, 61,  7, 13, "");
let pw_l3 = new Widget(pw, Widget.LABEL, 1, 61, 13, 19, "");
let pw_l4 = new Widget(pw, Widget.LABEL, 1, 61, 19, 25, "");
let pw_l5 = new Widget(pw, Widget.LABEL, 1, 61, 25, 31, "");
let pw_l6 = new Widget(pw, Widget.LABEL, 1, 61, 31, 37, "");
// Create window
let w = new Window("JavaScript Tree widget test", 0.85, 1.0, 0.75, 1.0);
// Create tree widget
let t = new Widget(w, Widget.TREE, 1, 61, 1, 51, "Suite");
// Add a root node to tree
let env_wi = new WidgetItem(t, "Oasys Ltd LS_DYNA Environment");
// Add a child to the root node
wi  = new WidgetItem(t, "PRIMER", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Prepare", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Efficient, reliable model setup with support for all of the latest
LS-DYNA features";
wi  = new WidgetItem(t, "LS-DYNA", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Analyse", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
// Add a sibling node after LS-DYNA
wi  = new WidgetItem(t, "REPORTER", Widget.AFTER, wi);
cwi = new WidgetItem(t, "Report", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Automatic report generation for LS-DYNA simulations";

// Add a sibling node before REPORTER
wi  = new WidgetItem(t, "T/HIS", Widget.BEFORE, wi);
cwi = new WidgetItem(t, "Process", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Plot, manipulate and process XY data from LS-DYNA";

// Alternatively, create WidgetItem without parent and add
let d3plot_wi   = new WidgetItem(null, "D3PLOT");
t.AddWidgetItem(d3plot_wi, Widget.BEFORE, wi);
cwi = new WidgetItem(null, "Visualise");
t.AddWidgetItem(cwi, Widget.CHILD, d3plot_wi);
d3plot_wi.onMouseOver = wi_onmouseover;
cwi.hover = " In-depth 3D visualisation of LS-DYNA results";
// Expand root node
env_wi.expanded = true;
// Link popup to tree widget
t.popupWindow = pw;
// Assign callbacks
t.onClick = click_tree;
t.onPopup = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    pw_l1.text = this.currentItem.text;
    if (this.currentItem.selected) pw_l2.text = "Selected";
    else                           pw_l2.text = "Not selected";
    if (this.currentItem.Parent())
        pw_l3.text = "Parent: " + this.currentItem.Parent().text;
    else
        pw_l3.text = "No parent";
    if (this.currentItem.FirstChild())
        pw_l4.text = "First child: " + this.currentItem.FirstChild().text;
    else
```

```
        pw_l4.text = "No children";
    if (this.currentItem.PreviousSibling())
        pw_l5.text = "Previous: " + this.currentItem.PreviousSibling().text;
    else
        pw_l5.text = "No previous";
    if (this.currentItem.NextSibling())
        pw_l6.text = "Next: " + this.currentItem.NextSibling().text;
    else
        pw_l6.text = "No next";
}
////////////////////////////////////////////////////////////////////////////
function click_tree()
{
    Message("Clicked on "+this.currentItem.text+" in tree");
}
////////////////////////////////////////////////////////////////////////////
function wi_onmouseover()
{
    Message("Called onMouseOver for WidgetItem "+this.text+" in tree");
}
```

Graphics (lines, circles, rectangles etc) can be drawn on Widget.LABEL and Widget.BUTTON widgets. If these methods are used the resolution of the widget is 100 units in x and y and the origin is at the top left of the widget. See the documentation below and the WidgetItem and Window classes for more details.

Constructor

new Widget(window*[Window or PopupWindow]*, type*[constant]*, left*[integer]*, right*[integer]*, top*[integer]*, bottom*[integer]*, text (optional)*[string]*)

Description

Create a new Widget object.

Arguments

- **window** (Window or PopupWindow)

Window or PopupWindow that widget will be created in

- **type** (constant)

Widget type. Can be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE

- **left** (integer)

left coordinate of widget

- **right** (integer)

right coordinate of widget

- **top** (integer)

top coordinate of widget

- **bottom** (integer)

bottom coordinate of widget

- **text (optional)** (string)

Text to show on widget (optional for LABEL, BUTTON, TEXTBOX and TREE, not required for CHECKBOX, COMBOBOX, LISTBOX, RADIOBUTTON and SLIDER). For a TREE widget the text will be used as a macroTag.

Returns

Widget object

Return type

Widget

Details of functions

AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)

Description

Adds a WidgetItem to a ComboBox ListBox or Radiobutton Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **position (optional)** (integer)

Position on Widget to add the WidgetItem. Any existing WidgetItems will be shifted down as required. If omitted the WidgetItem will be added to the end of the existing ones. **Note that positions start at 0**.

Returns

No return value

Example

To add WidgetItem wi to widget w:

```
w.AddWidgetItem(wi);
```

AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)

Description

Adds a WidgetItem to a Tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **relationship** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem** (WidgetItem)

Existing WidgetItem to add item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be added to the root node of the tree.

Returns

No return value

Example

To add WidgetItem wi to tree widget w after existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.AFTER, ewi);
```

To add WidgetItem wi to tree widget w as a child of existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.CHILD, ewi);
```

Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)

Description

Draws a circle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of circle. See foreground for colours.

- **fill** (boolean)

If circle should be filled or not.

- **xc** (integer)

x coordinate of centre of circle.

- **yc** (integer)

y coordinate of centre of circle.

- **radius** (integer)

radius of circle.

Returns

no return value

Example

To draw a red filled circle, radius 25, at (50, 50) on widget w:

```
w.Circle(Widget.RED, true, 50, 50, 25);
```

Clear()

Description

Clears any graphics on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

No arguments

Returns

no return value

Example

To clear any graphics for widget w:

```
w.Clear();
```

ClearSelection()

Description

Clears selection of any WidgetItems on the widget. Only possible for Widget.COMBOBOX, Widget.LISTBOX, Widget.RADIOBUTTON and Widget.TREE widgets.

Arguments

No arguments

Returns

no return value

Example

To clear selection of any WidgetItems for widget w:

```
w.ClearSelection();
```

Cross(colour (optional)*[constant]*)

Description

Draws a cross symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of cross symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red cross symbol on widget w:

```
w.Cross(Widget.RED);
```

CtrlPressed() [static]

Description

Check to see if the Ctrl key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Ctrl key pressed:

```
if (Widget.CtrlPressed()) { ... }
```

Delete()

Description

Deletes the widget from D3PLOT (removing it from the window it is defined in) and returns any memory/resources used for the widget. This function should not normally need to be called. However, sometimes a script may want to recreate widgets in a window many times and unless the old widgets are deleted D3PLOT will reach the maximum number of widgets for a window (Options.max_widgets). To avoid this problem this method can be used to force D3PLOT to delete and return the resources for a widget. **Do not use the Widget object after calling this method**.

Arguments

No arguments

Returns

no return value

Example

To delete widget w:

```
w.Delete();
```

DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)

Description

Draws a directory icon on the widget. Only possible for Widget.BUTTON widgets.

Arguments

- **line_colour** (constant)

Colour of lines of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

- **fill_colour** (constant)

Colour of fill of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

Returns

no return value

Example

To draw a directory icon on widget btn:

```
btn.DirectoryIcon(Widget.BLACK, Widget.YELLOW);
```

DumpImageString(filename*[string]*, format (optional)*[constant]*)

Description

Dumps a string representation of an image for a widget to a file in a form that can be used by Widget.ReadImageString(). Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **filename** (string)

Filename to dump string representation to

- **format (optional)** (constant)

Can be Widget.RGB8 or Widget.RGB24. Before version 15 D3PLOT only used 8 bits to store RGB (red, green and

blue) colour information for widget images. In version 15 widget images have been changed to use 24 bits to store RGB information (8 bits for red, 8 bits for green and 8 bits for blue). Both formats are supported. If omitted the new Widget.RGB24 format will be used. See Widget.ReadImageString() for more details.

Returns

no return value

Example

To dump the image data to file 'image_data' for widget w with the old 8 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB8);
```

To dump the image data to file 'image_data' for widget w with 24 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB24);
```

Hide()

Description

Hides the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To hide widget *w*

```
w.Hide();
```

ItemAt(index*[integer]*)

Description

Returns the WidgetItem object used at *index* in this Widget. See also Widget.TotalItems() and Widget.WidgetItems(). Note that for tree Widgets the items will not be returned in the order that they are displayed in, they will be returned in the order they were added to the tree.

Arguments

- **index** (integer)

index to return WidgetItem for. **Note that indices start at 0**.

Returns

WidgetItem object.

Return type

WidgetItem

Example

To loop over the WidgetItems used in Widget *w*

```
for (i=0; i<w.TotalItems(); i++)
{
    wi = w.ItemAt(i);
}
```

Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a line on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of line. See foreground for colours.

- **x1** (integer)

x coordinate of start of line.

- **y1** (integer)

y coordinate of start of line.

- **x2** (integer)

x coordinate of end of line.

- **y2** (integer)

y coordinate of end of line.

Returns

no return value

Example

To draw a red line from (10, 90) to (90, 10) on widget w:

```
w.Line(Widget.RED, 10, 90, 90, 10);
```

MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)

Description

Moves an existing WidgetItem in a tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to move

- **relationship** (constant)

What relationship (relative to relitem) to use when moving item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.AFTER.

- **relitem** (WidgetItem or null)

Existing WidgetItem to move item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be moved to the root node of the tree.

Returns

No return value

Example

To move WidgetItem wi in tree widget w after existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.AFTER, ewi);
```

To move WidgetItem wi in tree widget w as a child of existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.CHILD, ewi);
```

PixelsPerUnit() [static]

Description

Returns the number of pixels per unit coordinate. This will vary depending on the monitor D3PLOT is running on.

Arguments

No arguments

Returns

pixels/unit (real)

Return type

Number

Example

To return how many pixels there are per unit coordinate:

```
var ppu = Widget.PixelsPerUnit();
```

Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **points** (array)

Array of point coordinates

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
var a = new Array(20, 20, 50, 80, 80, 20);
w.Polygon(Widget.RED, true, a);
```

Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **x1** (integer)

x coordinate of point 1.

- **y1** (integer)

y coordinate of point 1.

- **x2** (integer)

x coordinate of point 2.

- **y2** (integer)

y coordinate of point 2.

- **... xn** (integer)

x coordinate of point n.

- **... yn** (integer)

y coordinate of point n.

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
w.Polygon(Widget.RED, true, 20, 20, 50, 80, 80, 20);
```

ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a file to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text. Note that due to the way that colours are used for menus in D3PLOT only a small number of colours are available for Widget images. Black and white images will display without any issues but colour images will be displayed with a reduced set of colours.

Arguments

- **filename** (string)

Image file (BMP, GIF, JPEG or PNG) to read. To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in D3PLOT. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255).
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image example.png for widget w and place it at the top left:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT);
```

To read image example.png for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image example.png for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageFile(null);
```

ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a JavaScript string previously created by Widget.DumpImageString() to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text.
Note, prior to version 15 of D3PLOT only a small number of colours were available for Widget images. In version 14 and earlier the RGB (red, green and blue) information for each pixel in the image was packed into a single byte (8 bits) with 3 bits for red, 3 for green and 2 for blue. Widget.DumpImageString() always returned the string beginning with "RRRGGGBB_RLE" which is this 8 bit format with run length encoding. This is format Widget.RGB8.
In version 15 support for Widget images was enhanced to give 24bit support for colours. The RGB information for each pixel has 8 bits for red, 8 bits for green and 8 bits for blue. This is format Widget.RGB24.
From version 15 Widget.DumpImageString() can either return the the old 8 bit format Widget.RGB8 (string beginning with "RRRGGGBB_RLE") or return the the new 24bit format Widget.RGB24 (string beginning with "RGB24_Z"). ReadImageString supports both formats.

Arguments

- **string** (string)

String containing the image data previously created by Widget.DumpImageString(). To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in D3PLOT. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255). Only used for the new 24bit format Widget.RGB24 (strings beginning with "RGB24_Z"). Ignored for the old 8 bit format Widget.RGB8 (strings beginning with "RRRGGGBB_RLE").
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image data from string s for widget w and place it at the top left:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT);
```

To read image data from string s for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image data from string s for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageString(null);
```

Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a rectangle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of rectangle. See foreground for colours.

- **fill** (boolean)

If rectangle should be filled or not.

- **x1** (integer)

x coordinate of first corner of rectangle.

- **y1** (integer)

y coordinate of first corner of rectangle.

- **x2** (integer)

x coordinate of second (opposite) corner of rectangle.

- **y2** (integer)

y coordinate of second (opposite) corner of rectangle.

Returns

no return value

Example

To draw a red filled rectangle with corners (20, 20) and (80, 80) on widget w:

```
w.Rectangle(Widget.RED, true, 20, 20, 80, 80);
```

RemoveAllWidgetItems()

Description

Removes any WidgetItems from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveWidgetItem.

Arguments

No arguments

Returns

No return value

Example

To remove all WidgetItems from widget w:

```
w.RemoveAllWidgetItems();
```

RemoveWidgetItem(item*[WidgetItem]*)

Description

Removes a WidgetItem from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveAllWidgetItems.

Arguments

- **item** (WidgetItem)

WidgetItem to remove

Returns

No return value

Example

To remove WidgetItem wi from widget w:

```
w.RemoveWidgetItem(wi);
```

Scroll(scroll*[constant or WidgetItem object]*)

Description

Scrolls a tree widget

Arguments

- **scroll** (constant or WidgetItem object)

How to scroll the tree widget. Can be: Widget.SCROLL_TOP, Widget.SCROLL_BOTTOM, Widget.SCROLL_UP, Widget.SCROLL_DOWN, Widget.SCROLL_PAGE_UP or Widget.SCROLL_PAGE_DOWN in which case the tree widget will be scrolled by that value or a WidgetItem, in which case the tree will be scrolled to make the WidgetItem visible, expanding any branches as necessary to do so..

Returns

No return value

Example

To scroll tree widget w to the top:

```
w.Scroll(Widget.SCROLL_TOP);
```

To scroll tree widget w so that WidgetItem wi is visible in the tree:

```
w.Scroll(wi);
```

ShiftPressed() [static]

Description

Check to see if the Shift key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Shift key pressed:

```
if (Widget.ShiftPressed()) { ... }
```

Show()

Description

Shows the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To show widget w:

```
w.Show();
```

Static()

Description

Windows have two different regions for Widgets. A 'normal' region which can be scrolled if required (if the window is made smaller scrollbars will be shown which can be used to scroll the contents) and a 'static' region at the top of the Window which is fixed and does not scroll. For an example of a static region in a Window see any of the keyword editing panels. The 'Dismiss', 'Create', 'Reset' etc buttons are in the static region. By default Widgets are put into the normal region of the Window. This method puts the Widget to the static region of the Window.

Arguments

No arguments

Returns

No return value

Example

To put widget w in the static part of the window:

```
w.Static();
```

StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*) [static]

Description

Returns the length of a string in Widget units. This can be used to find what size a Widget must be to be able to display the string.

Arguments

- **text** (string)

Text to find the width of

- **monospace (optional)** (boolean)

If true then width will be calculated using a monospace font. If false (default) then the normal proportional width font will be used

- **fontSize (optional)** (integer)

Calculation can be based on a defined font size, at the moment support is added only for font sizes of 6, 7, 8, 10, 12, 14, 18 and 24.

Returns

integer

Return type

Number

Example

To get the width of string 'Example':

```
var len = Widget.StringLength('Example');
```

Tick(colour (optional)*[constant]*)

Description

Draws a tick symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of tick symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red tick symbol on widget w:

```
w.Tick(Widget.RED);
```

TotalItems()

Description

Returns the number of the WidgetItem objects used in this Widget (or 0 if none used). See also Widget.ItemAt() and Widget.WidgetItems().

Arguments

No arguments

Returns

integer

Return type

Number

Example

To return the total number of WidgetItems used for Widget *w*

```
var total = w.TotalItems();
```

WidgetItems()

Description

Returns an array of the WidgetItem objects used in this Widget (or null if none used). See also Widget.ItemAt() and Widget.TotalItems().

Arguments

No arguments

Returns

Array of WidgetItem objects

Return type

Array

Example

To return WidgetItems used for Widget *w*

```
var wi = w.WidgetItems();
```

WidgetItem class

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- FirstChild()
- NextSibling()
- Parent()
- PreviousSibling()

WidgetItem properties

Name	Type	Description
background	constant	Widget background colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
expanded	logical	If the widget item is expanded (true) or not (false) in a tree. Only available for widgetitems used in TREE widgets.
foreground	constant	Widget foreground colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
hover	string	WidgetItem's hover text. Not used for RADIOBUTTON widgets.
index (read only)	integer	The index of this widgetitem in the parent widget (undefined if widgetitem is not assigned to a widget).
monospace	boolean	true if the widgetitem uses a monospace font instead of a proportional width font (default). Not used for RADIOBUTTON and TREE widgets.
onClick	function	Function to call when a widget item in a COMBOBOX, LISTBOX or TREE widget is clicked. The Widgetitem object is accessible in the function using the 'this' keyword.
onMouseOver	function	Function to call when the mouse moves over a widget item in a COMBOBOX, LISTBOX or TREE widget. The Widgetitem object is accessible in the function using the 'this' keyword.
selectable	logical	If the widget item can be selected (true) or not (false). Not used for RADIOBUTTON and TREE widgets.
selected	logical	If the widget item is selected (true) or not (false).
text	string	Widget text. If the WidgetItem is used in a tree widget then the tree will not automatically redraw (this is in case you want to change lots of tree nodes at once). In this case, use the Window Redraw method to redraw the window.
visible	logical	If the widget item is visible (true) or not (false) in a tree. A widgetitem will not be visible if it is a child of a widgetitem that is not expanded. Only available for widgetitems used in TREE widgets.

widget (read only)	Widget object	The widget that this item is defined for (null if not set)

Detailed Description

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets in a Window for a graphical user interface. The following example shows how WidgetItems are used to create a Combobox Widget and how to assign callbacks to determine when the selection has been changed.

```
var items = ["D3PLOT", "PRIMER", "SHELL", "REPORTER", "T/HIS"]
// Create window
var w = new Window("Combobox example", 0.8, 1.0, 0.5, 0.6);
// A simple combobox with a few items
var cl= new Widget(w, Widget.LABEL,   1, 30, 1, 7, "Programs:");
var cb= new Widget(w, Widget.COMBOBOX,  31, 61, 1, 7);
// Add WidgetItems to Combobox
for (i=0; i<items.length; i++)
    var wi = new WidgetItem(cb, items[i]);
// A combobox with many items showing a slider.
var li= new Widget(w, Widget.LABEL,   1, 30, 8, 14, "Long list:");
var ci= new Widget(w, Widget.COMBOBOX,  31, 61, 8, 14);
// Add WidgetItems to Combobox
// As an example we also make some of the WidgetItems unselectable and
// change the background colour
for (i=1; i<=100; i++)
{
    var wi = new WidgetItem(ci, "Item "+i);
    if ( (i % 10) == 5)
    {
        wi.selectable = false;
        wi.background = Widget.WHITE;
    }
}
var e = new Widget(w, Widget.BUTTON,   1, 21, 15, 21, "Exit");
// Assign callbacks
cb.onClick  = clicked;
cb.onChange = changed;
ci.onClick  = clicked;
ci.onChange = changed;
e.onClick   = confirm_exit
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If combobox is clicked then print the current selection
    if (this.selectedItem)
        Message("selection is currently '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If combobox selection is changed then print the new selection
    if (this.selectedItem)
        Message("selection is now '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Window and Widget classes for more details.

Constructor

new WidgetItem(widget*[Widget]*, text*[string]*, selectable (optional)*[boolean]*)

Description

Create a new WidgetItem object for a combobox, listbox or radio button widget.

Arguments

- **widget** (Widget)

Combobox, listbox or radio button Widget that the widget item will be created in. This can be null in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned later by using Widget.AddWidgetItem().

- **text** (string)

Text to show on widget item

- **selectable (optional)** (boolean)

If the widget item can be selected. If omitted the widget item will be selectable. Not used for RADIOBUTTON and TREE widgets.

Returns

WidgetItem object

Return type

WidgetItem

new WidgetItem(widget*[Widget]*, text*[string]*, relationship (optional)*[constant]*, relitem (optional)*[WidgetItem]*)

Description

Create a new WidgetItem object for a tree widget. If the widget argument is given and the relationship and relitem arguments are omitted then the widget item will be added as a root node in the tree. If the relationship and relitem arguments are also used then the item can be added at a specific location in the tree. Alternatively, the widget argument can be null, and the relationship and relitem arguments omitted, in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned to the tree later using Widget.AddWidgetItem()

Arguments

- **widget** (Widget)

Tree Widget that the widget item will be created in or null (if the relationship and relitem arguments are omitted)

- **text** (string)

Text to show on widget item

- **relationship (optional)** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem (optional)** (WidgetItem)

Existing WidgetItem to add item relative to

Returns

WidgetItem object

Return type

WidgetItem

Details of functions

FirstChild()

Description

Returns the first child WidgetItem or null if the WidgetItem has no children. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the first child widget item in a tree widget for widget item wi:

```
var cwi = wi.FirstChild();
```

NextSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the next sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.NextSibling();
```

Parent()

Description

Returns the parent WidgetItem or null if the WidgetItem has no parent. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the parent widget item in a tree widget for widget item wi:

```
var pwi = wi.Parent();
```

PreviousSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the previous sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.PreviousSibling();
```

Window class

The Window class allows you to create windows for a graphical user interface. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

- Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*)
- MiddleBorder()
- Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*)
- RightBorder()
- StartLoop()
- Theme(theme (optional)*[constant]*)
- TopBorder()
- UpdateGUI()
- Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*)

Member functions

- Delete()
- Hide()
- Recompute()
- Redraw()
- Show(modal (optional)*[boolean]*)

Window constants

Name	Description
Window.CANCEL	Show CANCEL button
Window.NO	Show NO button
Window.NONMODAL	Allow Window.Error, Window.Question, Window.Warning etc windows to be non modal
Window.OK	Show OK button
Window.YES	Show YES button

Constants for Resizing/positioning

Name	Description

Window.BOTTOM	Bottom resizing/positioning of window
Window.CENTRE	Centre (horizontal) positioning of window
Window.LEFT	Left resizing/positioning of window
Window.MIDDLE	Middle (vertical) positioning of window
Window.REDUCE	Window is allowed to reduce in size when resizing
Window.RIGHT	Right resizing/positioning of window
Window.TOP	Top resizing/positioning of window

Constants for Themes

Name	Description
Window.THEME_CLASSIC	Use the Classic theme (Note: Not only the script will use this theme, the whole interface of the program will switch to classic)
Window.THEME_CURRENT	Use the current theme
Window.THEME_DARK	Use the Dark theme (Note: Not only the script will use this theme, the whole interface of the program will switch to dark)
Window.THEME_LIGHT	Use the Light theme (Note: Not only the script will use this theme, the whole interface of the program will switch to light)
Window.USE_OLD_UI_JS	Use the original, pre v17, theme (default). (Note:The interface of the program will NOT switch to old)

Window properties

Name	Type	Description
active	boolean	If true (default) then the window then the window is active and widgets in the window can be used. If false then the window is inactive and the widgets cannot be used.
background	constant	Window background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
bottom	real	bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)
height	real	height of window
keepOnTop	boolean	If true then the window will be kept "on top" of other windows. If false (default) then the window stacking order can be changed.
left	real	left coordinate of window in range 0.0 (left) to 1.0 (right)
maxWidgets (read only)	integer	The maximum number of widgets that can be made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see totalWidgets
onAfterShow	function	Function to call **after** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that certain actions are done after the window is shown. It can also be used to show another window so this enables multiple windows to be shown. To unset the function set the property to null.
onBeforeShow	function	Function to call **before** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that buttons are shown/hidden etc before the window is shown. Note that it cannot be used to show another window. Use onAfterShow for that. To unset the function set the property to null.

onClose	function	Function to call when a Window is closed by pressing the X on the top right of the window. This may be useful to ensure that certain actions are done after the window is closed. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
onHide	function	Function to call when a Window is hidden by calling Hide(). This may be useful to ensure that certain actions are done after the window is hidden. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
resize	constant	Window resizing. By default when a Window is shown it is allowed to resize on all sides (left, right, top and bottom) to try to make enough room to show the Widgets. The behaviour can be changed by using this property. It can be any combination (bitwise OR) of Window.LEFT, Window.RIGHT, Window.TOP or Window.BOTTOM or 0. In addition Window.REDUCE can also be added to allow the window to reduce in size when resizing. Note that when Window.Show is called this property is set to 0 (i.e. not to resize on any side).
right	real	right coordinate of window in range 0.0 (left) to 1.0 (right)
showClose	boolean	If true (default) then a close (X) button will automatically be added on the top right of the window. If false then no close button will be shown.
shown (read only)	boolean	true if window is currently shown, false if not
title	string	Window title
top	real	top coordinate of window in range 0.0 (bottom) to 1.0 (top)
totalWidgets (read only)	integer	The total number of widgets that have been made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see maxWidgets
width	real	width of window

Detailed Description

The Window class allows you to make windows that you can place Widgets in to create a graphical user interface. The Widget class also gives a number of static methods for convenience. e.g. Window.GetInteger(). The following very simple example displays some text in a window with a button that unmaps the window when it is pressed and the user confirms that they want to exit.

```
// Create window with title "Text" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Text", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 40, 1,  7, "Press OK to exit");
// Create button widget
var e = new Widget(w, Widget.BUTTON, 11, 30, 8, 14, "OK");
// Assign the onClick callback method to the function confirm_exit'
e.onClick  = confirm_exit;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm window
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered Yes then exit.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Widget class for more details.

Constructor

new Window(title*[string]*, left*[real]*, right*[real]*, bottom*[real]*, top*[real]*)

Description

Create a new Window object.

Arguments

- **title** (string)

Window title to show in title bar

- **left** (real)

left coordinate of window in range 0.0 (left) to 1.0 (right)

- **right** (real)

right coordinate of window in range 0.0 (left) to 1.0 (right)

- **bottom** (real)

bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)

- **top** (real)

top coordinate of window in range 0.0 (bottom) to 1.0 (top)

Returns

Window object

Return type

Window

Example

To create a Window 'Example' in the top right half of the screen:

```
var w = new Window('Example', 0.5, 1.0, 0.5, 1.0);
```

Details of functions

BottomBorder() [static]

Description

Returns the vertical position of the bottom border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the bottom border:

```
var b = Window.BottomBorder();
```

BuildGUIFromString(guistring*[string]*) [static]

Description

Builds a GUI from a JSON string created by the GUI builder.

Arguments

- **guistring** (string)

The string to create the GUI from

Returns

object containing the GUI

Return type

Object

Example

To create a GUI from the string json_string:

```
var gui = Window.BuildGUIFromString(json_string);
```

Delete()

Description

Deletes the window from D3PLOT and returns any memory/resources used for the window. **This function should not normally need to be called**. However, in exceptional circumstances if a script recreates windows many times D3PLOT may run out of USER objects on Microsoft Windows because of the way D3PLOT creates and shows windows. To avoid this problem this method can be used to force D3PLOT to return the resources for a window. **Do not use the Window object after calling this method**.

Arguments

No arguments

Returns

No return value

Example

To delete window w:

```
w.Delete();
```

EndLoop() [static]

Description

Ends an event loop started by Window.StartLoop()

Arguments

No arguments

Returns

No return value

Example

To end a blocking event loop started by Window.StartLoop():

```
Window.EndLoop();
```

Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*) [static]

Description

Show an error message in a window.

Arguments

- **title** (string)

Title for window.

- **error** (string)

Error message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show error *Critical error!\nAbort?* in window with title *Error* with Yes and No buttons:

```
var answer = Window.Error("Error", "Critical error!\nAbort?", Window.YES |
Window.NO);
if (answer == Window.YES) Exit();
```

GetDirectory(initial (optional)*[string]*) [static]

Description

Map the directory selector box native to your machine, allowing you to choose a directory. On Unix this will be a Motif selector. Windows will use the standard windows directory selector.

Arguments

- **initial (optional)** (string)

Initial directory to start from.

Returns

directory (string), (or null if cancel pressed).

Return type

String

Example

To select a directory:

```
var dir = Window.GetDirectory();
```

GetFile(extension (optional)*[string]*, save (optional)*[boolean]*, initial (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose a file. See also Window.GetFiles() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

- **initial (optional)** (string)

Initial directory to start from.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To select a file using extension '.key':

```
var file = Window.GetFile(".key");
```

GetFilename(title*[string]*, message*[string]*, extension (optional)*[string]*, initial (optional)*[string]*, save (optional)*[boolean]*) [static]

Description

Map a window allowing you to input a filename (or select it using a file selector). OK and Cancel buttons are shown. See also Window.GetFile().

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **extension (optional)** (string)

Extension to filter by.

- **initial (optional)** (string)

Initial value.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native

operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To create an file input window with title *Choose file* and message *Choose the file to open* and return the filename input:

```
var filename = Window.GetFilename("Choose file", "Choose the file to open");
```

GetFiles(extension (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose multiple files. See also Window.GetFile() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

Returns

Array of filenames (strings), or null if cancel pressed.

Return type

String

Example

To select multiple files using extension '.key':

```
var files = Window.GetFiles(".key");
```

GetInteger(title*[string]*, message*[string]*, initial (optional)*[integer]*) [static]

Description

Map a window allowing you to input an integer. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (integer)

Initial value.

Returns

value input (integer), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input integer* and return the value input:

```
var value = Window.GetInteger("Input", "Input integer");
```

GetNumber(title*[string]*, message*[string]*, initial (optional)*[real]*) [static]

Description

Map a window allowing you to input a number. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (real)

Initial value.

Returns

value input (real), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input number* and return the value input:

```
var value = Window.GetNumber("Input", "Input number");
```

GetPassword(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input a password. OK and Cancel buttons are shown.
This is identical to Window.GetString except the string is hidden and no initial value can be given.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns
value input (string), or null if cancel pressed.

Return type
String

Example
To create an input window with title *Input* and message *Input password* and return the value input:
```
var value = Window.GetPassword("Input", "Input password");
```

GetString(title*[string]*, message*[string]*, initial (optional)*[string]*) [static]

Description
Map a window allowing you to input a string. OK and Cancel buttons are shown.

Arguments
- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (string)

Initial value.

Returns
value input (string), or null if cancel pressed.

Return type
String

Example
To create an input window with title *Input* and message *Input string* and return the value input:
```
var value = Window.GetString("Input", "Input string");
```

Hide()

Description
Hides (unmaps) the window. Also see the Window onHide property.

Arguments
No arguments

Returns
No return value

Example
To hide window w:
```
w.Hide();
```

Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*) [static]

Description

Show information in a window.

Arguments

- **title** (string)

Title for window.

- **info** (string)

Information to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show information *Information* in window with title *Example* with OK and Cancel buttons:

```
var answer = Window.Information("Example", "Information", Window.OK |
Window.CANCEL);
if (answer == Window.CANCEL) Message("You pressed the Cancel button");
```

MasterResolution() [static]

Description

Returns the resolution of the master programme window in pixels

Arguments

No arguments

Returns

Array of numbers containing x and y resolution in pixels

Return type

Number

Example

To get the resolution of the main window:

```
var res = Window.MasterResolution();
```

Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a message in a window.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show message *Press YES or NO* in window with title *Example* with YES and NO buttons:

```
var answer = Window.Message("Example", "Press YES or NO", Window.YES |
Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

MiddleBorder() [static]

Description

Returns the vertical position of the middle border (in range 0-1). The middle border is the border between the tools/keywords window and the docked windows. This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the middle border:

```
var b = Window.MiddleBorder();
```

Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a question in a window.

Arguments

- **title** (string)

Title for window.

- **question** (string)

Question to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted Yes and No button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show question *Do you want to continue?* in window with title *Question*:

```
var answer = Window.Question("Question", "Do you want to continue?");
if (answer == Window.NO) Message("You pressed No");
```

Recompute()

Description

Recomputes the positions of widgets in the window. If you have static widgets and 'normal' widgets in a window and you show and/or hide widgets the window needs to be recomputed to refresh the graphics, scroll bars etc. Calling this method will recompute and redraw the window.

Arguments

No arguments

Returns

No return value

Example

To recompute window w:

```
w.Recompute();
```

Redraw()

Description

Redraws the window. Sometimes if you show, hide or draw graphics on widgets the window needs to be redrawn to refresh the graphics. Calling this method will redraw the window refreshing the graphics.

Arguments

No arguments

Returns

No return value

Example

To redraw window w:

```
w.Redraw();
```

RightBorder() [static]

Description

Returns the horizontal position of the right border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the right border:

```
var b = Window.RightBorder();
```

Show(modal (optional)*[boolean]*)

Description

Shows (maps) the window and waits for user input.

Arguments

- **modal (optional)** (boolean)

If this window is modal (true) then the user is blocked from doing anything else in D3PLOT until this window is dismissed). If non-modal (false) then the user can still use other functions in D3PLOT.
If omitted the window will be modal.
Note that making a window modal will stop interaction in all other windows and may prevent operations such as picking from working in any macros that are run from scripts.
Before version 21 D3PLOT would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In D3PLOT version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in D3PLOT. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. In this case use Window.StartLoop().

Returns

No return value

Example

To show window w:

```
w.Show();
```

To show window w allowing the user to use other functions in D3PLOT:

```
w.Show(false);
```

StartLoop() [static]

Description

Starts a blocking event loop in D3PLOT. Before version 21 D3PLOT would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In D3PLOT version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in D3PLOT. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. An example of this is using a keyout hook script, or if you want to give aprompt/question similarly to Window.Message() where you do **not** want to return to the main event loop. You want to block until the user has specified the action.
Window.StartLoop() can be used to start a local blocking, event loop. To terminate the event loop and resume execution of the script use Window.EndLoop()
Note that only a single loop can be active in D3PLOT at any one time. i.e. they cannot be nested. Window.StartLoop() should be used as sparingly as possible and only used for specific short events (e.g. something like the equivalent of Window.Message() where you really do need to block) as if it is used in one script it will prevent it from being used in another script.

Arguments

No arguments

Returns

No return value

Example

To start a blocking event loop:

```
Window.StartLoop();
```

Theme(theme (optional)*[constant]*) [static]

Description

Set or get a user interface theme.

Arguments

- **theme (optional)** (constant)

If it is provided it is used to set the current theme. Can be either Window.USE_OLD_UI_JS, Window.THEME_CURRENT, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC.

Returns

Integer. When getting the theme one of: Window.USE_OLD_UI_JS, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC

Return type

Number

Example

To determine the current theme:

```
var ui = Window.Theme();
      if(ui == Window.THEME_DARK)
      {
          print("Theme is dark\n");
      }
      else if(ui == Window.THEME_LIGHT)
      {
          print("Theme is light\n");
      }
      else if(ui == Window.THEME_CLASSIC)
      {
          print("Theme is classic\n");
      }
      else
      {
          print("Theme is not set\n");
      }
```

To keep the original (pre v17) appearance of your JavaScript (default):

```
Window.Theme(Window.USE_OLD_UI_JS);
```

To use the current user interface theme:

```
Window.Theme(Window.THEME_CURRENT);
```

To use the dark user interface theme:

```
Window.Theme(Window.THEME_DARK);
```

TopBorder() [static]

Description

Returns the vertical position of the top border (in range 0-1). This can be used to help position windows on the screen. This is no longer used in D3PLOT and will always be 1 but is left for backwards compatibility.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the top border:

```
var b = Window.TopBorder();
```

UpdateGUI() [static]

Description

Force GUI to be updated. This function is not normally needed but if you are doing a computationally expensive operation and want to update the GUI it may be necessary as the GUI update requests are cached until there is spare time to update them. Calling this function forces any outstanding requests to be flushed.

Arguments

No arguments

Returns

No return value

Example

To force update of GUI:

```
Window.UpdateGUI();
```

Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a warning message in a window.

Arguments

- **title** (string)

Title for window.

- **warning** (string)

Warning message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show warning *Title is blank\nSet to ID?* in window with title *Warning* with Yes and No buttons:

```
var answer = Window.Warning("Warning", "Title is blank\nSet to ID?", Window.YES
| Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

Workflow class

The Workflow class allows you to read and write workflow files. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- NumberOfSelectedModels(workflow_name (optional)*[string]*)
- Refresh()
- WorkflowDefinitionFilename(workflow_name (optional)*[string]*)
- WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*)

Workflow constants

Constants for UnitSystem

Name	Description
Workflow.UNIT_SYSTEM_NONE	No unit system
Workflow.UNIT_SYSTEM_U1	U1 unit system (m, kg, s)
Workflow.UNIT_SYSTEM_U2	U2 unit system (mm, t, s)
Workflow.UNIT_SYSTEM_U3	U3 unit system (mm, kg, ms)
Workflow.UNIT_SYSTEM_U4	U4 unit system (mm, g, ms)
Workflow.UNIT_SYSTEM_U5	U5 unit system (ft, slug, s)
Workflow.UNIT_SYSTEM_U6	U6 unit system (m, t, s)

Detailed Description

The Workflow class gives you simple functions to read and write workflow files

Details of functions

ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the id of a model selected by the user by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the unit system for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the model id for.

Returns

integer

Return type

Number

Example

To get the id of the first model selected by the user

```
var id = Workflow.ModelIdFromIndex(0);
```

To get the id of the second model and workflow name "Automotive Assessment"

```
var id = Workflow.ModelIdFromIndex(1, "Automotive Assessment");
```

ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the unit system of a model selected by the user by index (starting at 0). Will be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Arguments

- **model_index** (integer)

The index of the model to return the unit system for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the unit system for.

Returns

integer

Return type

Number

Example

To get the unit system for the workflow selected from the menu, for the first model selected by the user

```
var unit_system = Workflow.ModelUnitSystemFromIndex(0);
```

To get the unit system of the second model and workflow name "Automotive Assessment"

```
var unit_system = Workflow.ModelUnitSystemFromIndex(1, "Automotive Assessment");
```

ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the build number of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program build number for.

- **workflow_name (optional)** (string)

The workflow name to return the build number for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the build number for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the build number of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var build = Workflow.ModelUserDataBuildFromIndex(0);
```

To get the build number of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var build = Workflow.ModelUserDataBuildFromIndex(1, "Automotive Assessment");
```

ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the user data associated with a model by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the user data for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the

list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the user data for.

Returns

object

Return type

Object

Example

To get the user data for the workflow selected from the menu, for the first model selected by the user

```
var user_data = Workflow.ModelUserDataFromIndex(0);
```

To get the user data for the second model that has user data for the workflow name "Automotive Assessment"

```
var user_data = Workflow.ModelUserDataFromIndex(1, "Automotive Assessment");
```

ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the name of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program name for.

- **workflow_name (optional)** (string)

The workflow name to return the program name for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the program name for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

string

Return type

String

Example

To get the name of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var program = Workflow.ModelUserDataProgramFromIndex(0);
```

To get the name of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var program = Workflow.ModelUserDataProgramFromIndex(1, "Automotive
Assessment");
```

ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the version of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program version for.

- **workflow_name (optional)** (string)

The workflow name to return the version for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the version for the first user data associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the version of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var version = Workflow.ModelUserDataVersionFromIndex(0);
```

To get the version of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var version = Workflow.ModelUserDataVersionFromIndex(1, "Automotive
Assessment");
```

NumberOfSelectedModels(workflow_name (optional)*[string]*) [static]

Description

Returns the number of models selected by the user.

Arguments

- **workflow_name (optional)** (string)

The workflow name to return the number of models for. If it's not defined the number of models that were selected by the user on the workflow menu is returned. If it's defined and the workflow was run from the workflow menu, the number of models, out of the models selected by the user, that have data for the named workflow is returned. If it's defined and the workflow is run from REPORTER, the number of models, out of all the models loaded in the session, that have data for the named workflow is returned.

Returns

integer

Return type

Number

Example

To get the number of models selected by the user in the workflow menu

```
var n = Workflow.NumberOfSelectedModels();
```

To get the number of models that have user data for the "Automotive Assessment" workflow

```
var n = Workflow.NumberOfSelectedModels("Automotive Assessment");
```

Refresh() [static]

Description

Scan for fresh workflow data

Arguments

No arguments

Returns

No return value

Example

```
Workflow.Refresh();
```

WorkflowDefinitionFilename(workflow_name (optional)*[string]*) [static]

Description

Returns the workflow definition filename

Arguments

- **workflow_name (optional)** (string)

The workflow name to return the workflow defintion filename for. This is required when a POST item is generated from REPORTER. If it is not specified the first workflow user data associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

string

Return type

String

Example

To get the worklow definition filename that the script has been run with

```
var workflow_definition_filename = Workflow.WorkflowDefinitionFilename();
```

WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*) [static]

Description

Writes a workflow to a JSON file. If the file already exists the workflow is added to the file (or updated if it is already in the file).

Arguments

- **user_data** (object)

Object containing user data required for the workflow.

- **output_filename** (string)

Filename to write to.

- **workflow_definition_filename** (string)

Filename of the workflow definition file.

- **extra (optional)** (object)

Extra workflow information

Object has the following properties:

Name	Type	Description
model_unit_system (optional)	integer	The model unit system. Can be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Returns

No return value

Example

To write the file "C:\my_workflow.json" with some user data and the contents of the workflow definition file "C:\workflows\my_workflow_definition.json"

```
      var user_data = { part_ids: [1, 2, 10, 100], node_ids: [12, 23, 24] };
      Workflow.WriteToFile(user_data, "C:\\my_workflow.json",
"C:\\workflows\\my_workflow_definition.json");
```

XlsxWorkbook class

The XlsxWorkbook class enables writing xlsx files. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Close()

XlsxWorkbook properties

Name	Type	Description
filename (read only)	string	Name of the xlsx file

Detailed Description

The XlsxWorkbook class provides functions to enable you to create xlsx files. The following simple example shows how to write a xlsx file:

```
 var workbook = new XlsxWorkbook("C:/temp/test.xlsx");
var worksheet = new XlsxWorksheet(workbook);
worksheet.AddText(0, 0, "Hello world!");
worksheet.AddNumber(1, 0, 1.2345);
worksheet.AddImage(2, 0, "image.png");
workbook.Close();
```

Constructor

new XlsxWorkbook(filename*[string]*)

Description

Create a new XlsxWorkbook object for writing xlsx files.

Arguments

- **filename** (string)

Filename of the xlsx file you want to write. The file will be overwritten (if it exists).

Returns

XlsxWorkbook object

Return type

XlsxWorkbook

Example

To create a new XlsxWorkbook object to write Xlsx file "/data/test/file.xlsx"

```
var workbook = new XlsxWorkbook("/data/test/file.xlsx");
```

Details of functions

Close()

Description

Close a Xlsx file

Arguments

No arguments

Returns

No return value

Example

To close Xlsx file workbook:

```
workbook.Close();
```

XlsxWorksheet class

Member functions

- AddImage(row*[integer]*, column*[integer]*, filename*[string]*)
- AddNumber(row*[integer]*, column*[integer]*, value*[number]*)
- AddText(row*[integer]*, column*[integer]*, text*[string]*)
- SetColumnProperties(column*[integer]*, width*[number]*)
- SetRowProperties(row*[integer]*, height*[number]*)

Constructor

new XlsxWorksheet(workbook*[XlsxWorkbook object]*, name (optional)*[string]*)

Description

Create a new XlsxWorksheet object for writing xlsx files.

Arguments

- **workbook** (XlsxWorkbook object)

The workbook to create the worksheet in.

- **name (optional)** (string)

The name of the worksheet. If omitted the default names 'Sheet1', 'Sheet2' etc will be used.

Returns

XlsxWorksheet object

Return type

XlsxWorksheet

Example

To create a new worksheet in workbook

```
var worksheet = new XlsxWorksheet(workbook);
```

Details of functions

AddImage(row*[integer]*, column*[integer]*, filename*[string]*)

Description

Add an image to the Xlsx file. Note that the image will not actually be read/inserted until the workbook is written by calling XlsxWorkbook.Close so you must make sure the image file exists until then.

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **filename** (string)

Name of the image file you want to add to the xlsx file. The image can be in png or jpeg format.

Returns

No return value

Example

To add image 'C:/temp/test.png' to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddImage(1, 2, 'C:/temp/test.png');
```

AddNumber(row*[integer]*, column*[integer]*, value*[number]*)

Description

Add number to the Xlsx file

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **value** (number)

Number you want to add to the xlsx file

Returns

No return value

Example

To add number 1.2345 to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddNumber(1, 2, 1.2345);
```

AddText(row*[integer]*, column*[integer]*, text*[string]*)

Description

Add text to the Xlsx file

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **text** (string)

Text you want to add to the xlsx file

Returns

No return value

Example

To add text 'test' to XlsxWorksheet worksheet on the second row, third column:

```
worksheet.AddText(1, 2, 'test');
```

SetColumnProperties(column*[integer]*, width*[number]*)

Description

Set the column properties in the worksheet

Arguments

- **column** (integer)

The column in the xlsx file (columns start at zero)

- **width** (number)

Width of the column to set

Returns

No return value

Example

To set the width of the third column in XlsxWorksheet worksheet to 30:

```
worksheet.SetColumnProperties(2, 30);
```

SetRowProperties(row*[integer]*, height*[number]*)

Description

Set the row properties in the worksheet

Arguments

- **row** (integer)

The row in the xlsx file (rows start at zero)

- **height** (number)

Height of the row to set

Returns

No return value

Example

To set the height of the third row in XlsxWorksheet worksheet to 20:

```
worksheet.SetRowProperties(2, 20);
```

XMLParser class

The XMLParser class enables reading data from XML files. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Parse(filename*[string]*)

XMLParser properties

Name	Type	Description
characterDataHandler	function	Function to call when character data is found. The function will be called with 1 argument which is a string containing the character data
commentHandler	function	Function to call when a comment is found. The function will be called with 1 argument which is a string containing the text inside the comment
endCDATAHandler	function	Function to call at the end of a CDATA section. The function does not have any arguments.
endElementHandler	function	Function to call when an element end tag is found. The function will be called with 1 argument which is a string containing the name of the element
startCDATAHandler	function	Function to call at the start of a CDATA section. The function does not have any arguments.
startElementHandler	function	Function to call when an element start tag is found. The function will be called with 2 arguments. Argument 1 is a string containing the name of the element. Argument 2 is an object containing the element attributes

Detailed Description

The XMLParser class provides a stream-oriented parser to enable you to read XML files. You register callback (or handler) functions with the parser and then parse the document. As the parser recognizes parts of the document, it will call the appropriate handler for that part (if you've registered one.) The document is fed to the parser in pieces. This allows you to parse really huge documents that won't fit into memory.
There are currently 6 handlers which can be set: XMLParser.startElementHandler, XMLParser.endElementHandler, XMLParser.characterDataHandler, XMLParser.commentHandler, XMLParser.startCDATAHandler and XMLParser.endCDATAHandler.
The following simple example shows how the parser could be used.

```
// Create a new parser object
var p = new XMLParser();
// assign handlers
p.startElementHandler  = startElem;
p.endElementHandler    = endElem;
p.characterDataHandler = text;
p.commentHandler       = comment;
// parse the file
p.Parse("/data/test.xml");
////////////////////////////////////////////////////////////////////////
function startElem(name, attr)
{
// handler to be called when a start element is found
// Print element name
```

```
    Println("START: " + name);
// Print attributes
    for (n in attr)
    {
        Println(" attr: " + n + "=" + attr[n]);
    }
}
function endElem(name)
{
// handler to be called when an end element is found
// Print element name
    Println("END: " + name);
}
function text(str)
{
// handler to be called when text is found
// Print text
    Println("TEXT: '" + str + "'");
}
function comment(str)
{
// handler to be called when a comment is found
// Print comment
    Println("COMMENT: '" + str + "'");
}
```

See the documentation below for more details.

Constructor

new XMLParser()

Description

Create a new XMLParser object for reading XML files.

Arguments

No arguments

Returns

XMLParser object

Return type

XMLParser

Example

To create a new XMLParser object

```
var p = new XMLParser();
```

Details of functions

Parse(filename*[string]*)

Description

starts parsing an XML file

Arguments

- **filename** (string)

XML file to parse

Returns

No return value

Example

To parse XML file "/data/test.xml"

```
var p = new XMLParser();
p.Parse("/data/test.xml");
```

Composites

Functions and constants relating to Composites

Functions

- GetElemsInPly(ply_id*[integer]*, state_id (optional)*[integer]*)
- GetPlyIntPoint(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, state_id (optional)*[integer]*)
- GetPlysInLayup(layup_id*[integer]*, state_id (optional)*[integer]*)

Details of functions

GetElemsInPly(ply_id*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns an object containing the number of elements in ply <ply_id>, the element type code, and also an array <list[ ]> of their internal indices. If there are no elements in the ply then false is returned. Ply data is only available if a .ztf file containing composite information has been read.

Arguments

- **ply_id** (integer)

The ply in which to return the list of elements. If +ve, the internal ply number starting at 1. If -ve, the external ply label. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
list	array of integers	Internal element ids
nn	integer	Number of elements in list
type	integer	Element type code

Return type

object

Example

```
// Get a list of elements in ply 5
if(a = GetElemsInPly(5))
{
    var nelems = a.nn;
    for(var i=0; i<nelems; i++)
    {
        Message("Element: " + GetLabel(a.type, a.list[i]))
    }
}
```

GetPlyIntPoint(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, state_id (optional)*[integer]*) [static]

Description

Return the integration point of <type/item> in ply <ply_id>. If the >type/item< is not in the ply then false is returned. Ply data is only available if a .ztf file containing composite information has been read.

Arguments

- **type_code** (integer)

A valid element type code (Currently only SHELL is valid)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **ply_id** (integer)

If +ve, the internal ply index. If -ve, the external ply label. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

integer

Return type

Number

Example

```
// Find the integration point in shell #1 occupied by internal ply index 14
var ip = GetPlyIntPoint(SHELL, 1, 14));
```

GetPlysInLayup(layup_id*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns an object containing the number of plys in layup <layup_id> and an array <list[ ]> of their internal indices. If there are no plys in the layup then false is returned. Ply data is only available if a .ztf file containing composite information has been read.

Arguments

- **layup_id** (integer)

The layup in which to return the list of plys. If +ve an internal layup index, if -ve an external layup label

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
list	array of integers	Array of internal ply indices
nn	integer	Number of plys in list

Return type

object

Example

```
// Print the ply labels in layup 1
if(a = GetPlysInLayup(1))
{
    var nplys = a.nn;
    for(var i=0; i<nplys; i++)
    {
        Message("Ply: " + GetLabel(CPLY, a.list[i]))
    }
}
```

Contacts

Functions and constants relating to Contacts

Functions

- GetSegmsInSurface(surface_id*[integer]*)
- SpoolNodesInSurface(surface_id*[integer]*, index*[integer]*, side*[integer]*)

Contacts constants

Name	Description
MASTER	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Master side on contact surface. Use Contact.SURFB instead [deprecated]
SLAVE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Slave side on contact surface. Use Contact.SURFA instead [deprecated]

Details of functions

GetSegmsInSurface(surface_id*[integer]*) [static]

Description

Returns the start and end indices of the tracked and reference segments in a contact surface

Arguments

- **surface_id** (integer)

The contact surface in which to return the list of segments. If +ve, the internal surface number starting at 1. If -ve, the external surface label. Internal numbers will be many times faster to process.

Returns

Object with the following properties:

Name	Type	Description
ms_end	integer	End index of reference surface segments
ms_start	integer	Start index of reference surface segments
ss_end	integer	End index of tracked surface segments
ss_start	integer	Start index of tracked surface segments

Return type

object

Example

```
// Get the segment indices of the first contact surface in the current model
if(a = GetSegmsInSurface(1))
{
    for(var i=a.ss_start; i<=a.ss_end; i++)
    {
        Message("Tracked segments: " + GetLabel(SEGM, i));
    }
}
```

SpoolNodesInSurface(surface_id*[integer]*, index*[integer]*, side*[integer]*) [static]

Description

Spools through the nodes on a contact surface

Arguments

- **surface_id** (integer)

The contact surface in which to spool. If +ve, the internal surface number starting at 1. If -ve, the external surface label. Internal numbers will be many times faster to process.

- **index** (integer)

Index of node to get in contact surface. To setup the spool, this has to be set to zero initially

- **side** (integer)

The side of the contact surface: Contact.SURFA or Contact.SURFB

Returns

integer. If the <index> is zero then this will be the number of nodes on the surface. If it's greater than zero then the return value is the index'th node in the surface. If the call fails then false is returned.

Return type

Number

Example

```
// Get the nodes in the SURFA side of the first contact surface in the current
model
if(n = SpoolNodesInSurface(1, 0, Contact.SURFA)) //Setup spool, index=0
{
    // Spool through nodes
    for(var i=1; i<=n; i++)
    {
        nid = SpoolNodesInSurface(1, i, Contact.SURFA);
        Message("Node: " + GetLabel(NODE, nid));
    }
}
```

CutSection

Functions and constants relating to CutSection

Functions

- GetCutCoords(options*[object]*)
- GetCutCoords(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [deprecated]
- GetCutForces(options*[object]*)
- GetCutForces(window_id*[integer]*, include_blanked (optional)*[integer]*, part_id (optional)*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [deprecated]
- GetCutSection(options*[object]*)
- GetCutSection(window_id*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [deprecated]
- RemoveCutDirection(options*[object]*) [deprecated]
- SetCutSection(options*[object]*)
- SetCutSection(window_id*[integer]*, attribute*[integer]*, value*[integer | array of reals | array of integers]*) [deprecated]

CutSection constants

Name	Description
FOLLOW_N	This constant is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. "Section follows nodes" flag [deprecated]

Constants for Action

Name	Description
NORMAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Positive or negative action Normal. Use Constant.NORMAL instead [deprecated]
OMIT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Positive or negative action Omit. Use Constant.OMIT instead [deprecated]
OUTLINE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Positive or negative action Outline (wire drawing). Use Constant.OUTLINE instead [deprecated]
TRANSPARENT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Positive or negative action Transparent. Use Constant.TRANSPARENT instead [deprecated]

Constants for Combination

Name	Description
INTERSECTION	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Intersection mode for multiple cut directions. Use Constant.INTERSECTION instead [deprecated]
UNION	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Union mode for multiple cut directions. Use Constant.UNION instead [deprecated]

Constants for Definition

Name	Description

CONST_X	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Constant X definition method. Use Constant.CONST_X instead [deprecated]
CONST_Y	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Constant Y definition method. Use Constant.CONST_Y instead [deprecated]
CONST_Z	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Constant Z definition method. Use Constant.CONST_Z instead [deprecated]
LS_DYNA	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. LS-DYNA definition method. Use Constant.LS_DYNA instead [deprecated]
N3	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 3 nodes definition method. Use Constant.N3 instead [deprecated]
OR_AND_V	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Origin and vectors definition method. Use Constant.OR_AND_V instead [deprecated]

Constants for Space

Name	Description
BASIC	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Basic (eulerian) space. Use Constant.BASIC instead [deprecated]
DEFORMED	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Deformed (lagrangian) space. Use Constant.DEFORMED instead [deprecated]
SCREEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Screen space. Use Constant.SCREEN instead [deprecated]
SPACE	This constant is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Space system call argument [deprecated]

Details of functions

GetCutCoords(options*[object]*) [static]

Description

Returns the coordinates where the cut-section cuts through element <type/item>.

Arguments

- **options** (object)

Object has the following properties:

Name	Type	Description
direction_id (optional)	integer	Index starting at 1 of the plane direction for multiple non-parallel planes. This should be at most the number of non-parallel planes (at most 3 if the maximum number of planes is defined). If omitted, the data for the first plane direction will be used.
item	integer	If +ve, the internal item number starting at 1. If -ve, the external label of the item.
model_id (optional)	integer	A valid model id that exists in <window_id>.

state_id (optional)	integer	State number to be used instead of the current state
type_code	integer	A valid type code (SHELL etc.))
window_id (optional)	integer	A valid window id.

Returns

Object with the following properties:

Name	Type	Description
n	integer	Number of places the cut-section cuts the item
x	array of reals	X coordinates where item is cut
y	array of reals	Y coordinates where item is cut
z	array of reals	Z coordinates where item is cut

Return type

object

Example

```
// Get the coordinates where the second cut plane in window 1 cuts the first
shell in model 3 in state 10.
if(a = GetCutCoords({ type_code:SHELL, item:1, window_id:1, model_id:3,
direction_id:2, state_id:10 }))
{
    var n = a.n;
    for(var i=0; i<n; i++)
    {
        Message("Coords: " + a.x[i] + ", " + a.y[i] + ", a.z[i]);
    }
}
```

GetCutCoords(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 19.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Returns the coordinates where the cut-section cuts through element <type/item>.

Arguments

- **type_code** (integer)

A valid type code (SHELL etc.))

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
n	integer	Number of places the cut-section cuts the item
x	array of reals	X coordinates where item is cut
y	array of reals	Y coordinates where item is cut
z	array of reals	Z coordinates where item is cut

Return type

object

Example

```
// Get the coordinates where the cut section cuts the first shell in the current
model.
if(a = GetCutCoords(SHELL, 1))
{
    var n = a.n;
    for(var i=0; i<n; i++)
    {
        Message("Coords: " + a.x[i] + ", " + a.y[i] + ", a.z[i]);
    }
}
```

GetCutForces(options*[object]*) [static]

Description

Returns the forces, moments, centroid and area of the cut section in <window_id>.

The coordinate system of these results depends upon the cut section's space system as follows:

- BASIC space: Forces are moments are always returned in the global axis system, about the geometrical centre of the cut elements at the given state. Therefore the effective origin is likely to change as the model deforms. (This is the method used by LS-DYNA)
- DEFORMED space: Forces and moments are returned in the plane local axis system, about the current section origin. The origin and axes will remain fixed as the model deforms unless one of the "section follows node(s)" options has been used.
- SCREEN space: Forces and moments are also returned in the plane local axis system. This space system is not suitable for computing results since these will change as the user updates the view, and therefore its use in this context is strongly deprecated.

WARNING #1: Cut-sections in D3PLOT are a "per window" attribute, cutting all models in a window at the current "frame".

If the optional <state_id> argument is not supplied the forces and moments returned will be at the state of the current "frame" of the window, and while this will normally be the same as the current "state" this is not necessarily the case, since the user may have interpolated results by time

Likewise if the optional <model_id> argument is not supplied then the model used will be the first in the window (as reported by function GetWindowModels()), which may not be the same as the "current model" of the JavaScript interface.

Therefore to avoid ambiguity when extracting cut-section forces and moments it is recommended that:

- The window being used should only contain a single model
- The window should be set up to display all states without interpolation, thus <state id> == <frame id>. (This is the default for windows.)

This "single model in a window" approach is strongly recommended in this context since visual feedback will then match computed values.

WARNING #2: By default computed forces do NOT include blanked elements.

Since cut section display is primarily intended to be used interactively the default behaviour is to omit blanked elements from the forceand moment calculation, since in this way the reported values match what is visible on the screen.

This behaviour is not ideal for batch processing since the user can, by manipulating blanking, change the results which are computed. Therefore the optional argument <include_blanked> may be used to override this behaviour and to force blanked elements to be considered. If omitted, or set to zero, then the default behaviour of omitting blanked elements will continue.

WARNING #3: Cutting a model exactly at mesh lines can result in ill-conditioned force and moment calculation.

It is tempting to define cut planes at nodes since this is easy to do, however this can give rise to ill-conditioning in a rectilinear mesh since the cut may lie exactly on the border between two adjacent elements and therefore won't "know" which one's results to use. Since LS-DYNA elements are constant stress there can be a step change in data values at element borders, and moving the cut plane by a tiny amount can result in a correspondingly large change in cut force and moment values.

It is strongly recommended that cut section definitions used for force and moment extraction should be located away from mesh lines so that they cut elements near their centres, thus avoiding any ambiguity about which elements to use.

WARNING #4: Any element types or parts excluded from the cut section are still included in the force and moment calculation.

Arguments

- **options** (object)

Object has the following properties:

Name	Type	Description
direction_id (optional)	integer	Index starting at 1 of the plane direction for multiple non-parallel planes. This should be at most the number of non-parallel planes (at most 3 if the maximum number of planes is defined). If omitted, the data for the first plane direction will be used.

include_ blanked (optional)	integer	0 to omit blanked elements (default), 1 to include them
model_id (optional)	integer	Model id that exists in <window_id>. If omitted the first model in the window will be used.
part_id (optional)	integer	0 all part ids considered (default), otherwise only forces in the specified part are computed. If +ve this is the internal part index, if -ve this is the external part label.
state_id (optional)	integer	State number to be used. If omitted the state of the window's current frame will be used.
window_id (optional)	integer	A valid window id. If omitted, cut section data for window 1 will be used.

Returns

Object with the following properties:

Name	Type	Description
area	real	Cut section area
centroid	array of reals	Cut section centroid, [Cx, Cy, Cz]
force	array of reals	3 Forces, [Fx, Fy, Fz]
moment	array of reals	3 Moments, [Mxx, Myy, Mzz]

Return type

object

Example

```
// Retrieve the results of the cut section in window 1 using all default
attributes.
if(a = GetCutForces({window_id: 1}))
{
    var fx = a.force[X];
    var myy = a.moment[Y];
    var area = a.area;
}
// Retrieve the results from unblanked elements in the third part using the
section
// in window 2 for state 12 in model 1 for the second non-parallel plane
direction.
var b = GetCutForces({window_id: 2, include_blanked: 0, part_id: 3, state_id:
12, model_id: 1, direction_id: 2});
```

GetCutForces(window_id*[integer]*, include_blanked (optional)*[integer]*, part_id (optional)*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 19.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Returns the forces, moments, centroid and area of the cut section in <window_id>.

The coordinate system of these results depends upon the cut section's space system as described in the non-deprecated function with the same name.

Arguments

- **window_id** (integer)

A valid window id

- **include_blanked (optional)** (integer)

0 to omit blanked elements (default), 1 to include them

- **part_id (optional)** (integer)

0 all part ids considered (default), otherwise only forces in the specified part are computed. If +ve this is the internal part index, if -ve this is the external part label.

- **state_id (optional)** (integer)

State number to be used. If omitted the state of the window's current frame will be used.

- **model_id (optional)** (integer)

Model id that exists in <window_id>. If omitted the first model in the window will be used.

Returns

Object with the following properties:

Name	Type	Description
area	real	Cut section area
centroid	array of reals	Cut section centroid, [Cx, Cy, Cz]
force	array of reals	3 Forces, [Fx, Fy, Fz]
moment	array of reals	3 Moments, [Mxx, Myy, Mzz]

Return type

object

Example

```
// Retrieve the results of the cut section in window 1 using all default
attributes.
if(a = GetCutForces(1))
{
    var fx = a.force[X];
    var myy = a.moment[Y];
    var area = a.area;
}
// Retrieve the results from unblanked elements in the third part using the
section in window 2 for state 12 in model 1.
var b = GetCutForces(2, 0, 3, 12, 1);
```

GetCutSection(options*[object]*) [static]

Description

Retrieves all attributes of the cut section in <window_id>.

Arguments

- **options** (object)

Retrieves all attributes of the cut section in <window_id>.

Object has the following properties:

Name	Type	Description

direction_id (optional)	integer	Index starting at 1 of the plane direction for multiple non-parallel planes. This should be at most the number of non-parallel planes (at most 3 if the maximum number of planes is defined). If omitted, the data for the first plane direction will be used.
model_id (optional)	integer	A valid model id that exists in <window_id>. If omitted the state of the window's current frame will be used. This only matters if the section uses the method CONST_X, CONST_Y or CONST_Z defined by a node or N3 and it has been set to follow nodes with FOLLOW_N. In which case the section origin and/or vectors may change as the node(s) move.
state_id (optional)	integer	State number to be used. If omitted the state of the window's current frame will be used. This only matters if the section uses the method CONST_X, CONST_Y or CONST_Z defined by a node or N3 and it has been set to follow nodes with FOLLOW_N. In which case the section origin and/or vectors may change as the node(s) move.
window_id (optional)	integer	A valid window id. If omitted, cut section data for window 1 will be returned.

Returns

Object with the following properties:

Name	Type	Description
combination	integer	How positive and negative actions for multiple directions are combined. Can be UNION or INTERSECTION. Note that this only has an effect with at least 2 cut plane directions.
definition	integer	One of OR_AND_V, CONST_X, CONST_Y, CONST_Z, N3, LS_DYNA or zero if no section has been defined yet
follow_n	integer	ON if the section follows any defining node(s) as appropriate, OFF if it does not. This value is only meaningful for definition == CONST_X/Y/Z where a node in nodes[0] was supplied, and N3
multi_ custom_cut	logical	whether or not custom spacing for multiple parallel cuts is on
multi_cut	logical	whether or not multiple parallel cuts are on
negative_ action	integer	Negative action for the cut direction. Can be OMIT, OUTLINE, NORMAL or TRANSPARENT.
nneg	integer	number of negative parallel planes when multi_cut is true and multi_custom_cut is false, undefined otherwise
nodes	array of integers	For definition = CONST_X/Y/Z: nodes[0] = index of node if supplied For definition = N3: nodes[0 to 2] = indices of three N3 nodes This array will always be present and have three entries, with unused entries being set to zero.
npos	integer	number of positive parallel planes when multi_cut is true and multi_custom_cut is false, undefined otherwise
origin	array of reals	Origin coordinates
positive_ action	integer	Positive action for the cut direction. Can be OMIT, OUTLINE, NORMAL or TRANSPARENT.
space	integer	Either BASIC, DEFORMED or SCREEN
spacing	real or array of reals	when multi_custom_cut is false and multi_cut is true: spacing value when multi_custom_cut is true and multi_cut is true: array of offsets from the local cut origin when multi_cut is false: 0.0
status	integer	Either OFF or ON

thick_cut	logical	whether or not thick cut is on
thickness	real	thickness for thick cuts when thick_cut is true, 0.0 otherwise
visible	integer	ON if the cut direction is active, OFF otherwise.
x_axis	array of reals	Local X axis vector (normalised)
y_axis	array of reals	Local Y axis vector (normalised)
z_axis	array of reals	Local Z axis vector (normalised)

Return type

object

Example

```
// Retrieve the attributes of the cut section in window 1 at the current state
and model.
var a = GetCutSection({window_id: 1});
// Retrieve the attributes of the cut section in window 2, at state #10 in model
#3.
var a = GetCutSection({window_id: 2, state_id: 10, model_id : 3});
// Retrieve the attributes of the cut section in window 1 for the second of
several
// non-parallel plane directions.
var a = GetCutSection({window_id: 1, direction_id: 2});
```

GetCutSection(window_id*[integer]*, state_id (optional)*[integer]*, model_id (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 19.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Retrieves all attributes of the cut section in <window_id>.

Arguments

- **window_id** (integer)

A valid window id

- **state_id (optional)** (integer)

State number to be used. If omitted the state of the window's current frame will be used. This only matters if the section uses the method CONST_X, CONST_Y or CONST_Z defined by a node or N3 and it has been set to follow nodes with FOLLOW_N. In which case the section origin and/or vectors may change as the node(s) move.

- **model_id (optional)** (integer)

A valid model id that exists in <window_id>. If omitted the state of the window's current frame will be used. This only matters if the section uses the method CONST_X, CONST_Y or CONST_Z defined by a node or N3 and it has been set to follow nodes with FOLLOW_N. In which case the section origin and/or vectors may change as the node(s) move.

Returns

Object with the following properties:

Name	Type	Description
definition	integer	One of OR_AND_V, CONST_X, CONST_Y, CONST_Z, N3, LS_DYNA or zero if no section has been defined yet

follow_n	integer	ON if the section follows any defining node(s) as appropriate, OFF if it does not. This value is only meaningful for definition == CONST_X/Y/Z where a node in nodes[0] was supplied, and N3
multi_ custom_cut	logical	whether or not custom spacing for multiple parallel cuts is on
multi_cut	logical	whether or not multiple parallel cuts are on
nneg	integer	number of negative parallel planes when multi_cut is true and multi_custom_cut is false, undefined otherwise
nodes	array of integers	For definition = CONST_X/Y/Z: nodes[0] = index of node if supplied For definition = N3: nodes[0 to 2] = indices of three N3 nodes This array will always be present and have three entries, with unused entries being set to zero.
npos	integer	number of positive parallel planes when multi_cut is true and multi_custom_cut is false, undefined otherwise
origin	array of reals	Origin coordinates
space	integer	Either BASIC, DEFORMED or SCREEN
spacing	real or array of reals	when multi_custom_cut is false and multi_cut is true: spacing value when multi_custom_cut is true and multi_cut is true: array of offsets from the local cut origin when multi_cut is false: undefined
status	integer	The status of the cutting switch. Either OFF or ON
thick_cut	logical	whether or not thick cut is on
thickness	real	thickness for thick cuts when thick_cut is true, undefined otherwise
x_axis	array of reals	Local X axis vector (normalised)
y_axis	array of reals	Local Y axis vector (normalised)
z_axis	array of reals	Local Z axis vector (normalised)

Return type

object

Example

```
// Retrieve the attributes of the cut section in window 1 at the current state
and model.
var a = GetCutSection(1);
// Retrieve the attributes of the cut-section in window 2, at state #10 in model
#3.
var a = GetCutSection(2, 10, 3);
```

RemoveCutDirection(options*[object]*) [static] [deprecated]

This function is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Turns off a cut plane from a window with multiple non-parallel planes. Note that from D3PLOT 20.0 onwards cut directions can be turned off with the <visible> property in SetCutSection instead.

Arguments

- **options** (object)

Object has the following properties:

Name	Type	Description
direction_id (optional)	integer	Index starting at 1 of the plane direction to be removed. This should be at most the number of non-parallel planes (at most 3 if the maximum number of planes is defined). If omitted, the last plane direction will be removed.
window_id	integer	A valid window ID

Returns

Return type

Example

```
// Assuming that there are 3 non-parallel cut planes in window 1, remove the
second direction:
RemoveCutDirection({ window_id:1, direction_id:2 });
```

SetCutSection(options*[object]*) [static]

Description

Sets properties of the cut section in <window_id>

Each D3PLOT window can have cut planes in up to three directions, which are by default not active. Their location, orientation and type can be defined here, and it can be turned on or off. Forces and moments from the cut sections can be obtained from function GetCutForces().

Cut section definitions are a "per window" attribute that apply to all models in the window. Thefore if the window has multiple models, and nodes are used to define the section (CONST_X, CONST_Y, CONST_Z with a node or N3), the origin and/or vectors of the section may vary for each model in the window. In addition if the coordinates of these nodes are "followed" (see the <follow_n> property on the options), then the section locations may change from state to state.

Arguments

- **options** (object)

The cut section properties which should be changed.

All coordinates and vectors must be defined in model space, and will always form an orthogonal right handed coordinate system in which local Z is normal to the cut plane.

Vector length is irrelevant (but should be well-conditioned), and the Y axis is obtained automatically from the vector cross product Z_AXIS x X_AXIS. If the Z and X axes as supplied are not at right angles the X will be updated to make it orthogonal to Y and Z.

<nodes[0]> or <origin> will define the cut section origin coordinate. The array <nodes> for N3 or origin/x_axis/xy_plane will define the cut section orientation.

Care must be taken when defining nodes for windows that contain multiple models. Since a node index (+ve)

may resolve to a different node in each model it is usually best to use external labels (-ve) in this context to avoid ambiguity. (The speed of the external => internal lookup will not matter as this function is unlikely to be called many times.)

FOLLOW_N(odes) will only have an effect if the cut section is defined by node(s), i.e. CONST_X, CONST_Y or CONST_Z with nodes[0] or N3.

Object has the following properties:

Name	Type	Description
attribute (optional)	integer	This property is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Can be one of STATUS, SPACE, OR_AND_V, CONST_X, CONST_Y, CONST_Z, N3, LS_DYNA, FOLLOW_N. From D3PLOT 20.0 onwards this property can be omitted in the SPACE, OR_AND_V and FOLLOW_N cases, whereas in the other cases the <definition> property should be used with the same value. [deprecated]
combination (optional)	integer	How positive and negative actions for multiple directions are combined. Can be UNION or INTERSECTION. Note that this only has an effect with at least 2 cut plane directions.
definition (optional)	integer	Definition method for the cut plane direction. Can be one of OR_AND_V, CONST_X, CONST_Y, CONST_Z, N3, LS_DYNA. This can be omitted when only properties independent from the plane position are changed, for example <follow_n> or <status>.
direction_id (optional)	integer	Index starting at 1 of the plane direction for multiple non-parallel planes. Can be 1, 2 or 3. It can be either an existing direction index to update or a free index to add a new plane direction. If <direction> is omitted, the data for the first plane direction will be set by this function.
follow_n (optional)	integer	OFF or ON (default OFF). Determines whether or not a DEFORMED space section will track the motion of the node(s) used to define it. This is only meaningful for sections defined by: • N3. The motion of all three nodes will update the origin and axes at each state. • CONST_X, CONST_Y or CONST_Z where a node has been used to define the origin. The node motion will update the section origin at each state, but its axes will remain constant.
negative_ action (optional)	integer	Negative action for the cut direction. Can be OMIT, OUTLINE, NORMAL or TRANSPARENT.
nneg (optional)	integer	number of negative parallel planes for uniform spacing (required when <spacing> is a single positive number for uniform spacing)
nodes (optional)	array of integers	Array of +ve indices or -ve labels of the nodes. For CONST_X, CONST_Y or CONST_Z this should have length 1 and contain the node whose X, Y or Z coordinate defines the plane position. For N3 it should have length 3 containing the three nodes where the plane passes through. (required for <definition> CONST_X, CONST_Y or CONST_Z when origin is not defined or for <definition> N3)
normal_head (optional)	array of reals	Normal head coordinate (required for <definition> LS_DYNA)
npos (optional)	integer	number of positive parallel planes for uniform spacing (required when <spacing> is a single positive number for uniform spacing)
origin (optional)	array of reals	Coordinate array defining the origin of the plane. (for <definition> CONST_X, CONST_Y or CONST_Z when nodes is not defined or for <definition> OR_AND_V or LS_DYNA)
positive_ action (optional)	integer	Positive action for the cut direction. Can be OMIT, OUTLINE, NORMAL or TRANSPARENT.
space (optional)	integer	BASIC, DEFORMED (default) or SCREEN (not recommended). Determines whether the section is Lagrangian (BASIC) or Eulerian (DEFORMED). In the BASIC case the section is tied to the undeformed geometry and will move and distort as the model deforms, in the DEFORMED case the section is fixed in model space and the structure passes through it. For compatibility with LS_DYNA the way forces are calculated also varies with section space - see the documentation on GetCutForces().

spacing (optional)	real or array of reals	Spacing for multiple parallel cuts. If this is a single positive number, multiple parallel cuts with uniform spacing will be turned on, where <npos> and <nneg> will be required to define the number of planes in the positive and negative directions. If this is an array of real numbers, multiple parallel cuts with custom spacing will be turned on, where this array is the list of offsets from the local cut origin. If spacing is 0.0, multiple parallel cuts will be turned off. If spacing is undefined, then multiple parallel cuts will keep their existing spacing.
status (optional)	integer	OFF or ON (default OFF). Determines whether or not the cutting switch is on in the current window. The cutting switch does not need to be on in order to compute cut forces and moments.
thickness (optional)	real	Thickness for thick cuts. If positive, thick cuts will be turned on. If 0.0, thick cuts will be turned off. If thickness is undefined, then thick cuts and thickness will remain on or off as before.
visible (optional)	integer	OFF or ON (default ON). Determines whether or not the cut direction at <direction_id> is active. For it to be visible, in addition to this <visible> property also the cutting switch needs to be turned on with <status>.
window_id (optional)	integer	A valid window id or ALL for all active windows. If omitted, the cut section will be set for ALL windows.
x_axis (optional)	array of reals	X axis vector (required for <definition> OR_AND_V)
x_axis_head (optional)	array of reals	X axis head coordinate (required for <definition> LS_DYNA)
xy_plane (optional)	array of reals	XY plane vector (required for <definition> OR_AND_V)

Returns

boolean

Return type

Boolean

Example

```
// Set the cut section to "deformed" (lagrangian) space in window 1.
SetCutSection({window_id: 1, space: DEFORMED});
// Make the section in window 2 constant in Z, with its origin at
// (1,2,3). Implicitly this means a plane of constant Z = 3.
if(!SetCutSection({window_id: 2, definition: CONST_Z, origin: [1,2,3]}))
{
    ... deal with error
}
// Make a cut-section in window 3 using the LS_DYNA method with the
// origin at (0,0,0), Z axis pointing down the global X vector (head at
// (10,0,0)), and X axis down the global Y vector (0,10,0)
if(!SetCutSection({window_id: 3, definition: LS_DYNA, origin: [0,0,0], normal_
head: [10,0,0], x_axis_head: [0,10,0]}))
{
    ... deal with error
}
// In window 1 define the second direction with origin (10, 0, 0), local
// X axis (1,-1,0) and local Y axis (1,1,1). This can be called whether
// direction 2 is defined already or not.
if(!SetCutSection({window_id: 1, definition: OR_AND_V, origin: [10,0,0], x_axis:
[1,-1,0], xy_plane: [1,1,1], direction_id: 2}))
{
    ... deal with error
}
// If there is only one cut plane in window 1, turn on a thick cut with
// thickness 4.0:
if(!SetCutSection({window_id: 1, thickness: 4.0}))
{
    ... deal with error
}
// Turn off a thick cut for the second direction in window 1:
if(!SetCutSection({window_id: 1, direction_id: 2, thickness: 0.0}))
{
    ... deal with error
}
// For a single cut plane in window 1 turn on 10 parallel cuts in
// positive and 5 parallel cuts in negative direction with a uniform
// spacing of 20.0 length units:
if(!SetCutSection({window_id: 1, spacing: 20.0, npos: 10, nneg: 5}))
{
    ... deal with error
}
// For the third plane direction in window 1 turn on parallel planes
// with custom spacing such that the offsets from the local cut origin
// are -20.0, 0.0, 10.0 and 20.0 length units:
if(!SetCutSection({window_id: 1, direction_id: 3, spacing: [-20.0, 0.0, 10.0,
20.0]}))
{
    ... deal with error
}
// Turn off parallel cuts for the first direction in window 1:
if(!SetCutSection({window_id: 1, spacing: 0.0}))
{
    ... deal with error
}
// For the first plane direction use normal drawing on the positive
// side and omit items on the negative side:
if(!SetCutSection({direction_id:1, positive_action:NORMAL, negative_
action:OMIT}))
{
    ... deal with error
}
// For multiple cut directions use the intersection mode:
if(!SetCutSection({combination:INTERSECTION}))
{
    ... deal with error
}
```

SetCutSection(window_id*[integer]*, attribute*[integer]*, value*[integer | array of reals | array of integers]*) [static] [deprecated]

This function is deprecated in version 19.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Sets properties of the cut section in <window_id>

Each D3PLOT window can have cut planes in up to three directions, which are by default not active. Their location, orientation and type can be defined here, and it can be turned on or off. Forces and moments from the cut sections can be obtained from function GetCutForces().

Cut section definitions are a "per window" attribute that apply to all models in the window. Thefore if the window has multiple models, and nodes are used to define the section (CONST_X, CONST_Y, CONST_Z with a node or N3), the origin and/or vectors of the section may vary for each model in the window. In addition if the coordinates of these nodes are "followed" (see the <follow_n> property on the options), then the section locations may change from state to state.

Arguments

- **window_id** (integer)

A valid window id or ALL for all active windows

- **attribute** (integer)

Can be one of STATUS, SPACE, OR_AND_V, CONST_X, CONST_Y, CONST_Z, N3, LS_DYNA, FOLLOW_N.

- **value** (integer | array of reals | array of integers)

The value of the specified <attribute>

- STATUS: OFF or ON (default OFF). Determines whether or not the cut section is active in the current window. The section does not have to be active in order to compute cut forces and moments.
- SPACE: BASIC, DEFORMED (default) or SCREEN (not recommended). Determines whether the section is Lagrangian (BASIC) or Eulerian (DEFORMED). In the BASIC case the section is tied to the undeformed geometry and will move and distort as the model deforms, in the DEFORMED case the section is fixed in model space and the structure passes through it. For compatibility with LS_DYNA the way forces are calculated also varies with section space - see the documentation on GetCutForces().
- FOLLOW_N: OFF or ON (default OFF). Determines whether or not a DEFORMED space section will track the motion of the node(s) used to define it. This is only meaningful for sections defined by:
  - N3. The motion of all three nodes will update the origin and axes at each state.
  - CONST_X, CONST_Y or CONST_Z where a node has been used to define the origin. The node motion will update the section origin at each state, but its axes will remain constant.

The section can be defined by any of the following:

- OR_AND_V: An array of 9 numbers in three triplets: <origin coordinate>, <X axis vector>, <XY plane vector>. Local Z is obtained from X cross XY.
- CONST_X: A coordinate array or node id. The plane will be aligned with the X axis with its origin either at the explicit coordinate (array) <coord[3]>, or at the coordinate of node (integer) <node_id>.
- CONST_Y: A coordinate array or node id. The plane will be aligned with the Y axis with its origin either at the explicit coordinate (array) <coord[3]>, or at the coordinate of node (integer) <node_id>.
- CONST_Z: A coordinate array or node id. The plane will be aligned with the Z axis with its origin either at the explicit coordinate (array) <coord[3]>, or at the coordinate of node (integer) <node_id>.
- N3: An array of 3 integer node ids. Node 1 is the origin, N1N2 is the local X vector and N1N3 defines the local XY plane. Local Z is obtained from N1N2 cross N1N3. +ve for internal indices, -ve for labels.
- LS_DYNA: An array of 9 numbers in three triplets: <Normal tail coord (origin)>, <Normal head coord>, <X axis head coord>. Local Z and local X are obtained directly, and local Y from Z cross X.

All coordinates and vectors must be defined in model space, and will always form an orthogonal right handed coordinate system in which local Z is normal to the cut plane.

Vector length is irrelevant (but should be well-conditioned), and the Y axis is obtained automatically from the vector cross product Z_AXIS x X_AXIS. If the Z and X axes as supplied are not at right angles the X will be updated to make it orthogonal to Y and Z.

<nodes[0]> or <origin> will define the cut section origin coordinate. The array <nodes> for N3 or origin/x_axis/xy_ plane will define the cut section orientation.

Care must be taken when defining nodes for windows that contain multiple models. Since a node index (+ve) may resolve to a different node in each model it is usually best to use external labels (-ve) in this context to avoid ambiguity. (The speed of the external => internal lookup will not matter as this function is unlikely to be called many times.)

FOLLOW_N(odes) will only have an effect if the cut section is defined by node(s), i.e. CONST_X, CONST_Y or CONST_Z with nodes[0] or N3.

Returns

boolean

Return type

Boolean

Example

```
// Set the cut section to "deformed" (lagrangian) space in window 1.
SetCutSection(1, SPACE, DEFORMED);
// Make the section in window 2 constant in Z, with its origin at (1,2,3).
Implicitly this means a plane of constant Z = 3.
var coord = new Array(1.0, 2.0, 3.0);
if(!SetCutSection(2, CONST_Z, coord))
{
    ... deal with error
}
// Make a cut-section in window 3 using the LS_DYNA method with the origin at
(0,0,0), Z axis pointing down the global
// X vector (head at (10,0,0)), and X axis down the global Y vector (0,10,0)
var data = new Array(0.0, 0.0, 0.0, 10.0, 0.0,0.0, 0.0, 10.0, 0.0);
if(!SetCutSection(3, LS_DYNA, data))
{
    ... deal with error
}
```

Data constants

Constants for Frame of Reference

Name	Description
CYLINDRICAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Cylindrical coordinate system. Use Constant.CYLINDRICAL instead [deprecated]
GLOBAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Global coordinate system. Use Constant.GLOBAL instead [deprecated]
LOCAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Element local coordinate system. Use Constant.LOCAL instead [deprecated]
MATERIAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Material axes coordinate system. Use Constant.MATERIAL instead [deprecated]
USER_ DEFINED	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. User-defined coordinate system. Use Constant.USER_DEFINED instead [deprecated]

Constants for GetNumberOf

Name	Description
CUT_ SECTION	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of non-parallel cut plane directions. Use Constant.CUT_SECTION instead [deprecated]
FAMILY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of families. Use Constant.FAMILY instead [deprecated]
GROUP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of groups. Use Type.GROUP instead [deprecated]
INCLUDE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of includes. Use Constant.INCLUDE instead [deprecated]

MODEL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of models. Use Type.MODEL instead [deprecated]
NEIPH	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of "Extra" Solid variables. Use Constant.NEIPH instead [deprecated]
NEIPS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of "Extra" Shell variables. Use Constant.NEIPS instead [deprecated]
NEIPT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of "Extra" Thick Shell variables. Use Constant.NEIPT instead [deprecated]
NIP_B	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of Beam integration points. Use Constant.NIP_B instead [deprecated]
NIP_H	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of Solid integration points. Use Constant.NIP_H instead [deprecated]
NIP_S	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of Shell integration points. Use Constant.NIP_S instead [deprecated]
NIP_T	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of Thick Shell integration points. Use Constant.NIP_T instead [deprecated]
N_ON_ PLAN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of on-plan integration points written. Use Constant.N_ON_PLAN instead [deprecated]
N_UBMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined beam scalar components. Use Constant.N_UBMS instead [deprecated]
N_UBMV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined beam vector components. Use Constant.N_UBMV instead [deprecated]
N_UNOS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined node scalar components. Use Constant.N_UNOS instead [deprecated]
N_UNOV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined node vector components. Use Constant.N_UNOV instead [deprecated]
N_USSS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined solid/shell scalar components. Use Constant.N_USSS instead [deprecated]
N_USST	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined solid/shell tensor components. Use Constant.N_USST instead [deprecated]
STATE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of states. Use Constant.STATE instead [deprecated]
USER	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Number of user-defined components. Use Constant.USER instead [deprecated]

Constants for Phase Angle Results

Name	Description
CURRENT_VAL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Current value result. Use Constant.CURRENT_VAL instead [deprecated]
MAGNITUDE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Magnitude result. Use Constant.MAGNITUDE instead [deprecated]

Details of functions

GetConditionParts(component*[integer]*, value*[real]*, mode*[integer]*, int_pt (optional)*[object | integer]*, extra (optional)*[integer]*) [static]

Description

Returns an object with all parts in current model filtered into two lists (pass_list and fail_list). Passing parts must have elements that pass the specified condition (indicated by <value> and <mode>) for the specified <component>.

NOTE: This function only works for scalar components. If <component> is a vector or tensor component, this function will return null.

Arguments

- **component** (integer)

A valid component code (e.g. Component.DX, Component.SXY)

- **value** (real)

A value to compare element data against.

- **mode** (integer)

Determines if condition is Constant.LT (<), Constant.LTEQ (<=), Constant.GT (>) or Constant.GTEQ (>=) than <value>.

- **int_pt (optional)** (object) | integer

This may be one of three types:
1. A +ve integer that is an integration point id
2. One of the types Constant.TOP, Constant.MIDDLE or Constant.BOTTOM for shell surfaces only
3. An object defining both through-thickness and on-plan integration points for fully integrated shells.

Integration points are only meaningful for some element type / data component combinations:
- Shells and Tshells: Stress and strain tensors; Plastic strain; "Extra" data (if written)
- Solids: All data components if NINTSLD on the database extent binary card is 8
- Beams: 3 Stresses and 2 strains in non-resultant beam types if BEAMIP on the database extent binary card is > 0

This has become a complex data field, please see the separate section on Defining the Integration point argument below.

Where the integration point is not relevant this argument may be omitted.

If <int_pt> is not defined, this function will loop through all through thickness integration points for each element to check if the condition is fufilled.

Use zero to define a null "padding" argument

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point
op (optional)	integer	On plan integration point. Defaults to the first one.

- **extra (optional)** (integer)

- The "Extra" solid or shell component id for components Component.SOX or Component.SHX
- The ALE mulit-material group id for components Component.AMMG and Component.AMMS
- The sub-number for user-defined components Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS, Component.UBMV

If any of the above component codes are used, the "extra" argument must be set to a non zero value.

Returns

Object with the following properties:

Name	Type	Description
fail_list	array of integers	List of failing parts
failed	integer	Number of failing parts
pass_list	array of integers	List of passing parts
passed	integer	Number of passing parts

Return type

object

Example

```
// Does the filtering for the (scalar) X stress of part elements at integration
point 2,
// checking if they are greater than 0.1
var a = GetConditionParts(Component.SXX, 0.1, Constant.GT, 2);
// Does the filtering for the yield utilisation factor of part elements (looping
through all
// integration points), checking if they are greater than or equals to 1.0
var b = GetConditionParts(Component.YUTF, 1.0, Constant.GTEQ);
```

GetContourLimit(mode*[integer]*, component (optional)*[string]*) [static]

Description

Returns the maximum/ minimum contour plot value of <component> specified for the current window. Returns null if <component> specified is not active.

Arguments

- **mode** (integer)

Constant.MIN for minimum contour plot value, or Constant.MAX for maximum contour plot value.

- **component (optional)** (string)

Contour plot component: "SCALAR_1" for Scalar 1, "SCALAR_2" for Scalar 2, "VECTOR_1" or "VECTOR" for Vector, "VECTOR_2" or "VEL" for "Vel". If only 1 component is active, <component> is optional and min/max will be evaluated for the active component. If more than 1 component is active and <component> is not specified, min/max will be evaluated for Scalar 1.

Returns

real (or null if <component> specified is not active)

Return type

Number

Example

```
// Gets the minimum contour plot value for Scalar 1
s1min = GetContourLimit(Constant.MIN, "SCALAR_1");
// Gets the maximum contour plot value for Scalar 2
s2max = GetContourLimit(Constant.MAX, "SCALAR_2");
// Gets the minimum contour plot value for Vector
v1min = GetContourLimit(Constant.MIN, "VECTOR_1");
// Gets the maximum contour plot value for "Vel"
v2max = GetContourLimit(Constant.MAX, "VECTOR_2");
```

GetData(component*[integer]*, type_code*[integer]*, item*[integer]*, int_pt (optional)*[object | integer]*, extra (optional)*[integer]*, fr_of_ref (optional)*[integer]*, state_id (optional)*[integer]*, dda (optional)*[integer]*, consider_blanking (optional)*[integer]*, mag_or_cur (optional)*[integer]*) [static]

Description

Returns the data for <component> of type <type_code> for the single <item>

WARNING: If the function arguments are grammatically correct but the requested data component is not present in the database, then 1, 3 or 6 zeros are returned as required, and no warning message is output. Therefore it is good practice to use function QueryDataPresent() to check that an optional data component is actually present in a database before attempting to extract its values.

NOTE: to return the same data for a range of items it will be much faster to call the GetMultipleData() variant of this function, described below.
In other words instead of something like this, calling GetData()for each item individually:

```
for(item=item_1; item<=item_2; item++)
{
    result = GetData(component, type, item, ...);
}
```

You can write the following to extract data into an array of results using a single call to GetMultipleData():

```
result = GetMultipleData(component, type, item_1, item_2, ...);
```

This reduces the time taken to extract data by a factor nearly equal to #items, and for a large model this can give a dramatic speed increase.

Arguments

- **component** (integer)

A valid component code (e.g. Component.DX, Component.SXY)

- **type_code** (integer)

A valid element type code (e.g. Type.SOLID, Type.SHELL)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **int_pt (optional)** (object) | integer

This may be one of three types:
1. A +ve integer that is an integration point id
2. One of the types Constant.TOP, Constant.MIDDLE or Constant.BOTTOM for shell surfaces only
3. An object defining both through-thickness and on-plan integration points for fully integrated shells.

Integration points are only meaningful for some element type / data component combinations:

- Shells and Tshells: Stress and strain tensors; Plastic strain; "Extra" data (if written)
- Solids: All data components if NINTSLD on the database extent binary card is 8
- Beams: 3 Stresses and 2 strains in non-resultant beam types if BEAMIP on the database extent binary card is > 0

This has become a complex data field, please see the separate section on Defining the Integration point argument below.

Where the integration point is not relevant this argument may be omitted. Use zero to define a null "padding" argument.

If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point
op (optional)	integer	On plan integration point. Defaults to the first one.

- **extra (optional)** (integer)

- The "Extra" solid or shell component id for components Component.SOX or Component.SHX
- The ALE mulit-material group id for components Component.AMMG and Component.AMMS
- The sub-number for user-defined components Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS, Component.UBMV

If any of the above component codes are used, the "extra" argument must be set to a non zero value.

Use zero to define a null "padding" argument if this is not required

- **fr_of_ref (optional)** (integer)

The frame of reference to return values in Constant.GLOBAL, Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED, Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used. If omitted, or set to zero, it defaults to Constant.GLOBAL for directional components and is ignore for all others.

- **state_id (optional)** (integer)

State number to be used instead of the current state

- **dda (optional)** (integer)

Direct Disk Access flag. Either Constant.OFF (default) for normal data cacheing or Constant.ON to enable direct disk reading of data.

If turned on this reads data not currently in core memory directly from disk without loading the complete data vector for the state into core.

This should be used if you want to extract results for a few items over a range of states, since it will potentially be faster.

- **consider_blanking (optional)** (integer)

Consider blanking flag. Either Constant.OFF (default) to ignore blanking or Constant.ON to consider blanking.

This argument is relevant for nodal contact force results. By default the sum of all forces at a given node for all surfaces using that node will be returned. By blanking all but the contact surface(s) of interest and setting this argument to ON the results can be restricted to the contact surface(s) you want.

- **mag_or_cur (optional)** (integer)

Magnitude or Current Value flag. This argument is relevant for analyses with phase angle results.

Set it to Constant.MAGNITUDE to output the magnitude

Set it to Constant.CURRENT_VAL to output the current value [Magniude * cos(phase + phi)]. This is dependent on the current phi angle displayed in the graphics window and can be set using SetWindowFrame(). See example below.

If omitted, or set to zero, it defaults to Constant.MAGNITUDE.

Returns

real|Array of reals

Return type

Number

Example

```
// Returns the (scalar) X stress of internal shell #27 at integration point 2,
in the element local coordinate system.
var a = GetData(Component.SXX, Type.SHELL, 27, 2, 0, Constant.LOCAL);
// Returns an array[6] of the strain tensor in solid element#93, implicitly in
the global coordinate system.
var b = GetData(Component.ETEN, Type.SOLID, 93);
var sxx = b[Constant.XX];
var sxy = b[Constant.XY];
// Returns an array[3] of the 2nd user-defined Nodal Vector component at
internal node #inode at state #3.
var c = GetData(Component.UNOV, Type.NODE, inode,0, 2, 0, 3);
var vx = c[Constant.X];
var vy = c[Constant.Y];
var vz = c[Constant.Z];
// For an anlysis with phase angles returns the DZ displacement of internal node
#1 at the second frame of state 3.
// (Note that the state has to be set with both SetCurrentState() and a
DialogueInput() command to get CURRENT_VAL
// to work as this works off the current settings in the graphics window and
SetCurrentState() does not update the
// graphics window, it is only used internally by the Javascript interface).
SetCurrentState(3);
DialogueInput("/STATE 3");
SetWindowFrame(1, 2);
var a = GetData(Componnent.DZ, Type.NODE, 1, 0, 0, 0, 0, Constant.OFF,
Constant.OFF, Constant.CURRENT_VAL);
```

GetMultipleData(component*[integer]*, type_code*[integer]*, item_1*[integer]*, item_2*[integer]*, int_pt (optional)*[object | integer]*, extra (optional)*[integer]*, fr_of_ref (optional)*[integer]*, state_id (optional)*[integer]*, dda (optional)*[integer]*, consider_blanking (optional)*[integer]*, mag_or_cur (optional)*[integer]*) [static]

Description

Returns the data for <component> of type <type_code> for the range of items <item1 .. item2>

WARNING #1: If the function arguments are grammatically correct but the requested data component is not present in the database, then 1, 3 or 6 zeros are returned as required, and no warning message is output. Therefore it is good practice to use function QueryDataPresent() to check that an optional data component is actually present in a database before attempting to extract its values.

WARNING #2: It is possible to extract vary large quantities of data using a single call of this function. Bear in mind that JavaScript representations of values are quite bloated, for example all "numbers"are 64 bit (8 byte) floating double format, and the language imposes further overheads because of the way it organises data. For large models it may be necessary to extract large blocks of data in several smaller chunks, rather than one big one.

WARNING #3: The data return value from this function is an array of length #rows, and the subscripts of this array start at row 0. In other words the result for item_1 in the call below will be returned in results array row data[0]. When extracting results for all items of a type, for example all shells in a model, item_1 will typically be 1, and it is easy to make the mistake of expecting this to be in results array row data[1]. In addition when you extract data for vector or tensor data the result will be a two-dimensional array, aligned data[#cols][#rows]. See the examples at the bottom of this description for more information about using two-dimensional arrays.

Arguments

- **component** (integer)

A valid component code (e.g. Component.DX, Component.SXY)

- **type_code** (integer)

A valid element type code (e.g. Type.SOLID, Type.SHELL)

- **item_1** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times

faster to process.

- **item_2** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Must have the same sign as item_1, so both must be +ve or -ve. It is legal for it to be the same as item_1, in which case only values for a single item will be extracted.

- **int_pt (optional)** (object) | integer

This may be one of three types:
1. A +ve integer that is an integration point id
2. One of the types Constant.TOP, Constant.MIDDLE or Constant.BOTTOM for shell surfaces only
3. An object defining both through-thickness and on-plan integration points for fully integrated shells.

Integration points are only meaningful for some element type / data component combinations:

- Shells and Tshells: Stress and strain tensors; Plastic strain; "Extra" data (if written)
- Solids: All data components if NINTSLD on the database extent binary card is 8
- Beams: 3 Stresses and 2 strains in non-resultant beam types if BEAMIP on the database extent binary card is > 0

This has become a complex data field, please see the separate section on Defining the Integration point argument below.

Where the integration point is not relevant this argument may be omitted. Use zero to define a null "padding" argument.

If the integration point is not defined it will use the integration point defined on the current GUI "data" panel, which defaults to the middle surface for shells, thick shells, and solids, and Mag All for beams, but may vary if changed by an interactive user. If consistent output from a script is required, independent of any prior interactive activity, an explicit integration point or surface should be defined.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point
op (optional)	integer	On plan integration point. Defaults to the first one.

- **extra (optional)** (integer)

- The "Extra" solid or shell component id for components Component.SOX or Component.SHX
- The ALE mulit-material group id for components Component.AMMG and Component.AMMS
- The sub-number for user-defined components Component.UNOS, Component.UNOV, Component.USSS, Component.USST, Component.UBMS, Component.UBMV

If any of the above component codes are used, the "extra" argument must be set to a non zero value.

Use zero to define a null "padding" argument if this is not required

- **fr_of_ref (optional)** (integer)

The frame of reference to return values in Constant.GLOBAL, Constant.LOCAL, Constant.CYLINDRICAL, Constant.USER_DEFINED, Constant.MATERIAL. This is only necessary for directional components (eg X stress) and then only when something other than the default Constant.GLOBAL coordinate system is to be used. If omitted, or set to zero, it defaults to Constant.GLOBAL for directional components and is ignore for all others.

- **state_id (optional)** (integer)

State number to be used instead of the current state

- **dda (optional)** (integer)

Direct Disk Access flag. Either Constant.OFF (default) for normal data cacheing or Constant.ON to enable direct disk reading of data.
If turned on this reads data not currently in core memory directly from disk without loading the complete data vector for the state into core.
This should be used if you want to extract results for a few items over a range of states, since it will potentially be faster.

- **consider_blanking (optional)** (integer)

Consider blanking flag. Either Constant.OFF (default) to ignore blanking or Constant.ON to consider blanking.

This argument is relevant for nodal contact force results. By default the sum of all forces at a given node for all surfaces using that node will be returned. By blanking all but the contact surface(s) of interest and setting this argument to ON the results can be restricted to the contact surface(s) you want.

- **mag_or_cur (optional)** (integer)

Magnitude or Current Value flag. This argument is relevant for analyses with phase angle results.

Set it to Constant.MAGNITUDE to output the magnitude
Set it to Constant.CURRENT_VAL to output the current value [Magniude * cos(phase + phi)]. This is dependent on the current phi angle displayed in the graphics window and can be set using SetWindowFrame(). See example below.

If omitted, or set to zero, it defaults to MAGNITUDE.

Returns

Object with the following properties:

Name	Type	Description

data	array of reals	• data[#rows] for data components that return a scalar value, eg DX
		• data[#cols][#rows] for data components that return a vector or tensor value, eg UNOV
		Take care when dealing with the two-dimensional array of results returned by the vector and tensor component cases, as the order in which the data is stored is [column][row]. For example if you have a tensor component then in order to extract the XY shear term for index you need to write:
		`r = GetMultipleData(args...)`
		`shear_term = r.data[Constant.XY][index];`
		Also remember that the rows in this array start at index 0, thus the results for item_1 will be row index [0] in the array of results returned, and so on.

nc	integer	The number of columns of data. 1 for scalar components, 3 for vector, 6 for tensor
nr	integer	The number of rows of data, ie how many items processed in the range <item_1 .. item_2>

Return type

object

Example

```
// Returns the (scalar) X stress of internal shells #1 to #100 inclusive at
integration
// point 2, in the element local coordinate system
a = GetMultipleData(Component.SXX, Type.SHELL, 1, 100, 2, 0, Constant.LOCAL);
sxx = a.data[0];  // X stress in first shell
sxx = a.data[99]; // X stress in 100th shell
// Returns an array[6] of the strain tensor in solid elements #1 to #100,
implicitly in the
// global coordinate system.
b = GetMultipleData(Component.ETEN, Type.SOLID, 1, 100);
sxx = b.data[Constant.XX][0];  // X strain in 1st solid
sxy = b.data[Constant.XY][99]; // XY strain in 100th solid
// Returns an array[3] of the 2nd user-defined Nodal Vector component at nodes
with external
// labels 1 to 100 at state #3.
// Note that when a range of external labels is supplied, ie -ve values for
<item_1> and <item_2>,
// you should check the .nr return value to see how many rows of results were
actually returned, since
// if there are gaps in that label range the result may not be |item_2| - |item_
1| + 1.
c = GetMultipleData(Component.UNOV, Type.NODE, -1, -100, 0, 2, 0, 3);
nres = c.nr; // Number of rows of data returned
vx = c.data[Constant.X][0]; // X component for 1st node
vy = c.data[Constant.Y][1]; // Y component for 2nd node
vz = c.data[Constant.Z][2]; // Z component for 3rd node
```

GetNumOnPlanIntPts(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the number of on plan points in an element in the current model

Arguments

- **type_code** (integer)

A type code (either Type.SHELL or Type.TSHELL)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

- **state_id (optional)** (integer)

The state to use instead of the current state. Only necessary in adaptively remeshed analyses.

Returns

integer

Return type

Number

Example

```
// Return the number of on plan points in the first SHELL element in the current
model
var a = GetNumOfPlanIntPts(Type.SHELL, 1);
```

GetNumberOf(type_code*[integer]*, options (optional)*[object]*) [static]

Description

Returns the number of items of type_code in the current model

Note that in adaptively remeshed models the current family may affect the number of nodes and elements returned. The family of the current state will be used unless you supply the optional state_id argument, in which case the family of that state will be used.

Notes:

The number of models returned by GetNumberOf(Type.MODEL) is actually the number of active and inactive model "slots" in the database, including those currently not in use. This means that it will always return the highest model number that has been used to date.

Therefore the following sequence:

- Read in (say) three models M1 to M3
- Delete models M1 and M2, leaving only M3 in use

Will result in GetNumberOf(Type.MODEL) returning the value 3.

You can use SetCurrentModel(model_id) to attempt to set a model and examine its return value to see whether it succeeded or failed:

```
n = GetNumberOf(Type.MODEL);
for(i=1; i<=n; i++)
{
    if(SetCurrentModel(i))  // TRUE if present
    {
        do something
    }
}
```

Arguments

- **type_code** (integer)

A valid type code or a 'GetNumberOf' constant

- **options (optional)** (object)

Object has the following properties:

Name	Type	Description
state_id (optional)	integer	The state to use instead of the current state. Only necessary in adaptively remeshed analyses.

Returns

integer

Return type

Number

Example

```
// Return the number of models
var a = GetNumberOf(Type.MODEL);
// Return the number of shell integration points
var a = GetNumberOf(Constant.NIP_S);
// Return the number of solid elements in family of state 20
var a = GetNumberOf(Type.SOLID, { state_id:20 });
```

GetNumberOf(type_code*[integer]*, state_id (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 19.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Returns the number of items of type_code in the current model

Also see the notes at the non-deprecated function with the same name.

Arguments

- **type_code** (integer)

A valid type code or a 'GetNumberOf' constant

- **state_id (optional)** (integer)

The state to use instead of the current state. Only necessary in adaptively remeshed analyses.

Returns

integer

Return type

Number

Example

```
// Return the number of models
var a = GetNumberOf(Type.MODEL);
// Return the number of shell integration points
var a = GetNumberOf(Constant.NIP_S);
// Return the number of solid elements in family of state 20
var a = GetNumberOf(Type.SOLID, 20);
```

QueryDataPresent(component*[integer]*, type_code (optional)*[integer]*) [static]

Description

Returns true if data <component> is present in the current model's database, otherwise false. For some data components that are switchable the <type_code> must also be supplied, these are listed below.

Arguments

- **component** (integer)

A valid component code (e.g. Component.DX, Component.SXY)

- **type_code (optional)** (integer)

One of the type codes Type.SOLID, Type.SHELL or Type.TSHELL if the component is:

- Stress tensor derived, e.g. SXX, ... SVON
- Strain tensor derived, e.g. EXX, ... EVON
- Effective plastic strain, EPL
- Strain rate, ERATE

Returns

boolean

Return type

Boolean

Example

```
// Returns true if Effective Plastic Strain exists for solid
var a = QueryDataPresent(Component.EPL, Type.SOLID);
// Returns true if nodal temperatures exist
var a = QueryDataPresent(Component.TEMP);
```

DataComponents

Functions and constants relating to DataComponents

NOTE: LSDA-derived data are only available if both a ZTF file (which provides geometry and topology) and an LSDA file (which provides results) have been read. Also an attempt to extract a data component that does not match the element type, for example spring force for a spotweld, will return 0.0. These components and their names are configured dynamically from the "d3plot.components" file, which will be be in one or more of the $OA_ADMIN, $OA_INSTALL or $OA_HOME directories. If this file is updated further components may become available.

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

DataComponents constants

Constants for ALE Data Components

Name	Description
ADENS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ALE density. Use Component.ADENS instead [deprecated]
ADOMF	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ALE dominant fraction. Use Component.ADOMF instead [deprecated]
AMMG	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ALE multi-material group id. Use Component.AMMG instead [deprecated]
AMMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ALE multi-material group mass. Use Component.AMMS instead [deprecated]

Constants for Basic and Integrated Beam Force/Moment Data Components

Name	Description
BFMV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Force and moment vector [BFX, BFY, BFZ, BMXX, BMYY, BMZZ]. Use Component.BFMV instead [deprecated]
BFR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Force magnitude. Use Component.BFR instead [deprecated]
BFX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X axial force. Use Component.BFX instead [deprecated]
BFY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y axial force. Use Component.BFY instead [deprecated]
BFZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z axial force. Use Component.BFZ instead [deprecated]

BMXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XX torsional moment. Use Component.BMXX instead [deprecated]
BMYY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. YY bending moment. Use Component.BMYY instead [deprecated]
BMZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ZZ bending moment. Use Component.BMZZ instead [deprecated]
BRM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Moment magnitude. Use Component.BRM instead [deprecated]

Constants for Basic and Integrated Beam Strain Data Components

Name	Description
BEAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Axial strain. Use Component.BEAX instead [deprecated]
BEP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Effective plastic strain. Use Component.BEP instead [deprecated]

Constants for Basic and Integrated Beam Stress Data Components

Name	Description
BSXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Axial stress. Use Component.BSXX instead [deprecated]
BSYX or BSXY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY shear stress. Use Component.BSXY instead [deprecated]
BSZX or BSXZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XZ shear stress. Use Component.BSZX instead [deprecated]

Constants for Belytschko-Schwer Resultant Beam Energy Data Components

Name	Description
BAED	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Axial energy density. Use Component.BAED instead [deprecated]
BAEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Axial energy. Use Component.BAEN instead [deprecated]
BBED	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Bending energy density. Use Component.BBED instead [deprecated]
BIE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Internal energy. Use Component.BIE instead [deprecated]
BIED	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Internal energy density. Use Component.BIED instead [deprecated]

Constants for Belytschko-Schwer Resultant Beam Moment Data

Components

Name	Description
BMY1	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y moment at end 1. Use Component.BMY1 instead [deprecated]
BMY2	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y moment at end 2. Use Component.BMY2 instead [deprecated]
BMZ1	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z moment at end 1. Use Component.BMZ1 instead [deprecated]
BMZ2	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z moment at end 2. Use Component.BMZ2 instead [deprecated]

Constants for Belytschko-Schwer Resultant Beam Rotation Data Components

Name	Description
BRXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Torsional rotation. Use Component.BRXX instead [deprecated]
BRY1	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y rotation at end 1. Use Component.BRY1 instead [deprecated]
BRY2	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y rotation at end 2. Use Component.BRY2 instead [deprecated]
BRZ1	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z rotation at end 1. Use Component.BRZ1 instead [deprecated]
BRZ2	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z rotation at end 2. Use Component.BRZ2 instead [deprecated]

Constants for Belytschko-Schwer Resultant Beam Strain Data Components

Name	Description
BPE1	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Plastic energy at end 1. Use Component.BPE1 instead [deprecated]
BPE2	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Plastic energy at end 2. Use Component.BPE2 instead [deprecated]
BSAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Total axial strain. Use Component.BSAX instead [deprecated]

Constants for Contact Surface Data Components (if a .ctf file has been read)

Name	Description

CAREA	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact segment area. Use Component.CAREA instead [deprecated]
CFGX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact global X force. Use Component.CFGX instead [deprecated]
CFGY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact global Y force. Use Component.CFGY instead [deprecated]
CFGZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact global Z force. Use Component.CFGZ instead [deprecated]
CFLX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact local X force. Use Component.CFLX instead [deprecated]
CFLY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact local Y force. Use Component.CFLY instead [deprecated]
CFLZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact local Z force. Use Component.CFLZ instead [deprecated]
CFM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact force magnitude. Use Component.CFM instead [deprecated]
CSN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact normal stress. Use Component.CSN instead [deprecated]
CST	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact tangential stress. Use Component.CST instead [deprecated]
CSX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact local X stress. Use Component.CSX instead [deprecated]
CSY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact local Y stress. Use Component.CSY instead [deprecated]

Constants for Element Plastic Strain Data Components

Name	Description
EPL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Effective plastic strain. Use Component.EPL instead [deprecated]
ERATE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain rate. Use Component.ERATE instead [deprecated]
PEMAG	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Plastic strain magnitude. Use Component.PEMAG instead [deprecated]

Constants for Element Plastic Strain Derived Data Components

Name	Description

PEAV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Average plastic strain. Use Component.PEAV instead [deprecated]
PEMAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max principal plastic strain. Use Component.PEMAX instead [deprecated]
PEMID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Middle principal plastic strain. Use Component.PEMID instead [deprecated]
PEMIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Min principal plastic strain. Use Component.PEMIN instead [deprecated]
PEMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max plastic shear strain. Use Component.PEMS instead [deprecated]

Constants for Element Plastic Strain Tensor Data Components

Name	Description
PETEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Plastic strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]. Use Component.PETEN instead [deprecated]
PEXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X Plastic strain. Use Component.PEXX instead [deprecated]
PEXY or PEYX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY Plastic shear strain. Use Component.PEXY instead [deprecated]
PEYY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y Plastic strain. Use Component.PEYY instead [deprecated]
PEYZ or PEZY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY Plastic shear strain. Use Component.PEYZ instead [deprecated]
PEZX or PEXZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ZX Plastic shear strain. Use Component.PEZX instead [deprecated]
PEZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z Plastic strain. Use Component.PEZZ instead [deprecated]

Constants for Element Strain Derived Data Components

Name	Description
E2MAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) max principal strain. Use Component.E2MAX instead [deprecated]
E2MIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) min principal strain. Use Component.E2MIN instead [deprecated]
E2SHEAR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) max shear strain. Use Component.E2SHEAR instead [deprecated]

EAV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Average strain. Use Component.EAV instead [deprecated]
EMAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max prinicipal strain. Use Component.EMAX instead [deprecated]
EMID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Middle prinicipal strain. Use Component.EMID instead [deprecated]
EMIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Min prinicipal strain. Use Component.EMIN instead [deprecated]
EMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max shear strain. Use Component.EMS instead [deprecated]
ENGMAJ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Engineering Major strain. Use Component.ENGMAJ instead [deprecated]
ENGMIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Engineering Minor strain. Use Component.ENGMIN instead [deprecated]
ENGTHK	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Engineering Thickness strain. Use Component.ENGTHK instead [deprecated]
ERATIO	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) principal strain ratio. Use Component.ERATIO instead [deprecated]
EVON	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. von Mises strain. Use Component.EVON instead [deprecated]

Constants for Element Strain Tensor Data Components

Name	Description
ETEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]. Use Component.ETEN instead [deprecated]
EXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X strain. Use Component.EXX instead [deprecated]
EXY or EYX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY shear strain. Use Component.EXY instead [deprecated]
EYY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y strain. Use Component.EYY instead [deprecated]
EYZ or EZY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. YZ shear strain. Use Component.EYZ instead [deprecated]
EZX or EXZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ZX shear strain. Use Component.EZX instead [deprecated]
EZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z strain. Use Component.EZZ instead [deprecated]

Constants for Element Stress Derived Data Components

Name	Description
LODE_A	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Lode angle. Use Component.LODE_A instead [deprecated]
LODE_P	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Lode parameter. Use Component.LODE_P instead [deprecated]
LODE_PA	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Lode parameter alt. Use Component.LODE_PA instead [deprecated]
S2MAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) max principal stress. Use Component.S2MAX instead [deprecated]
S2MIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) min principal stress. Use Component.S2MIN instead [deprecated]
S2SHEAR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2D (in-plane) max shear stress. Use Component.S2SHEAR instead [deprecated]
SAV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Average stress (pressure). Use Component.SAV instead [deprecated]
SMAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max principal stress. Use Component.SMAX instead [deprecated]
SMID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Middle principal stress. Use Component.SMID instead [deprecated]
SMIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Min principal stress. Use Component.SMIN instead [deprecated]
SMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max shear stress. Use Component.SMS instead [deprecated]
SVON	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. von Mises stress. Use Component.SVON instead [deprecated]
TRI	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Triaxiality. Use Component.TRI instead [deprecated]
YUTF	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Yield Utilisation Factor. Use Component.YUTF instead [deprecated]
YUTP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Yield Utilisation Percentage. Use Component.YUTP instead [deprecated]

Constants for Element Stress Tensor Data Components

Name	Description

STEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Stress tensor [SXX, SYY, SZZ, SXY, SYZ, SZX]. Use Component.STEN instead [deprecated]
SXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X stress. Use Component.SXX instead [deprecated]
SXY or SYX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY stress. Use Component.SXY instead [deprecated]
SYY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y stress. Use Component.SYY instead [deprecated]
SYZ or SZY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. YZ stress. Use Component.SYZ instead [deprecated]
SZX or SXZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ZX stress. Use Component.SZX instead [deprecated]
SZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z stress. Use Component.SZZ instead [deprecated]

Constants for Element Thermal Strain Derived Data Components

Name	Description
TEAV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Average thermal strain. Use Component.TEAV instead [deprecated]
TEMAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max principal thermal strain. Use Component.TEMAX instead [deprecated]
TEMID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Middle principal thermal strain. Use Component.TEMID instead [deprecated]
TEMIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Min principal thermal strain. Use Component.TEMIN instead [deprecated]
TEMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Max thermal shear strain. Use Component.TEMS instead [deprecated]

Constants for Element Thermal Strain Tensor Data Components

Name	Description
TETEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Thermal strain tensor [EXX, EYY, EZZ, EXY, EYZ, EZX]. Use Component.TETEN instead [deprecated]
TEXX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X Thermal strain. Use Component.TEXX instead [deprecated]
TEXY or PEYX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY Thermal shear strain. Use Component.TEXY instead [deprecated]

TEYY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y Thermal strain. Use Component.TEYY instead [deprecated]
TEYZ or TEZY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY Thermal shear strain. Use Component.TEYZ instead [deprecated]
TEZX or TEXZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. ZX Thermal shear strain. Use Component.TEZX instead [deprecated]
TEZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z Thermal strain. Use Component.TEZZ instead [deprecated]

Constants for Extra Solid and Shell Data Components

Name	Description
SHX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Extra shell and thick shell data. Use Component.SHX instead [deprecated]
SOX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Extra solid data. Use Component.SOX instead [deprecated]

Constants for Global Energy Data Components

Name	Description
GIE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Internal energy. Use Component.GIE instead [deprecated]
GKE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy. Use Component.GKE instead [deprecated]
GTE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Total energy. Use Component.GTE instead [deprecated]

Constants for Global Mass Data Components

Name	Description
GMASS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Mass. Use Component.GMASS instead [deprecated]

Constants for Global Momentum Data Components

Name	Description
GMM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Momentum magnitude. Use Component.GMM instead [deprecated]
GMX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X Momentum. Use Component.GMX instead [deprecated]
GMY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y Momentum. Use Component.GMY instead [deprecated]

GMZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z Momentum. Use Component.GMZ instead [deprecated]

Constants for Global Velocity Data Components

Name	Description
GVM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Velocity magnitude. Use Component.GVM instead [deprecated]
GVX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X Velocity. Use Component.GVX instead [deprecated]
GVY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y Velocity. Use Component.GVY instead [deprecated]
GVZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z Velocity. Use Component.GVZ instead [deprecated]

Constants for LSDA (binout) Database Cross Section Data Components

Name	Description
XSEC_A	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Database X-sect area. Use Component.XSEC_A instead [deprecated]
XSEC_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Database X-sect force (vector data). Use Component.XSEC_F instead [deprecated]
XSEC_M	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Database X-sect moment (vector data). Use Component.XSEC_M instead [deprecated]

Constants for LSDA (binout) Retractor Data Components

Name	Description
RT_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Retractor force. Use Component.RT_F instead [deprecated]
RT_P	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Retractor pull-out. Use Component.RT_P instead [deprecated]

Constants for LSDA (binout) SPC Data Components

Name	Description
SPC_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. SPC force (vector data at nodes). Use Component.SPC_F instead [deprecated]
SPC_M	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. SPC moment (vector data at nodes). Use Component.SPC_M instead [deprecated]

Constants for LSDA (binout) Seatbelt Data Components

Name	Description
SB_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Seatbelt axial force. Use Component.SB_F instead [deprecated]
SB_L	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Seatbelt length. Use Component.SB_L instead [deprecated]

Constants for LSDA (binout) Slipring Data Components

Name	Description
SR_P	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Slipring pull-through. Use Component.SR_P instead [deprecated]

Constants for LSDA (binout) Spotweld Data Components

Name	Description
SW_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spotweld axial force. Use Component.SW_F instead [deprecated]
SW_FAIL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spotweld failure. Use Component.SW_FAIL instead [deprecated]
SW_S	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spotweld shear force. Use Component.SW_S instead [deprecated]
SW_TIME	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spotweld failure time. Use Component.SW_TIME instead [deprecated]
SW_TRSN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spotweld torsion moment. Use Component.SW_TRSN instead [deprecated]

Constants for LSDA (binout) Spring Data Components

Name	Description
SP_E	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spring elongation. Use Component.SP_E instead [deprecated]
SP_F	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spring axial force. Use Component.SP_F instead [deprecated]
SP_M	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spring torsional moment. Use Component.SP_M instead [deprecated]
SP_R	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Spring rotation. Use Component.SP_R instead [deprecated]

Constants for Material Data Components for PARTs and Part-based elems (needs .ZTF file)

Name	Description
DENS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Material density. Use Component.DENS instead [deprecated]
FSTRN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Failure strain. Use Component.FSTRN instead [deprecated]
PRAT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Poisson's ratio. Use Component.PRAT instead [deprecated]
YMOD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Young's modulus. Use Component.YMOD instead [deprecated]
YSTRS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Yield stress. Use Component.YSTRS instead [deprecated]

Constants for Nastran OP2 Beam Data Components

Name	Description
BENL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss. Use Component.BENL instead [deprecated]
BENLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss density. Use Component.BENLD instead [deprecated]
BENLP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss percentage. Use Component.BENLP instead [deprecated]
BKEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy. Use Component.BKEN instead [deprecated]
BKEND	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy density. Use Component.BKEND instead [deprecated]
BKENP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy percentage. Use Component.BKENP instead [deprecated]
BSEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy. Use Component.BSEN instead [deprecated]
BSEND	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy density. Use Component.BSEND instead [deprecated]
BSENP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy percentage. Use Component.BSENP instead [deprecated]

Constants for Nodal Data Components

Name	Description
AM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Acceleration magnitude. Use Component.AM instead [deprecated]

AV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Acceleration vector [AX, AY, AZ]. Use Component.AV instead [deprecated]
AX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X acceleration. Use Component.AX instead [deprecated]
AY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y acceleration. Use Component.AY instead [deprecated]
AZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z acceleration. Use Component.AZ instead [deprecated]
BV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Basic (undeformed) vector [BX, BY, BZ]. Use Component.BV instead [deprecated]
BX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Basic (undeformed) X coordinate. Use Component.BX instead [deprecated]
BY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Basic (undeformed) Y coordinate. Use Component.BY instead [deprecated]
BZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Basic (undeformed) Z coordinate. Use Component.BZ instead [deprecated]
CV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Current vector [CX, CY, CZ]. Use Component.CV instead [deprecated]
CX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Current X coordinate. Use Component.CX instead [deprecated]
CY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Current Y coordinate. Use Component.CY instead [deprecated]
CZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Current Z coordinate. Use Component.CZ instead [deprecated]
DM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Displacement magnitude. Use Component.DM instead [deprecated]
DV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Displacement vector [DX, DY, DZ]. Use Component.DV instead [deprecated]
DX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X displacement. Use Component.DX instead [deprecated]
DY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y displacement. Use Component.DY instead [deprecated]
DZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z displacement. Use Component.DZ instead [deprecated]
RAM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation acceleration magnitude. Use Component.RAM instead [deprecated]

RAV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation acceleration vector [RAX, RAY, RAZ]. Use Component.RAV instead [deprecated]
RAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X rotation acceleration. Use Component.RAX instead [deprecated]
RAY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y rotation acceleration. Use Component.RAY instead [deprecated]
RAZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z rotation acceleration. Use Component.RAZ instead [deprecated]
RDM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation displacement magnitude. Use Component.RDM instead [deprecated]
RDV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation displacement vector [RDX, RDY, RDZ]. Use Component.RDV instead [deprecated]
RDX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X rotation displacement. Use Component.RDX instead [deprecated]
RDY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y rotation displacement. Use Component.RDY instead [deprecated]
RDZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z rotation displacement. Use Component.RDZ instead [deprecated]
RVM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation velocity magnitude. Use Component.RVM instead [deprecated]
RVV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rotation velocity vector [RVX, RVY, RVZ]. Use Component.RVV instead [deprecated]
RVX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X rotation velocity. Use Component.RVX instead [deprecated]
RVY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y rotation velocity. Use Component.RVY instead [deprecated]
RVZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z rotation velocity. Use Component.RVZ instead [deprecated]
VM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Velocity magnitude. Use Component.VM instead [deprecated]
VV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Velocity vector [VX, VY, VZ]. Use Component.VV instead [deprecated]
VX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X velocity. Use Component.VX instead [deprecated]
VY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y velocity. Use Component.VY instead [deprecated]

VZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z velocity. Use Component.VZ instead [deprecated]

Constants for Shell and Solid Data Components

Name	Description
AREA	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Area. Use Component.AREA instead [deprecated]
DTDT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. dTemp / dTime. Use Component.DTDT instead [deprecated]
EDEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Internal energy density. Use Component.EDEN instead [deprecated]
ENL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss (Nastran OP2 results only). Use Component.ENL instead [deprecated]
ENLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss density (Nastran OP2 results only). Use Component.ENLD instead [deprecated]
ENLP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Energy loss percentage (Nastran OP2 results only). Use Component.ENLP instead [deprecated]
HGEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Hourglass energy. Use Component.HGEN instead [deprecated]
JS_C_MASS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Mass. Use Component.EMASS instead [deprecated]
KEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy (Nastran OP2 results only). Use Component.KEN instead [deprecated]
KEND	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy density (Nastran OP2 results only). Use Component.KEND instead [deprecated]
KENP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Kinetic energy percentage (Nastran OP2 results only). Use Component.KENP instead [deprecated]
MADD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Added mass. Use Component.MADD instead [deprecated]
RFX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X force resultant. Use Component.RFX instead [deprecated]
RFXY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XY force resultant. Use Component.RFXY instead [deprecated]
RFY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y force resultant. Use Component.RFY instead [deprecated]
RMX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. MX moment resultant. Use Component.RMX instead [deprecated]

RMXY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. MXY moment resultant. Use Component.RMXY instead [deprecated]
RMY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. MY moment resultant. Use Component.RMY instead [deprecated]
RQX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. XZ shear force resultant. Use Component.RQX instead [deprecated]
RQY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. YZ shear force resultant. Use Component.RQY instead [deprecated]
RVOL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Relative volume (solid). Use Component.RVOL instead [deprecated]
SEN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy (Nastran OP2 results only). Use Component.SEN instead [deprecated]
SEND	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy density (Nastran OP2 results only). Use Component.SEND instead [deprecated]
SENP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Strain energy percentage (Nastran OP2 results only). Use Component.SENP instead [deprecated]
TBOT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodal (shell) bottom surface temperature. Use Component.TBOT instead [deprecated]
TEMP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodal temperature. Use Component.TEMP instead [deprecated]
TFM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Temperature magnitude. Use Component.TFM instead [deprecated]
TFV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Temperature vector [TFX, TFY, TFZ]. Use Component.TFV instead [deprecated]
TFX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. X temperature flux. Use Component.TFX instead [deprecated]
TFY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Y temperature flux. Use Component.TFY instead [deprecated]
TFZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Z temperature flux. Use Component.TFZ instead [deprecated]
THK	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Thickness. Use Component.THK instead [deprecated]
TMID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodal (shell) middle surface temperature. Use Component.TMID instead [deprecated]
TSTP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Timestep. Use Component.TSTP instead [deprecated]

TTOP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodal (shell) top surface temperature. Use Component.TTOP instead [deprecated]
VOL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Volume (solid). Use Component.VOL instead [deprecated]

Elements

Functions and constants relating to Elements

Functions

- GetElemAxes(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- GetElemBetaAngle(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, int_pnt (optional)*[integer]*, state_id (optional)*[integer]*)
- GetElemsAtNode(node*[integer]*, type_code*[integer]*, state_id (optional)*[integer]*)
- GetElemsInPart(part_id*[integer]*, state_id (optional)*[integer]*)
- GetTopology(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)

Details of functions

GetElemAxes(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the local axes of the element in model space, expressed as direction cosines in a 2d array

Arguments

- **type_code** (integer)

A valid element type code (SOLID, BEAM, SHELL or TSHELL)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

2d array of reals. The cosines of the element in model space as a two-dimensional array, subscripts [row][col], with cosines organised in rows.

Spelled out in detail for results array R this means:

- X axis cosines: R[X][X], R[X][Y], R[X][Z]
- Y axis cosines: R[Y][X], R[Y][Y], R[Y][Z]
- Z axis cosines: R[Z][X], R[Z][Y], R[Z][Z]

Return type

Number

Example

```
// Return the direction cosines of shell 1
var r = GetElemAxes(SHELL, 1);
var yz_cosine = r[Y][Z];
```

GetElemBetaAngle(type_code*[integer]*, item*[integer]*, ply_id*[integer]*, int_pnt (optional)*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the beta angle (in degrees) at either the ply id or integration point number on element <item> of <type_code>

If <ply_id> is non-zero then <int_pnt> can be omitted or set to zero.

If <ply_id> is zero then <int_pnt> must be defined and non-zero.

When working with <ply_id> if the ply does not exist in the element, then false is returned.

When working with <int_pnt> a value will always be returned, but this will be zero if no beta angle is defined for the element / int_pnt combination.

Ply data is only available if a .ztf file containing composite information has been read.

Arguments

- **type_code** (integer)

A valid element type code (Currently only SHELL is valid)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **ply_id** (integer)

If +ve, the internal ply index. If -ve, the external ply label. Internal numbers will be many times faster to process. Set to zero if <int_pt> is to be used instead.

- **int_pnt (optional)** (integer)

Integration point in the range 1 - maxint, required if <ply_id> is zero.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

real

Return type

Number

Example

```
// Return the beta angle in shell 1 for ply external label 13
var beta = GetElemBetaAngle(SHELL, 1, -13);
// Return the beta angle in shell 1 at integration point 7
var beta = GetElemBetaAngle(SHELL, 1, 0, 7);
```

GetElemsAtNode(node*[integer]*, type_code*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns an object containing the number of elements of <type> at <node>, and also an array <list[ ]> of their internal indices. If there are no elements of <type> at the node then false is returned.

Arguments

- **node** (integer)

The node at which to return the list of elements. If +ve, the internal node number starting at 1. If -ve, the external node

label. Internal numbers will be many times faster to process.

- **type_code** (integer)

A valid element type code (SOLID etc.)

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
list	array of integers	Internal element ids
nn	integer	Number of elements in list

Return type

object

Example

```
// Get a list of shell elements at node 5
if(a = GetElemsAtNode(5, SHELL))
{
    var nelems = a.nn;
    var e1 = a.list[0];
    var e2 = a.list[1];
}
```

GetElemsInPart(part_id*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns an object containing the number of elements in part <part_id>, the element type code, and also an array <list[ ]> of their internal indices. If there are no elements in the part then false is returned.

Arguments

- **part_id** (integer)

The part in which to return the list of elements. If +ve, the internal part number starting at 1. If -ve, the external part label. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
list	array of integers	Internal element ids
nn	integer	Number of elements in list
type	integer	Element type code

Return type

object

Example

```
// Get a list of elements in part 5
if(a = GetElemsInPart(5))
{
    var nelems = a.nn;
    for(var i=0; i<nelems; i++)
    {
        Message("Element: " + GetLabel(a.type, a.list[i]))
    }
}
```

GetTopology(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the topology list for internal <item> of type <type_code>. This should only be used for element types which have nodal topologies.

Arguments

- **type_code** (integer)

A valid element type code (SOLID etc.)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

Object with the following properties:

Name	Type	Description
nn	integer	Number of nodes in topology list
pid	integer	Internal part id for part-based elements, otherwise zero
top	array of integers	Internal node ids

Return type

object

Example

```
// Get the topology of internal shell 27
var a = GetTopology(SHELL, 27);
var nnodes = a.nn;
var n1 = a.top[0];
var n2 = a.top[1];
var pid = a.pid;
```

Groups

Functions and constants relating to Groups

Functions

- GetGroupInfo(group_id*[integer]*)

Details of functions

GetGroupInfo(group_id*[integer]*) [static]

Description

Returns information about a group in the current model

Arguments

- **group_id** (integer)

Group number

Returns

Object with the following properties:

Name	Type	Description
label	integer	The label of the group
name	string	The name of the group

Return type

object

Example

```
// Print the name of the first group in the current model
var info = GetGroupInfo(1);
Print("Group name = " + info.name + "\n");
```

Includes

Functions and constants relating to Includes

Functions

- GetIncludeInfo(include_id*[integer]*)

Details of functions

GetIncludeInfo(include_id*[integer]*) [static]

Description

Returns information about an include file in the current model

Arguments

- **include_id** (integer)

Include number

Returns

Object with the following properties:

Name	Type	Description
label	integer	The label of the include file
name	string	The name of the include file
parent	integer	The parent include file (0 if main file)

Return type

object

Example

```
// Print the name of the first include file in the current model
var info = GetIncludeInfo(1);
Print("Include name = " + info.name + "\n");
```

IntegrationPoints

Detailed Description

Defining the Integration point argument in GetData() and GetMultipleData() has become a complex field. This section describes the different ways it can be defined and what values it can be set to.

Defining the Integration point argument <int_pnt> for use in GetData() and GetMultipleData()

Recent developments in LS-DYNA mean that the permutations of integration point and element type have become quite complex if some of the more detailed output options are chosen. Therefore this section has been split up by element type.

Shells and Thick shell elements:

<int_pt> may be ignored for "whole element" data components such as strain energy density, thickness and force/moment resultants; it may also be ignored for nodally derived data such as displacement, etc. For all other data components the table below should be used.

MAXINT on the *DATABASE_EXTENT_BINARY card:	
>= 0	Shell output has MAXINT (or 3 if MAXINT = 0) integration points through the thickness of the element, results are averaged at the centre on plan. Stress tensors, plastic strains and any "extra" variables are written out for each integration point. Other results: force and moment resultants, thickness, energy are written for the whole element. <int_pnt> may be: • A +ve integer to obtain results at integration point <int_pnt> • One of Constant.TOP, Constant.MIDDLE or Constant.BOTTOM to obtain results at that surface Integration point numbering starts at the bottom of the element with point 1, working upwards in the +ve local Z direction.

< 0	Shell output is written for |MAXINT| integration points through the thickness, and also for on-plan (in-plane) integration points.
	<int_pnt> needs to be an object which specifies members "ip" for the through-thickness integration point and "op" for the on-plan. For example you might write the Javascript:
	`var ip_arg = { }; // Create an empty object`
	`ip_arg.ip = 2;  // Through-thickness integration point #2`
	`ip_arg.op = 4;  // On plan integration point #4`
	Which would specify though thickness integration point 2, and on-plan integration point 4.
	If the on plan point is not specified it will default to using the first one.
	The function GetNumOnPlanIntPts() can be used to get the number of on plan points for an element.

You need to take particular care with the quantity of through-thickness integration points. LS-DYNA allows them to be defined as follows:

- On the *SECTION_SHELL card, field NIP
- On the *PART_COMPOSITE card
- On the *ELEMENT_SHELL_COMPOSITE card

Regardless of the above LS-DYNA writes results at MAXINT (or 3 if MAXINT is zero) through-thickness integration points for each element, so when extracting data for a specific integration point you may need to know something about its *ELEMENT, *SECTION and *PART definition.

If you have written a ZTF file from Oasys PRIMER then D3PLOT will "know about" these cards and will be able to determine the TOP, MIDDLE and BOTTOM surface of each element.

If you have **not** written a ZTF file then it is strongly recommended that you only use Constant.TOP, Constant.MIDDLE or Constant.BOTTOM if MAXINT = 0 or 3, since otherwise D3PLOT cannot "know" reliably which surface is which in a given element, and will treat all elements as having MAXINT points.

Solid elements:

If you are extracting nodally-derived results (eg displacement) then <int_pnt> can be ignored. Otherwise use the table below:

NINTSLD on the *DATABASE_EXTENT_BINARY card:	
Is zero or 1	Solid element output is averaged at the element centre. <int_pnt> will be ignored and may be set to zero.
Is 8	Solid element data is written at all 8 integration points. <int_pnt> should be the integration point number

Although NINTSLD = 8 case writes 8 data "slots" for a solid element integration points, degenerate types (wedges and tetrahedra) will only populate a subset of those slots.

Beam elements:

If you are extracting nodally derived results (eg displacement), or your beams are resultant Belytschko-Schwer type then <int_pnt> can be ignored. Otherwise use the table below:

BEAMIP on the *DATABASE_EXTENT_BINARY card:	
= 0	No extra beam data has been written <int_pnt> will be ignored and may be set to zero.
> 0	Extra data has been written for BEAMIP integration points <int_pnt> should be the integration point number if you are extracting an "extra" data component. Otherwise it can be ignored and may be set to zero.

"Extra" beam data is specified as follows:

- It only applies to Hughes-Liu ("integrated") beam formulations.
- It is 5 values: axial stress, 2 shear stresses, effective plastic strain, axial strain. (However see remark 2 on *Database Extent Binary in the LS-DYNA manual for some special cases)

Other beam data, the forces and moments and any extra "resultant" Belytschko-Schwer plastic results, are written for the beam as a whole and ignore <int_pnt>

Other element types:

These all ignore the <int_pnt> argument which may be set to zero or omitted.

Labels

Functions and constants relating to Labels

Functions

- GetLabel(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)

Details of functions

GetLabel(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the external label of internal <item> of type <type_code>

Arguments

- **type_code** (integer)

A valid type code (e.g. NODE, SOLID, SHELL)

- **item** (integer)

The internal number starting from 1

- **state_id (optional)** (integer)

State number to use instead of the current state

Returns

integer

Return type

Number

Example

```
// Get the label of the 27th internal node
var label = GetLabel(NODE, 27);
```

Materials

Functions and constants relating to Materials

Functions

- GetMid(type_code*[integer]*, item*[integer]*, layer_id (optional)*[integer]*, state_id (optional)*[integer]*)

Details of functions

GetMid(type_code*[integer]*, item*[integer]*, layer_id (optional)*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the external material id of internal <item> of type <type_code>

Use of this function requires that material data be present, which means that a .ztf file must have been read. If the optional <layer_id> argument is used the element must be in a part using a *PART_COMPOSITE definition.

If the material number is requested for a (composite) layer that does not exist in this item a value of zero is returned. No warning message is issued in this situation since experience has shown that this is a common occurrence and excessive warning messages are a nuisance.

Arguments

- **type_code** (integer)

PART or a valid part-based element type code (e.g. SOLID, SHELL)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **layer_id (optional)** (integer)

For composites the layer number 1 - n.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

integer

Return type

Number

Example

```
// Return the external material id of *PART 2
var a = GetMid(PART, 2);
// Return the external material id of the 3rd layer of *PART_COMPOSITE 12
var b = GetMid(PART, 12, 3);
// Return the external material id of the 27th internal shell
var c = GetMid(SHELL, 27);
// Return the external material id of the 2nd layer of internal shell 100
// Assumes the part is a *PART_COMPOSITE
var d = GetMid(SHELL, 100, 2);
```

Models

Functions and constants relating to Models

Functions

- GetModelInfo(model_id (optional)*[integer]*, family_id (optional)*[integer]*)
- ModelExists(model_id*[integer]*)
- SetCurrentModel(model_id*[integer]*)

Details of functions

GetModelInfo(model_id (optional)*[integer]*, family_id (optional)*[integer]*) [static]

Description

Returns information about filenames in the current model, or in model_id if specified. It is an error to define model_id that is not currently in use.

Notes

The vast majority of analyses do not use adaptive remeshing and the family_id argument can be ignored. When it is given:

Family id 0 is the base analysis

Family id 1 is the first remesh, ie name_aa

... and so on

Arguments

- **model_id (optional)** (integer)

Model number. The current model is used if unspecified or zero

- **family_id (optional)** (integer)

Family number (starting from zero). The family number of an adaptive remesh analysis

Returns

Object with the following properties:

Name	Type	Description
ctf_name	string	the full name, including the pathname, of the contact force CTF file (intfor)
num_ families	integer	the number of adaptive remesh families in the file sequence. Will be one for a normal non-adaptive analysis
num_states	integer	the number of complete states in the file sequence
op2_name	string	the full name, including the pathname, of the Nastran OP2 file
pp_name	string	the full name, including the pathname, of the LS-PREPOST database file
ptf_name	string	the full name, including the pathname, of the complete state PTF/d3plot file
xtf_name	string	the full name, including the pathname, of the extra database XTF file
ztf_name	string	the full name, including the pathname, of the extra database ZTF file

Return type

object

Example

```
// Print the name of the PTF (d3plot) file of the current model and the number
of states
var info = GetModelInfo();
Print("PTF filename = " + info.ptf_name + "\n");
Print("Number of states = " + info.num_states + "\n");
// Print the name of the 3rd adaptive remesh PTF file in model 2
var info = GetModelInfo(2, 3);
Print("PTF filename = " + info.ptf_name + "\n");
```

ModelExists(model_id*[integer]*) [static]

Description

Checks whether a model exists in the database

Arguments

- **model_id** (integer)

Model number to check

Returns

boolean

Return type

Boolean

Example

```
// Check if model #2 exists
ModelExists(2);
```

SetCurrentModel(model_id*[integer]*) [static]

Description

Sets the current model in the JavaScript interface to model_id

At the start of script execution the current model is automatically set to the first active model in the database

Arguments

- **model_id** (integer)

Model number to be made current

Returns

boolean

Return type

Boolean

Example

```
// Make model #2 current
SetCurrentModel(2);
```

Parts

Functions and constants relating to Parts

Functions

- GetPartInfo(part_id*[integer]*)
- GetPid(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)

Details of functions

GetPartInfo(part_id*[integer]*) [static]

Description

Returns information about a part in the current model

Arguments

- **part_id** (integer)

Internal part number

Returns

Object with the following properties:

Name	Type	Description
alpha	integer	Part transparency (0-255)
blue	integer	Blue component of part colour (0-255)
green	integer	Green component of part colour (0-255)
include	integer	The include number part is in (0 if main file)
red	integer	Red component of part colour (0-255)
title	string	The part title

Return type

object

Example

```
// Return the title of the first part in the model
var info = GetPartInfo(1);
Print("Part title = " + info.title + "\n");
```

GetPid(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Returns the internal part id of internal <item> of type <type_code>

Arguments

- **type_code** (integer)

A valid part-based element type code (e.g. SOLID, SHELL)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **state_id (optional)** (integer)

State number to be used instead of the current state

Returns

integer

Return type

Number

Example

```
// Return the internal part id of the 27th internal shell
var a = GetPid(SHELL, 27);
```

Selecting

Functions and constants relating to Selecting

Functions

- IsSelected(type_code*[integer]*, item*[integer]*)
- Pick(type_code*[integer]*, number*[integer]*)
- Select(type_code*[integer]*)

Details of functions

IsSelected(type_code*[integer]*, item*[integer]*) [static]

Description

Checks whether an item has been selected with Select()

Arguments

- **type_code** (integer)

The type of item to select (SOLID, etc.)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

Returns

boolean

Return type

Boolean

Example

```
// Returns JS_TRUE if the 1st PART in the model was selected.
if(IsSelected(PART, 1))
{
    ....
}
```

Pick(type_code*[integer]*, number*[integer]*) [static]

Description

Allows the user to interactively pick a specified number of items

NOTE: If you are using the WINDOW type code, the function should be seen as "Pick item/model and return it's WINDOW ID" i.e. if you try and use the pick function and click somewhere away from the model, the function will return null. On the other hand, if you click the model then it will return the WINDOW ID in which the model resides.

Arguments

- **type_code** (integer)

The type of item to select (SOLID, etc.)

- **number** (integer)

The number of items to pick.
- > 0 The internal indicies of the picked items are returned
- < 0 The external labels of the picked items are returned

Returns

Array of integers

Return type

Number

Example

```
// Pick 4 PARTS and return the internal index of each one in array (a)
var a = Pick(PART, 4);
// Pick 3 NODES and return the external labels of each one in array (b)
var b = Pick(NODE, -3);
```

Select(type_code*[integer]*) [static]

Description

Allows the user to interactively select items using the mouse or from a menu.

Arguments

- **type_code** (integer)

The type of item to select (SOLID, etc.)

Returns

integer, >0 the number of items selected, -1 user cancelled the operation, -2 model doesn't contain any of the type requested

Return type

Number

Example

```
// Select PARTS interactively and return the number selected.
var a = Select(PART);
```

Sets

Functions and constants relating to Sets

Functions

- GetItemsInSet(set_type*[integer]*, set_id*[integer]*)
- GetSetInfo(set_type*[integer]*, set_id*[integer]*)

Details of functions

GetItemsInSet(set_type*[integer]*, set_id*[integer]*) [static]

Description

Returns an object containing the number of items in set <set_id> of set type <set_type> and also an array <list[ ]> of their internal indices. If there are no items in the set then false is returned.

Arguments

- **set_type** (integer)

A valid type code (SET_PART, etc.)

- **set_id** (integer)

The set id. If +ve, the internal number starting at 1. If -ve, the external label of the set. Internal numbers will be many times faster to process.

Returns

Object with the following properties:

Name	Type	Description
list	array of integers	Internal entity indices
nn	integer	Number of entities in list

Return type

object

Example

```
// Get a list of parts in the 5th SET_PART
if(a = GetItemsInSet(SET_PART, 5))
{
    var nparts = a.nn;
    for(var i=0; i<nparts; i++)
    {
        Message("Part: " + GetLabel(PART, a.list[i]));
    }
}
```

GetSetInfo(set_type*[integer]*, set_id*[integer]*) [static]

Description

Returns information about a set in the current model

Arguments

- **set_type** (integer)

A valid type code (SET_PART, etc.)

- **set_id** (integer)

The set id. If +ve, the internal number starting at 1. If -ve, the external label of the set. Internal numbers will be many times faster to process.

Returns

Object with the following properties:

Name	Type	Description
label	integer	The label of the set
name	string	The name of the set
nn	integer	Number of items in the set

Return type

object

Example

```
// Print the name of the first *SET_PART in the current model
var info = GetSetInfo(SET_PART, 1);
Print("Set name = " + info.name + "\n");
```

SharedConstants

Functions and constants relating to SharedConstants

SharedConstants constants

Constants for Dispose

Name	Description
DELETE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Delete. Use Constant.DELETE instead [deprecated]
LEAVE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Leave behind (eg don't delete). Use Constant.LEAVE instead [deprecated]

Constants for General

Name	Description
ALL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. All of a category. Use Constant.ALL instead [deprecated]
GT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Greater than (>). Use Constant.GT instead [deprecated]
GTEQ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Greater than or equals (>=). Use Constant.GTEQ instead [deprecated]
LT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Less than (<). Use Constant.LT instead [deprecated]
LTEQ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Less than or equals (<=). Use Constant.LTEQ instead [deprecated]
MAX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Maximum value. Use Constant.MAX instead [deprecated]
MIN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Minimum value. Use Constant.MIN instead [deprecated]
OFF	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Switch off. Use Constant.OFF instead [deprecated]
ON	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Switch on. Use Constant.ON instead [deprecated]
STATUS	This constant is deprecated in version 20.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Return status of something [deprecated]

Constants for Item Type

Name	Description

BEAM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Beams. Use Type.BEAM instead [deprecated]
BOLT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Bolts. Use Type.BOLT instead [deprecated]
BWLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Beam spotwelds. Use Type.BWLD instead [deprecated]
CONN	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. All connection types. Use Type.CONX instead [deprecated]
CWLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *CONSTRAINED_SPOTWELD spotwelds. Use Type.CWLD instead [deprecated]
DES	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Discrete Element Sphere. Use Type.DES instead [deprecated]
ELEM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Generic elements. Use Type.ELEMENT instead [deprecated]
GWLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *CONSTRAINED_GENERALIZED spotwelds. Use Type.GWLD instead [deprecated]
HSWA	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Hex spotweld assemblies. Use Type.HSWA instead [deprecated]
HWLD	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Hex (Solid) spotwelds. Use Type.HWLD instead [deprecated]
JOINT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Joints. Use Type.JOINT instead [deprecated]
MASS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Lumped masses. Use Type.MASS instead [deprecated]
MIG	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. MIG welds. Use Type.MIG instead [deprecated]
NODE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodes. Use Type.NODE instead [deprecated]
NRB	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Nodal Rigid Bodies. Use Type.NRB instead [deprecated]
PART	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Parts. Use Type.PART instead [deprecated]
PRET	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Pretensioners. Use Type.PRETENSIONER instead [deprecated]
RBOLT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rigid bolts. Use Type.RBOLT instead [deprecated]

RETR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Retractors. Use Type.RETRACTOR instead [deprecated]
SBELT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Seatbelt elements. Use Type.SEATBELT instead [deprecated]
SBENT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Seatbelt types generally. Use Type.SBENT instead [deprecated]
SECT	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. (Element) section definitions. Use Type.SECTION instead [deprecated]
SEGM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Interface (contact, blast, etc) segment. Use Type.SEGMENT instead [deprecated]
SET_BEAM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_BEAM sets. Use Type.SET_BEAM instead [deprecated]
SET_ DISCRETE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_DISCRETE sets. Use Type.SET_DISCRETE instead [deprecated]
SET_NODE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_NODE sets. Use Type.SET_NODE instead [deprecated]
SET_PART	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_PART sets. Use Type.SET_PART instead [deprecated]
SET_SHELL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_SHELL sets. Use Type.SET_SHELL instead [deprecated]
SET_SOLID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_SOLID sets. Use Type.SET_SOLID instead [deprecated]
SET_ TSHELL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. *SET_TSHELL sets. Use Type.SET_TSHELL instead [deprecated]
SHELL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Shells. Use Type.SHELL instead [deprecated]
SLIP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Slip-rings. Use Type.SLIPRING instead [deprecated]
SOLID	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Solids. Use Type.SOLID instead [deprecated]
SPC	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Single Point Constraint. Use Type.SPC instead [deprecated]
SPH	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Smoothed Particle Hydrodynamics. Use Type.SPH instead [deprecated]
SPRING	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Springs (discrete elements). Use Type.SPRING instead [deprecated]

SURF	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Contact surfaces. Use Type.CONTACT instead [deprecated]
TSHELL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Thick shells. Use Type.TSHELL instead [deprecated]
WALL	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rigidwalls. Use Type.RIGIDWALL instead [deprecated]
WINDOW	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. D3PLOT window id. Use Type.WINDOW instead [deprecated]
XSEC	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Database cross-sections. Use Type.XSEC instead [deprecated]

Constants for Surface

Name	Description
BOTTOM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Bottom shell surface. Use Constant.BOTTOM instead [deprecated]
MIDDLE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Middle shell surface. Use Constant.MIDDLE instead [deprecated]
TOP	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Top shell surface. Use Constant.TOP instead [deprecated]

Constants for Tensor Array Subscripts

Name	Description
XX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 0 for tensors. Use Constant.XX instead [deprecated]
XY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 3 for tensors (can also use YX as an alternative). Use Constant.XY instead [deprecated]
YY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 1 for tensors. Use Constant.YY instead [deprecated]
YZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 4 for tensors (can also use ZY as an alternative). Use Constant.YZ instead [deprecated]
ZX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 5 for tensors (can also use XZ as an alternative). Use Constant.ZX instead [deprecated]
ZZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2 for tensors. Use Constant.ZZ instead [deprecated]

Constants for Vector Array Subscripts

Name	Description

X	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 0 for vectors. Use Constant.X instead [deprecated]
Y	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 1 for vectors. Use Constant.Y instead [deprecated]
Z	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. 2 for vectors. Use Constant.Z instead [deprecated]

Ssh class

The Ssh class allows you to connect to a remote computer using ssh, scp and sftp commands. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Ssh constants

Constants for file bits

Name	Description
Ssh.SETGROUP_BIT	Set group bit
Ssh.SETUID_BIT	Set uid bit
Ssh.STICKY_BIT	sticky bit

Constants for file types

Name	Description
Ssh.DIRECTORY	Directory
Ssh.FILE	Regular file
Ssh.SOCKET	Socket
Ssh.SYMBOLIC_LINK	Symbolic link

Constants for permissions

Name	Description
Ssh.GROUP_EXECUTE	Group has execute permission
Ssh.GROUP_READ	Group has read permission
Ssh.GROUP_WRITE	Group has write permission
Ssh.OTHER_EXECUTE	Others have execute permission
Ssh.OTHER_READ	Others have read permission

Ssh.OTHER_WRITE	Others have write permission
Ssh.OWNER_EXECUTE	Owner has execute permission
Ssh.OWNER_READ	Owner has read permission
Ssh.OWNER_WRITE	Owner has write permission

Detailed Description

The Ssh class gives you simple functions to do secure connections to a remote computer using ssh. The Oasys Ltd LS-DYNA environment software is built with the OpenSSH library to support the ssh, scp and sftp protocols. The basic workflow is to create a connection using the Ssh constructor, authenticate the connection either by using a password and AuthenticateWithPassword or with a public key and AuthenticateWithPublicKey then the method Execute can be used to execute commands on the remote machine, the methods Get and Put can be used to copy files to and from the remote machine using scp, and the commands SftpGet, SftpList, SftpMkdir, SftpPut and SftpRmdir can be used to perform secure file transfer commands.
ssh uses a public and private key pair to do communication. The software uses RSA for the private and public keys and stores them in the files id_rsa and id_rsa.pub in the .oasys_ssh directory of your home directory (C:\Users\your.name\.oasys_ssh on Windows by default). A key length of 2048 bits is recommended. You keep your private key secure in your .oasys_ssh directory but the public key can be copied to the authorized_keys file on remote machines so that authentication can be done etc. The software also maintains fingerprints for the machines you connect to to ensure that you are connecting to the machine that you think you are. The first time you connect to a machine you are asked to confirm the remote machine is correct and the software stores the fingerprint for it in the known_hosts file in your .oasys_ssh directory. For second and subsequent connections the software checks the fingerprint of the remote machine against the one it has stored and will only connect if it matches.
When creating a new ssh connection to a remote machine and transferring files a small 'buffer' is required to transfer the data. The size of this buffer can be controlled using the Options.ssh_buffer_size property **before** the Ssh object is created.

Constructor

new Ssh(hostname*[string]*, username*[string]*)

Description

Create a new Ssh object for secure communication to a remote computer.

Arguments

- **hostname** (string)

The hostname of the machine that you want to connect to

- **username** (string)

The username on the machine that you want to connect to

Returns

Ssh object

Return type

Ssh

Example

To create a connection to machine "example" as user "username"

```
var s = new Ssh("example", "username");
```

Details of functions

AuthenticateWithPassword(password*[string]*)

Description

Authenticate the connection using password.

Arguments

- **password** (string)

The password for the username on the remote machine

Returns

no return value

Example

To prompt the user for a password and authenticate using it in SSH connection s:

```
var password = Window.GetPassword("Enter Password to connect", "Password");
s.AuthenticateWithPassword(password);
```

AuthenticateWithPublicKey(passphrase (optional)*[string]*)

Description

Authenticate the connection using your public key. Your public key from the file .oasys_ssh/id_rsa.pub must be in the file .oasys_ssh/authorized_keys on the remote machine.

Arguments

- **passphrase (optional)** (string)

The passphrase for authentication on the remote machine if required

Returns

no return value

Example

Authenticate using your public key in SSH connection s:

```
s.AuthenticateWithPublicKey();
```

Execute(data*[object]*)

Description

Execute a command in the ssh session and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to the command

command	string	The command you want to run

Returns

Object with the following properties:

Name	Type	Description
status	integer	The exit code from the command
stderr	string	The standard error output from the command
stdout	string	The standard output from the command

Return type

object

Example

To run command "example.bat" with arguments "foo" and "bar" in SSH connection s:

```
var output = s.Execute( { command: 'example.bat', arguments: [ 'foo', 'bar' ]}
);
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Get(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "/path/to/file.txt", creating local file "C:\path\to\file.txt" in SSH connection s:

```
s.Get("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

Put(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "/path/to/file.txt" in SSH connection s:

```
s.Put("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

SftpGet(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "file.txt", creating local file "C:\path\to\file.txt" in SSH connection s using sftp:

```
s.SftpGet("file.txt", "C:\\path\\to\\file.txt");
```

SftpList(remote*[string]*)

Description

Gets a listing from the ssh connection using sftp.

Arguments

- **remote** (string)

The remote path to get the listing from

Returns

Array of objects. Each object contains the following information for a file/directory:

Name	Type	Description
atime	integer	Access time for the file (seconds since epoch)
gid	integer	The group ID
info	constant	Bitwise information for the file/directory. See the permissions, file types and file bits constants
mtime	integer	Modification time for the file (seconds since epoch)
name	string	The name of the file/directory
size	integer	The size of the file
uid	integer	The user ID

Return type

object

Example

To get listing from the the remote path "temp" in SSH connection s using sftp:

```
var listing = s.SftpList("temp");
for (l=0; l<listing.length; l++)
{
    Message(listing[l].name + ":" + listing[l].size;
}
```

SftpMkdir(remote*[string]*, mode*[constant]*)

Description

Creates a directory in the remote ssh connection using sftp.

Arguments

- **remote** (string)

The remote directory to create

- **mode** (constant)

The mode/permissions for the directory. See the permissions constants for details. Note that the user's file-creation mask (umask) value will also be taken into account when creating the directory.

Returns

true if successful, false if not

Return type

Boolean

Example

To create the remote path "temp" with, create, write and execute permissions for only the owner, in SSH connection s using sftp:

```
var success = s.SftpMkdir("temp", Ssh.OWNER_READ|Ssh.OWNER_WRITE|Ssh.OWNER_
EXECUTE);
```

SftpPut(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "file.txt" in SSH connection s:

```
s.SftpPut("file.txt", "C:\\path\\to\\file.txt");
```

SftpRmdir(remote*[string]*)

Description

Deletes a directory in the remote ssh connection using sftp. If this fails it is probably because the directory is not empty.

Arguments

- **remote** (string)

The remote directory to delete

Returns

true if successful, false if not

Return type

Boolean

Example

To delete the remote path "temp" in SSH connection s using sftp:

```
var success = s.SftpRmdir("temp");
```

States

Functions and constants relating to States

Functions

- GetTime(state_id (optional)*[integer]*)
- LockState(state_id*[integer]*)
- SetCurrentState(state_id*[integer]*)
- UnlockState(state_id*[integer]*)

Details of functions

GetTime(state_id (optional)*[integer]*) [static]

Description

Returns the analysis time of the current state, or that of <state_id> if defined

Arguments

- **state_id (optional)** (integer)

State number to use

Returns

real

Return type

Number

Example

```
// Get the time of the current state
var time = GetTime();
// Get the time of the first state
var time = GetTime(1);
```

LockState(state_id*[integer]*) [static]

Description

"Locks" any memory already allocated for data storage in <state_id>, preventing it from being reused by other states looking for memory in which to store data.

When dealing with large models it is normally the case that the amount of data to be processed far exceeds the amount of memory installed in the computer, meaning that it is not possible to store all data of interest in memory at the same time. Therefore D3PLOT tries to minimise the amount of data currently stored in memory by reusing the memory allocated previously for other states and/or data components. This process is called "scavenging" and the rules it uses when trying to decide from where to scavenge memory are, in order of descending preference:

1. Data from a different component in a different state
2. Data from this component in a different state
3. Data from an unused component in this state
4. If none of the above are available then allocate some fresh memory from the operating system

In most cases a Javascript will be working with one state at a time, so the problem of reusing memory in this state for purpose A when it is still required for purpose B will not arise. However if, for example, you are writing a script that compares data from this state and the previous one inside a loop it is possible that "churning" could arise from the sequence:

.

For each state

GetData in state N Scavenges memory from state N-1 to store the data for state N

GetData in state N-1 Scavenges memory from state N to store data for state N-1

.

In this example the script would probably run incredibly slowly as each GetData() call would have to reread data from disk into the newly scavenged memory, so you would end up with <#elements * 2> disk reads of all the data for this component and element type. The same would be true if PutUbinData() or GetUbinData() were used as both of these require the data to be "put" or "got" to exist in memory, requiring that memory to be obtained from somewhere.

By "locking" states **N** and **N-1** in this example you would force D3PLOT to allocate enough memory to hold both data vectors in memory at the same time, and the script would run <#elements * 2> times faster. For a model with 1,000,000 elements this might reduce the run-time from months to seconds!

Clearly states should not be "locked" unnecessarily or, more importantly, left "locked" when there is no longer any need for the data they contain, since this will lead to a significant build-up of memory usage. Therefore states can be unlocked in three ways:

- Explicitly by using the Javascript function UnlockState()
- Implicitly by using the Javascript function SetCurrentState(), which unlocks all states except the current one
- Implicitly by exiting the Javascript, as normal (interactive or batch) D3PLOT usage will implicitly unlock all but the current state.

To summarise: this function is likely to be needed only when you are performing repeated "gets" and/or "puts" of data to and from more than one state.

Locking and unlocking states takes place in the current model only, and has no effect on states in any other model.

Arguments

- **state_id** (integer)

State number to lock

Returns

boolean

Return type

Boolean

Example

```
// Lock data in state #13
LockState(13);
```

SetCurrentState(state_id*[integer]*) [static]

Description

Sets the current state for the JavaScript interface to state_id

This is the state used for all the "get" and "put" functions which handle model-related data. If the optional state_id argument in a get/put function call is used then that state is used instead for the duration of that call, but this current state is not changed.

The current state is a property of the current model, in other words each model has its own, separate, current state. For all models this defaults to state #1 (if present).

Setting the current state in model i has no effect on the current state in any other model.

Arguments

- **state_id** (integer)

State number to make current

Returns

boolean

Return type

Boolean

Example

```
// Make state #27 current
SetCurrentState(27);
```

UnlockState(state_id*[integer]*) [static]

Description

"Unlocks" this state for the purposes of memory scavenging, making any data vectors within it eligible for reuse by other states looking for memory

Please see the documentation on LockState() for a description of what this function does and when it might be needed.

Arguments

- **state_id** (integer)

State number to unlock

Returns

boolean

Return type

Boolean

Example

```
// Unlock data in state #13
UnlockState(13);
```

UserComponents

Functions and constants relating to UserComponents

Functions

- CreateUbinComponent(component_name*[string]*, component_type*[integer]*, data_type*[integer]*, if_existing*[integer]*, dispose (optional)*[integer]*, location (optional)*[integer or string]*)

UserComponents constants

Name	Description
UBMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Beam scalar. Use Component.UBMS instead [deprecated]
UBMV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Beam vector. Use Component.UBMV instead [deprecated]
UNOS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Node scalar. Use Component.UNOS instead [deprecated]
UNOV	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Node vector. Use Component.UNOV instead [deprecated]
USSS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Solid and shell scalar. Use Component.USSS instead [deprecated]
USST	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Solid and shell tensor. Use Component.USST instead [deprecated]

Constants for Component Type

Name	Description
U_BEAM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. User-defined beam component. Use Component.BEAM instead [deprecated]
U_NODE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. User-defined nodal component. Use Component.NODE instead [deprecated]
U_OTHR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. User-defined other (LSDA) component. Use Component.OTHER instead [deprecated]
U_SOSH	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. User-defined solid, shell and thick shell component. Use Component.SOLID_SHELL_TSHELL instead [deprecated]

Constants for Data Type

Name	Description
U_SCALAR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Scalar data (1 value). Use Component.SCALAR instead [deprecated]
U_TENSOR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Tensor data (6 values). Use Component.TENSOR instead [deprecated]
U_VECTOR	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Vector data (3 values). Use Component.VECTOR instead [deprecated]

Constants for Existing

Name	Description
RENAME	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Rename. Use Component.RENAME instead [deprecated]
REPLACE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Replace. Use Component.REPLACE instead [deprecated]

Constants for Location

Name	Description
IN_CORE	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. held in memory. Use Component.IN_CORE instead [deprecated]

Details of functions

CreateUbinComponent(component_name*[string]*, component_type*[integer]*, data_type*[integer]*, if_existing*[integer]*, dispose (optional)*[integer]*, location (optional)*[integer or string]*) [static]

Description

Create a new user-defined binary (UBIN) component

Note that user-defined components are "program wide", so once created the data "slots" exist in all models. Data values that are not populated will return a value of zero.

Arguments

- **component_name** (string)

A name for this component, up to 30 characters long. If the name is not unique, D3PLOT's behaviour will depend on the value of the 'if_existing' argument to this function.

- **component_type** (integer)

One of the constants
- U_NODE for nodal data
- U_SOSH for solid, shell and thick shell data
- U_BEAM for beam data
- U_OTHR for LSDA (Other) data

User-defined components must fall into one of these four categories. It is not possible to have a component of a given name that contains data for more than one of these types.

- **data_type** (integer)

One of the constants
- U_SCALAR for scalar data (any type)

- U_VECTOR for vector data (U_NODE, U_BEAM and U_OTHR only)
- U_TENSOR for tensor data (U_SOSH only)
- U_OTHR for LSDA (Other) data

Choose the data type that matches the information you want to store.

- **if_existing** (integer)

Action to take if UBIN component 'component_name' already exists.

One of the constants

- REPLACE deletes the existing UBIN component, replacing it with this definition. This means that any existing data for the user-defined component of this name is deleted and the component is re-initialised.
- RENAME changes the 'component_name' argument of this function call by adding a suffix to make it unique, so the existing component of this name (and data) will be left unchanged and the new one will not clash with it.

- **dispose (optional)** (integer)

What to do with the ".ubd" files when the model is closed or D3PLOT exits.

One of the constants

- LEAVE (default) will leave any ".ubd" files on disk so that they are available for any future D3PLOT sessions.
- DELETE will delete these files when then model is closed or D3PLOT exits.

If this argument is ommitted or set to zero then LEAVE behaviour is used. However alternative default behaviour may be specified by setting the preference

d3plot*ubd_file_dispose: to **LEAVE** or **DELETE**

- **location (optional)** (integer or string)

Specify where the data for this component is to be stored, one of

- A valid <pathname> .ubd files will be written to this directory instead of the original analysis. This will usually be a better solution than the alternative options of keeping data "in core" since it allows D3PLOT memory management to operate normally, writing data to disk if space is needed in memory. The directory <pathname> must exist, and you must have write permission to it.
- **JOBDIR**(<pathname>) the path of the directory containing the results, in other words the default location for the files. However you can append a further <pathname> to this in order to specify a directory relative to JOBDIR, for example:
  - **JOBDIR/..** Means the directory above the current results
  - **JOBDIR/../../my_results** Means two directories above, in the sub-directory 'my_results'
- IN_CORE stipulates that this component's data will always be held in memory, and will never be written to disk. This solves the problem of data files being in read-only directories since no .ubd files are written. However it also means that D3PLOT will not dump data for currently unused states to disk, meaning that you may run out of memory if you generate too much data in your JavaScripts.

If IN_CORE is used the value of 'dispose' above is ignored.

If this argument is omitted then the default behaviour of creating .ubd files in the same directory as the analysis database files will be used. However an alternative default directory may also be specified by the preference:

d3plot*ubd_file_location: <pathname> or **IN_CORE** or **JOBDIR**(<pathname>)

If both <location> and this preferenceare defined then <location> in this function call takes precedence.

Notes on pathnames:

1. On Windows platforms forward slash / and backslash \ can be used interchangeably in pathnames. On Linux platforms you must use forward slash / only, so in a multi-system environment it is recommended that you use forward slash syntax only.
2. If <pathname> contains white space then you must enclose the whole string in "...", for example "C:\my results".

Returns

integer handle for the newly created component that should be used in subsequent UBIN processing function calls. This handle should be regarded as private data and not modified in any way. In addition, if a UBIN component is created and then recreated and over-written in a script (**if_existing = REPLACE**) the handle from each call may be different - don't assume that is has not changed.

Return type

Number

Example

```
// Create a component for nodal scalar data
var handle_1 = CreateUbinComponent("My nodal data", U_NODE, U_SCALAR, REPLACE);
// Create a tensor component for solid, shell and thick shell data
var handle_2 = CreateUbinComponent("My shell tensor data", U_SOSH, U_TENSOR,
REPLACE);
```

DeleteUbinComponent(handle*[integer]*) [static]

Description

Deletes an existing UBIN component handle. The component is deleted from memory, and any associated .ubd files cached on disk are also deleted.

If this succeeds it returns JS_TRUE, otherwise JS_FALSE.

Arguments

- **handle** (integer)

The handle of an existing UBIN component

Returns

boolean

Return type

Boolean

Example

```
// Delete the UBIN component handle_1
if(!DeleteUbinComponent(handle_1))
{
    ...deal with failure...
}
```

GetUbinData(handle*[integer]*, item_type*[integer]*, item*[integer]*, int_pt*[object | integer]*, state_id (optional)*[integer]*) [static]

Description

Retrieves data for type/item from a UBIN component.

If the data has not previoulsy been written, values of 0.0 will be returned.

Arguments

- **handle** (integer)

The handle of an existing UBIN component as returned by CreateUbinComponent().

- **item_type** (integer)

An item type constant, NODE, SOLID, SHELL, etc. This must match the underlying type of the UBIN component, thus NODE for components of type U_NODE, and so on. It is illegal to attempt to store data for a type that does not match the underlying UBIN component type thus, for example, you cannot store NODE data for a U_SOSH component.

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **int_pt** (object) | integer

Integration point: must be a +ve layer number (lowest = 1).

Or zero for item type / data component combinations that do not consider integration points in this context. (for example nodal displacements or beam forces).

Or, for fully integrated elements with on plan integration points, an object with properties "ip" and "op". For a further explanation see Defining the Integration point argument in GetData().

"Top", "Middle" and "Bottom" are not allowed in this context since "middle" is not directly readable in cases with an even number of points.

A value of 1 should normally be used for solid elements.

Note, from D3PLOT 11.0 onwards, the order of the integration points for SHELLS and TSHELLS is <int_pnt> 1->n: BOTTOM->TOP surface (so long as a ZTF file is present). See Section 13.8.2.2.

Prior to this they were in the order of the integration points output by LS-DYNA, e.g. for <maxint>=3 <int_pnt> 1 was the MIDDLE surface, <int_pnt> 2 was the BOTTOM surface and <int_pnt> 3 was the TOP surface.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point.
op (optional)	integer	On plan integration point. Defaults to the first one.

- **state_id (optional)** (integer)

State number to be used. If omitted, the current state is used.

Returns

real|Array of reals

Return type

Number

Example

```
// Retrieve an array of tensor data for solid #27, which implies that the UBIN
data
// component <handle_1> is of type U_SOSH, and that its data type is U_TENSOR.
dvec = GetUbinData(handle_1, SOLID, 27, 1);
sxx = dvec[0];
szx = dvec[5];
// Retrieve the scalar value of node #17, in state <istate>.
// This implies that the UBIN component <handle_2> is of type U_NODE and its
data is U_SCALAR.
nval = GetUbinData(handle_2, NODE, 17, 0, istate);
```

LocateUbinComponent(component_name*[string]*) [static]

Description

Locates an existing UBIN component by name and returns its handle. This is useful when a previous run has created a UBIN component and this script wishes to work with it.

'component_name' is not case-sensitive, but an exact character match is required, so embedded white space is significant.

If the lookup succeeds this function returns an object with with properties about the component, if it fails it returns the value JS_FALSE.

Arguments

- **component_name** (string)

A name to search for, a character string up to 30 characters long. Component names are not case-sensitive, but searching only succeeds if an exact match is found.

Returns

Object with the following properties:

Name	Type	Description
ctype	integer	the component type, U_NODE, U_SOSH, U_BEAM or U_OTHR
dtype	integer	the data type, U_SCALAR, U_VECTOR or U_TENSOR
handle	integer	the integer handle of the UBIN component

Return type

object

Example

```
// Look for component "My nodal data" and put the result of a successful lookup
in object 'udata'.
if(udata = LocateUbinComponent("My nodal data"))
{
    handle = udata.handle;
    ...
}
else
{
    ... deal with failure
}
```

PutUbinData(handle*[integer]*, item_type*[integer]*, item*[integer]*, int_pt*[object | integer]*, data*[real|array of reals]*, state_id (optional)*[integer]*) [static]

Description

Stores data for type/item in a UBIN component handle.

This will overwrite any existing data in that "slot", which will be lost.

Arguments

- **handle** (integer)

The handle of an existing UBIN component as returned by CreateUbinComponent().

- **item_type** (integer)

An item type constant, NODE, SOLID, SHELL etc. This must match the underlying type of the UBIN component, thus NODE for components of type U_NODE, and so on. It is illegal to attempt to store data for a type that does not match the underlying UBIN component type thus, for example, you cannot store NODE data for a U_SOSH component.

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. Internal numbers will be many times faster to process.

- **int_pt** (object) | integer

Integration point: must be a +ve layer number (lowest = 1)

Or zero for item type / data component combinations that do not consider integration points in this context (for example nodal displacements or beam forces).

Or, for fully integrated elements with on plan integration points, an object with properties "ip" and "op". For a further explanation see Defining the Integration point argument in GetData().

"Top", "Middle" and "Bottom" are not allowed in this context since "middle" is not directly readable in cases with an even number of points.

A value of 1 should normally be used for solid elements.

Note from D3PLOT 11.0 onwards, the order of the integration points for SHELLS and TSHELLS is <int_pnt> 1->n: BOTTOM->TOP surface (so long as a ZTF file is present). See Section 13.8.2.2.

Prior to this they were in the order of the integration points outputby LS-DYNA, e.g. for <maxint>=3 <int_pnt> 1 was the MIDDLE surface, <int_pnt> 2 was the BOTTOM surface and <int_pnt> 3 was the TOP surface.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point.
op (optional)	integer	On plan integration point. Defaults to the first one.

- **data** (real|array of reals)

The data to be stored. Its format depends on the "data type" of the component:

U_SCALAR: Scalar or array of length >=1

U_VECTOR: Array of length >= 3

U_TENSOR: Array of length >= 6

The alignment of array members should be as follows:

Vector: [X, Y, Z]

Tensor: [XX, YY, ZZ, XY, YZ, ZX]

- **state_id (optional)** (integer)

State number to be used. If omitted, the current state is used.

Returns

boolean

Return type

Boolean

Example

```
// Write an array of tensor data for solid #27, which implies that the UBIN data
component <handle_1>
// is of type U_SOSH,and that its data type is U_TENSOR.
dvec = new Array(6);
dvec[XX] = sxx;
dvec[YZ] = syz;
PutUbinData(handle_1, SOLID, 27, 1, dvec);
// Write the scalar value 19.5 for node #17, in state <istate>.
// This implies that the UBIN component <handle_2> is of type U_NODE and its
data is U_SCALAR.
PutUbinData(handle_2, NODE, 17, 0, 19.5, istate);
```

Utils class

The Utils class contains various useful utility functions. More...

The D3PLOT JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Ascii85Decode(encoded*[string]*)
- Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*)
- Build()
- CallPromiseHandlers()
- CheckinLicense(feature*[string]*)
- CheckoutLicense(feature*[string]*)
- GarbageCollect()
- HTMLBrowser()
- HiResTimer()
- PdfReader()
- TimerResolution()
- Version()

Detailed Description

The Utils class is used to provide various useful functions.

Details of functions

Ascii85Decode(encoded*[string]*) [static]

Description

Decodes an ASCII85 encoded string. See Utils.Ascii85Encode() for details on the method.

Arguments

- **encoded** (string)

An ASCII85 encoded string

Returns

ArrayBuffer object

Return type

ArrayBuffer

Example

To decode an ASCII85 encoded string:

```
var decoded = Utils.Ascii85Decode(encoded);
```

Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*) [static]

Description

Encodes an ASCII85 encoded string. This enables binary data to be represented by ASCII characters using five ASCII characters to represent four bytes of binary data (making the encoded size 1/4 larger than the original). By doing this binary data can be stored in JavaScript strings. Note that the method used by D3PLOT to encode and decode strings differs from the standard ASCII85 encoding as that uses the ASCII characters ", ’ and \ which cannot be used in JavaScript strings as they have special meanings. The method in D3PLOT uses
0-84 are !-u (ASCII codes 33-117) (i.e. 33 is added to it) with the following exceptions
v is used instead of " (ASCII code 118 instead of 34)
w is used instead of ’ (ASCII code 119 instead of 39)
x is used instead of \ (ASCII code 120 instead of 92)
If all five digits are 0 they are represented by a single character z instead of !!!!!

Arguments

- **data** (ArrayBuffer)

ArrayBuffer containing the data

- **length (optional)** (integer)

Length of data in array buffer to encode. If omitted the whole array buffer will be encoded

Returns

string

Return type

String

Example

To encode ArrayBuffer data:

```
var encoded = Utils.Ascii85Encode(data);
```

Build() [static]

Description

Returns the build number

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current build number

```
var build = Utils.Build();
```

CallPromiseHandlers() [static]

Description

Manually call any promise handlers/callbacks in the job queue

Arguments

No arguments

Returns

no return value

Example

To run any queued promise handlers/callbacks:

```
Utils.CallPromiseHandlers();
```

CheckinLicense(feature*[string]*) [static]

Description

Checks a license for a feature back in

Arguments

- **feature** (string)

feature to check license back in for

Returns

no return value

Example

To check in a license for "EXAMPLE":

```
Utils.CheckinLicense("EXAMPLE");
```

CheckoutLicense(feature*[string]*) [static]

Description

Checks out a license for a feature

Arguments

- **feature** (string)

feature to check license for

Returns

true if license available, false if not

Return type

Boolean

Example

To checkout a license for "EXAMPLE":

```
var got = Utils.CheckoutLicense("EXAMPLE");
if (got == false) Exit();
```

GarbageCollect() [static]

Description

Forces garbage collection to be done. This should not normally need to be called but in exceptional circumstances it can be called to ensure that garbage collection is done to return memory.

Arguments

No arguments

Returns

no return value

Example

To force garbage collection to be done:

```
Utils.GarbageCollect();
```

HTMLBrowser() [static]

Description

Returns the path to the default HTML browser

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default HTML browser

```
var path = Utils.HTMLBrowser();
```

HiResTimer() [static]

Description

A high resolution timer that can be used to time how long things take. The first time this is called the timer will start and return 0. Subsequent calls will return the time in nanoseconds since the first call. Note that the timer will almost certainly not have 1 nanosecond precision but, depending on the platform, should should have a resolution of at least 1 microsecond. The resolution can be found by using Utils.TimerResolution()

Arguments

No arguments

Returns

number

Return type

number

Example

To time how long something takes to nanosecond precision:

```
var start = Utils.HiResTimer();
do something that takes some time...
var end = Utils.HiResTimer();
Message("it took " + (end-start) + "nanoseconds");
```

PdfReader() [static]

Description

Returns the path to the executable of the default pdf reader

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default pdf reader

```
var path = Utils.PdfReader();
```

TimerResolution() [static]

Description

Returns the resolution (precision) of the Utils.HiResTimer() timer in nanoseconds

Arguments

No arguments

Returns

number

Return type

number

Example

To find the resolution of the timer in nanoseconds:

```
var resolution = Utils.TimerResolution();
```

Version() [static]

Description

Returns the version number

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the current version number

```
var version = Utils.Version();
```

Visibility

Functions and constants relating to Visibility

Functions

- Blank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*)
- IsBlanked(type_code*[integer]*, item*[integer]*, window_id (optional)*[integer]*)
- IsDeleted(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*)
- IsVisible(type_code*[integer]*, item*[integer]*, window_id*[integer]*, state_id (optional)*[integer]*)
- NumDeleted(type_code*[integer]*, state_id (optional)*[integer]*)
- Unblank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*)

Details of functions

Blank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*) [static]

Description

Blank an item

Arguments

- **type_code** (integer)

The type of item to check (SOLID, PART etc.) Note: If <item> is "ALL_DEL" (all deleted elements), only element types are acceptable.

- **item** (integer or array of integers or string)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. It can also be an array of items (index/label) or a string indicating various items ("ALL" for all items of the type and "ALL_DEL" for deleted items of the type.)

- **window_id (optional)** (integer)

A window id. If defined then the item is blanked in that window. If not defined or set 0 to then the item is blanked in all windows.

Returns

No return value

Example

```
// Blanks the 1st PART in the current model in all windows
Blank(PART, 1);
// Blanks the 1st PART in the current model in window 2
Blank(PART, 1, 2);
// Blanks the 1st PART in the current model in all windows
Blank(PART, 1, 0);
// Blanks all PARTs in window 2
Blank(PART, "ALL", 2);
// Blanks everything in window 2
Blank(MODEL, "ALL", 2);
// Blanks all SHELLs specified in the array shell_list in window 1
Blank(SHELL, shell_list, 1);
```

IsBlanked(type_code*[integer]*, item*[integer]*, window_id (optional)*[integer]*) [static]

Description

Checks whether an item is currently blanked. If the type is PART then this function will only return true if all elements of the PART are currently blanked. If the PART is empty this returns false

Arguments

- **type_code** (integer)

The type of item to check (SOLID, etc.)

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

- **window_id (optional)** (integer)

A window id. If defined then the function will return true if the item is blanked in that window. If not defined or set to then the function returns true if it is blanked in any window.

Returns

boolean

Return type

Boolean

Example

```
// Return true if the 1st SHELL in the model is blanked in any window
if(IsBlanked(SHELL, 1))
{
    ....
}
// Return true if the 1st SHELL in the model is blanked in window 2
if(IsBlanked(SHELL, 1, 2))
{
    ....
}
// Return true if the 1st SHELL in the model is blanked in any window
if(IsBlanked(SHELL, 1, 0))
{
    ....
}
```

IsDeleted(type_code*[integer]*, item*[integer]*, state_id (optional)*[integer]*) [static]

Description

Checks whether an item is currently deleted. If the type is PART then this function will only return true if all the elements of the PART are currently deleted

The deleted status is computed as follows:

- Part-based elements: LS-DYNA reports the deletion status for part-based elements (but not DISCRETE or 1d SEATBELT elements) which have failed according to the failure criteria of their deletion model. Reincarnation of dead elements is possible: *DEFINE_CONSTRUCTION_STAGES will result in an inactive element being marked as deleted, and it will be "undeleted" if that stage becomes active later on in the analysis.
- Parts themselves: LS-DYNA does not delete parts as such. A deformable part in which all elements have been deleted is removed from the calculation, but this removal is not reported in the results database. D3PLOT considers a part to be deleted if it has no elements, or all of its elements are marked as deleted. Note that a rigid part with no elements is a perfectly legitimate- if unusual - construct in LS-DYNA.
- Nodes: LS-DYNA does not delete nodes, but nodes with no structural mass are removed from the calculation. However this removal is not reported in the results database. D3PLOT considers a node to be deleted if all the elements to which it is attached are themselves deleted. Remember that D3PLOT does not "know about" all possible connections to a node, for example it may be an extra node on a rigid body, in a rigid part set, or constrained in some other obscure way. Therefore the test "deleted if all attached nodes are deleted" may give false positives and should not be considered definitive.

Arguments

- **type_code** (integer)

This function only supports the following type codes. PART, NODE, SOLID, BEAM, TSHELL, SPH, DES

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

- **state_id (optional)** (integer)

A valid state id. If omitted the current state will be used.

Returns

boolean

Return type

Boolean

Example

```
// Returns true if the 1st SHELL in the model has been deleted
if(IsDeleted(SHELL, 1))
{
    ....
}
```

IsVisible(type_code*[integer]*, item*[integer]*, window_id*[integer]*, state_id (optional)*[integer]*) [static]

Description

Checks whether an item is currently visible.

An item is considered "visible" if the following conditions are all true:

1. Not blanked
2. The visibility switch is on for type_code
3. Is not empty, if type is PART
4. The item has not been deleted in the current state if the type is an element

Arguments

- **type_code** (integer)

This function only supports the following type codes. PART, NODE, SOLID, BEAM, TSHELL, SPH, DES

- **item** (integer)

If +ve, the internal item number starting at 1. If -ve, the external label of the item.

- **window_id** (integer)

A valid window id

- **state_id (optional)** (integer)

A valid state id. If omitted the current state will be used.

Returns

boolean

Return type

Boolean

Example

```
// Returns true if the 1st SHELL in the model in the first window is visible
if(IsVisible(SHELL, 1, 1))
{
    ....
}
```

NumDeleted(type_code*[integer]*, state_id (optional)*[integer]*) [static]

Description

Gets the number of deleted elements or segments

Arguments

- **type_code** (integer)

The type of item to check. Only accepts ELEM for #elements or SEGM for #segments.

- **state_id (optional)** (integer)

A state id. If defined then the number of deleted items is calculated for that state. If not defined or set to 0 then the number of items is calculated for the current state.

Returns

integer

Return type

Number

Example

```
// Number of deleted elements in current state of the current model
var a = NumDeleted(ELEM);
// Number of deleted elements in state 3 of the current model
var b = NumDeleted(ELEM, 3);
// Number of deleted segments in state 5 of the current model
var c = NumDeleted(SEGM, 5);
```

Unblank(type_code*[integer]*, item*[integer or array of integers or string]*, window_id (optional)*[integer]*) [static]

Description

Unblank an item

Arguments

- **type_code** (integer)

The type of item to check (SOLID, PART etc.) Note: If <item> is "ALL_DEL" (all deleted elements), only element types are acceptable.

- **item** (integer or array of integers or string)

If +ve, the internal item number starting at 1. If -ve, the external label of the item. It can also be an array of items (index/label) or a string indicating various items ("ALL" for all items of the type and "ALL_DEL" for deleted items of the type.)

- **window_id (optional)** (integer)

A window id. If defined then the item is unblanked in that window. If not defined or set to 0 then the item is unblanked in all windows.

Returns

No return value

Example

```
// Unblanks the 1st PART in the current model in all windows
Unblank(PART, 1);
// Unblanks the 1st PART in the current model in window 2
Unblank(PART, 1, 2);
// Unblanks the 1st PART in the current model in all windows
Unblank(PART, 1, 0);
// Unblanks all PARTs in window 2
Unblank(PART, "ALL", 2);
// Unblanks everything in window 2
Unblank(MODEL, "ALL", 2);
// Unblanks all SOLIDs specified in the array solid_list in window 1
Unblank(SOLID, solid_list, 1);
```

Windows

Functions and constants relating to Windows

Functions

- CreateWindow(model_list*[Array of integers|integer]*)
- DeleteWindow(window_list*[Array of numbers|number]*, dispose_flag (optional)*[integer]*)
- GetWindowFrame(window_id*[integer]*)
- GetWindowMaxFrame(window_id*[integer]*)
- GetWindowModels(window_id*[integer]*)
- SetWindowActive(window_id*[integer]*, active_flag*[integer]*)
- SetWindowFrame(window_id*[integer]*, frame_number*[integer]*)

Details of functions

CreateWindow(model_list*[Array of integers|integer]*) [static]

Description

Creates a new window containing one or more models contained in model_list

Arguments

- **model_list** (Array of integers|integer)

Model number(s). Can be a single model number, an array of model numbers or the constant ALL

Returns

boolean

Return type

Boolean

Example

```
// Create a new window containing models #2 and #3
var a = new Array(2, 3);
CreateWindow(a);
// Create a new window containing model #6
CreateWindow(6);
// Create a new window containing all currently active models
CreateWindow(ALL);
```

DeleteWindow(window_list*[Array of numbers|number]*, dispose_flag (optional)*[integer]*) [static]

Description

Deletes one or more windows in window_list, dealing with "orphaned" models according to dispose_flag.

WARNING

- D3PLOT does not permit gaps in window numbering, therefore when a window is deleted any windows higher than this are renumbered downwards to fill the gap.
- However D3PLOT does ***not*** renumber models following the deletion of preceding ones. Deleted model ids simply become "inactive".

This means that following a window deletion operation:

- The total number of windows will change.
- Any window ids above those deleted will have been renumbered downwards.
- If any orphan models were deleted these models will now be inactive.
- If the current Javascript model has been deleted then the "current" model pointer will be reset to the first active model, or <undefined> if there are no such models.

Therefore if a script is to continue execution after a window deletion operation it is prudent to ensure that any "current" user-defined variables in the Javascript are reset to sensible values.

Arguments

- **window_list** (Array of numbers|number)

Window numbers. Can be a single window number, an array of window numbers or the constant ALL

- **dispose_flag (optional)** (integer)

LEAVE (default) leaves orphaned models in the database or DELETE deletes orphaned models

Returns

boolean

Return type

Boolean

Example

```
// Delete windows #2 and #3 leaving any orphaned models in the database
var a = new Array(2, 3);
DeleteWindow(a);
// Delete window #6, also deleting any orphaned models
DeleteWindow(6, DELETE);
```

GetWindowFrame(window_id*[integer]*) [static]

Description

Returns the current "frame" in window_id

See the notes in GetWindowMaxFrame() on how frame number relates to state number

Arguments

- **window_id** (integer)

Window number or ALL. Specifies the window(s) to have the frame number set

Returns

integer

Return type

Number

Example

```
// Get the current frame of window #1
var a = GetWindowFrame(1);
```

GetWindowMaxFrame(window_id*[integer]*) [static]

Description

Returns the highest "frame" number in window_id

"Frame" number is usually the same as state number, but there are a few situations when this is not the case:

- Eigenvalue analyses. Each state is animated though *#frames* between +/-180 degrees phase angle
- Nastran-derived static analyses. Each loadcase is likewise animated through *#frames*
- Transient analyses that are being interpolated by time, giving (endtime / time interval) frames

In all cases animating a window results in it cycling through frames 1 to max *#frames*.

Arguments

- **window_id** (integer)

Window number

Returns

integer

Return type

Number

Example

```
// Get the highest frame of number in window #2
var a = GetWindowMaxFrame(2);
```

GetWindowModels(window_id*[integer]*) [static]

Description

Returns the model number(s) in window_id

Every active window in D3PLOT must have at least one model, but may have any number

Arguments

- **window_id** (integer)

Window number

Returns

Object with the following properties:

Name	Type	Description

list	Array of integers	List of model numbers
nm	integer	the number of models in the window

Return type

object

Example

```
// Get list of model numbers in window #1
var a = GetWindowModels(1);
for(i=0; i<a.nm; i++)
{

SetWindowActive(window_id*[integer]*, active_flag*[integer]*) [static]

Description

Set the "active" flag on a window.

When more than one window is in use it is convenient to be able to operate on a group of "active" windows with a single command in the JavaScript, rather than having to loop over selected windows each time, and this function provides that capability. This activity status is used solely within the Javascript interface and does not have any bearing upon or connection with the Wn "tabs" used in the graphical userinterface.

By default all windows are active (ON), but you can change this by setting the activity of specific windows ON or OFF.

Arguments

- **window_id** (integer)

Window number or ALL. Specifies the window(s) to have their status set

- **active_flag** (integer)

OFF or ON. OFF makes the selected window(s) inactive, ON makes window(s) active

Returns

boolean

Return type

Boolean

Example

```
// Turn off the activity flag for window #1
SetWindowActive(1, OFF);
// Make all current windows active
SetWindowActive(ALL, ON);
```

SetWindowFrame(window_id*[integer]*, frame_number*[integer]*) [static]

Description

Sets the current "frame" in the window(s) specified to frame_number.

The effect is immediate and the window(s) will be redrawn if necessary to show the requested frame

See the notes in GetWindowMaxFrame() on how frame number relates to state number

Arguments

- **window_id** (integer)

Window number or ALL

- **frame_number** (integer)

The frame number to set. Should be a +ve integer value in the range 1 to max #frames in window. Values greater than max #frames are truncated to this

Returns

boolean

Return type

Boolean

Example

```
// Set window #1 to display frame #10
SetWindowFrame(1, 10);
// Set all windows to display frame #3
SetWindowFrame(ALL, 3);
```

Examples

The following simple examples show how the functions above might be used. Further example scripts may be found in directory **$OASYS/d3plot_library/examples**

Capturing a sequence of static images to JPEG files

The following example loops over all frames in window #1 issuing the dialogue command "**/IMAGE JPG example_file_** *class="courier">nnn***.jpg**" which will capture each frame in a separate JPEG file.

```
n = GetWindowMaxFrame(1); // Here window #1 is assumed to be current
for (i=1; i<=n; i++)
{
  SetWindowFrame(1, i);
  DialogueInput("/IMAGE JPG example_file_" + i + ".jpg");
}
```

Looping through states extracting cut-section results

The following example works through each state in the current model in turn, setting up a cut-section at the constant X coordinate of node #100, then rotates this section through 360 degrees in 5 degree increments, printing out the resulting forces and moments at each increment.

```
/* We need an array with 9 subscripts to hold data */
var data = new Array(9);
/* Turn on cut section display in window #1 */
SetCutSection(1, STATUS, ON);
/* Loop over all states in the model in turn */
n = GetNumberOf(STATE);
for(i=1; i<=n; i++)
{
    time = GetTime(i);
    Print("Time = " + time + "\n");
/* Set sections at const X at current position of node 100, and "get" the result
*/
    SetCutSection(1, CONST_X, 100);
/* Note that GetCutSection() gets the forces in the current state shown in the
window, and
** that to get results at a different time the state argument must be specified
as here. */
    info = GetCutSection(1, 0, 0, i);
/* The following uses origin and vectors mode to sweep the section through 360
degrees in
** 5 degree increments, extracting the forces and moments at each position */
    data[0] = info.origin[X]; /* Origin stays where it currently is */
    data[1] = info.origin[Y];
    data[2] = info.origin[Z];
    for(i=0; i<=360; i+=5)
    {
        st = Math.sin(i*0.017453);
        ct = Math.cos(i*0.017453);

        data[3] = ct; /* X axis vector */
        data[4] = 0.0;
        data[5] = st;
        data[6] = 0.0; /* XY plane vector */
        data[7] = st;
        data[8] = ct;
        SetCutSection(1, OR_AND_V, data);
        c = GetCutForces(1);
        Print("Forces = " + c.force[X] + ", " + c.force[Y] + ", " + c.force[Z] +
"\n");
        Print("Moments = " + c.moment[X] + ", " + c.moment[Y] + ", " +
c.moment[Z] + "\n");
        Print("Centroid = " + c.centroid[X] + ", " + c.centroid[Y] + ", " +
c.centroid[Z] + "\n");
        Print("Area = " + c.area + "\n\n");
```

```
    }
}
```

Calculating the max value and storing it as a UBIN component.

This example loops over all states in model #1 finding the maximum Sxx value of each solid and shell in the model, and storing it as a new scalar UBIN component in state #1.

```
/* If you have > 1 model then set the one you want. Model #1 is assumed in
** this example. */
SetCurrentModel(1);
/* It is assumed that only a single scalar value is required, and it is for
** solids & shells. So find out the number of states, solids and shells */
nstate = GetNumberOf(STATE);
nshell = GetNumberOf(SHELL);
nsolid = GetNumberOf(SOLID);
shell_env = new Array();
solid_env = new Array();
/* Create arrays to hold the max/min data. Here they are initialised to
** zero, which might not be a good choice if you are looking for max values
** and incoming results could be negative. Fill in your own initial value. */
for(j=1; j<=nshell; j++) shell_env[j] = 0.0;
for(j=1; j<=nsolid; j++) solid_env[j] = 0.0;

/* Loop over states collecting max data.
  **
  ** Note that making the outer loop the state is more efficient than making it
the
  ** element, since changing state is a more costly operation. */
for(i=1; i<=nstate; i++)
{
     SetCurrentState(i);
     Print("Doing state " + i + "\n");
     for(j=1; j<=nshell; j++)
     {
         c = GetData(SXX, SHELL, j, 1);
         if(c > shell_env[j]) shell_env[j] = c;
     }
     for(j=1; j<=nsolid; j++)
     {
        c = GetData(SXX, SOLID, j, 1);
        if(c > solid_env[j]) solid_env[j] = c;
     }
}
/* Now create a scalar user-defined binary component to hold the result */
icomp = CreateUbinComponent("Maximum of SXX", U_SOSH, U_SCALAR, REPLACE);
/* Data has to be stored at a state, so choose state 1 */
SetCurrentState(1);
/* Then populate this user-defined component, intg point #1. */
for(j=1; j<=nshell; j++) PutUbinData(icomp, SHELL, j, 1, shell_env[j]);
for(j=1; j<=nsolid; j++) PutUbinData(icomp, SOLID, j, 1, solid_env[j]);
```

Extracting data by ply from a composite analysis.

Post-processing composite analyses can be difficult because the elements have many integration points, and a physical ply may not use the same integration point in two adjacent elements, meaning that post-processing by "layer" (ie by integration point) is not helpful.

This script assumes that ply information has been created using a *PART_COMPOSITE card, with each ply assigned to a separate material id of the relevant ply number, and it sorts results into a separate UBIN component by ply. In this way a given UBIN component will show results for a single ply across the whole model.

```
// JavaScript to plot composite data for selected elements
// Date: 26 June 2008
// Version 1.0
n = get_window_max_frame(1);
set_current_model(1);
```

```

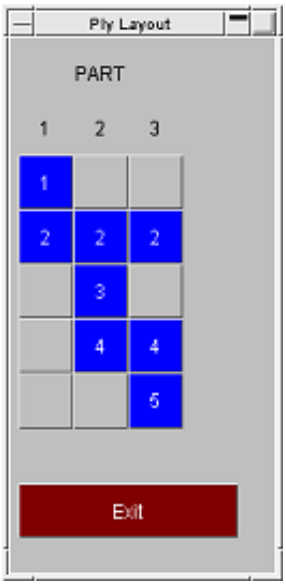
Using the Window and Widget classes to present ply data graphically



This example demonstrates the use of Menu Window and Widget classes of the common API shared with PRIMER to present information to the user graphically, and to interact with them.

It goes through a laminate model using *PART_COMPOSITE and sorts the plies into usage by part. This information is then presented to the user as shown in the figure here and the script pauses until the user clicks on "Exit" in order to continue.

```
SetCurrentModel(1);
SetCurrentState(1);
nsh = GetNumberOf(SHELL);
nip = GetNumberOf(NIP_S);
npa = GetNumberOf(PART);
var part = new Array();
var part_id = new Array();
var part_flag = 0;
var co1 = 0; // part counter
var co2 = 0; // ply counter
var ply = new Array();
var ply_id = new Array();
var ply_flag = 0;
var tmp1 = 0;
var offset = {}; // part, ip
var order1= {}; // part, ip
var order2= {}; // part, ip
var max1 = {};
var max2 = {};
var iter= 0; // iteration counter
var i_flag = 0;
var t_flag = 0;
// setup part array
for (i=1; i<=nsh; i++) //shell
{
  part_flag = 0;
  a = GetPid(SHELL, i);
  a = GetLabel(PART, a);
  b = GetMid(SHELL, i, 1);
  for(j=1; j<=co1; j++) //part
  {
    if (a == part_id[j] || b == 0) // check to see if the part is already
defined or not a Part Composite
    {
      part_flag = 1;
    }
  }
  if (part_flag == 0)
  {
    co1 = co1 + 1;
    part[co1] = i;
```

```
    part_id[co1] = a;
  }
}
    // setup ply order array

for (i=1; i<=co1; i++) // part

          temp = GetData(DZ, NODE, inode);
          if(temp > z_max)
          {
            max_state = istate; /* Store the state the maximum occurs */
            max_node = inode; /* Store the node the maximum occurs at */
            z_max = temp; /* Store the maximum */
          }
          if(temp < z_min)
          {
            min_state = istate; /* Store the state the minimum occurs */
            min_node = inode; /* Store the node the minimum occurs at */
            z_min = temp; /* Store the minimum */
          }
        }
      }
    }
  }
}
/* Open a file to write the variables to */
f = new File("./reporter_variables", File.WRITE);
/* Write to the file */
f.Writeln("VAR Z_MAX DESCRIPTION='Maximum z displacement' VALUE='" + z_max +
"'");
f.Writeln("VAR Z_MIN DESCRIPTION='Minimum z displacement' VALUE='" + z_min +
"'");
f.Writeln("VAR Z_MAX_NODE DESCRIPTION='Node with maximum z displacement'
VALUE='" + max_node + "'");
f.Writeln("VAR Z_MIN_NODE DESCRIPTION='Node with minimum z displacement'
VALUE='" + min_node + "'");
f.Writeln("VAR Z_MAX_STATE DESCRIPTION='State with maximum z displacement'
VALUE='" + max_state + "'");
f.Writeln("VAR Z_MIN_STATE DESCRIPTION='State with minimum z displacement'
VALUE='" + min_state + "'");
/* Close the file */
f.Close();
```

Next section

global class

The global class is the main JavaScript class. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AllocateFlag()
- ClearFlag(flag*[Flag]*)
- DialogueInput(command*[string]*)
- DialogueInputNoEcho(command*[string]*)
- DisableGraphWindowUpdates()
- DisableMenuUpdates()
- EnableGraphWindowUpdates()
- EnableMenuUpdates()
- ErrorMessage(string*[Any valid javascript type]*)
- Execute(data*[object]*)
- Exit(write hook interrupt (optional)*[boolean]*)
- GetCurrentDirectory()
- GetFtcfVar(name*[string]*)
- GetInstallDirectory()
- GetPreferenceValue(program*[string]*, name*[string]*)
- GetStartInDirectory()
- Getenv(name*[string]*)
- Message(string*[Any valid javascript type]*)
- MilliSleep(time*[integer]*)
- NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*)
- OpenManual(program*[string]*, page*[string]*)
- Plot()
- Print(string*[Any valid javascript type]*)
- Println(string*[Any valid javascript type]*)
- ReturnFlag(flag*[Flag]*)
- SetCurrentDirectory(directory path*[string]*)
- SetFtcfVar(name*[string]*)
- Sleep(time*[integer]*)
- System(string*[Any valid javascript type]*)
- Unix()
- UpdateCurveMenu()
- WarningMessage(string*[Any valid javascript type]*)
- Windows()

Detailed Description

The global class declares the global object in JavaScript that contains the global properties and methods. As well as the core JavaScript methods, T/HIS also defines other additional ones. e.g. Message(), Print() etc. See the documentation below for more details.

Details of functions

AllocateFlag() [static]

Description

Allocate a flag for use in the script. See also ReturnFlag() and Once allocated the flag is automatically cleared for all entity types and all the curves currently in T/HIS.

Arguments

No arguments

Returns

Flag (integer)

Return type

Number

Example

To allocate a flag

```
var flag = AllocateFlag();
```

ClearFlag(flag*[Flag]*) [static]

Description

Clears a flag on all curves and entity types.

Arguments

- **flag** (Flag)

The flag to return.

Returns

No return value.

Example

To clear flag f:

```
ClearFlag(f);
```

DialogueInput(command*[string]*) [static]

Description

Execute one or more lines of command line dialogue input.

Arguments

- **command** (string)

Command to execute (as if it had been typed into the dialogue box)

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value

Example

To mulitply curves 1 and 2 by 10:

```
DialogueInputNoEcho("/op mul #1 10 #", "/op mul #2 10 #");
```

Note that each call to DialogueInput starts afresh at the top of the T/HIS command line "tree", so where multiple commands need to be given at sub-menu levels they need to be included in a single call.

DialogueInputNoEcho(command*[string]*) [static]

Description

Execute one or more lines of command line dialogue input **with no echo of commands to dialogue box**.

Arguments

- **command** (string)

Command to execute (as if it had been typed into the dialogue box)

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value

Example

To mulitply curves 1 and 2 by 10:

```
DialogueInputNoEcho("/op mul #1 10 #", "/op mul #2 10 #");
```

As with DialogueInput above each call starts at the top of the T/HIS command tree structure, so any commands destined for sub-menus must all be arguments to a single call.

DisableGraphWindowUpdates() [static]

Description

Disable Graph Window updates.

Arguments

No arguments

Returns

No return value

Example

Turn off graph window updates

```
DisableGraphWindowUpdates();
```

DisableMenuUpdates() [static]

Description

Disable menu system updates.

Arguments

No arguments

Returns

No return value

Example

Disable menu system updates

```
DisableMenuUpdates();
```

EnableGraphWindowUpdates() [static]

Description

Enable Graph Window updates.

Arguments

No arguments

Returns

No return value

Example

Turn off graph window updates

```
EnableGraphWindowUpdates()
```

EnableMenuUpdates() [static]

Description

Enable menu system updates.

Arguments

No arguments

Returns

No return value

Example

Enable menu system updates

```
EnableMenuUpdates();
```

ErrorMessage(string*[Any valid javascript type]*) [static]

Description

Print an error message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as an error to the dialogue box

```
ErrorMessage("The title is " + m.title);
```

Execute(data*[object]*) [static]

Description

Execute a program or script outside T/HIS and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to program
program	string	The program you want to run. Note that on Linux this will consider PATH when resolving executable filenames without an absolute path. If you want to run something from the current directory and you do not have '.' in your PATH then you will need to write './something' as the program.

Returns

Object with the following properties:

Name	Type	Description
status	integer	The exit code from the program/script
stderr	string	The standard error output from the program/script
stdout	string	The standard output from the program/script

Return type

object

Example

To run script "example.bat" with arguments "foo" and "bar":

```
var output = Execute( { program: 'example.bat', arguments: [ 'foo', 'bar' ]} );
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Exit(write hook interrupt (optional)*[boolean]*) [static]

Description

Exit script

Arguments

- **write hook interrupt (optional)** (boolean)

If Exit() is called from a write_hook.js script, the first argument will be processed as in the following: If the argument is provided and set to "true", it is used to interrupt the write out of the model, so that the script exits without anything being written out. An argument value of "false" exits the script and allows the model to be written out as normal. An example of this function's use in a Write Hook script can be found at $OA_INSTALL/primer_library/scripts/hooks/example_write_hook.js.

Returns

No return value

Example

Exit with

```
Exit();
```

GetCurrentDirectory() [static]

Description

Get the current working directory

Arguments

No arguments

Returns

String containing current working directory

Return type

String

Example

To get the current directory:

```
var cwd = GetCurrentDirectory();
```

GetFtcfVar(name*[string]*) [static]

Description

Get the value of a FAST-TCF variable

Arguments

- **name** (string)

The FAST-TCF variable name (case independent)

Returns

String containing variable value or null if variable does not exist

Return type

String

Example

To get the value for FAST-TCF variable Job

```
var job_name = GetFtcfVar("Job");
```

GetInstallDirectory() [static]

Description

Get the directory in which executables are installed. This is the OA_INSTALL environment variable, or if that is not set the directory in which the current executable is installed. Returns NULL if not found

Arguments

No arguments

Returns

string

Return type

String

Example

To get the install directory:

```
var install_dir = GetInstallDirectory();
```

GetPreferenceValue(program*[string]*, name*[string]*) [static]

Description

Get the Preference value with the given string in the any of admin ("OA_ADMIN") or install ("OA_INSTALL") or home ("OA_HOME") directory oa_pref

Arguments

- **program** (string)

The program name string : Valid values are ’All’, ’D3PLOT’, ’PRIMER’, ’REPORTER’, ’SHELL’, ’T/HIS’

- **name** (string)

The preference name string

Returns

: String containing preference value or null if preference string is not present in any oa_pref. Also if none of the above environment variables are not present, then API simply returns null. While returning preference value, locked preference value in admin and then install oa_pref takes precedence over home oa_pref. If preference is not locked in any of these oa_pref, preference in home directory oa_pref is returned.

Return type

String

Example

To get the preference value:

```
var pref_list = GetPreferenceValue(’All’, "font_size");
```

GetStartInDirectory() [static]

Description

Get the directory passed to T/HIS by the -start_in command line argument

Arguments

No arguments

Returns

String containing start_in directory or NULL if not set

Return type

String

Example

To get the start_in directory:

```
var start_in = GetStartInDirectory();
```

Getenv(name*[string]*) [static]

Description

Get the value of an environment variable

Arguments

- **name** (string)

The environment variable name

Returns

String containing variable value or null if variable does not exist

Return type

String

Example

To get the value for environment variable HOME

```
var home = Getenv("HOME");
```

Message(string*[Any valid javascript type]*) [static]

Description

Print a message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print. If '\r' is added to the end of the string then instead of automatically adding a carriage return in the dialogue box, the next message will overwrite the current one. This may be useful for giving feedback to the dialogue box when doing an operation.

Returns

No return value

Example

To print the title of model object m as a message to the dialogue box

```
Message("The title is " + m.title);
```

MilliSleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* milliseconds. See also Sleep()

Arguments

- **time** (integer)

Number of milliseconds to pause for

Returns

No return value

Example

To pause for 500 milliseconds

```
MilliSleep(500);
```

NumberToString(number*[integer/real]*, width*[integer]*, pref_int (optional)*[boolean]*) [static]

Description

Formats a number to a string with the specified width.

Arguments

- **number** (integer/real)

The number you want to format.

- **width** (integer)

The width of the string you want to format it to (must be less than 80).

- **pref_int (optional)** (boolean)

By default only integer values inside the single precision 32 bit signed integer limit of approximately +/-2e9 are formatted as integers, all other numeric values are formatted as floats. With this argument set to TRUE then integer values up to the mantissa precision of a 64 bit float, approximately +/-9e15, will also be formatted as integers.

Returns

String containing the number

Return type

String

Example

To write the number 1.2345e+6 to a string 10 characters wide

```
var str = NumberToString(1.2345e+6, 10);
```

OpenManual(program*[string]*, page*[string]*) [static]

Description

Open the Oasys manuals at a requested page

Arguments

- **program** (string)

The program manual to open. Can be "primer", "d3plot" or "this"

- **page** (string)

The page to open in the manual, e.g. "running-this.html"

Returns

true if successful, false if not

Return type

Boolean

Example

To open the T/HIS manual on the running-this.html page

```
OpenManual("this", "running-this.html");
```

Plot() [static]

Description

Updates all the T/HIS graphs.

Arguments

No arguments

Returns

No return value

Example

Update all graphs

```
Plot();
```

Print(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!"

```
Print("Hello, world!");
```

To print the title of model object m with a carriage return

```
print("The title is " + m.title + "\n");
```

Println(string*[Any valid javascript type]*) [static]

Description

Print a string to stdout **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!" automatically adding a carriage return

```
Println("Hello, world!");
```

To print the title of model object m, automatically adding a carriage return

```
Println("The title is " + m.title);
```

ReturnFlag(flag*[Flag]*) [static]

Description

Return a flag used in the script. See also AllocateFlag() and

Arguments

- **flag** (Flag)

The flag to return.

Returns

No return value.

Example

To return flag f:

```
ReturnFlag(f);
```

SetCurrentDirectory(directory path*[string]*) [static]

Description

Sets the current working directory.

Arguments

- **directory path** (string)

Path to the directory you would like to change into.

Returns

true if successful, false if not

Return type

Boolean

Example

To change into the directory "/data/test" exists

```
SetCurrentDirectory("/data/test")
```

SetFtcfVar(name*[string]*) [static]

Description

Set the value of a FAST-TCF variable. If the variable already exists then it's value is updated

Arguments

- **name** (string)

The FAST-TCF variable name (case independent)

Returns

String containing variable value or null if variable does not exist

Return type

String

Example

To create a new FAST-TCF variable called run_number with the value "10"

```
var home = SetFtcfVar("run_number","10");
```

Sleep(time*[integer]*) [static]

Description

Pause execution of the script for *time* seconds. See also MilliSleep()

Arguments

- **time** (integer)

Number of seconds to pause for

Returns

No return value

Example

To pause for 2 seconds

```
Sleep(2);
```

System(string*[Any valid javascript type]*) [static]

Description

Do a system command outside T/HIS. To run an external command and get the output then please use Execute() instead.

Arguments

- **string** (Any valid javascript type)

The system command that you want to do

Returns

integer (probably zero if command successful but is implementation-dependant)

Return type

Number

Example

To make the directory "example"

```
System("mkdir example");
```

Unix() [static]

Description

Test whether script is running on a Unix/Linux operating system. See also Windows()

Arguments

No arguments

Returns

true if Unix/Linux, false if not

Return type

Boolean

Example

To test if the OS is Unix

```
if ( Unix() )
```

UpdateCurveMenu() [static]

Description

Updates the scroll bar in the Curve Manager. Useful if your script has created lots of new curves and you want to update the menu (otherwise, the scroll bar range will only be updated when the script exits).

Arguments

No arguments

Returns

No return value

Example

Update curve slider

```
UpdateCurveMenu();
```

WarningMessage(string*[Any valid javascript type]*) [static]

Description

Print a warning message to the dialogue box **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print the title of model object m as a warning to the dialogue box

```
WarningMessage("The title is " + m.title);
```

Windows() [static]

Description

Test whether script is running on a Windows operating system. See also Unix()

Arguments

No arguments

Returns

true if Windows, false if not

Return type

Boolean

Example

To test if the OS is Windows

```
if ( Windows() )
```

Colour class

The Colour class contains constants relating to colours. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetFromName(name*[string]*)
- RGB(red*[integer]*, green*[integer]*, blue*[integer]*)

Colour constants

Name	Description
Colour.BACKGROUND	Background colour
Colour.BLACK	Colour black
Colour.BLUE	Colour blue
Colour.CYAN	Colour cyan
Colour.DARK_GREEN	Colour dark green
Colour.DARK_GREY	Colour dark grey
Colour.DARK_MAGENTA	Colour dark magenta
Colour.FOREGROUND	Foreground colour
Colour.GOLD	Colour gold
Colour.GREEN	Colour green
Colour.HOT_PINK	Colour hot pink
Colour.INDIGO	Colour indigo
Colour.LIGHT_GREY	Colour light grey
Colour.LIGHT_PINK	Colour light pink
Colour.LIME	Colour lime
Colour.MAGENTA	Colour magenta
Colour.MAROON	Colour maroon
Colour.MEDIUM_BLUE	Colour medium blue
Colour.MEDIUM_GREEN	Colour medium green
Colour.MEDIUM_GREY	Colour medium grey
Colour.NAVY	Colour navy
Colour.OLIVE	Colour olive
Colour.ORANGE	Colour orange
Colour.PALE_YELLOW	Colourpale yellow

Colour.PINK	Colour pink
Colour.PURPLE	Colour purple
Colour.RED	Colour red
Colour.SEA_GREEN	Colour sea green
Colour.SKY	Colour sky
Colour.TURQUOISE	Colour turquoise
Colour.USER_1	Colour user defined 1
Colour.USER_2	Colour user defined 2
Colour.USER_3	Colour user defined 3
Colour.USER_4	Colour user defined 4
Colour.USER_5	Colour user defined 5
Colour.USER_6	Colour user defined 6
Colour.USER_n (n = 1 to 150)	n-th user defined colour
Colour.WHITE	Colour white
Colour.YELLOW	Colour yellow

Detailed Description

The Colour class is used to define colours:

```
p.colour = Colour.RED;
```

Details of functions

GetFromName(name*[string]*) [static]

Description

Returns the colour for a given core or user colour name

Arguments

- **name** (string)

The name of the colour, for example red or user_green or green/cyan.

Returns

colour value (integer)

Return type

Number

RGB(red*[integer]*, green*[integer]*, blue*[integer]*) [static]

Description

Creates a colour from red, green and blue components

Arguments

- **red** (integer)

red component of colour (0-255).

- **green** (integer)

green component of colour (0-255).

- **blue** (integer)

blue component of colour (0-255).

Returns

colour value (integer)

Return type

Number

Component class

The following component constants can be used in GetDataFlagged() in T/HIS.

Component constants

Constants for MODEL

Name	Description
Component.GSTP	Time step
Component.GKE	Kinetic energy
Component.GIE	Internal energy
Component.GSWE	Stonewall energy
Component.GSPE	Spring and damper energy
Component.GHG	Hourglass energy
Component.GSDE	System damping energy
Component.GJE	Joint internal energy
Component.GSIE	Sliding interface energy
Component.GEW	External work
Component.GRBE	Rigid Body stopper energy
Component.GTE	Total energy
Component.GTER	Total/initial energy
Component.GVX	Average X velocity
Component.GVY	Average Y velocity
Component.GVZ	Average Z velocity
Component.GTZC	Time per zone cycle
Component.GMASS	Total mass
Component.GMADD	Added mass
Component.GPM	%age Mass increase
Component.GEKE	Eroded Kinetic energy
Component.GEIE	Eroded Internal energy
Component.GEHG	Eroded Hourglass energy
Component.GER	Energy Ratio w/o Eroded
Component.DRCE	Current Distortional KE
Component.DRMX	Maximum Distortional KE
Component.DRCO	Convergence Factor
Component.DRKE	Total Kinetic energy
Component.LKE	Lumped Kinetic energy
Component.GMPE	Mat Plastic energy
Component.GMEE	Mat Elastic energy

Component.GMDE	Mat Damage energy
Component.GDIE	Dissipated IE
Component.GDKE	Dissipated KE
Component.GDE	Drilling energy

Constants for PART

Name	Description
Component.GKE	Kinetic energy
Component.GIE	Internal energy
Component.GHG	Hourglass energy
Component.GTE	Total energy
Component.GMX	X momentum
Component.GMY	Y momentum
Component.GMZ	Z momentum
Component.GVX	Average X velocity
Component.GVY	Average Y velocity
Component.GVZ	Average Z velocity
Component.GMASS	Mass
Component.GAM	Added mass
Component.GEKE	Eroded Kinetic energy
Component.GEIE	Eroded Internal energy
Component.GMPE	Mat Plastic energy
Component.GMEE	Mat Elastic energy
Component.GMDE	Mat Damage energy

Constants for NODE

Name	Description
Component.TEMP	Temperature
Component.DX	X Displacement
Component.DY	Y Displacement
Component.DZ	Z Displacement
Component.DM	Displacement Magnitude
Component.VX	X Velocity
Component.VY	Y Velocity
Component.VZ	Z Velocity
Component.VM	Velocity Magnitude
Component.AX	X Acceleration
Component.AY	Y Acceleration

Component.AZ	Z Acceleration
Component.AM	Acceleration Magnitude
Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.CV	Current Vector
Component.BX	Basic X co-ordinate
Component.BY	Basic Y co-ordinate
Component.BZ	Basic Z co-ordinate
Component.BV	Basic Vector
Component.RDX	X rotation
Component.RDY	Y rotation
Component.RDZ	Z rotation
Component.RDM	Rotation Magnitude
Component.RVX	X rotational velocity
Component.RVY	Y rotational velocity
Component.RVZ	Z rotational velocity
Component.RVM	Rotation Vel Magnitude
Component.RAX	X rotational acceleration
Component.RAY	Y rotational acceleration
Component.RAZ	Z rotational acceleration
Component.RAM	Rotation Accel Magnitude
Component.TFX	X Thermal Flux
Component.TFY	Y Thermal Flux
Component.TFZ	Z Thermal Flux
Component.TFM	Thermal Flux Magnitude
Component.TTOP	Top Temperature
Component.TBOT	Bottom Temperature

Constants for SOLID

Name	**Description**
Component.SXX	Stress in XX
Component.SYY	Stress in YY
Component.SZZ	Stress in ZZ
Component.SXY	Stress in XY
Component.SYZ	Stress in YZ
Component.SZX	Stress in ZX
Component.SMAX	MAX principal stress
Component.SMIN	MIN principal stress

Component.SMS	MAX shear stress
Component.SVON	von Mises stress
Component.SAV	Average stress (Pressure)
Component.STR	Triaxiality Factor
Component.EPL	Effective plastic strain
Component.EXX	Strain in XX
Component.EYY	Strain in YY
Component.EZZ	Strain in ZZ
Component.EXY	Strain in XY
Component.EYZ	Strain in YZ
Component.EZX	Strain in ZX
Component.EMAX	MAX principal strain
Component.EMIN	MIN principal strain
Component.EMS	MAX shear strain
Component.EVON	von Mises strain
Component.EAV	Average strain
Component.PEMAG	Plastic Strain Magnitude
Component.SOX	Extra data

Constants for BEAM

Name	**Description**
Component.BFX	Axial force
Component.BFY	Shear force in Y
Component.BFZ	Shear force in Z
Component.BMXX	Torsional moment
Component.BMYY	Moment in Y
Component.BMZZ	Moment in Z
Component.BSAX	Axial strain
Component.BPE1	Bending energy: end 1
Component.BPE2	Bending energy: end 2
Component.BRY1	Y rotation: end 1
Component.BRY2	Y rotation: end 2
Component.BRZ1	Z rotation: end 1
Component.BRZ2	Z rotation: end 2
Component.BRXX	Torsional rotation
Component.BMY1	Y Bending moment: end 1
Component.BMY2	Y Bending moment: end 2
Component.BMZ1	Z Bending moment: end 1
Component.BMZ2	Z Bending moment: end 2

Component.BACE	Axial collapse energy
Component.BIE	Internal energy
Component.BSXX	Axial stress
Component.BSXY	XY Shear stress
Component.BSZX	ZX Shear stress
Component.BEP	Effective plastic strain
Component.BEAX	Axial strain
Component.BDX	Relative Axial displacement
Component.BDY	Relative S - Displacement
Component.BDZ	Relative T - Displacement
Component.BRY	Rotation in S
Component.BRZ	Rotation in T
Component.BDNA	Relative Axial force
Component.BDNS	Resultant S - Force
Component.BDNT	Resultant T - Force
Component.BDMA	Axial moment
Component.BDMS	Moment in S
Component.BDMT	Moment in T
Component.BDDX	Axial Direction X
Component.BDDY	Axial Direction Y
Component.BDDZ	Axial Direction Z
Component.BDSX	S - Direction X
Component.BDSY	S - Direction Y
Component.BDSZ	S - Direction Z
Component.BDTX	T - Direction X
Component.BDTY	T - Direction Y
Component.BDTZ	T - Direction Z
Component.BEX	Extra data

Constants for SHELL

Name	**Description**
Component.SXX	Stress in XX
Component.SYY	Stress in YY
Component.SZZ	Stress in ZZ
Component.SXY	Stress in XY
Component.SYZ	Stress in YZ
Component.SZX	Stress in ZX
Component.SMAX	MAX principal stress
Component.SMIN	MIN principal stress

Component.SMS	MAX shear stress
Component.SVON	von Mises stress
Component.SAV	Average stress (Pressure)
Component.STR	Triaxiality Factor
Component.EPS	Effective plastic strain
Component.EXX	Strain in XX
Component.EYY	Strain in YY
Component.EZZ	Strain in ZZ
Component.EXY	Strain in XY
Component.EYZ	Strain in YZ
Component.EZX	Strain in ZX
Component.EMAX	MAX principal strain
Component.EMIN	MIN principal strain
Component.EMS	MAX shear strain
Component.EVON	von Mises strain
Component.EAV	Average strain
Component.PEMAG	Plastic Strain Magnitude
Component.RMX	Moment in X
Component.RMY	Moment in Y
Component.RMXY	Moment in XY
Component.RQX	Shear force in X
Component.RQY	Shear force in Y
Component.RFX	Normal force in X
Component.RFY	Normal force in Y
Component.RFXY	Normal force in XY
Component.THK	Thickness
Component.EDEN	Internal energy density
Component.SHX	Extra data

Constants for THICK_SHELL

Name	**Description**
Component.SXX	Stress in XX
Component.SYY	Stress in YY
Component.SZZ	Stress in ZZ
Component.SXY	Stress in XY
Component.SYZ	Stress in YZ
Component.SZX	Stress in ZX
Component.SMAX	MAX principal stress
Component.SMIN	MIN principal stress

Component.SMS	MAX shear stress
Component.SVON	von Mises stress
Component.SAV	Average stress (Pressure)
Component.STR	Triaxiality Factor
Component.EPL	Effective plastic strain
Component.EXX	Strain in XX
Component.EYY	Strain in YY
Component.EZZ	Strain in ZZ
Component.EXY	Strain in XY
Component.EYZ	Strain in YZ
Component.EZX	Strain in ZX
Component.EMAX	MAX principal strain
Component.EMIN	MIN principal strain
Component.EMS	MAX shear strain
Component.EVON	von Mises strain
Component.EAV	Average strain
Component.PEMAG	Plastic Strain Magnitude
Component.SHX	Extra data

Constants for RIGIDWALL

Name	**Description**
Component.FN	Normal force
Component.FX	Global X force
Component.FY	Global Y force
Component.FZ	Global Z force
Component.EN	Energy

Constants for SPRING

Name	**Description**
Component.SP_F	Resultant Force
Component.SP_E	Elongation
Component.SP_FE	Res Force v Elongation
Component.SP_FX	Global X force
Component.SP_FY	Global Y force
Component.SP_FZ	Global Z force
Component.SP_EN	Energy
Component.SP_M	Resultant Moment

Component.SP_R	Rotation
Component.SP_MR	Res Moment v Rotation
Component.SP_MX	Moment in X
Component.SP_MY	Moment in Y
Component.SP_MZ	Moment in Z

Constants for SEATBELT

Name	Description
Component.SB_F	Force
Component.SB_S	Strain
Component.SB_FS	Force v Strain
Component.SB_L	Current Length

Constants for RETRACTOR

Name	Description
Component.RT_F	Force
Component.RT_P	Pullout
Component.RT_FP	Force v Pullout

Constants for SLIPRING

Name	Description
Component.SR_P	Pull through
Component.SR_W	Warp Angle
Component.SR_S	Skew Angle
Component.SR_F	Friction Coeff
Component.SR_N	Normal Force
Component.SR_B1	Side 1 Belt Force
Component.SR_B2	Side 2 Belt Force

Constants for PRETENSIONER

Name	Description
Component.PR_FI	’Fired’ (= 1)

Constants for CONTACT

Name	Description

Component.CFXA	A Surface X force
Component.CFXS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface X force (alternative name for Component.CFXA) [deprecated]
Component.CFYA	A Surface Y force
Component.CFYS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Y force (alternative name for Component.CFYA) [deprecated]
Component.CFZA	A Surface Z force
Component.CFZS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Z force (alternative name for Component.CFZA) [deprecated]
Component.CFMA	A Surface Force Mag
Component.CFMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Force Mag (alternative name for Component.CFMA) [deprecated]
Component.CFXB	B Surface X force
Component.CFX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface X force (alternative name for Component.CFXB) [deprecated]
Component.CFYB	B Surface Y force
Component.CFY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Y force (alternative name for Component.CFYB) [deprecated]
Component.CFZB	B Surface Z force
Component.CFZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Z force (alternative name for Component.CFZB) [deprecated]
Component.CFMB	B Surface Force Mag
Component.CFM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Force Mag (alternative name for Component.CFMB) [deprecated]
Component.CMXA	A Surface X moment
Component.CMXS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface X moment (alternative name for Component.CMXA) [deprecated]
Component.CMYA	A Surface Y moment
Component.CMYS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Y moment (alternative name for Component.CMYA) [deprecated]
Component.CMZA	A Surface Z moment
Component.CMZS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Z moment (alternative name for Component.CMZA) [deprecated]
Component.CMXB	B Surface X moment
Component.CMX	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface X moment (alternative name for Component.CMXB) [deprecated]
Component.CMYB	B Surface Y moment

Component.CMY	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Y moment (alternative name for Component.CMYB) [deprecated]
Component.CMZB	B Surface Z moment
Component.CMZ	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Z moment (alternative name for Component.CMZB) [deprecated]
Component.CMA	A Surface Mass
Component.CMS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface Mass (alternative name for Component.CMA) [deprecated]
Component.CMB	B Surface Mass
Component.CMM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface Mass (alternative name for Component.CMB) [deprecated]
Component.CENA	A Surface side energy
Component.CENS	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. A Surface side energy (alternative name for Component.CENA) [deprecated]
Component.CENB	B Surface side energy
Component.CENM	This constant is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. B Surface side energy (alternative name for Component.CENB) [deprecated]
Component.CFRI	Frictional energy
Component.CTEN	Total energy

Constants for NODE_GROUP

Name	Description
Component.RFX	X force
Component.RFY	Y force
Component.RFZ	Z force
Component.RFM	Force Magnitude
Component.EN	Energy
Component.LFX	Local X force
Component.LFY	Local Y force
Component.LFZ	Local Z force
Component.GRFX	X force
Component.GRFY	Y force
Component.GRFZ	Z force
Component.GRFM	Force Magnitude
Component.GEN	Energy

Constants for AIRBAG

Name	Description

Component.PR	Pressure
Component.VOL	Volume
Component.DE	Density
Component.IE	Internal energy
Component.IN	Mass flow rate in
Component.OU	Mass flow rate out
Component.MIN	Mass in
Component.MOU	Mass out
Component.MASS	Total mass
Component.SA	Surface area
Component.TEMP	Gas temperature
Component.FR	Reaction force
Component.TKE	Translational KE
Component.IFE	Inflator Energy
Component.DMP	Damping Energy
Component.PP	Ave Particle Pressure
Component.MAF	Mass flow rate via fabric
Component.MAV	Mass flow rate via vent
Component.MOF	Mass out via fabric
Component.MOV	Mass out via vent
Component.AR	Total area
Component.PRP	+ve Pressure
Component.PRN	-ve Pressure
Component.HCE	Heat Convection Energy
Component.EV	Enhanced Vent Flag
Component.LE	Leak Energy
Component.GAS	Gas Flow rate
Component.PVO	Por Volume
Component.PTE	Part Temperature
Component.UN	Unblocked Area
Component.BA	Blocked Area
Component.LK	Leakage
Component.TRE	Translational Energy
Component.NP	Num Particles
Component.X	X co-ordinate
Component.Y	Y co-ordinate
Component.Z	Z co-ordinate
Component.VX	X Velocity
Component.VY	Y Velocity

Component.VZ	Z Velocity
Component.VM	Velocity Magnitude

Constants for JOINT

Name	**Description**
Component.FX	X force
Component.FY	Y force
Component.FZ	Z force
Component.FM	Force Magnitude
Component.MX	Moment in X
Component.MY	Moment in Y
Component.MZ	Moment in Z
Component.MM	Moment Magnitude
Component.EN	Energy
Component.PHA	Phi angle
Component.PHDT	d(Phi)/dt
Component.PHS	Phi stiffness moment
Component.PHD	Phi damping moment
Component.PHT	Phi total moment
Component.THA	Theta angle
Component.THDT	d(Theta)/dt
Component.THS	Theta stiffness moment
Component.THD	Theta damping moment
Component.THT	Theta total moment
Component.PSA	Psi angle
Component.PSDT	d(Psi)/dt
Component.PSS	Psi stiffness moment
Component.PSD	Psi damping moment
Component.PST	Psi total moment
Component.AA	Alpha angle
Component.ADT	d(Alpha)/dt
Component.ALS	Alpha stiffness moment
Component.ALD	Alpha damping moment
Component.ALT	Alpha total moment
Component.BA	Beta angle
Component.BDT	d(Beta)/dt
Component.BES	Beta stiffness moment
Component.BED	Beta damping moment
Component.BET	Beta total moment

Component.GA	Gamma angle
Component.GDT	d(Gamma)/dt
Component.GSF	Gamma scale factor
Component.DX	X displacement
Component.DXDT	d(X)/dt
Component.DY	Y displacement
Component.DYDT	d(Y)/dt
Component.DZ	Z displacement
Component.DZDT	d(Z)/dt
Component.SFX	X stiffness force
Component.SFY	Y stiffness force
Component.SFZ	Z stiffness force
Component.DFX	X damping force
Component.DFY	Y damping force
Component.DFZ	Z damping force
Component.TFX	X total force
Component.TFY	Y total force
Component.TFZ	Z total force
Component.DP	P displacement
Component.DPDT	d(P)/dt
Component.DR	R displacement
Component.DRDT	d(R)/dt
Component.SFP	P stiffness force
Component.SFR	R stiffness force
Component.DFP	P damping force
Component.DFR	R damping force
Component.TFP	P total force
Component.TFR	R total force

Constants for X_SECTION

Name	**Description**
Component.XSEC_FX	X force
Component.XSEC_FY	Y force
Component.XSEC_FZ	Z force
Component.XSEC_FM	Force Magnitude
Component.XSEC_MX	Moment in X
Component.XSEC_MY	Moment in Y
Component.XSEC_MZ	Moment in Z

Component.XSEC_MM	Moment Magnitude
Component.XSEC_CX	X centroid coord
Component.XSEC_CY	Y centroid coord
Component.XSEC_CZ	Z centroid coord
Component.XSEC_A	Area of section

Constants for SUBSYSTEM

Name	**Description**
Component.GKE	Kinetic energy
Component.GIE	Internal energy
Component.GHG	Hourglass energy
Component.GKR	Kinetic Energy Ratio
Component.GIR	Internal Energy Ratio
Component.GMX	X momentum
Component.GMY	Y momentum
Component.GMZ	Z momentum
Component.MASS	Total mass
Component.GCM	Center of mass
Component.GXCM	X Center of mass
Component.GYCM	Y Center of mass
Component.GZCM	Z Center of mass
Component.GI11	Inertia Tensor Row11
Component.GI12	Inertia Tensor Row12
Component.GI13	Inertia Tensor Row13
Component.GI21	Inertia Tensor Row21
Component.GI22	Inertia Tensor Row22
Component.GI23	Inertia Tensor Row23
Component.GI31	Inertia Tensor Row31
Component.GI32	Inertia Tensor Row32
Component.GI33	Inertia Tensor Row33
Component.GI1	Principal inertia i11
Component.GI2	Principal inertia i22
Component.GI3	Principal inertia i33
Component.GP11	Principal Directions Row11
Component.GP12	Principal Directions Row12
Component.GP13	Principal Directions Row13
Component.GP21	Principal Directions Row21
Component.GP22	Principal Directions Row22

Component.GP23	Principal Directions Row23
Component.GP31	Principal Directions Row31
Component.GP32	Principal Directions Row32
Component.GP33	Principal Directions Row33

Constants for PART_GROUP

Name	**Description**
Component.GKE	Kinetic energy
Component.GIE	Internal energy
Component.GHG	Hourglass energy
Component.GTE	Total energy
Component.GMADD	Added mass

Constants for GEOMETRIC_CONTACT

Name	**Description**
Component.FX	X force
Component.FY	Y force
Component.FZ	Z force
Component.FM	Force Magnitude
Component.MX	Moment in X
Component.MY	Moment in Y
Component.MZ	Moment in Z
Component.MM	Moment Magnitude

Constants for NODAL_RB

Name	**Description**
Component.DX	X Displacement
Component.DY	Y Displacement
Component.DZ	Z Displacement
Component.DM	Displacement Magnitude
Component.VX	X Velocity
Component.VY	Y Velocity
Component.VZ	Z Velocity
Component.VM	Velocity Magnitude
Component.AX	X Acceleration
Component.AY	Y Acceleration
Component.AZ	Z Acceleration
Component.AM	Acceleration Magnitude

Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.RDX	X rotation
Component.RDY	Y rotation
Component.RDZ	Z rotation
Component.RDM	Rotation Magnitude
Component.RVX	X rotational velocity
Component.RVY	Y rotational velocity
Component.RVZ	Z rotational velocity
Component.RVM	Rotation Vel Magnitude
Component.RAX	X rotational acceleration
Component.RAY	Y rotational acceleration
Component.RAZ	Z rotational acceleration
Component.RAM	Rotation Accel Magnitude
Component.D11	Direction Cosine 11
Component.D12	Direction Cosine 12
Component.D13	Direction Cosine 13
Component.D21	Direction Cosine 21
Component.D22	Direction Cosine 22
Component.D23	Direction Cosine 23
Component.D31	Direction Cosine 31
Component.D32	Direction Cosine 32
Component.D33	Direction Cosine 33
Component.LDX	Local X Displacement
Component.LDY	Local Y Displacement
Component.LDZ	Local Z Displacement
Component.LVX	Local X Velocity
Component.LVY	Local Y Velocity
Component.LVZ	Local Z Velocity
Component.LAX	Local X Acceleration
Component.LAY	Local Y Acceleration
Component.LAZ	Local Z Acceleration
Component.LRDX	Local X rotation
Component.LRDY	Local Y rotation
Component.LRDZ	Local Z rotation
Component.LRVX	Local X rotational vel
Component.LRVY	Local Y rotational vel
Component.LRVZ	Local Z rotational vel

Component.LRAX	Local X rotational accel
Component.LRAY	Local Y rotational accel
Component.LRAZ	Local Z rotational accel

Constants for WELD

Name	Description
Component.SW_F	Axial force
Component.SW_S	Shear force
Component.SW_FAIL	Failure
Component.SW_MF	Maximum Failure
Component.SW_LE	Length
Component.SW_TIME	Failure Time
Component.SW_TO	Torsion
Component.SW_MM	Moment Magnitude
Component.SW_FF	DC Failure Function
Component.SW_NF	Normal Failure
Component.SW_SF	Shear Failure
Component.SW_BF	Bending Failure
Component.SW_AREA	Spotweld Area

Constants for SPC

Name	Description
Component.SPC_FX	X Force
Component.SPC_FY	Y Force
Component.SPC_FZ	Z Force
Component.SPC_FM	Force Magnitude
Component.SPC_MX	Moment in X
Component.SPC_MY	Moment in Y
Component.SPC_MZ	Moment in Z
Component.SPC_MM	Moment Magnitude
Component.SPC_XTF	X Total Set Force
Component.SPC_YTF	Y Total Set Force
Component.SPC_ZTF	Z Total Set Force
Component.SPC_RF	Resultant Set Force
Component.SPC_XMF	X Total Model Force

Component.SPC_YMF	Y Total Model Force
Component.SPC_ZMF	Z Total Model Force
Component.SPC_RMF	Resultant Model Force

Constants for BOUNDARY

Name	Description
Component.FX	Applied X Force
Component.FY	Applied Y Force
Component.FZ	Applied Z Force
Component.FR	Applied Resultant force
Component.MX	Applied X Moment
Component.MY	Applied Y Moment
Component.MZ	Applied Z Moment
Component.MM	Applied Moment Magnitude
Component.EN	Energy from applied force

Constants for FSI

Name	Description
Component.PR	Pressure
Component.FX	X force
Component.FY	Y force
Component.FZ	Z force
Component.FM	Force Magnitude
Component.MP	Mass (Porous+Vent)
Component.ML	Mass (Leakage)
Component.LFX	Leakage X Force
Component.LFY	Leakage Y Force
Component.LFZ	Leakage Z Force
Component.LFM	Leakage Force Magnitude
Component.TEMP	Temperature
Component.TC	Temperature Change
Component.X	X co-ordinate
Component.Y	Y co-ordinate
Component.Z	Z co-ordinate
Component.SO	Cpld Solid ID

Constants for SPH

Name	Description

Component.DE	Density
Component.EXX	Strain in XX
Component.EYY	Strain in YY
Component.EZZ	Strain in ZZ
Component.EXY	Strain in XY
Component.EYZ	Strain in YZ
Component.EZX	Strain in ZX
Component.EFS	Effective Stress
Component.SXX	Stress in XX
Component.SYY	Stress in YY
Component.SZZ	Stress in ZZ
Component.SXY	Stress in XY
Component.SYZ	Stress in YZ
Component.SZX	Stress in ZX
Component.SM	Smoothing Length
Component.TEMP	Temperature
Component.ERXX	Strain in XX
Component.ERYY	Strain in YY
Component.ERZZ	Strain in ZZ
Component.ERXY	Strain in XY
Component.ERYZ	Strain in YZ
Component.ERZX	Strain in ZX

Constants for TRACER

Name	**Description**
Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.CV	Current Vector
Component.VX	X Velocity
Component.VY	Y Velocity
Component.VZ	Z Velocity
Component.VM	Velocity Magnitude
Component.SXX	Stress in XX
Component.SYY	Stress in YY
Component.SZZ	Stress in ZZ
Component.SXY	Stress in XY
Component.SYZ	Stress in YZ
Component.SZX	Stress in ZX

Component.EPL	Effective Plastic Strain
Component.DE	Density
Component.RV	Relative Volume
Component.AC	Active

Constants for PULLEY

Name	Description
Component.PL_FT	Force
Component.PL_SL	Slip
Component.PL_SR	Slip Rate
Component.PL_AN	Wrap Angle

Constants for ICFD

Name	Description
Component.FPX	X Pressure Drag
Component.FPY	Y Pressure Drag
Component.FPZ	Z Pressure Drag
Component.FPM	Pressure Drag Magnitude
Component.FVX	X Viscous Drag
Component.FVY	Y Viscous Drag
Component.FVZ	Z Viscous Drag
Component.FVM	Viscous Drag Magnitude
Component.MPX	MX Pressure Drag
Component.MPY	MY Pressure Drag
Component.MPZ	MZ Pressure Drag
Component.MPM	Pressure Drag Magnitude
Component.MVX	MX Viscous Drag
Component.MVY	MY Viscous Drag
Component.MVZ	MZ Viscous Drag
Component.MVM	Viscous Drag Magnitude
Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.CV	Current Vector
Component.VX	X Velocity
Component.VY	Y Velocity
Component.VZ	Z Velocity
Component.VM	Velocity Magnitude

Component.AVX	X AVelocity
Component.AVY	Y AVelocity
Component.AVZ	Z AVelocity
Component.AVM	AVelocity Magnitude
Component.PR	Pressure
Component.PA	Average Pressure
Component.DE	Density
Component.VTX	X Vorticity
Component.VTY	Y Vorticity
Component.VTZ	Z Vorticity
Component.VTM	Vorticity Magnitude
Component.QC	Q Criterion
Component.VC	Viscosity
Component.VT	Viscous Turbulence
Component.LS	Level Set Function
Component.A	Alpha
Component.TEMP	Temperature
Component.TAA	Temp Area Average
Component.TSA	Temp Sum Average
Component.TEH	Average Heat Flux
Component.AR	Total Area
Component.HTC	Heat Transfer Coeff

Constants for CESE

Name	**Description**
Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.CV	Current Vector
Component.VX	X Velocity
Component.VY	Y Velocity
Component.VZ	Z Velocity
Component.VM	Velocity Magnitude
Component.VTX	X Vorticity
Component.VTY	Y Vorticity
Component.VTZ	Z Vorticity
Component.VTM	Vorticity Magnitude
Component.DE	Density
Component.PR	Pressure

Component.TEMP	Temperature
Component.FPX	X Pressure Force
Component.FPY	Y Pressure Force
Component.FPZ	Z Pressure Force
Component.FPM	Pressure Force Magnitdue
Component.FVX	X Viscous Force
Component.FVY	Y Viscous Force
Component.FVZ	Z Viscous Force
Component.FVM	Viscous Force Magnitude
Component.AR	Total Area

Constants for EM

Name	**Description**
Component.CX	X co-ordinate
Component.CY	Y co-ordinate
Component.CZ	Z co-ordinate
Component.CV	Current Vector
Component.ECX	X Current
Component.ECY	Y Current
Component.ECZ	Z Current
Component.ECM	Current Magnitude
Component.BFDX	X BField
Component.BFDY	Y BField
Component.BFDZ	Z BField
Component.BFDM	BField Magnitude
Component.AFX	X AField
Component.AFY	Y AField
Component.AFZ	Z AField
Component.AFM	AField Magnitude
Component.S	Sigma
Component.MUR	Relative Permeability
Component.JHR	Joule Heating Rate
Component.LOFX	X Lorentz Force
Component.LOFY	Y Lorentz Force
Component.LOFZ	Z Lorentz Force
Component.LOFM	Lorentz Force Magnitude
Component.EFX	X EField
Component.EFY	Y EField
Component.EFZ	Z EField

Component.EFM	EField Magnitude
Component.ECV	Voltage
Component.ECC	Charge
Component.ECCT	Current
Component.ECRD	Circuit Resistance
Component.ECRJ	Equivalent Resistance
Component.ECI	Inductance
Component.ECM1	Mutual Inductance 1
Component.ECM2	Mutual Inductance 2
Component.ECM3	Mutual Inductance 3
Component.ECDV	Voltage
Component.ECDC	Charge
Component.ECDT	Current
Component.ECDE	Total Energy
Component.PLFX	X Lorentz Force
Component.PLFY	Y Lorentz Force
Component.PLFZ	Z Lorentz Force
Component.PLFM	M Lorentz Force
Component.PJHE	Joule Heating Energy
Component.PMAG	Magnetic Energy
Component.PKIN	Kinetic Energy
Component.PPLA	Plastic Energy
Component.EIV	Voltage
Component.EICT	Current
Component.ECRC	Contact Current
Component.ECRR	Contact Resistance
Component.ECRA	Contact Area
Component.EBV	Voltage
Component.EBC	Current
Component.EBA	Area
Component.ECT	Current
Component.ERD	Contact Resistance
Component.POW	Power
Component.ENE	Energy
Component.TVO	TotVoltage
Component.OCV	OCV
Component.DVO	DampVoltage
Component.RCT	Current
Component.SOC	SOC

Component.SOF	SOCFunc
Component.SOS	SOCShift
Component.SOM	SOCSum
Component.RR0	R0
Component.R10	R10
Component.C10	C10
Component.TEM	Temp
Component.CNM	Ckt Number
Component.ERVC	Volume Current
Component.ERSC	Surface Current
Component.ERVM	Magnetic Field
Component.RUN	Run timestep
Component.CFL	Condition timestep
Component.RBC	Ratio
Component.VC2	VC2
Component.VC3	VC3
Component.R20	R20
Component.R30	R30
Component.C20	C20
Component.C30	C30
Component.OHP	Ohm Heat Power
Component.RHP	Reversible Heat Power
Component.ECP	Equivalent Capacity Power
Component.OHE	Ohm heat energy
Component.RHE	Reversible heat energy
Component.ECE	Equivalent Capacity energy
Component.ESE	Equivalent storage energy
Component.ECJH	Ext ckt Joule Heating
Component.ECME	Ext ckt Magnetic Energy
Component.ECCE	Ext ckt Capacitor Energy
Component.MJH	Mesh conductor Joule Heating
Component.MME	Mesh conductor Mag Energy
Component.AME	Air Magnetic Energy
Component.TEE	Total EM Energy
Component.TPE	Total Plastic Energy
Component.TKE	Total kinetic Energy
Component.MSR	Maximum short resistance
Component.NSC	Number of short circuits
Component.TNC	Total number of circuits

Component.TSR	Total short resistance
Component.MXR	Maximum resistance
Component.SHC	Short circuits
Component.TOC	Total circuits
Component.TOR	Total resistance
Component.ARS	Area short

Constants for PBLAST

Name	Description
Component.AIE	Air Internal Energy
Component.DPIE	Detn Product IE
Component.OIE	Outside Domain IE
Component.ATE	Air Translational E
Component.DPTE	Detn Product Trans E
Component.OTE	Outside Domain Trans E
Component.APR	Air Pressure
Component.DPPR	Detn Product Pressure
Component.RPR	Resultant Pressure
Component.AR	Surface Area
Component.AFX	Air X Force
Component.AFY	Air Y Force
Component.AFZ	Air Z Force
Component.DPFX	Detn Product X Force
Component.DPFY	Detn Product Y Force
Component.DPFZ	Detn Product Z Force
Component.RFX	Resultant X Force
Component.RFY	Resultant Y Force
Component.RFZ	Resultant Z Force

Constants for PRTUBE

Name	Description
Component.AR	Cross section area
Component.DE	Density
Component.PR	Pressure
Component.VEL	Velocity

Constants for BEARING

Name	Description

Component.FX	X Force
Component.FY	Y Force
Component.FZ	Z Force
Component.MX	X Moment
Component.MY	Y Moment
Component.MZ	Z Moment
Component.DX	X Displacement
Component.DY	Y Displacement
Component.DZ	Z Displacement
Component.AX	X Angle
Component.AY	Y Angle
Component.AZ	Z Angle
Component.LFX	Local X Force
Component.LFY	Local Y Force
Component.LFZ	Local Z Force
Component.LMX	Local X Moment
Component.LMY	Local Y Moment
Component.LMZ	Local Z Moment
Component.LDX	Local X Displacement
Component.LDY	Local Y Displacement
Component.LDZ	Local Z Displacement
Component.LAX	Local X Angle
Component.LAY	Local Y Angle
Component.LAZ	Local Z Angle

Constants for CURVOUT

Name	**Description**
Component.COUT	CURVOUT

Constants for index

Name	**Description**
Component. js_label	button_label

Constant class

The Constant class defines various constants. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Constant constants

Constants for Surface

Name	Description
Constant.BOTTOM	Bottom shell surface
Constant.MIDDLE	Middle shell surface
Constant.TOP	Top shell surface

Detailed Description

The Constant class gives you access to various constants that are used in the T/HIS API. They are defined in the Constant class so the global namespace is not polluted. See the documentation below for more details.

Curve class

The Curve class gives you access to curves in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AddFlaggedToGraph(flag*[Flag]*, graph (optional)*[int]*)
- Copy(source*[integer]*, target*[integer]*)
- Delete(curve*[integer]*)
- DeleteFlagged(flag*[Flag]*)
- Exists(curve*[integer]*)
- First()
- FirstFreeID()
- FirstID()
- FlagAll(flag*[integer]*)
- GetFlagged(flag*[Flag]*)
- GetFromID(ID*[integer]*)
- GetFromTag(TAG*[string]*)
- HighestID()
- Pick(prompt*[string]*, modal (optional)*[boolean]*)
- RemoveFlaggedFromGraph(flag*[Flag]*, graph (optional)*[int]*)

Curve constants

Name	Description
Curve.AFTER	Insertion of curve data option.
Curve.BEFORE	Insertion of curve data option.

Curve properties

Name	Type	Description

average (read only)	real	Curve average value
colour	integer	The Colour of the curve
directory	string	Directory the curve came from
entity_id	integer	The ID of the entity that the curve was generated from.
entity_type	integer	The Entity type that the curve was generated from
file	string	Filename the curve came from
hic (read only)	real	Curve HIC value - returns 0.0 if the HIC hasn't been calculated
hic_tmax (read only)	real	End of HIC time windows - returns 0.0 if the HIC hasn't been calculated
hic_tmin (read only)	real	Start of HIC time windows - returns 0.0 if the HIC hasn't been calculated
hicd (read only)	real	Curve HIC(d) value - returns 0.0 if the HIC(d) hasn't been calculated
hicd_tmax (read only)	real	End of HIC(d) time windows - returns 0.0 if the HIC(d) hasn't been calculated
hicd_tmin (read only)	real	Start of HIC(d) time windows - returns 0.0 if the HIC(d) hasn't been calculated
id (read only)	integer	Curve ID
is_null (read only)	integer	Returns 1 if the curve is NULL
label	string	Curve label
model	integer	The ID of the model that a curve was read from.
npoints (read only)	integer	Number of curve points
regr_rsq (read only)	real	Pearson's R^2 value for regression curve, returns 0.0 if the curve has not come from the regression operation.
regr_sdgrad (read only)	real	Standard deviation of the linear regression gradient value, returns 0.0 if the curve has not come from linear regression.
regr_sdicpt (read only)	real	Standard deviation of the linear regression intercept value, returns 0.0 if the curve has not come from linear regression.
regr_sdyx (read only)	real	Standard deviation of the linear regression values 'y = bx + c', returns 0.0 if the curve has not come from linear regression.
rms (read only)	real	Curve RMS value
style	integer	The LineStyle used to draw the curve
symbol	integer	The Symbol style for a curve
tag	string	Curve tag. If a FAST-TCF script is running then this is the FAST-TCF tag
title	string	Curve title
tms (read only)	real	3ms Clip value - returns 0.0 if the 3ms Clip value hasn't been calculated
tms_tmax (read only)	real	End of 3ms clip time windows - returns 0.0 if the 3ms Clip hasn't been calculated
tms_tmin (read only)	real	Start of 3ms clip time windows - returns 0.0 if the 3ms Clip hasn't been calculated
unit_system	integer	The Curve UnitSystem
width	integer	The LineWidth used to draw the curve

x_at_ymax (read only)	real	X axis value at the Y axis maximum
x_at_ymin (read only)	real	X axis value at the Y axis minimum
x_axis_label	string	Curve X axis label
x_axis_unit	integer	The X axis Units
xmax (read only)	real	X axis maximum value
xmin (read only)	real	X axis minimum value
y_axis_label	string	Curve Y axis label
y_axis_unit	integer	The Y axis Units
ymax (read only)	real	Y axis maximum value
ymin (read only)	real	Y axis minimum value

Detailed Description

The Curve class allows you to create, modify, edit and manipulate curves. See the documentation below for more details.

Constructor

new Curve(lcid*[integer]*, tag (optional)*[string]*, Line label (optional)*[string]*, X-axis label (optional)*[string]*, Y-axis label (optional)*[string]*)

Description

Create a new Curve object. The curve will be added to all the currently active graphs.

Arguments

- **lcid** (integer)

Curve number

- **tag (optional)** (string)

Tag used to reference the curve in FAST-TCF scripts

- **Line label (optional)** (string)

Line label for the curve

- **X-axis label (optional)** (string)

X-axis label for the curve

- **Y-axis label (optional)** (string)

Y-axis label for the curve

Returns

Curve object

Return type

Curve

Example

To create a new curve with label 200

```
var l = new Curve(200);
```

Details of functions

AddFlaggedToGraph(flag*[Flag]*, graph (optional)*[int]*) [static]

Description

Adds flagged curves to a graph.

Arguments

- **flag** (Flag)

Flag to check on the curve

- **graph (optional)** (int)

Graph to add the curve to. If undefined then the curve is added to all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To add curves flagged with flag f to graphs 1 and 3:

```
Curve.AddFlaggedToGraph(f,1,3);
```

To add curves flagged with flag to all graphs:

```
Curve.AddToGraph(f);
```

AddPoint(xvalue*[real]*, yvalue*[real]*)

Description

Adds a point at the end of the curve.

Arguments

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

Returns

No return value.

Example

To add the point x=3.5, y=5.5 to curve l:

```
l.AddPoint(3.5,5.5);
```

AddToGraph(graph (optional)*[int]*)

Description

Adds a curve to a graph.

Arguments

- **graph (optional)** (int)

Graph to add the curve to. If undefined then the curve is added to all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To add a curve (c) to graphs 1 and 3:

```
c.AddToGraph(1,3);
```

To add a curve (c) to all graphs:

```
c.AddToGraph();
```

ClearFlag(flag*[integer]*)

Description

Clears a flag on the curve.

Arguments

- **flag** (integer)

Flag to clear on the curve

Returns

No return value

Example

To clear flag f for curve l:

```
l.ClearFlag(f);
```

Copy(source*[integer]*, target*[integer]*) [static]

Description

Copies a curve.

Arguments

- **source** (integer)

ID of curve to copy from

- **target** (integer)

ID of curve to copy to

Returns

No return value

Example

To copy curve 1 to curve 4:

```
Curve.Copy(1,4);
```

To copy curve a to curve b,

```
Curve.Copy(a.id,b.id);
```

Delete(curve*[integer]*) [static]

Description

Deletes a curve

Arguments

- **curve** (integer)

ID of curve to delete

Returns

No return value

Example

To delete curve n

```
Curve.Delete(n);
```

DeleteFlagged(flag*[Flag]*) [static]

Description

Deletes flagged curves

Arguments

- **flag** (Flag)

Flag to check on the curve

Returns

No return value

Example

To delete curves flagged with flag f

```
Curve.DeleteFlagged(f);
```

DeletePoint(ipt*[integer]*)

Description

Deletes a point in a curve. The input for the point number should start at 1 for the 1st point not zero.

Arguments

- **ipt** (integer)

The point you want to insert the data before or after.

Returns

No return value.

Example

To delete the 3rd point in curve l:

```
l.DeletePoint(3);
```

Exists(curve*[integer]*) [static]

Description

Checks if a curve exists

Arguments

- **curve** (integer)

ID of curve to check

Returns

TRUE if the curve exists, otherwise FALSE

Return type

Boolean

Example

To check if a curve n exists

```
var exists = Curve.Exists(n);
```

First() [static]

Description

Returns the first curve.

Arguments

No arguments

Returns

Curve object (or null if there are no more curves in the model).

Return type

Curve

Example

To get the 1st curve

```
var curve = Curve.First();
```

FirstFreeID() [static]

Description

Returns the ID of the first free curve.

Arguments

No arguments

Returns

ID of first unsued curve.

Return type

Number

Example

To get the ID of the first free curve:

```
var curve = Curve.FirstFreeID();
```

FirstID() [static]

Description

Returns the ID of the first curve.

Arguments

No arguments

Returns

ID of the first curve defined.

Return type

Number

Example

To get the 1st curve

```
var curve = Curve.FirstID();
```

FlagAll(flag*[integer]*) [static]

Description

Flags all of the curves with a defined flag

Arguments

- **flag** (integer)

Flag to set on the curves

Returns

No return value

Example

To flag all of the curves with flag f:

```
Curve.FlagAll(f);
```

Flagged(flag*[integer]*)

Description

Checks if the curve is flagged or not.

Arguments

- **flag** (integer)

Flag to check on the curve

Returns

true if flagged, false if not.

Return type

Boolean

Example

To check if curve d has flag f set on it:

```
if (d.Flagged(f) ) do_something...
```

Freeze(graph*[integer]*, Freeze option*[integer]*)

Description

Freezes an unblanked curve on one or all graphs.

Arguments

- **graph** (integer)

Graph number to freeze curve on or 0 for all graphs.

- **Freeze option** (integer)

No argument or 1 to freeze the curve, 0 to unfreeze.

Returns

No return value

Example

To freeze a curve c on graph 3:

```
c.Freeze(3,1)
```

GetFlagged(flag*[Flag]*) [static]

Description

Returns an array of all curves flagged with a given flag.

Arguments

- **flag** (Flag)

Flag for which to return flagged objects.

Returns

Array of Curve objects (or null if no curves are flagged)

Return type

Array

Example

To get the curves flagged with flag f:

```
var curve_array = Curve.GetFlagged(f);
```

GetFromID(ID*[integer]*) [static]

Description

Returns the curve object for a curve ID.

Arguments

- **ID** (integer)

ID of curve to return object for

Returns

Curve object (or null if the curve does not exist.

Return type

Curve

Example

To get the curve n

```
var curve = Curve.GetFromID(n);
```

GetFromTag(TAG*[string]*) [static]

Description

Finds a curve from it’s Tag. This function is only available when running a Javascript from within a FAST-TCF script

Arguments

- **TAG** (string)

TAG of curve to return object for

Returns

Curve object (or null if there are no free curves).

Return type

Curve

Example

To get the curve with a tag "tag"

```
var curve = Curve.GetFromTag(tag);
```

GetPoint(row*[integer]*)

Description

Returns x and y data for a point in a curve. The input for the point number should start at 1 for the 1st point not zero. In the array returned array[0] contains the x axis value and array[1] contains the y-axis value.

Arguments

- **row** (integer)

The point you want the data for.

Returns

Array of point values

Return type

array

Example

To get the curve data for the 3rd point for curve l:

```
if (l.npoints >= 3)
{
    var point_data = l.GetPoint(3);
}
```

HighestID() [static]

Description

Returns the ID of the highest curve currently being used

Arguments

No arguments

Returns

ID of highest curve currently being used.

Return type

Number

Example

To get the highest curve ID

```
var id= Curve.HighestID();
```

InsertPoint(ipt*[integer]*, xvalue*[real]*, yvalue*[real]*, position*[integer]*)

Description

Inserts a new point before or after the specified point.

Arguments

- **ipt** (integer)

The point you want to insert the data before or after.

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

- **position** (integer)

Specify either before or after the selected pioint. Use ’Curve.BEFORE’ for before, and ’Curve.AFTER’ for after.

Returns

No return value.

Example

To insert the values after the 3rd row to x=3, y=5 for curve l:

```
l.InsertPoint(3, 3, 5, Curve.AFTER);
```

Next()

Description

Returns the next curve in the model.

Arguments

No arguments

Returns

Curve object (or null if there are no more curves in the model).

Return type

Curve

Example

To get the curve in model m after curve l:

```
var curve = l.Next();
```

Pick(prompt*[string]*, modal (optional)*[boolean]*) [static]

Description

Picks a single curve.

Arguments

- **prompt** (string)

Text to display as a prompt to the user

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in T/HIS until this window is dismissed). If omitted the selection will be modal.

Returns

Curve object (or null if the user cancels the pick operation).

Return type

Curve

Example

To pick a curve, giving the prompt 'Pick curve':

```
var curve = Curve.Pick('Pick curves');
```

Previous()

Description

Returns the previous curve in the model.

Arguments

No arguments

Returns

Curve object (or null if there are no more curves in the model).

Return type

Curve

Example

To get the curve in model m before this one:

```
var curve = curve.Previous();
```

RemoveFlaggedFromGraph(flag*[Flag]*, graph (optional)*[int]*) [static]

Description

Removes flagged curves from a graph.

Arguments

- **flag** (Flag)

Flag to check on the curve

- **graph (optional)** (int)

Graph to remove the curve from. If undefined then the curve is removed from all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To remove curves flagged with flag f from graphs 1 and 3:

```
Curve.RemoveFlaggedFromGraph(f,1,3);
```

To remove curves flagged with flag f from all graphs:

```
Curve.RemoveFlaggedFromGraph(f);
```

RemoveFromGraph(graph (optional)*[int]*)

Description

Removes a curve from a graph.

Arguments

- **graph (optional)** (int)

Graph to remove the curve from, If undefined then the curve is removed from all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To remove a curve (c) from graphs 1 and 3:

```
c.RemoveFromGraph(1,3);
```

To remove a curve (c) from all graphs:

```
c.RemoveFromGraph();
```

Select(flag*[integer]*, prompt*[string]*, modal (optional)*[boolean]*) [static]

Description

Allows the user to select curves.

Arguments

- **flag** (integer)

Flag to use when selecting curves

- **prompt** (string)

Text to display as a prompt to the user

- **modal (optional)** (boolean)

If selection is modal (blocks the user from doing anything else in T/HIS until this window is dismissed). If omitted the selection will be modal.

Returns

Number of items selected or null if menu cancelled

Return type

Number

Example

To select curves, flagging those selected which flag f, giving the prompt 'Select curves':

```
var num = Curve.Select(f, 'Select curves');
```

SetFlag(flag*[integer]*)

Description

Sets a flag on the curve.

Arguments

- **flag** (integer)

Flag to set on the curve

Returns

No return value

Example

To set flag f for curve l:

```
l.SetFlag(f);
```

SetPoint(ipt*[integer]*, xvalue*[real]*, yvalue*[real]*)

Description

Sets the x and y values for a specified point in a curve.

Arguments

- **ipt** (integer)

The point to set the data for.

- **xvalue** (real)

The x value of the point.

- **yvalue** (real)

The y value of the point.

Returns

No return value.

Example

To set the values for the 3rd point to x=3, y=5 for curve l:

```
l.SetPoint(3, 3, 5);
```

UnflagAll(flag*[integer]*) [static]

Description

Unsets a defined flag on all of the curves.

Arguments

- **flag** (integer)

Flag to unset on the curves

Returns

No return value

Example

To unset the flag f on all of the curves:

```
Curve.UnflagAll(f);
```

Update()

Description

Updates a curve properties (min,max, average values etc).

Arguments

No arguments

Returns

No return value.

Example

To update the properties of curve l:

```
l.Update();
```

YatX(xvalue*[real]*)

Description

Returns the y value of the curve at a given x value, interpolating if requested x value lies between data points.

Arguments

- **xvalue** (real)

The x value.

Returns

Y value

Return type

real

Example

To get the y value of curve c when x=1.4:

```
var y = c.YatX(1.4);
```

Datum class

The Datum class gives you access to datums in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Delete(datum*[string]*)
- Exists(datum*[string]*)
- First()
- GetFromAcronym(datum*[string]*)

Member functions

- AddToGraph(graph (optional)*[int]*)
- IsOnGraph(graph*[int]*)
- Next()
- RemoveFromGraph(graph (optional)*[int]*)

Datum constants

Name	Description
Datum.CONSTANT_X	Constant X type datum.
Datum.CONSTANT_Y	Constant Y type datum.
Datum.CONSTANT_Y2	Constant Y2 type datum.
Datum.FILL_ABOVE_BELOW	Fill datum above and below.
Datum.FILL_RIGHT_LEFT	Fill datum right and left.
Datum.LABEL_10_POINT	Label font size 10.
Datum.LABEL_12_POINT	Label font size 12.
Datum.LABEL_14_POINT	Label font size 14.
Datum.LABEL_18_POINT	Label font size 16.
Datum.LABEL_24_POINT	Label font size 24.
Datum.LABEL_8_POINT	Label font size 8.
Datum.LABEL_ABOVE_CENTRE	Label position above centre.
Datum.LABEL_ABOVE_LEFT	Label position above left.
Datum.LABEL_ABOVE_RIGHT	Label position above right.
Datum.LABEL_AUTOMATIC	Label automatic font size.
Datum.LABEL_BELOW_CENTRE	Label position below centre.
Datum.LABEL_BELOW_LEFT	Label position below left.
Datum.LABEL_BELOW_RIGHT	Label position below right.

Datum.LABEL_BOTTOM_LEFT	Label position bottom left.
Datum.LABEL_BOTTOM_RIGHT	Label position bottom right.
Datum.LABEL_COURIER_BOLD	Label Courier bold font.
Datum.LABEL_COURIER_MEDIUM	Label Courier medium font.
Datum.LABEL_DEFAULT	Label default font.
Datum.LABEL_HELVETICA_BOLD	Label Helvetica bold font.
Datum.LABEL_HELVETICA_MEDIUM	Label Helvetica medium font.
Datum.LABEL_HORIZONTAL	Label horizonal orientation.
Datum.LABEL_MIDDLE_LEFT	Label position middle left.
Datum.LABEL_MIDDLE_RIGHT	Label position middle right.
Datum.LABEL_NONE	No label.
Datum.LABEL_TIMES_BOLD	Label Times bold font.
Datum.LABEL_TIMES_MEDIUM	Label Times medium font.
Datum.LABEL_TOP_LEFT	Label position top left.
Datum.LABEL_TOP_RIGHT	Label position top right.
Datum.LABEL_VERTICAL	Label vertical orientation.
Datum.POINTS	Points type datum.

Datum properties

Name	Type	Description
acronym	string	Datum acronym
fill_colour_above	Colour	The colour above the datum line
fill_colour_below	Colour	The colour below the datum line
fill_colour_between	Colour	The colour in between the datum line and the optional second datum line
fill_colour_left	Colour	The colour left of the datum line
fill_colour_right	Colour	The colour right of the datum line
fill_type	integer	The fill type. Can be Datum.FILL_ABOVE_BELOW, Datum.FILL_RIGHT_LEFT. Note that this can only be changed if the datum is of the type Datum.POINTS.
label	string	Datum label
label2	string	Label for optional 2nd datum line
label_colour	Colour	The colour of the datum label
label_font	integer	The label font. Can be Datum.LABEL_DEFAULT, Datum.LABEL_HELVETICA_BOLD, Datum.LABEL_HELVETICA_MEDIUM, Datum.LABEL_TIMES_BOLD, Datum.LABEL_TIMES_MEDIUM, Datum.LABEL_COURIER_BOLD, Datum.LABEL_COURIER_MEDIUM
label_orientation	integer	The orientation of the label. Can be Datum.LABEL_HORIZONTAL, Datum.LABEL_VERTICAL

label_position	integer	The label position. Can be Datum.LABEL_NONE, Datum.LABEL_ABOVE_CENTRE, Datum.LABEL_ABOVE_LEFT, Datum.LABEL_ABOVE_RIGHT, Datum.LABEL_BELOW_CENTRE, Datum.LABEL_BELOW_LEFT, Datum.LABEL_BELOW_RIGHT, Datum.LABEL_MIDDLE_LEFT, Datum.LABEL_TOP_LEFT, Datum.LABEL_BOTTOM_LEFT, Datum.LABEL_MIDDLE_RIGHT, Datum.LABEL_TOP_RIGHT, Datum.LABEL_BOTTOM_RIGHT
label_size	integer	The label font size. Can be Datum.LABEL_AUTOMATIC, Datum.LABEL_8_POINT, Datum.LABEL_10_POINT, Datum.LABEL_12_POINT, Datum.LABEL_14_POINT, Datum.LABEL_18_POINT, Datum.LABEL_24_POINT,
line_colour	Colour	The colour of the datum line
line_style	LineStyle	The line style used to draw the datum line
line_width	LineWidth	The line width used to draw the datum line

Detailed Description

The Datum class allows you to create and manipulate datums. See the documentation below for more details.

Constructor

new Datum(acronym*[string]*, type*[integer]*, value*[real or array of reals]*, second value (optional)*[real]*)

Description

Create a new Datum object. The datum will be added to all the currently active graphs.

Arguments

- **acronym** (string)

Datum acronym

- **type** (integer)

Specify type of datum line. Can be Datum.CONSTANT_X, Datum.CONSTANT_Y, Datum.CONSTANT_Y2, Datum.POINTS

- **value** (real or array of reals)

Value for Datum.CONSTANT_X, Datum.CONSTANT_Y or Datum.CONSTANT_Y2 type Datum. If it is a Datum.POINTS type Datum then this should be an array of X, Y pairs or a curve ID to copy points from.

- **second value (optional)** (real)

Second constant value for use with constant X,Y or Y2 datums and can optionally be provided

Returns

Datum object

Return type

Datum

Example

To create a new datum with acronym my_datum and a constant Y value of 100

```
var d = new Datum("my_datum", Datum.CONSTANT_Y, 100);
```

To create a new datum with acronym my_datum and some X, Y points

```
var points = new Array(6);
points[0] = 0.0;
points[1] = 10.0;
points[2] = 1.0;
points[3] = 15.0;
points[4] = 2.0;
points[5] = 17.0;
var d = new Datum("my_datum", Datum.POINTS, points);
```

Details of functions

AddToGraph(graph (optional)*[int]*)

Description

Adds a datum to a graph.

Arguments

- **graph (optional)** (int)

Graph to add the datum to. If undefined then the datum is added to all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To add a datum (d) to graphs 1 and 3:

```
d.AddToGraph(1, 3);
```

To add a datum (d) to all graphs:

```
d.AddToGraph();
```

Delete(datum*[string]*) [static]

Description

Deletes a datum

Arguments

- **datum** (string)

Acronym of datum to delete

Returns

No return value

Example

To delete datum "my_datum"

```
Datum.Delete("my_datum");
```

Exists(datum*[string]*) [static]

Description

Checks if a datum exists

Arguments

- **datum** (string)

Acronym of datum to check

Returns

TRUE if the datum exists, otherwise FALSE

Return type

Boolean

Example

To check if a datum "my_datum" exists

```
var exists = Datum.Exists("my_datum");
```

First() [static]

Description

Returns the first datum.

Arguments

No arguments

Returns

Datum object (or null if there are no datum in the model).

Return type

Datum

Example

To get the 1st datum

```
var d = Datum.First();
```

GetFromAcronym(datum*[string]*) [static]

Description

Returns the datum object for a datum acronym.

Arguments

- **datum** (string)

Acronym of datum to return object for

Returns

Datum object (or null if the datum does not exist).

Return type

Datum

Example

To get the datum "my_datum"

```
var d = Datum.GetFromAcronym("my_datum");
```

IsOnGraph(graph*[int]*)

Description

Returns whether a datum is on a graph.

Arguments

- **graph** (int)

Graph id

Returns

true if it is on the graph, false otherwise

Return type

Boolean

Example

To check if datum (d) is on graph 3:

```
d.IsOnGraph(3);
```

Next()

Description

Returns the next datum in the model.

Arguments

No arguments

Returns

Datum object (or null if there are no more datums in the model).

Return type

Datum

Example

To get the next datum after datum d:

```
var datum = d.Next();
```

RemoveFromGraph(graph (optional)*[int]*)

Description

Removes a datum from a graph.

Arguments

- **graph (optional)** (int)

Graph to remove the datum from. If undefined then the datum is removed from all graphs.

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

No return value.

Example

To remove a datum (d) from graphs 1 and 3:

```
d.RemoveFromGraph(1,3);
```

To remove a datum (d) from all graphs:

```
d.RemoveFromGraph();
```

Entity class

The Entity class contains constants relating to Entity types. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Entity constants

Name	Description
Entity.AIRBAG	AIRBAG entity code (for all airbag related entities)
Entity.AIRBAG_CHAMBER_DATA	AIRBAG CHAMBER DATA entity code
Entity.AIRBAG_CPM_PART_DATA	AIRBAG CPM PART DATA entity code
Entity.AIRBAG_CPM_SENSORS	AIRBAG CPM SENSORS entity code
Entity.AIRBAG_CV_PART_DATA	AIRBAG CV PART DATA entity code
Entity.AIRBAG_DATA	AIRBAG DATA entity code
Entity.AIRBAG_PART_DATA	AIRBAG PART DATA entity code
Entity.BEAM	BEAM entity code
Entity.BEAM_DISCRETE	DISCRETE BEAM entity code
Entity.BEAM_NORMAL	NORMAL BEAM entity code
Entity.BEARING	BEARING entity code
Entity.BOUNDARY	BOUNDARY entity code
Entity.BOUNDARY_DIS_NODAL_LOAD	DISCRETE NODAL LOAD entity code
Entity.BOUNDARY_DIS_RBODY_LOAD	DISCRETE RIGID BODY LOAD entity code
Entity.BOUNDARY_PRES_NODAL_LOAD	PRESSURE NODAL LOAD entity code
Entity.BOUNDARY_VEL_NODAL_LOAD	VELOCITY NODAL LOAD entity code
Entity.BOUNDARY_VEL_RBODY_LOAD	VELOCITY RIGID BODY LOAD entity code
Entity.CESE	CESE entity code
Entity.CESE_DRAG_DATA	CESE FSI DRAG DATA entity code
Entity.CESE_NODE_DATA	CESE NODE DATA entity code
Entity.CESE_POINT_DATA	CESE POINT DATA entity code
Entity.CESE_SEGMENT_DATA	CESE SEGMENT SET DATA entity code
Entity.CONTACT	CONTACT entity code
Entity.CONTACT_ENERGIES	CONTACT ENERGIES entity code

Entity.CONTACT_FORCES	CONTACT FORCES entity code
Entity.CURVOUT	CURVOUT entity code
Entity.EM	EM entity code
Entity.EM_BOUNDARYOUT_DATA	EM BOUNDARYOUT DATA entity code
Entity.EM_CIRCUIT0D_DATA	EM CIRCUIT0D DATA entity code
Entity.EM_CIRCUITRES_DATA	EM CIRCUITRES DATA entity code
Entity.EM_CIRCUIT_DATA	EM CIRCUIT DATA entity code
Entity.EM_GLOBAL_DATA	EM GLOBAL DATA entity code
Entity.EM_ISOPOTCONNOUT_DATA	EM ISOPOTCONNOUT DATA entity code

Entity.ICFD	ICFD entity code
Entity.ICFD_DRAG_DATA	ICFD DRAG DATA entity code
Entity.ICFD_NODE_DATA	ICFD NODE DATA entity code
Entity.ICFD_POINT_DATA	ICFD POINT DATA entity code
Entity.ICFD_THERMAL_DATA	ICFD THERMAL DATA entity code
Entity.JOINT	JOINT entity code
Entity.JOINT_FLEXION_TORSION	FLEXION TORSION JOINT entity code
Entity.JOINT_GENERALIZED	GENERALIZED JOINT entity code
Entity.JOINT_JOINT	Conventional LS-DYNA JOINT entity code
Entity.JOINT_TRANSLATIONAL	TRANSLATIONAL JOINT entity code
Entity.MASS	MASS entity code
Entity.MODEL	MODEL entity code
Entity.NODAL_RB	NODAL RIGID BODY entity code
Entity.NODAL_RB_BODY	BODY in NODAL RIGID BODY entity code
Entity.NODAL_RB_PART	PART in NODAL RIGID BODY entity code
Entity.NODE	NODE entity code

Entity.NODE_GROUP	NODAL FORCE GROUP entity code
Entity.NODE_GROUP_GROUPS	GROUPS in NODAL FORCE GROUP entity code
Entity.NODE_GROUP_NODES	NODES in NODAL FORCE GROUP entity code
Entity.PART	PART entity code
Entity.PART_GROUP	PART GROUP entity code
Entity.PBLAST	PBLAST entity code
Entity.PBLAST_DATA	PBLAST DATA entity code
Entity.PBLAST_PART	PBLAST PART entity code
Entity.PRETENSIONER	PRETENSIONER entity code
Entity.PRTUBE	PRTUBE entity code
Entity.PULLEY	PULLEY entity code
Entity.RETRACTOR	RETRACTOR entity code
Entity.RIGIDWALL	RIGIDWALL entity code
Entity.SEATBELT	SEATBELT entity code
Entity.SHELL	SHELL entity code
Entity.SLIPRING	SLIPRING entity code
Entity.SOLID	SOLID entity code
Entity.SPC	SPC entity code
Entity.SPC_FORCES	SPC FORCES entity code
Entity.SPC_MODEL	SPC MODEL entity code
Entity.SPC_MOMENTS	SPC MOMENTS entity code
Entity.SPC_SET	SPC SET entity code
Entity.SPH	SPH entity code
Entity.SPRING	SPRING entity code
Entity.SPRING_ROTATIONAL	ROTATIONAL SPRING entity code
Entity.SPRING_TRANSLATIONAL	TRANSLATIONAL SPRING entity code
Entity.SUBSYSTEM	SUBSYSTEM entity code
Entity.THICK_SHELL	THICK SHELL entity code
Entity.TRACER	TRACER entity code
Entity.WELD	WELD entity code
Entity.WELD_ASSEMBLY	WELD ASSEMBLY entity code
Entity.WELD_CONSTRAINED	CONSTRAINED WELD entity code
Entity.WELD_GENERALISED	GENERALISED WELD entity code
Entity.WELD_NON_NODAL	NON-NODAL WELD entity code
Entity.WELD_SOLID	SOLID WELD entity code
Entity.WELD_SPOTWELD_BEAMS	SPOTWELD BEAMS entity code
Entity.X_SECTION	CROSS SECTION entity code

Detailed Description

The Entity class is used to define entity type codes that can then be compared with the entity Curve property and input for functions in the Model class.

```
Node = Entity.NODE;
```

File class

The File class allows you to read and write text files. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Copy(source*[string]*, dest*[string]*)
- Delete(filename*[string]*)
- DriveMapFilename(filename*[string]*, format*[constant]*)
- Exists(filename*[string]*)
- FindFiles(directory*[string]*, type (optional)*[constant]*)
- Get(url*[string]*, filename*[string]*, options (optional)*[object]*)
- IsAbsolute(filename*[string]*)
- IsDirectory(filename*[string]*)
- IsFile(filename*[string]*)
- IsReadable(filename*[string]*)
- IsWritable(filename*[string]*)
- Mkdir(directory*[string]*)
- Mktemp()
- Proxy(name*[string]*)
- ProxyPassword(name*[string]*)
- ProxyUsername(username*[string]*)
- ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*)
- Rename(oldname*[string]*, newname*[string]*)
- Size(filename*[string]*)
- Upload(filename*[string]*, url*[string]*, options (optional)*[object]*)

Member functions

- Close()

- WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)
- Writeln(string*[Any valid javascript type]*)

File constants

Name	Description
File.APPEND	Flag to open file for appending
File.BINARY	Flag to open file in binary mode. This will have no effect on unix/linux but for windows if a file is opened for writing with binary mode \n will not be translated to \r\n (CRLF), it will be written as \n (LF)
File.READ	Flag to open file for reading

File.UTF8	Flag to open file for reading as UTF-8 encoding.
File.WRITE	Flag to open file for writing

Constants for Find types

Name	Description
File.DIRECTORY	Find directories
File.FILE	Find files

Constants for Seek types

Name	Description
File.CURRENT	Seek relative to current file position
File.END	Seek relative to end of the file
File.START	Seek relative to start of the file

File properties

Name	Type	Description
filename (read only)	string	Name of the file
mode (read only)	constant	Mode the file was opened with (File.READ, File.WRITE etc)

Detailed Description

The File class gives you simple functions to read and write text files. The following simple example shows how to read from the file "/data/test/file.txt" and print each line read to the dialogue box:

```
var f, line;
f = new File("/data/test/file.txt", File.READ);
while ( (line = f.ReadLine()) != undefined)
{
    Message(line);
}
f.Close();
```

The following simple example shows how to write the numbers 1 to 10 to the file "/data/test/file.txt":

```
var n, line;
f = new File("/data/test/file.txt", File.WRITE);
for (n=1; n<=10; n++)
{
    f.Writeln(n);
}
f.Close();
```

See the documentation below for more details.

Constructor

new File(filename*[string]*, mode*[constant]*)

Description

Create a new File object for reading and writing text files.

Arguments

- **filename** (string)

Filename of the file you want to read/write. If reading, the file must exist. If writing, the file will be overwritten (if it exists) if mode is File.WRITE, or if mode is File.APPEND it will be appended to if it exists, or created if it does not. When reading a file the filename can also be a URL (uniform resource locator) in which case the file will be read from the remote site. See File.Get() for more details on the format of the URL.

- **mode** (constant)

The mode to open the file with. Can be File.READ, File.WRITE or File.APPEND. For File.WRITE or File.APPEND it can also be ORed with File.BINARY if required. By default text is read and written as ASCII. To read/write text in utf-8 mode can also be ORed with File.UTF8 if required.

Returns

File object

Return type

File

Example

To create a new file object to read file "/data/test/file.txt"

```
var f = new File("/data/test/file.txt", File.READ);
```

Details of functions

Close()

Description

Close a file opened by a File object.

Arguments

No arguments

Returns

No return value

Example

To close File object f.

```
f.Close();
```

Copy(source*[string]*, dest*[string]*) [static]

Description

Copies a file

Arguments

- **source** (string)

Source filename you want to copy.

- **dest** (string)

Destination filename you want to copy source file to.

Returns

true if copy successful, false otherwise.

Return type

Boolean

Example

To copy the file "/data/test/file.key" to "/data/test/file.key_backup"

```
var copied = File.Copy("/data/test/file.key", "/data/test/file.key_backup");
```

Delete(filename*[string]*) [static]

Description

Deletes a file

Arguments

- **filename** (string)

Filename you want to delete.

Returns

true if successful, false if not.

Return type

Boolean

Example

To delete the file "/data/test/file.key"

```
var deleted = File.Delete("/data/test/file.key");
```

DriveMapFilename(filename*[string]*, format*[constant]*) [static]

Description

Changes a filename or directory name to the correct format for a specific operating system using the directory mappings (if present)

Arguments

- **filename** (string)

Filename you want to drive map.

- **format** (constant)

The format for the file/directory name. Can be Include.NATIVE, Include.UNIX or Include.WINDOWS

Returns

string containing drive mapped filename

Return type

String

Example

If T/HIS has drive S: mapped to "/data" (by using the primer*drive_s, this*drive_s, d3plot*drive_s or oasys*drive_s preference)

```
var mapped = File.DriveMapFilename("/data/test/file.key", Include.WINDOWS);
```

mapped will be "S:\test\file.key".

```
var mapped = File.DriveMapFilename("S:\\test\\file.key", Include.UNIX);
```

mapped will be "/data/test/file.key".

Exists(filename*[string]*) [static]

Description

Check if a file exists. See also File.IsDirectory() and See also File.IsFile().

Arguments

- **filename** (string)

Filename you want to check for existance.

Returns

true/false

Return type

Boolean

Example

To see if the file "/data/test/file.key" exists

```
if (File.Exists("/data/test/file.key")) { do something }
```

FindFiles(directory*[string]*, type (optional)*[constant]*) [static]

Description

Find any files and/or directories in a directory.

Arguments

- **directory** (string)

Directory to look for files/directories in.

- **type (optional)** (constant)

Type of things to find. Can be bitwise OR of File.FILE and File.DIRECTORY. If omitted only files will be returned.

Returns

Array of filenames/directories

Return type

Array

Example

To return the filenames in the directory /data/test:

```
var fileList = File.FindFiles("/data/test")
```

To return the directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.DIRECTORY)
```

To return the files and directories in the directory /data/test:

```
var fileList = File.FindFiles("/data/test", File.FILE|File.DIRECTORY)
```

FindLineContaining(contain*[string]*)

Description

Reads a line from a file which contains **contain**, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must contain that string. If more than one argument is used then lines which contain any of the arguments will be returned

Arguments

- **contain** (string)

String which matching lines must contain

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which contain 'example'.

```
var line;
while ( (line = f.FindLineContaining("example") ) != undefined)
{
}
```

FindLineStarting(start*[string]*)

Description

Reads a line from a file which starts with start, opened for reading by a File object. Although this is possible using core JavaScript functions this function should be significantly faster as most of the processing is done by PRIMER in C rather than in the JavaScript interpreter. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must start with that string. If more than one argument is used then lines which start with any of the arguments will be returned

Arguments

- **start** (string)

String which matching lines must start with

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `undefined` if end of file

Return type

String

Example

Loop, reading lines from File object f which start 'example'.

```
var line;
while ( (line = f.FindLineStarting("example") ) != undefined)
{
}
```

Flush()

Description

Flushes a file opened for writing by a File object.

Arguments

No arguments

Returns

No return value

Example

To flush File object f.

```
f.Flush();
```

Get(url*[string]*, filename*[string]*, options (optional)*[object]*) [static]

Description

Get a file from a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **url** (string)

URL (uniform resource locator) of remote file you want to get. Currently http and ftp are supported. For http give the full address including the leading 'http://'. e.g.
'http://www.example.com/file.html'.
For ftp an optional username and password can be given. e.g.
'ftp://ftp.example.com' retrieves the directory listing for the root directory.
'ftp://ftp.example.com/readme.txt' downloads the file readme.txt from the root directory.
'ftp://user:password@ftp.example.com/readme.txt' retrieves the readme.txt file from the user's home directory.

- **filename** (string)

Filename you want to save the file to.

- **options (optional)** (object)

Options for get. If 'username' and 'password' are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description

password (optional)	string	Password
response (optional)	boolean	If set to true, then the response code will be returned instead of true/false. This can be used to retieve error messages and codes when the file is not returned successfully.
username (optional)	string	Username

Returns

true if file was successfully got, false otherwise.

Return type

Boolean

Example

To get the file "http://www.example.com/file.html" and save it to C:\temp:

```
File.Get("http://www.example.com/file.html", "C:\temp\file.html");
```

IsAbsolute(filename*[string]*) [static]

Description

Check if a filename is absolute or relative.

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is absolute (which it is!)

```
if (File.IsAbsolute("/data/test")) { do something }
```

IsDirectory(filename*[string]*) [static]

Description

Check if a filename is a directory. See also File.Exists(), File.IsFile(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a directory

```
if (File.IsDirectory("/data/test")) { do something }
```

IsFile(filename*[string]*) [static]

Description

Check if a filename is a file. See also File.Exists(), File.IsDirectory(), File.IsReadable() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is a file

```
if (File.IsFile("/data/test")) { do something }
```

IsReadable(filename*[string]*) [static]

Description

Check if a filename has read permissions. See also File.Exists(), File.IsDirectory() and File.IsWritable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is readable

```
if (File.IsReadable("/data/test")) { do something }
```

IsWritable(filename*[string]*) [static]

Description

Check if a filename has write permissions. If *filename* exists and it is a file then it is checked to see if it can be opened with write (File.APPEND permissions). If *filename* exists and it is a directory then the directory is checked for write permission (can files be created in the directory). If *filename* does not exist then it is assumed to be a file and is checked to see if it can be opened for writing (File.WRITE permissions). See also File.Exists(), File.IsDirectory() and File.IsReadable().

Arguments

- **filename** (string)

Filename you want to check.

Returns

true/false

Return type

Boolean

Example

To see if the filename "/data/test" is writable

```
if (File.IsWritable("/data/test")) { do something }
```

Mkdir(directory*[string]*) [static]

Description

Make a directory. If PRIMER preference 'directory_permission' is set e.g.755 then this will apply (same as if set by chmod 755) ignoring any setting of umask. If there is no preference then the users current setting of umask will control permissions (same as system mkdir)

Arguments

- **directory** (string)

The name of the directory you want to create.

Returns

true if successfully created, false if not.

Return type

Boolean

Example

To make the directory "/data/test"

```
var success = File.Mkdir("/data/test");
```

Mktemp() [static]

Description

Make a temporary filename for writing a temporary file.

Arguments

No arguments

Returns

String name of temporary filename that can be used.

Return type

String

Example

To get a temp filename"

```
var filename = File.Mktemp();
```

Proxy(name*[string]*) [static]

Description

Set a proxy for files opened by http, ftp etc. See also File.Get(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **name** (string)

The name of the proxy.

Returns

No return value

Example

To set the proxy to "http://example.proxy.com" using port 80:

```
File.Proxy("http://example.proxy.com:80");
```

ProxyPassword(name*[string]*) [static]

Description

Set a proxy password for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyUsername().

Arguments

- **name** (string)

Password for the proxy server.

Returns

No return value

Example

To set the proxy password to "password":

```
File.ProxyPassword("password");
```

ProxyUsername(username*[string]*) [static]

Description

Set a proxy username for files opened by http, ftp etc. See also File.Get(), File.Proxy() and File.ProxyPassword().

Arguments

- **username** (string)

The username for the proxy.

Returns

No return value

Example

To set the proxy username to "username":

```
File.ProxyUsername("username");
```

ReadAll()

Description

Reads **all** the remaining characters from a file opened for reading by a File object. As this function can read the entire file as a string be careful when reading large files as it will consume large amounts of memory.

Arguments

No arguments

Returns

String. Characters read from file or undefined if end of file

Return type

String

Example

Read all characters from File object f.

```
var c = f.ReadAll();
```

ReadArrayBuffer(length (optional)*[integer]*)

Description

Reads binary data from a file opened for reading by a File object. The data is returned as an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **length (optional)** (integer)

Number of bytes to try to read from the file. If omitted all the remaining data from the file will be read.

Returns

ArrayBuffer object or undefined if end of file

Return type

ArrayBuffer

Example

To read data as 32bit unsigned integers from File object f.

```
var ab = f.ReadArrayBuffer();
var u32 = new Uint32Array(ab);
for (var i=0; i<u32.length; i++
{
    var value = u32[i];
}
```

ReadCSV(filename*[string]*, delimiter (optional)*[string]*, comment (optional)*[string]*) [static]

Description

Reads the input CSV file and returns an array of string arrays. If the CSV file has legitimate records the function returns an Array object containing sub-arrays of strings otherwise the function returns NULL. The lengths of all the sub-arrays are the same and equal to maximum number of fields in any of the records. For records in a CSV file having fewer fields, the respective sub-arrays are padded with NULL elements to the maximum array length.

Arguments

- **filename** (string)

Filename you want to read CSV options from.

- **delimiter (optional)** (string)

Delimiter string to be used. Default is a comma (",").

- **comment (optional)** (string)

Comment string to be used. Default is a dollar sign ("$").

Returns

Array object containing string arrays.

Return type

String

Example

To Read CSV file "sample.csv" and print all records to a Window.

```
var csv_file_path = "C:\\sample.csv";
var records = "";
if(!File.Exists(csv_file_path))
{
    Window.Information("CSV file %s not present", csv_file_path);
    Exit();
}
var csv_array = File.ReadCSV(csv_file_path);
if(csv_array != null)
{
    for(var i = 0; i < csv_array.length; i++)
    {
        var record_array = csv_array[i];
        for(var j = 0; j < record_array.length; j++)
        {
            if(record_array[j] != null)
                records = records + record_array[j] + " , ";
        }
        records = records + "\n";
    }
}
Options.max_window_lines = csv_array.length;
Window.Information("File.ReadCSV Ouptut", records);
```

To Read CSV file "sample.csv" with delimiter string "::" and comment string "##".

```
var csv_array = File.ReadCSV(csv_file_path, "::", "##");
```

ReadChar()

Description

Reads a single character from a file opened for reading by a File object.

Arguments

No arguments

Returns

character read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading characters from File object f.

```
var c;
while ( (c = f.ReadChar()) != undefined) { ... }
```

ReadLine()

Description

Reads a line from a file opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 512 characters is used. If you expect a file to have lines longer than 512 characters then use ReadLongLine which allows lines of any length.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLine()) != undefined) { ... }
```

ReadLongLine()

Description

Reads a line from a file opened for reading by a File object. The line can be any length. If your file has lines shorter than 512 characters then you may want to use ReadLine instead which is faster.

Arguments

No arguments

Returns

string read from file or

`undefined`

if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = f.ReadLongLine()) != undefined) { ... }
```

Rename(oldname*[string]*, newname*[string]*) [static]

Description

Rename an existing file to have a different name.

Arguments

- **oldname** (string)

Existing filename you want to rename

- **newname** (string)

New filename you want to rename to

Returns

true if successful, false if not.

Return type

Boolean

Example

To rename the file "/data/test/file.key" to "/data/test/new_file.key"

```
var size = File.Rename("/data/test/file.key", "/data/test/new_file.key");
```

Seek(offset*[integer]*, origin (optional)*[constant]*)

Description

Set the current position for reading or writing in a File object.

Arguments

- **offset** (integer)

Offset to seek to in the file

- **origin (optional)** (constant)

Origin for offset. Must be one of File.START, File.END or File.CURRENT. If omitted File.START will be used.

Returns

no return value

Example

To seek to the end of File f:

```
f.Seek(0, File.END);
```

To seek to the beginning of File f:

```
f.Seek(0, File.START);
```

To move forward 10 characters in File f:

```
f.Seek(10, File.CURRENT);
```

Size(filename*[string]*) [static]

Description

Return the size of a file in bytes

Arguments

- **filename** (string)

Filename you want the size of.

Returns

size in bytes

Return type

Number

Example

To get the size of the file "/data/test/file.key"

```
var size = File.Size("/data/test/file.key");
```

Tell()

Description

Return the current file position for a File object. Note that on Windows when reading files if the file is not opened with File.BINARY this may not return the correct file position for files with unix line endings.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current file position for File f:

```
var pos = f.Tell();
```

Upload(filename*[string]*, url*[string]*, options (optional)*[object]*) [static]

Description

Uploads a file to a remote location. See also File.Proxy(), File.ProxyPassword() and File.ProxyUsername().

Arguments

- **filename** (string)

Filename you want to upload.

- **url** (string)

URL (uniform resource locator) of the remote location you want to upload the file to. Currently only http is supported. Give the full address including the leading 'http://'. e.g. 'http://www.example.com/file.html'.

- **options (optional)** (object)

Options for upload. If both of these are set then basic authorization using the username and password will be used.

Object has the following properties:

Name	Type	Description
password (optional)	string	Password
username (optional)	string	Username

Returns

true if file was successfully uploaded, false otherwise.

Return type

Boolean

Example

To upload the file "C:\temp\file.txt" to "http://www.example.com/file.txt":

```
File.Upload("C:/temp/file.txt", "http://www.example.com/file.txt");
```

Write(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object. **Note that a carriage return is not added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f

```
f.Write("Hello, world!\n");
```

To write the title of model m to File object f

```
f.Write("The title of model 2 is " + m.title + "\n");
```

WriteArrayBuffer(buffer*[ArrayBuffer]*, length (optional)*[integer]*)

Description

Writes binary data to a file opened for writing by a File object. The data to write is an ArrayBuffer object. For more details on how to use an ArrayBuffer see the following links:
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Typed_arrays
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/ArrayBuffer
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/TypedArray
https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/DataView.

Arguments

- **buffer** (ArrayBuffer)

ArrayBuffer to write to file

- **length (optional)** (integer)

Number of bytes to write to the file. If omitted all the data in the ArrayBuffer will be written (buffer.byteLength bytes)

Returns

No return value

Example

To write ArrayBuffer ab to File object f.

```
f.WriteArrayBuffer(ab);
```

Writeln(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object **adding a carriage return**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f automatically adding a carriage return

```
f.Writeln("Hello, world!");
```

To write the title of model m to File object f automatically adding a carriage return

```
f.Writeln("The title of model 2 is " + m.title);
```

Graph class

The Graph class gives you access to graphs in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- DeleteFromID(ID*[integer]*)
- GetFromID(ID*[integer]*)
- Total()

Member functions

- AddCurveID(Curve ID*[Integer]*, No redraw (optional)*[Integer]*)
- AddToPage(Page number*[Integer]*)
- Delete()
- GetAllCurveIDs()
- GetAllPageIDs()
- GetNumCurves()
- Lock(Lock type*[Integer]*)
- RemoveCurveID(ID*[Integer]*)
- RemoveFromPage(ID*[Integer]*)

Graph constants

Name	Description
Graph.AXIS_LINEAR	Linear axis type
Graph.AXIS_LOG	Logarithmic axis type
Graph.FONT_COURIER_BOLD	Courier bold font
Graph.FONT_COURIER_ MEDIUM	Courier medium font
Graph.FONT_DEFAULT	Takes the font defined in the preference file
Graph.FONT_HELVETICA_ BOLD	Helvetical bold font
Graph.FONT_HELVETICA_ MEDIUM	Helvetical medium font
Graph.FONT_SIZE_10	10 point font size
Graph.FONT_SIZE_12	12 point font size
Graph.FONT_SIZE_14	14 point font size
Graph.FONT_SIZE_18	18 point font size
Graph.FONT_SIZE_24	24 point font size
Graph.FONT_SIZE_8	8 point font size

Graph.FONT_SIZE_AUTO	Font size would be automatically adjusted based on the graph area
Graph.FONT_TIMES_BOLD	Times New Roman bold font
Graph.FONT_TIMES_MEDIUM	Times New Roman medium font
Graph.GRID_OFF	Turn off the grid.
Graph.GRID_ON	Turn on the grid.
Graph.LEGEND_1_COLUMN	Curve labels will be displayed in a single column in the legend
Graph.LEGEND_2_COLUMN	Curve labels will be displayed in two columns in the legend
Graph.LEGEND_AUTO	Automatic legend layout (see Legend)
Graph.LEGEND_COLUMN_LIST	Column list legend layout (see Legend)
Graph.LEGEND_FLOATING	Floating legend layout (see Legend)
Graph.LEGEND_OFF	Off legend layout (see Legend)
Graph.NO	Flag for no.
Graph.OFF	Flag to turn off.
Graph.ON	Flag to turn on.
Graph.PREFIX_AUTO	Automatically add prefix to the curve label in the legend (see Legend)
Graph.PREFIX_DIR	Directory name of the model will be used as the curve label prefix in the legend (see Legend)
Graph.PREFIX_MODEL_ NUMBER	Model number will be used as the curve label prefix in the legend (see Legend)
Graph.PREFIX_OFF	Turn off the curve label prefix in the legend (see Legend)
Graph.PREFIX_ON	Add prefix to the curve label in the legend (see Legend)
Graph.PREFIX_THF	Root name of the THF file will be used as the curve label prefix in the legend (see Legend)
Graph.PREFIX_USER_DEFINED	A user defined prefix will be used as the curve label prefix in the legend (see Legend)
Graph.YES	Flag for yes.

Graph properties

Name	Type	Description
active	constant	If the graph is active or inactive. Can take Graph.YES or Graph.NO
add_x_units	constant	shows x-axis units. It can take either Graph.ON or Graph.OFF
add_y2_units	constant	shows second y-axis units. It can take either Graph.ON or Graph.OFF
add_y_units	constant	shows y-axis units. It can take either Graph.ON or Graph.OFF
auto_title	string	Turn on to set graph title automatically and turn off to define the graph title manually using the property Graph.title. Can take either Graph.ON or Graph.OFF
auto_xlabel	constant	Turn on to set label for the x-axis automatically and turn off to define the label for the x-axis manually using the property xlabel. Can take either Graph.ON or Graph.OFF
auto_xmax	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the maximum value for the y-axis range automatically and Graph.OFF will use the property xmax value as the maximum value for the x-axis range

auto_xmin	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the minimum value for the x-axis range automatically and Graph.OFF will use the property xmin value as the minimum value for the x-axis range
auto_y2label	constant	Turn on to set label for the second y-axis automatically and turn off to define the label for the second y-axis manually using the property y2label. Can take either Graph.ON or Graph.OFF
auto_y2max	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the maximum value for the second y-axis range automatically and Graph.OFF will use the property y2max value as the maximum value for the second y-axis range
auto_y2min	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the minimum value for the second y-axis range automatically and Graph.OFF will use the property y2min value as the minimum value for the second y-axis range
auto_ylabel	constant	Turn on to set label for the y-axis automatically and turn off to define the label for the y-axis manually using the property ylabel. Can take either Graph.ON or Graph.OFF
auto_ymax	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the maximum value for the y-axis range automatically and Graph.OFF will use the property ymax value as the maximum value for the y-axis range
auto_ymin	constant	Can take either Graph.ON or Graph.OFF. Graph.ON will set the minimum value for the y-axis range automatically and Graph.OFF will use the property ymin value as the minimum value for the y-axis range
background_ colour	Colour	Graph background colour
foreground_ colour	Colour	Graph foreground colour
grid	constant	To turn on/off the grid. Can take Graph.GRID_ON or Graph.GRID_OFF
id (read only)	integer	Graph ID
legend_ background_ colour	Colour	Background colour for the legend area
legend_ background_ trans	integer	Transparancy of the legend area. The value should lie between 0 and 100
legend_font	constant	Font for the curve labels in the legend. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_ COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
legend_font_ colour	Colour	Font colour for the curve labels in the legend
legend_font_ size	constant	Font size for the curve labels in the legend. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_ SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_layout	constant	Defines the legend layout type. Can take Graph.LEGEND_COLUMN_LIST, Graph.LEGEND_AUTO, Graph.LEGEND_OFF or Graph.LEGEND_FLOATING
legend_prefix_ format	constant	Format of the prefix that is being included in the curve label of the legend. Can take either Graph.PREFIX_MODEL_NUMBER, Graph.DIR, Graph.PREFIX_THF or Graph.PREFIX_USER_DEFINED
legend_show_ prefix	constant	Include the prefix in the curve label of the legend. Can take either Graph.PREFIX_AUTO, Graph.PREFIX_ON or Graph.PREFIX_OFF
legend_show_ user_lines	constant	Visibility of user lines when Graph.LEGEND_COLUMN_LIST is selected for legend layout. Can take either Graph.ON or Graph.OFF

legend_user_line_1	string	User defined line 1 from the legend area
legend_user_line_1_size	constant	Font size for the user defined line 1. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_line_2	string	User defined line 2 from the legend area
legend_user_line_2_size	constant	Font size for the user defined line 2. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_line_3	string	User defined line 3 from the legend area
legend_user_line_3_size	constant	Font size for the user defined line 3. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_line_4	string	User defined line 4 from the legend area
legend_user_line_4_size	constant	Font size for the user defined line 4. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_line_5	string	User defined line 6 from the legend area
legend_user_line_5_size	constant	Font size for the user defined line 5. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_line_6	string	User defined line 6 from the legend area
legend_user_line_6_size	constant	Font size for the user defined line 6. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
legend_user_lines_colour	Colour	Font colour for the user defined lines in the legend
legend_user_lines_font	constant	Font for the user defined lines in the legend. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
num_legend_columns	constant	Number of columns of curve labels in legends. Can take Graph.LEGEND_1_COLUMN, Graph.LEGEND_2_COLUMN or Graph.LEGEND_3_COLUMN
show_title	string	Shows graph title. Can take either Graph.ON or Graph.OFF
show_xlabel	constant	Shows graph x-axis label. Can take either Graph.ON or Graph.OFF
show_y2label	constant	Shows graph second y-axis label. Can take either Graph.ON or Graph.OFF
show_ylabel	constant	Shows graph y-axis label. Can take either Graph.ON or Graph.OFF
title	string	Graph title
x_axis_type	constant	Defines x-axis type i.e. linear or logarithmic. Can take either Graph.AXIS_LINEAR or Graph.AXIS_LOG
x_unit_colour	Colour	Colour of the x-axis units

x_unit_decimals	integer	Defines the number decimals in the x-axis units.
x_unit_font	constant	Font for the x-axis units. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
x_unit_format	constant	Defines the format for the x-axis units. Can take either Graph.AXIS_UNITS_AUTO, Graph.AXIS_UNITS_SCIENTIFIC or Graph.AXIS_UNITS_GENERAL
x_unit_size	constant	Font size for the x-axis units. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
xlabel	string	Label for x-axis
xlabel_colour	Colour	Colour of the x-axis label
xlabel_font	constant	Font for the x-axis label. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
xlabel_size	constant	Font size for the x-axis label. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
xmax	real	Maximum value of x-axis range
xmin	real	Minimum value of the x-axis range
y2_axis_type	constant	Defines second y-axis type i.e. linear or logarithmic. Can take either Graph.AXIS_LINEAR or Graph.AXIS_LOG
y2_unit_colour	Colour	Colour of the second y-axis units
y2_unit_decimals	integer	Defines the number decimals in the second y-axis units.
y2_unit_font	constant	Font for the second y-axis label. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
y2_unit_format	constant	Defines the format for the second y-axis units. Can take either Graph.AXIS_UNITS_AUTO, Graph.AXIS_UNITS_SCIENTIFIC or Graph.AXIS_UNITS_GENERAL
y2_unit_size	constant	Font size for the second y-axis units. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
y2label	string	Label for second y-axis
y2label_colour	Colour	Colour of the second y-axis label
y2label_font	constant	Font for the second y-axis label. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
y2label_size	constant	Font size for the second y-axis label. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
y2max	real	Maximum value of the second y-axis range

y2min	real	Minimum value of the second y-axis range
y_axis_type	constant	Defines y-axis type i.e. linear or logarithmic. Can take either Graph.AXIS_LINEAR or Graph.AXIS_LOG
y_unit_colour	Colour	Colour of the y-axis units
y_unit_decimals	integer	The number decimals in the y-axis units.
y_unit_font	constant	Font for the y-axis units. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
y_unit_format	constant	Defines the format for the y-axis units. Can take either Graph.AXIS_UNITS_AUTO, Graph.AXIS_UNITS_SCIENTIFIC or Graph.AXIS_UNITS_GENERAL
y_unit_size	constant	Font size for the y-axis units. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
ylabel	string	Label for y-axis
ylabel_colour	Colour	Colour of the y-axis label
ylabel_font	constant	Font for the y-axis label. Can take either Graph.FONT_DEFAULT, Graph.FONT_HELVETICA_MEDIUM, Graph.FONT_HELVETICA_BOLD, Graph.FONT_TIMES_MEDIUM, Graph.FONT_TIMES_BOLD, Graph.FONT_COURIER_MEDIUM or Graph.FONT_COURIER_BOLD
ylabel_size	constant	Font size for the y-axis label. Can take either Graph.FONT_SIZE_AUTO, Graph.FONT_SIZE_8, Graph.FONT_SIZE_10, Graph.FONT_SIZE_12, Graph.FONT_SIZE_14, Graph.FONT_SIZE_18 or Graph.FONT_SIZE_24
ymax	real	Maximum value of y-axis range
ymin	real	Minimum value of the y-axis range

Detailed Description

The Graph class contains information on the number of graphs. See the documentation below for more details.

Constructor

new Graph(index (optional)*[integer]*)

Description

Create a new Graph.

Arguments

- **index (optional)** (integer)

Graph index to copy initial display and axis settings from (optional). If not defined then the display and axis settings will be copied from those defined in the preference file.

Returns

Graph object

Return type

Graph

Example

To create a new graph and copy all of the setting from graph 2

```
var l = new Graph(2);
```

Details of functions

AddCurveID(Curve ID*[Integer]*, No redraw (optional)*[Integer]*)

Description

Adds a curve to the graph.

Arguments

- **Curve ID** (Integer)

ID of the curve to add.

- **No redraw (optional)** (Integer)

If this argument is 1 then the graph will not be redrawn after the curve is added. This is to be used if a large number of curves are to be added to a graph, so as to avoid the same curves being drawn multiple times. No argument or 0 will trigger a redraw after the curve is added.

Returns

Returns true if the curve is successfully added to the graph else it would return false

Return type

Boolean

Example

To add a curve with id (n) to the graph (g):

```
g.AddCurveID(n);
```

AddToPage(Page number*[Integer]*)

Description

Adds the graph to the page.

Arguments

- **Page number** (Integer)

Page number for which to add the graph to.

Returns

Returns true if the graph is successfully added to the page else it would return false

Return type

Boolean

Example

To add a graph (g) to page id (n):

```
g.AddToPage(n);
```

Delete()

Description

Deletes the graph

Arguments

No arguments

Returns

No return value

Example

Deletes the graph (g)

```
g.Delete();
```

DeleteFromID(ID*[integer]*) [static]

Description

Deletes a graph

Arguments

- **ID** (integer)

ID of graph to delete

Returns

No return value

Example

To delete the graph n

```
Graph.DeleteFromID(n);
```

Maximum number of graphs in T/HIS is 32

GetAllCurveIDs()

Description

Returns the IDs of the curves present in the graph in an array.

Arguments

No arguments

Returns

Array of curve IDs

Return type

array

Example

To get the array of all the curve ids present in a graph (g):

```
var num = g.GetAllCurveIDs();
```

GetAllPageIDs()

Description

Returns all the pages containing the graph.

Arguments

No arguments

Returns

Array of page IDs

Return type

array

Example

To get the list of all page ids containing the graph (g):

```
var pages_ids = g.GetAllPageIDs();
```

GetFromID(ID*[integer]*) [static]

Description

Returns the graph object for a given graph id.

Arguments

- **ID** (integer)

ID of graph to return the graph for

Returns

Graph object or NULL if graph does not exists

Return type

Graph

Example

To get the graph n

```
var num = Graph.GetFromID(n);
```

Maximum number of graphs in T/HIS is 32

GetNumCurves()

Description

Returns number curves present in the graph.

Arguments

No arguments

Returns

Number of curves present in the graph.

Return type

Number

Example

To find number of curves in a graph (g):

```
var num = g.GetNumCurves();
```

Lock(Lock type*[Integer]*)

Description

Locks the blanking status of either blanked curves, unblanked curves or all curves on the graph.

Arguments

- **Lock type** (Integer)

No argument or 0 to lock blanked curves, -1 to unlock blanked curves, -2 to unfreeze all visible curves

Returns

No return value

Example

To lock all blanked curves on graph g:

```
g.Lock();
```

RemoveCurveID(ID*[Integer]*)

Description

Removes a curve from the graph.

Arguments

- **ID** (Integer)

ID of the curve to be removed

Returns

Returns true if the curve is successfully removed from the graph else it would return false

Return type

Boolean

Example

To remove a curve with id (n) from the graph (g):

```
g.RemoveCurveID(n);
```

RemoveFromPage(ID*[Integer]*)

Description

Removes the graph from a page.

Arguments

- **ID** (Integer)

ID of the page from which the graph is to be removed

Returns

Returns true if the graph is successfully removed from the page else it would return false

Return type

Boolean

Example

To remove the graph (g) from page with id (n):

```
g.RemoveFromPage(n);
```

Total() [static]

Description

Returns the total number of graphs.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To find how many graphs there are in T/HIS:

```
var num = Graph.Total();
```

Group class

The Group class gives you access to groups in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- DeleteGroup(group ID or name*[integer or string]*, delete automatic groups (optional)*[integer]*)
- Get(Name*[string]*)
- GetFromID(ID*[integer]*)
- Total()

Member functions

- Add(Curve*[Curve]*)
- AddAll()
- AddID(ID*[integer]*)
- Contains(Curve*[Curve]*)
- ContainsID(ID*[integer]*)
- GetCurveIDs()
- GetCurves()
- Remove(Curve*[Curve]*)
- RemoveAll()
- RemoveID(ID*[integer]*)
- Spool()
- SpoolID()
- StartSpool()

Group properties

Name	Type	Description
crv_at_ymax	integer	Curve number of the curve with the maximum Y value in the group.
crv_at_ymin	integer	Curve number of the curve with the minimum Y value in the group.
curves (read only)	integer	Number of curves in the group
name (read only)	string	Group name
x_at_ymax	real	X value at the maximum Y value over all curves in the group.
x_at_ymin	real	X value at the minimum Y value over all curves in the group.
x_at_yminpos	real	X value at the minimum positive Y value over all curves in the group.
xmax	real	Maximum X value over all curves in the group.
xmin	real	Minimum X value over all curves in the group.
xminpos	real	Minimum positive X value over all curves in the group.
ymax	real	Maximum Y value over all curves in the group.
ymin	real	Minimum Y value over all curves in the group.
yminpos	real	Minimum positive Y value over all curves in the group.

Detailed Description

The Group class allows you to create, and modify groups. See the documentation below for more details.

Constructor

new Group(name*[string]*)

Description

Create a new Group object.

Arguments

- **name** (string)

Group name used to reference the group

Returns

Group object

Return type

Group

Example

To create a new group with the name X-Velocity

```
var l = new Group("X-velocity");
```

Details of functions

Add(Curve*[Curve]*)

Description

Adds a curve object to group.

Arguments

- **Curve** (Curve)

Curve that will be added to group

Returns

No return value.

Example

To add curve c to curve group g:

```
g.Add(c);
```

AddAll()

Description

Adds all curves to group.

Arguments

No arguments

Returns

No return value.

Example

To add all curves to curve group g:

```
g.AddAll();
```

AddID(ID*[integer]*)

Description

Adds curve by ID to a group.

Arguments

- **ID** (integer)

The ID of the curve you want to add.

Returns

No return value.

Example

To add curve 3 to curve group g:

```
g.AddID(3);
```

Contains(Curve*[Curve]*)

Description

Checks if a curve object is in a curve group.

Arguments

- **Curve** (Curve)

Curve that will be checked

Returns

TRUE if the curve is in the group, otherwise FALSE

Return type

Boolean

Example

To check if a curve object n is in group g

```
var exists = g.Contains(n);
```

ContainsID(ID*[integer]*)

Description

Checks if a curve ID is in a curve group.

Arguments

- **ID** (integer)

The ID of the curve you want to check.

Returns

TRUE if the curve is in the group, otherwise FALSE

Return type

Boolean

Example

To check if a curve ID n is in group g

```
var exists = g.ContainsID(n);
```

DeleteGroup(group ID or name*[integer or string]*, delete automatic groups (optional)*[integer]*) [static]

Description

Deletes a curve group

Arguments

- **group ID or name** (integer or string)

ID of group to delete or name of group. If this argument is 0, delete all groups. Automatically generated groups won't be deleted unless the next argument is set to 1.

- **delete automatic groups (optional)** (integer)

If this argument is 1, automatic groups can be deleted. If no argument or 0, automatic groups cant be deleted.

Returns

No return value

Example

To delete group n

```
Group.DeleteGroup(n);
```

Get(Name*[string]*) [static]

Description

Returns a group object.

Arguments

- **Name** (string)

Name of the group to return object for

Returns

Group object (or Null if the group does not exist).

Return type

Group

Example

To get the group called ’left’

```
var group = Group.Get("left");
```

GetCurveIDs()

Description

Returns an array of Curve ID’s for all the Curves in the group.

Arguments

No arguments

Returns

Array of integers.

Return type

Number

Example

To make an array of Curve ID’s for all the curves in group g:

```
var curves = g.GetCurveIDs();
```

GetCurves()

Description

Returns an array of Curve Objects for all the Curves in the group.

Arguments

No arguments

Returns

Array of Curve objects.

Return type

Array

Example

To make an array of Curve objects for all the curves in group g:

```
var curves = g.GetCurves();
```

GetFromID(ID*[integer]*) [static]

Description

Returns a group object.

Arguments

- **ID** (integer)

ID of the group to return object for

Returns

Group object (or Null if the group does not exist).

Return type

Group

Example

To get the group number 1

```
var group = Group.GetFromID(1);
```

Remove(Curve*[Curve]*)

Description

Removes a curve object from a group.

Arguments

- **Curve** (Curve)

Curve that will be removed from group

Returns

No return value.

Example

To remove curve c from curve group g:

```
g.Remove(c);
```

RemoveAll()

Description

Removes all curves from a group.

Arguments

No arguments

Returns

No return value.

Example

To remove all curves from curve group g:

```
g.RemoveAll();
```

RemoveID(ID*[integer]*)

Description

Remove a curve by ID from a group.

Arguments

- **ID** (integer)

The ID of the curve you want to remove.

Returns

No return value.

Example

To remove curve 3 from curve group g:

```
g.RemoveID(3);
```

Spool()

Description

Spools a group, entry by entry and returns the curve objects. See also Group.StartSpool

Arguments

No arguments

Returns

Curve Object of item, or NULL if no more curves in group

Return type

Curve

Example

To spool group g:

```
var id;
g.StartSpool();
while (id = g.Spool() )
{
    do something...
}
```

SpoolID()

Description

Spools a group, entry by entry and returns the curve ID’s or 0 when no more curves in group. See also Group.StartSpool

Arguments

No arguments

Returns

integer

Return type

Number

Example

To spool group g :

```
var id;
g.StartSpool();
while (id = g.SpoolID() )
{
    do something...
}
```

StartSpool()

Description

Starts a group spooling operation. See also Group.Spool

Arguments

No arguments

Returns

No return value

Example

To start spooling group g:

```
g.StartSpool();
```

Total() [static]

Description

Returns the total number of curve group currently defined

Arguments

No arguments

Returns

Number of curve groups currently defined.

Return type

Number

Example

To get the number of curve groups

```
var total = Group.Total();
```

Include class

The Include class allows you to access the include files in a model. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Include constants

Constants for Directory separators

Name	Description
Include.NATIVE	Use directory separators native to this machine when writing directory names.
Include.UNIX	Use unix directory separators when writing directory names.
Include.WINDOWS	Use windows directory separators when writing directory names.

Detailed Description

Originally developed for use in PRIMER, the Include class allows a user to create and query include files in a model. A stripped-back version of this class has been added to T/HIS and REPORTER for consistency between the programs.
See File.DriveMapFilename for the current use of this class in T/HIS.

LineStyle class

The LineStyle class contains constants relating to the curve line style. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LineStyle constants

Name	Description
LineStyle.DASH	Dashes lines
LineStyle.DASH2	Dash pattern 2
LineStyle.DASH3	Dash pattern 3
LineStyle.DASH4	Dash pattern 4
LineStyle.DASH5	Dash pattern 5
LineStyle.DASH6	Dash pattern 6
LineStyle.NONE	No line
LineStyle.SOLID	Solid lines

Detailed Description

The LineStyle class is used to define the line style used to draw curves:

```
p.style = LineStyle.SOLID;
```

LineWidth class

The LineWidth class contains constants relating to the curve line width. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

LineWidth constants

Name	Description
LineWidth.BOLD	Bold lines (4 pixels wide)
LineWidth.FINE	Fine lines (1 pixel wide)
LineWidth.HEAVY	Heavy lines (8 pixels wide)
LineWidth.NORMAL	Normal lines (2 pixels wide)
LineWidth.W1	1 pixel wide
LineWidth.W10	10 pixel wide
LineWidth.W2	2 pixel wide
LineWidth.W3	3 pixel wide
LineWidth.W4	4 pixel wide
LineWidth.W5	5 pixel wide
LineWidth.W6	6 pixel wide
LineWidth.W7	7 pixel wide
LineWidth.W8	8 pixel wide
LineWidth.W9	9 pixel wide

Detailed Description

The LineWidth class is used to define the line width used to draw curves:

```
p.width = LineWidth.NORMAL;
```

Model class

The Model class gives you access to models in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Exists(model number*[integer]*)

- SetFlag(flag*[Flag]*, entity_type*[integer]*, item*[integer]*, end (optional)*[integer]*)
- UnflagAll(flag*[Flag]*, entity_type*[integer]*)

Model constants

Name	Description
Model.ALL_FILES	Option to select all files (.thf, LSDA, ASCII, .ztf) when reading model in.
Model.ASCII	Option to select ASCII files when reading model in.
Model.LSDA	Option to select LSDA/binout file when reading model in.
Model.THF	Option to select .thf/d3thdt file when reading model in.
Model.XTF	Option to select .xtf/xtfile file when reading model in.
Model.ZTF	Option to select .ztf file when reading model in.

Model properties

Name	Type	Description
dir (read only)	string	Directory containing the model file.
file (read only)	string	File selected when reading the model.

id (read only)	integer	Model ID
title (read only)	string	Model title.

Detailed Description

The Model class contains information on filenames and directories belonging to a model. See the documentation below for more details.

Details of functions

ClearFlag(flag*[Flag]*, entity_type*[integer]*, item*[integer]*, end (optional)*[integer]*)

Description

Clears a defined flag on an internal (or external) item(s) of type of entity_type in the model.

Arguments

- **flag** (Flag)

The flag you want to clear.

- **entity_type** (integer)

The Entity type that the defined flag will be cleared on.

- **item** (integer)

If +ive: The internal item number starting from 1. If -ive: The external item label.

- **end (optional)** (integer)

To unflag range of items, specify an optional end of range. Unflags items from item to range.

Returns

TRUE if the flag is successfully cleared on the item, otherwise FALSE

Return type

Boolean

Example

To clear the flag f on the 6th node in model m:

```
m.ClearFlag(f, Entity.NODE, 6);
```

To clear the flag f on the Node 13456 in model m:

```
m.ClearFlag(f, Entity.NODE, -13456);
```

To clear the flag f on the first 10 nodes in model m:

```
m.ClearFlag(f, Entity.NODE, 1, 10);
```

To clear the flag f on nodes with labels 1000, 1001, 1002, ..., 1009 in model m:

```
m.ClearFlag(f, Entity.NODE, -1000, -1009);
```

Delete()

Description

Deletes a model
Do not use the Model object after calling this method.

Arguments

No arguments

Returns

TRUE if the model sucessfully deleted, otherwise FALSE

Return type

Boolean

Example

To delete model m:

```
var deleted = m.Delete();
```

Exists(model number*[integer]*) [static]

Description

Checks if a model exists

Arguments

- **model number** (integer)

The number of the model you want to check the existence of.

Returns

TRUE if the model exists, otherwise FALSE

Return type

Boolean

Example

To check if a model n exists

```
var exists = Model.Exists(n);
```

FlagAll(flag*[Flag]*, entity_type*[integer]*)

Description

Sets a defined flag on all of items of type of entity_type in the model.

Arguments

- **flag** (Flag)

The flag you want to set.

- **entity_type** (integer)

The Entity type that the defined flag will be set on.

Returns

TRUE if the flag is successfully set on all the items, otherwise FALSE

Return type

Boolean

Example

To set the flag f on all the nodes in model m:

```
m.FlagAll(f, Entity.NODE);
```

Flagged(flag*[Flag]*, entity_type*[integer]*, item*[integer]*)

Description

Checks if a defined flag is set on an internal (or external) item of type of entity_type in the model.

Arguments

- **flag** (Flag)

The flag you want to check.

- **entity_type** (integer)

The Entity type to check.

- **item** (integer)

If +ive: The internal item number starting from 1. If -ive: The external item label.

Returns

TRUE if the flag is set, FALSE if the flag is not set.

Return type

Boolean

Example

To check if flag f is set on the 6th node in model m:

```
m.Flagged(f, Entity.NODE, 6);
```

To check if flag f is set on the Node 13456 in model m:

```
m.Flagged(f, Entity.NODE, -13456);
```

GetDataFlagged(flag*[Flag]*, data_comp*[integer]*, int_pnt (optional)*[object | integer]*, extra (optional)*[integer]*)

Description

Gets curve objects for a data component for relevant items that are flagged with a specified flag in the model.
Some data components are valid for different entity types (e.g. SXX). If the same flag is set on items of different entity types, data is returned for all relevant, flagged entity types.
To return the same data for multiple items of the same type, it will be much faster if you flag all items you want data for, and do a single call to GetDataFlagged().
The curves are ordered by type, then by the ascending internal index of the items. Use curve properties to identify which curve is which. **If the data is not available in the model for a flagged item, or not available for the selected integration points or extra value, a curve is not returned.** You can use QueryDataPresent() to check if the data is available.
It is recommended that you check the number of curves returned. This can be compared with the number of flagged entities, see GetNumberFlagged().
If the data is generally available in the model, but not for the specific flagged item, a "null curve" which contains no x-y data values is returned. For example, a specific shell may have fewer integration points than MAX_INT for all shells, a "null curve" would be returned for the higher integration points.

Arguments

- **flag** (Flag)

The flag to use. For model data, use 0 to define a null "padding" argument.

- **data_comp** (integer)

The Data Component to extract.

- **int_pnt (optional)** (object) | integer

The integration points to extract.
This argument can be either an integer or an object.
This argument is ignored when the entity type is not SOLID, SHELL, THICK_SHELL or BEAM.

An *integer* specifies the integration point to extract:
For SOLIDs: value between 0 for Average/Centre and 8. (Defaults to Average/Centre).
For SHELLs and THICK_SHELLs: value between 1 and # integration points, or codes Constant.TOP, Constant.MIDDLE, Constant.BOTTOM. (Defaults to MIDDLE integration point).
For integrated BEAMs: value between 1 and # integration points. (Defaults to integration point 1).

Use 0 to define a null "padding" argument, then uses the default integration point.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point as described above.
np (optional)	integer	The nodes to extrapolate to. For SOLIDs, SHELLs and THICK_SHELLs: value between 1 and # nodes on the entity. (Defaults to none).
op (optional)	integer	On plan integration point. For SHELLs and THICK_SHELLs: value between 0 for Average/Centre and 4. (Defaults to Average/Centre).

- **extra (optional)** (integer)

The extra component id for SOLIDs, SHELLs, THICK_SHELLs or BEAMs.

Returns

Array of Curve objects.

Return type

Array

Example

To get X direct stress for flagged SOLIDs, SHELLs and THICK_SHELLs with flag f in model m:

```
var cur_array = m.GetDataFlagged(f, Component.SXX);
```

To get X direct stress at top integration point for flagged SHELLs and THICK_SHELLs with flag f in model m:

```
var cur_array = m.GetDataFlagged(f, Component.SXX, Constant.TOP);
```

To get X direct stress at top integration point, and on-plan integration point 3 for flagged SHELLs and THICK_SHELLs with flag f in model m:

```
var cur_array = m.GetDataFlagged(f, Component.SXX, {ip:Constant.TOP, op:3});
```

To get extra beam data 3 for flagged BEAMs with flag f in model m:

```
var cur_array = m.GetDataFlagged(f, Component.BEX, 0, 3);
```

To get the total mass in model m:

```
var cur_array = m.GetDataFlagged(0, Component.GMASS);
```

GetFromID(model number*[integer]*) [static]

Description

Returns the Model object for a model ID or null if model does not exist.

Arguments

- **model number** (integer)

number of the model you want the Model object for

Returns

Model object (or null if model does not exist).

Return type

Model

Example

To get the model n

```
var model = Model.GetFromID(n);
```

GetInternalID(entity_type*[integer]*, item*[integer]*)

Description

Gets the internal ID of external item of type entity_type in the model.

Arguments

- **entity_type** (integer)

The Entity type of the item.

- **item** (integer)

The external item number.

Returns

Integer internal ID (starting from 1) with reference to the entity_type code. Returns integer internal ID of 0 if item cannot be found.

Return type

Number

Example

To get the internal ID of Airbag 300 in model m:

```
var x = m.GetInternalID(Entity.AIRBAG, 300);
```

GetLabel(entity_type*[integer]*, item*[integer]*)

Description

Gets the external label of internal item of type entity_type in the model.

Arguments

- **entity_type** (integer)

The Entity type of the item.

- **item** (integer)

The internal item number starting from 1.

Returns

Integer external ID (or 0 if there is an error, or the internal ID if there are no external IDs).

Return type

Number

Example

To get the external ID of the 2nd airbag in model m:

```
var x = m.GetLabel(Entity.AIRBAG, 2);
```

GetLabelFromName(entity_type*[integer]*, name*[string]*)

Description

Gets the external label from the database history name name of type entity_type in the model. This is quicker if you use parent entity type codes (e.g. Entity.WELD rather than Entity.WELD_CONSTRAINED)

Arguments

- **entity_type** (integer)

The Entity type of the item.

- **name** (string)

The name of the item. If only the first part of the name is given, it must be unambiguous.

Returns

Integer external ID of the first matching name (or 0 if there is an error).

Return type

Number

Example

To get the external label the of Contact named "Rear Bolt" in database history:

```
var name = m.GetLabelFromName(Entity.CONTACT, "Rear Bolt");
```

GetName(entity_type*[integer]*, item*[integer]*)

Description

Gets the database history name of an internal (or external) item of type entity_type in the model.

Arguments

- **entity_type** (integer)

The Entity type of the item.

- **item** (integer)

If +ive: The internal item number starting from 1. If -ive: The external item label.

Returns

String containing the database history name (or null if not available).

Return type

String

Example

To get the database history name of the 2nd airbag in model m:

```
var name = m.GetName(Entity.AIRBAG, 2);
```

To get the database history name of Airbag 300 in model m:

```
var name = m.GetName(Entity.AIRBAG, -300);
```

GetNumberFlagged(flag*[Flag]*, entity_type (optional)*[integer]*)

Description

Gets the number of entities flagged with a requested flag in the model.

Arguments

- **flag** (Flag)

The flag you want to check.

- **entity_type (optional)** (integer)

If specified, the Entity type to look at. If not specified, all types are looked at.

Returns

Integer number

Return type

Number

Example

To get the number of airbag parts flagged with flag f in model m:

```
var num = m.GetNumberFlagged(f, Entity.AIRBAG_PART_DATA);
```

GetNumberOf(entity_type*[integer]*)

Description

Gets the number of entities of a requested type in the model.

Arguments

- **entity_type** (integer)

The Entity type that you want to know the number of.

Returns

Integer number

Return type

Number

Example

To get the number of airbags in model m:

```
var num = m.GetNumberOf(Entity.AIRBAG);
```

HighestID() [static]

Description

Returns the ID of the highest model currently being used

Arguments

No arguments

Returns

ID of highest model currently being used.

Return type

Number

Example

To get the highest model ID

```
var id= Model.HighestID();
```

QueryDataPresent(data_comp*[integer]*, entity_type (optional)*[integer]*, int_pnt (optional)*[object | integer]*, extra (optional)*[integer]*)

Description

Checks if a data component data_comp for a given entity is present in a model's database. For SOLIDs, SHELLs, THICK_SHELLs and BEAMs the integration point and extra component ID can also be checked. This will show if curves for any flagged items of this type will be returned for GetDataFlagged(). Note, it does not check if the data component is *valid*, for example a specific shell may have fewer integration points than MAX_INT for all shells, so curves returned for GetDataFlagged() may still be "null" with no x-y data.

Arguments

- **data_comp** (integer)

The Data Component to check.

- **entity_type (optional)** (integer)

The Entity type to check. This argument can only be omitted when checking for global model data.

- **int_pnt (optional)** (object) | integer

The integration points to check.
This argument can be either an integer or an object.
This argument is ignored if the entity type is not SOLID, SHELL, THICK_SHELL or BEAM.

An *integer* specifies the integration point to check:
For SOLIDs: value between 0 for Average/Centre and 8. (Defaults to Average/Centre).
For SHELLs and THICK_SHELLs: value between 1 and # integration points, or codes Constant.TOP, Constant.MIDDLE, Constant.BOTTOM. (Defaults to MIDDLE integration point).
For integrated BEAMs: value between 1 and # integration points. (Defaults to integration point 1).

Use 0 to define a null "padding" argument, then checks the default integration point.

Object has the following properties:

Name	Type	Description
ip	integer	Through thickness integration point as described above.
np (optional)	integer	The nodes to extrapolate to. For SOLIDs, SHELLs and THICK_SHELLs: value between 1 and # nodes on the entity. (Defaults to none).

op (optional)	integer	On plan integration point. For SHELLs and THICK_SHELLs: value between 0 for Average/Centre and 4. (Defaults to Average/Centre).

- **extra (optional)** (integer)

The extra component id for SOLIDs, SHELLs, THICK_SHELLs or BEAMs.

Returns

true if data is present, otherwise false.

Return type

Boolean

Example

To check for X direct stress data for SOLIDs in model m:

```
if(m.QueryDataPresent(Component.SXX, Entity.SOLID)) ...
```

To check for X direct stress data at integration point 5 for SHELLs in model m:

```
if(m.QueryDataPresent(Component.SXX, Entity.SHELL, 5)) ...
```

To check for X direct stress data at both the top integration point, and also extrapolated to node 3 for SHELLs in model m:

```
if(m.QueryDataPresent(Component.SXX, Entity.SHELL, {ip:Constant.TOP, np:3}) ...
```

To check for extra 3 beam data for BEAMs in model m:

```
if(m.QueryDataPresent(Component.BEX, Entity.BEAM, 0, 3);
```

To check for total mass data in model m:

```
if(m.QueryDataPresent(Component.GMASS));
```

Read(filename*[string]*, filetype (optional)*[integer]*) [static]

Description

Reads in a new model.

Arguments

- **filename** (string)

Filename you want to read.

- **filetype (optional)** (integer)

Filetypes you want to read. Can be bitwise OR of Model.THF, Model.XTF, Model.LSDA, Model.ASCII, Model.ZTF and Model.ALL_FILES. If omitted all available files will be read.

Returns

Model object (or null if error).

Return type

Model

Example

To read in model /data/test/file.thf:

```
var m = Model.Read("/data/test/file.thf");
```

To read in model /data/test/file.thf only with .ztf files:

```
var m = Model.Read("/data/test/file.thf", Model.ZTF);
```

To read in model /data/test/file.thf only with .thf, .ascii and .ztf files:

```
var m = Model.Read("/data/test/file.thf", Model.THF | Model.ASCII | Model.ZTF);
```

SetFlag(flag*[Flag]*, entity_type*[integer]*, item*[integer]*, end (optional)*[integer]*)

Description

Sets a defined flag on an internal (or external) item(s) of type of entity_type in the model.

Arguments

- **flag** (Flag)

The flag you want to set.

- **entity_type** (integer)

The Entity type that the defined flag will be set on.

- **item** (integer)

If +ive: The internal item number starting from 1. If -ive: The external item label.

- **end (optional)** (integer)

To flag range of items, specify an optional end of range. Flags items from item to range.

Returns

TRUE if the flag is successfully set on the item, otherwise FALSE

Return type

Boolean

Example

To set the flag f on the 6th node in model m:

```
m.SetFlag(f, Entity.NODE, 6);
```

To set the flag f on the Node 13456 in model m:

```
m.SetFlag(f, Entity.NODE, -13456);
```

To set the flag f on the first 10 nodes in model m:

```
m.SetFlag(f, Entity.NODE, 1, 10);
```

To set the flag f on nodes with labels 1000, 1001, 1002, ..., 1009 in model m:

```
m.SetFlag(f, Entity.NODE, -1000, -1009);
```

Total() [static]

Description

Returns the total number of models.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To find how many models there are in T/HIS:

```
var num = Model.Total();
```

UnflagAll(flag*[Flag]*, entity_type*[integer]*)

Description

Unsets a defined flag flag on all of items of type of entity_type in the model.

Arguments

- **flag** (Flag)

The flag you want to unset.

- **entity_type** (integer)

The Entity type that the defined flag will be unset on.

Returns

TRUE if the flag is successfully unset on all the items, otherwise FALSE

Return type

Boolean

Example

To unset the flag f on all the nodes in model m:

```
m.UnflagAll(f, Entity.NODE);
```

Operate class

The Operate class gives you access to the built in curve operations in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Abs(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Acos(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Acu(Input Curve*[Curve]*, Offset*[real]*, Time Period*[real]*, Output Curve (optional)*[Curve]*)
- Ad(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Add(Input Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*)
- Adx(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*)
- Asi(X Acceleration*[Curve]*, Y Acceleration*[Curve]*, Z Acceleration*[Curve]*, Acceleration conversion factor*[real]*, X Acceleration Limit*[real]*, Y Acceleration Limit*[real]*, Z Acceleration Limit*[real]*, Calculation method*[string]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)
- Asin(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Atan(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Atan2(First Input Curve*[Curve]*, Second Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Av(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*)
- Ave(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*)
- Bes(Input Curve*[Curve]*, Frequency*[real]*, Order*[integer]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)
- Blc(Input Curve*[Curve]*)
- But(Input Curve*[Curve]*, Frequency*[real]*, Order*[integer]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)
- C1000(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)
- C180(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)
- C60(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*)

Detailed Description

The Operate class allows you to use the built in curve operations in T/HIS to generate new curves. Most of the curve operations generate a new curve and return the curve object for the new curve. A few functions (NIJ, FFT, etc) generate multiple output curves and these return an array of curve objects.
See the documentation below for more details.

Details of functions

Abs(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert a curve to absolute values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To convert curve m to absolute values and store as curve p

```
p = Operate.Abs(m);
```

Acos(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Arc Cosine

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Arc Cosine() of curve m and store as curve p

```
p = Operate.Acos(m);
```

Acu(Input Curve*[Curve]*, Offset*[real]*, Time Period*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Evaluates the integratal of a curve over a user defined period

Arguments

- **Input Curve** (Curve)

Input Curve

- **Offset** (real)

User defined offset

- **Time Period** (real)

Time to integrate over

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Integrate c curve over 0.07 seconds with a 0.1 offset.

```
p = Operate.Acu(m,0.1,0.007);
```

Ad(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert acceleration spectrum to a displacment spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Ad(m);
```

Add(Input Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Add Y axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To add curves m and n together and store as curve p

```
p = Operate.Add(m,n);
```

To add 20.0 to the values in curve m and store as curve p

```
p = Operate.Add(m,20.0);
```

Adx(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Add X axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To add X axis values for curves m and n together and store as curve p

```
p = Operate.Adx(m,n);
```

To add 20.0 to the X axis values in curve m and store as curve p

```
p = Operate.Adx(m,20.0);
```

Asi(X Acceleration*[Curve]*, Y Acceleration*[Curve]*, Z Acceleration*[Curve]*, Acceleration conversion factor*[real]*, X Acceleration Limit*[real]*, Y Acceleration Limit*[real]*, Z Acceleration Limit*[real]*, Calculation method*[string]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Acceleration Severity Index. This value is used to assess the performance of road side crash barriers. The calculation method can be set to 2010 (BS EN 1317-1:2010) or 1998 (BS EN 1317-1:1998).

Arguments

- **X Acceleration** (Curve)

X Acceleration Curve

- **Y Acceleration** (Curve)

Y Acceleration Curve

- **Z Acceleration** (Curve)

Z Acceleration Curve

- **Acceleration conversion factor** (real)

Factor required to divide input acceleration curve by to convert to (G)

- **X Acceleration Limit** (real)

X direction acceleration limit

- **Y Acceleration Limit** (real)

Y direction acceleration limit

- **Z Acceleration Limit** (real)

Z direction acceleration limit

- **Calculation method** (string)

Either 2010 or 1998.

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate ASI using the 2010 method with input curves x,y and z, factors 12,9,10 and a conversioon factor of 9810. Regularise the input curves using an interval of 0.0001 first.

```
p = Operate.Asi(x,y,z,9810.0,12.0,9.0,10.0,"2010",0.0001);
```

Asin(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Arc Sine

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Arc Sine() of curve m and store as curve p

```
p = Operate.Asin(m);
```

Atan(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Arc Tangent

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Arc Tangent() of curve m and store as curve p

```
p = Operate.Atan(m);
```

Atan2(First Input Curve*[Curve]*, Second Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Arc Tangent using atan2(y, x)

Arguments

- **First Input Curve** (Curve)

Input Curve

- **Second Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Arc Tangent() of curve m / curve n and store as curve p

```
p = Operate.Atan2(m, n);
```

Av(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert acceleration spectrum to a velocity spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Av(m);
```

Ave(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Average a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Average the array of curves stored in curve array x and store as curve p

```
p = Operate.Ave(x);
```

Bes(Input Curve*[Curve]*, Frequency*[real]*, Order*[integer]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Bessel Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **Frequency** (real)

Cut-off Frequency (Hz)

- **Order** (integer)

Filter order

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m using a cut-off of 400Hz and order 2 and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.Bes(m,400.0,2,0.0001);
```

Blc(Input Curve*[Curve]*) [static]

Description

Carry out a baseline correction on an accleration time history

Arguments

- **Input Curve** (Curve)

Moment / Time Curve

Returns

Array of Curve objects.
1st curve : Corrected curve
2nd curve : Integrated Velocity
3rd curve : Integrated Displacement

Return type

Array

Example

Calculate baseline correction on curve m, .

```
c_array = Operate.Blc(m);
corrected_curve = c_array[0];
vel_curve = c_array[1];
disp_curve = c_array[2];
```

But(Input Curve*[Curve]*, Frequency*[real]*, Order*[integer]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Butterworth Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **Frequency** (real)

Cut-off Frequency (Hz)

- **Order** (integer)

Filter order

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m using a cut-off of 400Hz and order 2 and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.But(m,400.0,2,0.0001);
```

C1000(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

SAE Class 1000 Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.C1000(m,0.0001);
```

C180(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

SAE Class 180 Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.C180(m,0.0001);
```

C60(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

SAE Class 60 Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.C60(m,0.0001);
```

C600(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

SAE Class 600 Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.C600(m,0.0001);
```

Cat(First Curve*[Curve]*, Second Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Concatenate 2 curves together

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To concatenate the values for curve n to those in curve m and store as curve p

```
p = Operate.Cat(m,n);
```

Clip(Input Curve*[Curve]*, X min*[real]*, X max*[real]*, Y min*[real]*, Y max*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Clip a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **X min** (real)

X minimum value

- **X max** (real)

X maximum value

- **Y min** (real)

Y minimum value

- **Y max** (real)

Y maximum value

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Clip a curve m to within 0.1<x<0.3, 0.0<y<100.0 and store as curve p

```
p = Operate.Clip(m,0.1,0.3,0.0,100.0);
```

Com(First Curve*[Curve]*, Second Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Combine Y axis values from 2 curves together

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To combine the Y axis values for curve n to those in curve m and store as curve p

```
p = Operate.Com(m,n);
```

Cor(First Curve*[Curve]*, Second Curve*[Curve]*, Correlation type*[string]*) [static]

Description

Curve Correlation function. This Correlation function provides a measure of the degree to which two curves match. When comparing curves by eye, the quality of correlation may be judged on the basis of how well matched are the patterns of peaks, the overall shapes of the curves, etc, and can allow for differences of timing as well as magnitude. Thus a simple function based on the difference of Y-values (such as T/HIS ERR function) does not measure correlation in the same way as the human eye. The T/HIS correlation function attempts to include and quantify the more subtle ways in which the correlation of two curves may be judged.
The correlation can be calculated using either a strict or loose set of input parameters.
The degree of correlation is rated between 0 and 100.

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve)

Second Curve

- **Correlation type** (string)

Correlation type, strict or loose

Returns

Correlation value

Return type

real

Example

Calculate the correlation between curves m and n using the strict input parameters.

```
val = Operate.Cor(m,n,"strict");
```

Cor3(First Curve*[Curve]*, Second Curve*[Curve]*, X axis factor (optional)*[real]*, Y axis factor (optional)*[real]*) [static]

Description

Curve Correlation function. This function first normalises the curves using two factors either specified by the user or defaults calculated by the program (the maximum absolute X and Y values of both graphs). For each point on the first normalised curve, the shortest distance to the second normalised curve is calculated. The root mean square value of all these distances is subtracted from 1 and then multiplied by 100 to get an index between 0 and 100. The process is repeated along the second curve and the two indices are averaged to get a final index. The higher the index the closer the correlation between the two curves.
Note that the choice of normalising factors is important. Incorrect factors may lead to a correlation index outside the range of 0 to 100

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve)

Second Curve

- **X axis factor (optional)** (real)

Normalising factor used for X axis values

- **Y axis factor (optional)** (real)

Normalising factor used for Y axis values

Returns

Correlation value

Return type

real

Example

Calculate the correlation between curves m and n using the default normalising factors.

```
val = Operate.Cor3(m,n);
```

Calculate the correlation between curves m and n using 0.1 and 1000.0 as the X and Y normalising factors.

```
val = Operate.Cor3(m,n,0.1,1000);
```

Cos(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Cosine

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Cosine() of curve m and store as curve p

```
p = Operate.Cos(m);
```

Da(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert displacment spectrum to an acceleration spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Da(m);
```

Dif(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Differentiate a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To differentiate curve m and store as curve p

```
p = Operate.Dif(m);
```

Div(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Divide Y axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To divide the Y axis values for curve n by curve m and store as curve p

```
p = Operate.Div(m,n);
```

To devide the Y axis values in curve m by 20.0 and store as curve p

```
p = Operate.Div(m,20.0);
```

Dix(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Divide X axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To divide the X axis values for curve n by curve m and store as curve p

```
p = Operate.Dix(m,n);
```

To devide the X axis values in curve m by 20.0 and store as curve p

```
p = Operate.Dix(m,20.0);
```

Ds(Input Curve*[Curve]*, Broadening Factor*[real]*, Redefine Frequencies*[string]*, Output Curve (optional)*[Curve]*) [static]

Description

Generate a design spectrum from a reponse spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Broadening Factor** (real)

Spectrum broadening factor

- **Redefine Frequencies** (string)

T-HIS selects a new set of frequencies for the output (yes or no)

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and let T-HIS determine the new frequencies, store as curve p

```
p = Operate.Ds(m,"yes");
```

Dv(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert displacment spectrum to a velocity spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Dv(m);
```

Env(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Generate an Envelope that bounds the min and max values of a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Envelope of curves stored in curve array x and store as curve p

```
p = Operate.Env(x);
```

Err(First Curve*[Curve]*, Second Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate the degree of correlation between 2 curves

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To calculate the correlation between curves n and m and store as curve p

```
p = Operate.Err(m,n);
```

Exc(Input Curve*[Curve]*, Output option*[string]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate and displays an EXCeedence plot. This is a plot of force (Y axis) versus cumulative time (X axis) for which the force level has been exceeded. By default the Automatic option will create an exceedence plot using either the +ve OR the -ve values depending on which the input curve contains most of.
The Positive option will calculate the exceedence plot using only the points with +ve y values.
The Negative option will calculate the exceedence plot using only the points with -ve y values.

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output option** (string)

Select between automatic, positive or negative.

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Exceedence plot for curve m, using the positive option and store as curve p

```
p = Operate.Exc(m,"positive");
```

Exp(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate E to the power of Y axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate E to the power of Y axis values for curve m and store as curve p

```
p = Operate.Exp(m);
```

Fft(Input Curve*[Curve]*, Output option*[string]*, X axis interval (optional)*[real]*, Scaling option (optional)*[string]*) [static]

Description

Fast Fourier Transform

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output option** (string)

Generate magnitude, magnitude+phase or real+imaginary, (one of magnitude,phase,real)

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Scaling option (optional)** (string)

Scaling option, (either one or two)

Returns

Curve object/array or NULL

Return type

Curve

Example

Generate magnitude and phase curves and return a curve array. Regularise the input curve using an interval of 0.0001 first and scale using option two.

```
c_array = Operate.Fft(m,"phase",0.0001,"one");
mag_curve = c_array[0];
phase_curve = c_array[1];
```

Fir(Input Curve*[Curve]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

FIR Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m and output as curve p . Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.Fir(m,0.0001);
```

Hic(Input Curve*[Curve]*, Window*[real]*, Acceleration factor*[real]*) [static]

Description

HIC Calculation. After calculating the HIC value for a curve the value can also be obtained from the curve using the Curve.hic property. In addition to the HIC value the start and end time for the time window can also be obtained using the Curve.hic_tmin and Curve.hic_tmax properties.

Arguments

- **Input Curve** (Curve)

Input Curve

- **Window** (real)

Maximum time window

- **Acceleration factor** (real)

Factor required to divide input acceleration curve by to convert to (G)

Returns

HIC value

Return type

real

Example

Calculate HIC for curve m, using a window of 0.036s and a factor of 9810.

```
val = Operate.Hic(m,0.036,9810.0);
```

Hicd(Input Curve*[Curve]*, Window*[real]*, Acceleration factor*[real]*) [static]

Description

Modified HIC(d) Calculation for free motion headform. After calculating the HIC value for a curve the value can also be obtained from the curve using the Curve.hicd property. In addition to the HIC(d) value the start and end time for the time window can also be obtained using the Curve.hicd_tmin and Curve.hicd_tmax properties.

Arguments

- **Input Curve** (Curve)

Input Curve

- **Window** (real)

Maximum time window

- **Acceleration factor** (real)

Factor required to divide input acceleration curve by to convert to (G)

Returns

HIC(d) value

Return type

real

Example

Calculate HIC(d) for curve m, using a window of 0.036s and a factor of 9810.

```
val = Operate.Hicd(m,0.036,9810.0);
```

Ifft(First Curve*[Curve]*, Second Curve*[Curve]*, Input type*[string]*) [static]

Description

Inverse Fast Fourier Transform

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve)

Second Curve

- **Input type** (string)

Specifies if inputs are magnitude+phase or real+imaginary, (magnitude or real)

Returns

Curve object or NULL

Return type

Curve

Example

Generate curve from magnitude (m) and phase (p) data and return as curve q.

```
q = Operate.Ifft(m,p,"magnitude");
```

Int(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Integrate a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To integrate curve m and store as curve p

```
p = Operate.Int(m);
```

Log(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Natural Log of Y axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Natural Log of Y axis values for curve m and store as curve p

```
p = Operate.Log(m);
```

Log10(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Log (base 10) of Y axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Log (base 10) of Y axis values for curve m and store as curve p

```
p = Operate.Log10(m);
```

Log10x(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Log (base 10) of X axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Log (base 10) of X axis values for curve m and store as curve p

```
p = Operate.Log10x(m);
```

Logx(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Natural Log of X axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Natural Log of X axis values for curve m and store as curve p

```
p = Operate.Logx(m);
```

Lsq(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Least Squares Fit for a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To calculate Least Squares Fit for curve m and store as curve p

```
p = Operate.Lsq(m);
```

Map(First Curve*[Curve]*, Second Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Map Y axis values from one curve onto another curve

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To map curve n onto curve m and store as curve p

```
p = Operate.Map(m,n);
```

Max(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Maximum of a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Maximum of curves stored in curve array x

```
p = Operate.Max(x);
```

Min(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Minimum of a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Minimum of curves stored in curve array x

```
p = Operate.Min(x);
```

Mon(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Sort a curve into monotonically increasing X axis values.

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To sort curve m and store as curve p

```
p = Operate.Mon(m);
```

Mul(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Multiply Y axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To multiply the Y axis values for curve n from m and store as curve p

```
p = Operate.Mul(m,n);
```

To multiply the Y axis values in curve m by 20.0 and store as curve p

```
p = Operate.Mul(m,20.0);
```

Mux(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Multiply X axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To multiply the X axis values for curve n from m and store as curve p

```
p = Operate.Mux(m,n);
```

To multiply the X axis values in curve m by 20.0 and store as curve p

```
p = Operate.Mux(m,20.0);
```

Ncp(First Curve*[Curve]*, Second Curve*[Curve]*) [static]

Description

Calculate a platic rotation curve for a beam from a moment/time and rotation/time

Arguments

- **First Curve** (Curve)

Moment / Time Curve

- **Second Curve** (Curve)

Rotation /Time Curve

Returns

Curve object or NULL

Return type

Curve

Example

Calculate plastic rotation curve p using curves m and r.

```
q = Operate.Ncp(m,r);
```

Nij(Shear Force*[Curve]*, Axial Force*[Curve]*, Moment*[Curve]*, Fzc_t*[real]*, Fzc_c*[real]*, Myc_f*[real]*, Myc_e*[real]*, E*[real]*) [static]

Description

Biomechanical neck injury predictor. Used as a measure of injury due to the load transferred through the occipital condyles.
This function returns an array containing 4 curve objects.
Curve 1 - "Nte" is the tension-extension condition
Curve 2 - "Ntf" is the tension-flexion condition
Curve 3 - "Nce" is the compression-extension condition
Curve 4 - "Ncf" is the compression-flexion condition.

Arguments

- **Shear Force** (Curve)

Shear Force Curve

- **Axial Force** (Curve)

Axial Force Curve

- **Moment** (Curve)

Moment Curve

- **Fzc_t** (real)

Critical Axial Force (Tension)

- **Fzc_c** (real)

Critical Axial Force (Compression)

- **Myc_f** (real)

Critical bending moment (Flexion)

- **Myc_e** (real)

Critical bending moment (Extension)

- **E** (real)

Distance

Returns

Array of Curve objects.
1st curve : Nte curve
2nd curve : Ntf curve
3rd curve : Nce curve
4th curve : Ncf curve

Return type

Array

Example

Calculate NIJ curves using input curves x,y,z, and constants Fzc=1.0 (tension) / 2.0 (compression), Myc=3.0 (flexion) / 4.0 (extenstion) and E=0.0.

```
c_array = Operate.Nij(x,y,z,1.0,2.0,3.0,4.0,0.0);
```

Nor(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Normalise Y axis values between [-1,1]

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Normalise Y axis values of curve m and store as curve p

```
p = Operate.Nor(m);
```

Nor2(Input Curve*[Curve]*, Y Min Value*[real]*, Y Max Value*[real]*, Lock to Axis Y Min*[integer]*, Lock to Axis Y Max*[integer]*, Output Curve (optional)*[Curve]*) [static]

Description

Normalise Y axis values with manual settings. The operation takes the absolute value of the user-specified Y Min and Y Max. It then finds the maximum of these two numbers and divides all Y data by this number. There are two locks which probe or "lock on to" the Y Max and Y Min axis values which offers quick axis-normalizing.

Arguments

- **Input Curve** (Curve)

First Curve

- **Y Min Value** (real)

The Minimum Y value

- **Y Max Value** (real)

The Maximum Y value

- **Lock to Axis Y Min** (integer)

Set the Lock button for the Y Minimum textbox

- **Lock to Axis Y Max** (integer)

Set the Lock button for the Y Maximum textbox

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Normalise the Y axis values of curve m taking the absolute maximum between the two values -200 and 100 (which for this example will equate to 200) with the Y Min Lock active and the Y Max Lock Inactive. This is then stored as curve p.

```
p = Operate.Nor2(m, -200, 100, 1, 0);
```

Nox(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Normalise X axis values between [-1,1]

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Normalise X axis values of curve m and store as curve p

```
p = Operate.Nox(m);
```

Nox2(Input Curve*[Curve]*, X Min Value*[real]*, X Max Value*[real]*, Lock to Axis X Min*[integer]*, Lock to Axis X Max*[integer]*, Output Curve (optional)*[Curve]*) [static]

Description

Normalise X axis values with manual settings. The operation takes the absolute value of the user-specified X Min and X Max. It then finds the maximum of these two numbers and divides all X data by this number. There are two locks which probe or "lock on to" the X Max and X Min axis values which offers quick axis-normalizing.

Arguments

- **Input Curve** (Curve)

First Curve

- **X Min Value** (real)

The Minimum X value

- **X Max Value** (real)

The Maximum X value

- **Lock to Axis X Min** (integer)

Set the Lock button for the X Minimum textbox

- **Lock to Axis X Max** (integer)

Set the Lock button for the X Maximum textbox

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Normalise the X axis values of curve m taking the absolute maximum between the two values -200 and 100 (which for this example will equate to 200) with the X Min Lock active and the X Max Lock Inactive. This is then stored as curve p.

```
p = Operate.Nox2(m, -200, 100, 1, 0);
```

Octave(Input Curve*[Curve]*, Band type to convert to*[String]*, Output Type*[String]*, Input Type*[String]*, Output Curve (optional)*[Curve]*) [static]

Description

Coverts a narrow band curve to either Octave or 1/Third Octave bands

Arguments

- **Input Curve** (Curve)

Input Curve

- **Band type to convert to** (String)

Band type to convert to. Either "Octave" or "Third" Octave.

- **Output Type** (String)

Generate curve containing either "RMS" or "mean" values.

- **Input Type** (String)

Input curve contains either "Linear" or "dB" values.

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m that contains Linear values to 1/3 Octave bands and output RMS in curve p

```
p = Operate.Octave(m,"third","rms","linear");
```

Order(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Reverse the order of points in a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Reverse the order of points in curve m and store as curve p

```
p = Operate.Order(m);
```

Pbut(Input Curve*[Curve]*, Frequency*[real]*, Order*[integer]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Pure Butterworth Filter

Arguments

- **Input Curve** (Curve)

Input Curve

- **Frequency** (real)

Cut-off Frequency (Hz)

- **Order** (integer)

Filter order

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Filter curve m using a cut-off of 400Hz and order 2 and output as curve p. Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.Pbut(m,400.0,2,0.0001);
```

Power(Input Curve*[Curve]*, Power*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Raise to the power

Arguments

- **Input Curve** (Curve)

Input Curve

- **Power** (real)

Power to raise Y axis values by

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Raise the Y axis values for curve m to the power 2.5 and store as curve p

```
p = Operate.Power(m,2.5);
```

Rave(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate rolling average of a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate rolling average of curve m and store as curve p

```
p = Operate.Rave(m);
```

Rec(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate reciprocal

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate receprocal of curve m and store as curve p

```
p = Operate.Rec(m);
```

Reg(Input Curve*[Curve]*, X axis interval*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Regularise X axis intervals for a curve.

Arguments

- **Input Curve** (Curve)

Input Curve

- **X axis interval** (real)

New X axis interval

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Regularise curve m using a new X axis intreval of 0.0001.

```
p = Operate.Reg(m,0.0001);
```

Res(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Resultant of a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Resultant of curves stored in curve array x

```
p = Operate.Res(x);
```

Rev(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Reverse X and Y axis values

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Reverse X and Y axis values of curve m and store as curve p

```
p = Operate.Rev(m);
```

Rs(Input Curve*[Curve]*, Damping Factor*[real]*, Sampling Points*[int]*, X axis interval (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Generate a reponse spectrum from input accelerations

Arguments

- **Input Curve** (Curve)

Input Curve

- **Damping Factor** (real)

Dammping factor

- **Sampling Points** (int)

Number of points to sample over (30 or 70)

- **X axis interval (optional)** (real)

If defined then T-HIS will automatically regularise the curve using this value first

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Array of Curve objects
1st curve : Relative displacement
2nd curve : Relative velocity
3th curve : Pseudo relative velocity
4th curve : Absolute acceleration
5th curve : Pseudo absolute acceleration

Return type

Array

Example

Generate a response spectrum using a factor of 0.05 and 70 sampling points. Regularise the input curve using an interval of 0.0001 first.

```
p = Operate.Rs(m,0.05,70,0.0001);
```

Sin(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Sine

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Sine() of curve m and store as curve p

```
p = Operate.Sin(m);
```

Smooth(Input Curve*[Curve]*, Smoothing Factor*[integer]*, Output Curve (optional)*[Curve]*) [static]

Description

Apply a smoothing factor to a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Smoothing Factor** (integer)

Number of points to average over

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Smooth curve m using 7 points and store as curve p

```
p = Operate.Smooth(m,7);
```

Sqr(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Square root of a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Square root curve m and store as curve p

```
p = Operate.Sqr(m);
```

Stress(Input Curve*[Curve]*, Convert to*[string]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert between true and engineering stress

Arguments

- **Input Curve** (Curve)

Input Curve

- **Convert to** (string)

Type to convert to (True or Engineering)

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m from engineering to true strees and store as curve p

```
p = Operate.Stress(m,"True");
```

Sub(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Subtract Y axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To subtract the Y axis values for curve n from m and store as curve p

```
p = Operate.Sub(m,n);
```

To subtract 20.0 from the Y axis values in curve m and store as curve p

```
p = Operate.Sub(m,20.0);
```

Sum(Curves*[Array of Curve objects]*, Output Curve (optional)*[Curve]*) [static]

Description

Sum of a group of curves

Arguments

- **Curves** (Array of Curve objects)

Array of Curve objects

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Sum of curves stored in curve array x

```
p = Operate.Sum(x);
```

Sux(First Curve*[Curve]*, Second Curve or constant*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Subtract X axis values

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve or constant** (Curve or real)

Second Curve or constant

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

To subtract the X axis values for curve n from m and store as curve p

```
p = Operate.Sux(m,n);
```

To subtract 20.0 from the X axis values in curve m and store as curve p

```
p = Operate.Sux(m,20.0);
```

Tan(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Calculate Tangent

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate Tangent() of curve m and store as curve p

```
p = Operate.Tan(m);
```

Thiv(X Acceleration*[Curve]*, Y Acceleration*[Curve]*, Yaw Rate*[Curve]*, Dx*[real]*, Dy*[real]*, X0*[real]*) [static]

Description

Theoretical Head Impact Velocity and the Post Impact Head Deceleration. These values are used to assess the performance of road side crash barriers.
This function returns an array containing 2 curve objects. The 1st curve is the THIV curve and the 2nd is the PHD curve. The peak values of these curves are the corresponding THIV and PHD values and can be obtained using the Curve.ymax property.

Arguments

- **X Acceleration** (Curve)

X Acceleration Curve

- **Y Acceleration** (Curve)

Y Acceleration Curve

- **Yaw Rate** (Curve)

Yaw Rate Curve

- **Dx** (real)

Horizontal distance between occupants head and vehicle

- **Dy** (real)

Lateral distance between occupants head and vehicle

- **X0** (real)

Horizontal distance between occupants head and vehicle CofG

Returns

Array of Curve objects.
1st curve : THIV curve
2nd curve : PHD curve

Return type

Array

Example

Calculate THIV and PHD curves x,y,z and distances Dx=0.6, Dy=0.3, X0=0.0.

```
c_array = Operate.Thiv(x,y,z,0.6,0.3,0.0);
thiv = c_array[0].ymax;
phd = c_array[1].ymax;
```

Tms(Input Curve*[Curve]*, Period*[real]*) [static]

Description

3ms Clip Calculation. After calculating the 3ms clip value for a curve the value can also be obtained from the curve using the Curve.tms property. In addition to the 3ms clip value the start and end time for the time window can also be obtained using the Curve.tms_tmin and Curve.tms_tmax properties.

Arguments

- **Input Curve** (Curve)

Input Curve

- **Period** (real)

Clip period

Returns

3ms clip value

Return type

real

Example

Calculate 3ms clip for curve m, using a clip period of 0.003s.

```
val = Operate.Tms(m,0.003);
```

Translate(Input Curve*[Curve]*, X value*[real]*, Y value*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Translate a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **X value** (real)

X translation value

- **Y value** (real)

Y translation value

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Translate curve m by x=0.2, y=0.3 and store as curve p

```
p = Operate.Translate(m,0.2,0.3);
```

Tti(Upper Rib Acceleration*[Curve]*, Lower Rib Acceleration*[Curve]*, T12 Acceleration*[Curve]*) [static]

Description

Thorax Trauma Index.

Arguments

- **Upper Rib Acceleration** (Curve)

Upper Rib Acceleration Curve

- **Lower Rib Acceleration** (Curve)

Lower Rib Acceleration Curve

- **T12 Acceleration** (Curve)

T12 Acceleration Curve

Returns

TTI value

Return type

real

Example

Calculate TTI using curves x,y and z as inputs.

```
val = Operate.TTi(x,y,z);
```

Va(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert velocity spectrum to an acceleration spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Va(m);
```

Vc(Input Curve*[Curve]*, A*[real]*, B*[real]*, Calculation method*[string]*, Output Curve (optional)*[Curve]*) [static]

Description

Viscous Criteria calculate. The VC calculation can be done using 2 different calculation methods ECER95 and IIHS.

Arguments

- **Input Curve** (Curve)

Input Curve

- **A** (real)

Constant A

- **B** (real)

Constant B

- **Calculation method** (string)

Either ECER95 or IIHS.

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate VC for curve m, using A=1.3, B=0.229 and the ECER95 method

```
p = Operate.Vc(m,1.3,0.229,"ECER95");
```

Vd(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Convert velocity spectrum to a displacment spectrum

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m and store as curve p

```
p = Operate.Vd(m);
```

Vec(First Curve*[Curve]*, Second Curve*[Curve or real]*, Third Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Vector magnitude of 3 curves

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Third Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate vector magnitude of curves m,n,o and store as curve p

```
p = Operate.Vec(m,n,o);
```

Vec2d(First Curve*[Curve]*, Second Curve*[Curve or real]*, Output Curve (optional)*[Curve]*) [static]

Description

Vector magnitude of 2 curves

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve or real)

Second Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Calculate vector magnitude of curves m and n and store as curve p

```
p = Operate.Vec2d(m,n);
```

Wif(First Curve*[Curve]*, Second Curve*[Curve]*) [static]

Description

Weigthed Integrated Factor (WIFAC) Correlation function.

Arguments

- **First Curve** (Curve)

First Curve

- **Second Curve** (Curve)

Second Curve

Returns

Correlation value

Return type

real

Example

Calculate the correlation between curves m and n.

```
val = Operate.Wif(m,n);
```

Window(Input Curve*[Curve]*, Window Type*[string]*, percentage lead in (optional)*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Apply a smoothing window to a curve

Arguments

- **Input Curve** (Curve)

Input Curve

- **Window Type** (string)

Window type to apply (Hanning, cosine or exponetial)

- **percentage lead in (optional)** (real)

percentage lead in for cosine window

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Apply a hanning window to curve m and store as curve p

```
p = Operate.Window(m,"Hanning");
```

Zero(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Translate curve to 0,0

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Translate curve m to (0,0) and store as curve p

```
p = Operate.Zero(m);
```

ZeroX(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Translate curve to X=0.0

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Translate curve m to X=0 and store as curve p

```
p = Operate.ZeroX(m);
```

ZeroY(Input Curve*[Curve]*, Output Curve (optional)*[Curve]*) [static]

Description

Translate curve to Y=0.0

Arguments

- **Input Curve** (Curve)

Input Curve

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Translate curve m to Y=0 and store as curve p

```
p = Operate.ZeroY(m);
```

---

dB(Input Curve*[Curve]*, Reference Value*[real]*, Output Curve (optional)*[Curve]*) [static]

Description

Converts a curve to dB (y = 20.0*log(y/yref))

Arguments

- **Input Curve** (Curve)

Input Curve

- **Reference Value** (real)

Reference value

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Convert curve m to dB's using a reference value of 10.0 and store as curve p

```
p = Operate.dB(m,10.0);
```

---

dBA(Input Curve*[Curve]*, Weighting Type*[String]*, Output Curve (optional)*[Curve]*) [static]

Description

Applies A-weighting to a curve (convert from dB to dBA)

Arguments

- **Input Curve** (Curve)

Input Curve

- **Weighting Type** (String)

Apply either Narrow band (narrow) or Octave band (octave) A weighting

- **Output Curve (optional)** (Curve)

Curve to overwrite

Returns

Curve object or NULL

Return type

Curve

Example

Apply narrow band A-weighting to convert curve m from dB to dBA and store as curve p

```
p = Operate.dBA(m,"narrow");
```

Options class

The Options class enables you to access several options in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Options class properties

Name	Type	Description
auto_ confirm	logical	If true then T/HIS will automatically confirm (i.e. press the OK button) on (most) message boxes that are mapped. If false (default) then the message boxes will be shown and wait for the user to press a button. This option may be useful to help automate an operation where T/HIS would normally show a message box and wait for the user to press a button.

Properties for ssh

Name	Type	Description
ssh_ buffer_ size	integer	The size of the buffer used (in kiloBytes) when transferring data to/from the remote machine in the Ssh class. Depending on your network and the size of the files you are transferring, changing this value may make file transfers quicker. The default value is 64(kB) but any value in the range 1(kB) to 1024(kB) is allowed.

Properties for widgets

Name	Type	Description
max_widgets	integer	The maximum number of Widgets that can be made for one Window. The default value is 1000
max_ window_ lines	integer	The maximum number of lines that can be made for a Window.Error(), Window.Information(), Window.Message(), Window.Question() or Window.Warning() window. The default value is 25

Detailed Description

The Options class is used to get/set options that T/HIS uses for certain functions. The options are available as **class** properties. See the documentation for more details. An example: Options.mass_properties_include_attached_mass_ deformable_elems=true

Page class

The Page class allows you to return or set the current active page in T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- AddGraph(Page number*[Integer]*, Graph number (optional)*[Integer]*, Graph number to copy properties from (optional)*[Integer]*, Number of graphs (optional)*[Integer]*)
- Layout(Page number*[Integer]*, Layout*[String or Integer]*, Num in X (optional)*[Integer]*, Num in Y (optional)*[Integer]*)
- RemoveGraph(Page number*[Integer]*, Graph number (optional)*[Integer]*, Lower end of range for removing graphs (optional)*[Integer]*, Upper end of range for removing graphs (optional)*[Integer]*)
- ReturnActivePage()
- ReturnGraphs(Page number*[Integer]*)
- SetActivePage(Page number*[Integer]*)

Detailed Description

The Page class allows you to return or set the current active page in T/HIS.

Details of functions

AddGraph(Page number*[Integer]*, Graph number (optional)*[Integer]*, Graph number to copy properties from (optional)*[Integer]*, Number of graphs (optional)*[Integer]*) [static]

Description

Adds one or more graphs to the specified page.

Arguments

- **Page number** (Integer)

Page number to add graph(s) to.

- **Graph number (optional)** (Integer)

Graph number to add to page. If this argument is 0 or not given, a new graph is created.

- **Graph number to copy properties from (optional)** (Integer)

If the second argument is 0, this specifies which graph to copy properties from when creating new graphs.

- **Number of graphs (optional)** (Integer)

If the second argument is 0, this specifies the number of new graphs to create and add to the specified page.

Returns

True if the graph was added, false if failed.

Return type

Boolean

Example

To add graph 1 to page 2

```
Page.AddGraph(2,1);
```

Layout(Page number*[Integer]*, Layout*[String or Integer]*, Num in X (optional)*[Integer]*, Num in Y (optional)*[Integer]*) [static]

Description

Sets the layout of either all pages or a specified page.

Arguments

- **Page number** (Integer)

Page number for which to set layout. If this argument is 0 then layout will be set on all pages individually. If -1 then the layout will be set globally, as in the 'Graphs' panel.

- **Layout** (String or Integer)

Layout specifier. Options are: "wide" or 1 - Tile wide, "tall" or 2 - Tile tall, "1x1" or 3 - 1x1, "2x2" or 4 - 2x2, "3x3" or 5 - 3x3, "xy" or 6 - XxY.

- **Num in X (optional)** (Integer)

Number of graphs in X-direction if user-defined XxY layout (6).

- **Num in Y (optional)** (Integer)

Number of graphs in Y-direction if user-defined XxY layout (6).

Returns

True if the layout was set, false if failed.

Return type

Boolean

Example

To set the layout of page 1 to 'Tile tall'.

```
Page.Layout(1,"tall");
```

RemoveGraph(Page number*[Integer]*, Graph number (optional)*[Integer]*, Lower end of range for removing graphs (optional)*[Integer]*, Upper end of range for removing graphs (optional)*[Integer]*) [static]

Description

Remove one or more graphs from the specified page.

Arguments

- **Page number** (Integer)

Page number to remove the graph from.

- **Graph number (optional)** (Integer)

Graph number to remove from page. If this argument is 0 or not given, the highest number graph on the page will be removed. If this argument is -1, all graphs will be removed.

- **Lower end of range for removing graphs (optional)** (Integer)

If the second argument is 0, this specifies the lower end of the range for removing graphs. All graphs with numbers within the specified range will be removed from the page.

- **Upper end of range for removing graphs (optional)** (Integer)

If the second argument is 0, this specifies the upper end of the range for removing graphs. All graphs with numbers within the specified range will be removed from the page. If this argument is not given then it will be set to 32 by default.

Returns

True if the graph was removed, false if failed.

Return type

Boolean

Example

To remove any graph with number between 2 and 6 from page 3

```
Page.RemoveGraph(3,0,2,6);
```

ReturnActivePage() [static]

Description

Returns the current active page in T/HIS.

Arguments

No arguments

Returns

integer

Return type

Number

Example

To return the current active page

```
var p = Page.ReturnActivePage();
```

ReturnGraphs(Page number*[Integer]*) [static]

Description

Returns the graphs on the specified page as an array of Graph objects.

Arguments

- **Page number** (Integer)

Page number for which to return the graphs it contains.

Returns

Array of Graph objects

Return type

Array

Example

To return the graphs on page 2.

```
Page.ReturnGraphs(2);
```

SetActivePage(Page number*[Integer]*) [static]

Description

Sets the current active page in T/HIS, returning -1 if the page does not exist or the page number if it does.

Arguments

- **Page number** (Integer)

Page number to set to active page

Returns

True if the page was set, false if the page does not exist.

Return type

Boolean

Example

To set the current active page to 2

```
Page.SetActivePage(2);
```

PopupWindow class

The PopupWindow class allows you to create popup windows for a graphical user interface. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Hide()

PopupWindow properties

Name	Type	Description
persistent	boolean	If the popup window will remain mapped when a button is pressed in it. By default (false) when a button is pressed in the popup window the popup will be unmapped. If set to true then the popup will remain mapped until the user clicks out of the window or hides it by calling Hide()

Detailed Description

The PopupWindow class allows you to make popup windows (that you can place Widgets in) and link them to Widgets. The popup window is then displayed by right clicking on the Widget the popup is linked to. The following very simple example shows how to create a popup window and link it to a label Widget.

```
// Create popup window
var pw = new PopupWindow();
// Create some widgets in the popup window
var pl = new Widget(pw, Widget.LABEL,   1, 30,  1,  7, "Label");
var pb = new Widget(pw, Widget.BUTTON,  1, 30,  7, 13, "Button");
var pt = new Widget(pw, Widget.TEXTBOX, 1, 30, 20, 26, "Textbox");
// Create window with title "Popup example" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Popup example", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 50, 1,  7, "Right click for popup...");
// link popup window to widget
l.popupWindow = pw;
// Assign the onPopup callback method to the function 'do_popup'
// This is only required if you want to make any changes before the popup
appears
l.onPopup  = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    Message("Showing popup");
}
```

See the documentation below and the Widget class for more details.

Constructor

new PopupWindow()

Description

Create a new PopupWindow object.

Arguments

No arguments

Returns

PopupWindow object

Return type

PopupWindow

Example

To create a PopupWindow containing the buttons "Create" and "Edit" and link it to button b:

```
var pw = new PopupWindow();
var c = new Widget(pw, Widget.BUTTON, 1, 30, 1, 7,  "Create");
var e = new Widget(pw, Widget.BUTTON, 1, 30, 7, 13, "Edit");
b.popupWindow = pw;
```

Details of functions

Hide()

Description

Hides (unmaps) the popup window.

Arguments

No arguments

Returns

No return value

Example

To hide popup window w:

```
w.Hide();
```

Read class

The Read class allows the user to read CSV, Curve and other filetypes into T/HIS. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Bulk(Filename*[String]*, Options (optional)*[object]*)
- CSV(Filename*[String]*, Options (optional)*[object]*)
- CSV(Filename*[String]*, CSV type (optional)*[integer]*, Row containing curve labels (optional)*[integer]*, Row containing axis labels (optional)*[integer]*, CSV separation option (optional)*[integer]*, X values column number (optional)*[integer]*, X axis start value (optional)*[real]*, X axis interval (optional)*[real]*) [deprecated]
- Cur(Filename*[String]*, Options (optional)*[object]*)
- DIAdem(Filename*[String]*, X-axis channel*[integer]*, Options (optional)*[object]*)
- DIAdem(Filename*[String]*, X-axis channel *[integer]*, X-axis start value (optional)*[real]*, X axis interval (optional)*[real]*, Show channel names (optional)*[real]*, Filter (optional)*[String]*) [deprecated]
- Equation(Formula*[String]*, Options (optional)*[object]*)
- Equation(Formula*[String]*, X values option (optional)*[integer]*, X start (optional)*[real]*, X end (optional)*[real]*, X interval (optional)*[real]*) [deprecated]
- ISO(Filename*[String]*, Options (optional)*[object]*)
- ISO(Filename*[String]*, File format (optional)*[integer]*, Label type (optional)*[integer]*) [deprecated]
- Key(Filename*[String]*, Options (optional)*[object]*)
- LSPP(Filename*[String]*, Options (optional)*[object]*)
- LSPP(Filename*[String]*, File format (optional)*[integer]*) [deprecated]

Read constants

Name	Description
Read.CSV_COMMA	CSV comma separator
Read.CSV_SPACE	CSV space separator
Read.CSV_TAB	CSV tab separator
Read.CSV_XYXY	CSV format X,Y,X,Y
Read.CSV_XYYY	CSV format X,Y,Y,Y
Read.DIADEM_COMMENT	Diadem comment written to curve tag
Read.DIADEM_NAME	Diadem channel name written to curve tag
Read.EQUATION_CURVE_VARS	Calculate x values from curve variables for equations
Read.EQUATION_X_OR_CURVE	If there are no curve variables, use the X start, end and interval values for equation x values. Otherwise calculate x values from the curve variables.
Read.EQUATION_X_VALS	Use the X start, end and interval values for equation x values
Read.ISO_CHANNEL_CODE	Use the channel code for the ISO curve labels
Read.ISO_CHANNEL_LABEL	Use the channel label for the ISO curve labels

Read.ISO_MULTIPLE_CHANNELS	Multiple channels ISO file
Read.ISO_SINGLE_CHANNEL	Single channel ISO file
Read.LSPP_CURVE_FILE	LSPP curve file format
Read.LSPP_XY_PAIRS	LSPP XY pairs file format

Detailed Description

The Read class allows the user to read CSV, Curve and other filetypes into T/HIS.

Details of functions

Bulk(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads a Bulk Data file into T/HIS.

Arguments

- **Filename** (String)

Name of Bulk Data file to read

- **Options (optional)** (object)

Options which give you greater control of reading a Bulk file:

Object has the following properties:

Name	Type	Description
outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve. By default, this will be set to the highest free curve.

Returns

No return value

Example

To read a Bulk Data file named "example.bdf"

```
Read.Bulk("example.bdf");
```

To read a Bulk Data file named "example.bdf" at the lowest free curve

```
var options = new Object();
options.outputOpt = "#";
Read.Bulk("example.bdf",options);
```

CSV(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads a CSV file into T/HIS.

Arguments

- **Filename** (String)

Name of CSV file to read.

- **Options (optional)** (object)

Options which give you greater control of reading a CSV file:

Object has the following properties:

Name	Type	Description
csvType (optional)	integer	CSV file type. Can be Read.CSV_XYXY or Read.CSV_XYYY
outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve. By default, this will be set to the highest free curve.
rowAxisLabel (optional)	integer	Index of the row containing axis labels. This is row 2 by default, so should be set to 0 if no axis labels are present.
rowCurveLabel (optional)	integer	Index of the row containing curve labels. This is row 1 by default, so should be set to 0 if no curve labels are present.
separator (optional)	integer	Separator. Can be Read.CSV_COMMA, Read.CSV_SPACE or Read.CSV_TAB
xColIndex (optional)	integer	Index of the column containing X-values. This is column 1 by default.
xInterval (optional)	real	User defined X-interval between points, to use together with xStartVal
xStartVal (optional)	real	Instead of taking X-values from the CSV file, this allows the user to define a value for the start of the X-axis.

Returns

No return value

Example

To read an XYYY CSV file with X-values in column 3, named "example.csv" starting at curve 5.

```
var options = new Object();
options.csvType = Read.CSV_XYYY;
options.xColIndex = 3;
options.outputOpt = "#5";
Read.CSV("example.csv", options);
```

CSV(Filename*[String]*, CSV type (optional)*[integer]*, Row containing curve labels (optional)*[integer]*, Row containing axis labels (optional)*[integer]*, CSV separation option (optional)*[integer]*, X values column number (optional)*[integer]*, X axis start value (optional)*[real]*, X axis interval (optional)*[real]*) [static] [deprecated]

This function is deprecated in version 18.1. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Reads a CSV file into T/HIS.

Arguments

- **Filename** (String)

Name of CSV file to read.

- **CSV type (optional)** (integer)

CSV file type. Can be Read.CSV_XYXY or Read.CSV_XYYY

- **Row containing curve labels (optional)** (integer)

Index of the row containing curve labels. This is row 1 by default, so should be set to 0 if no curve labels are present.

- **Row containing axis labels (optional)** (integer)

Index of the row containing axis labels. This is row 2 by default, so should be set to 0 if no axis labels are present.

- **CSV separation option (optional)** (integer)

Separator. Can be Read.CSV_COMMA, Read.CSV_SPACE or Read.CSV_TAB

- **X values column number (optional)** (integer)

Index of the column containing X-values. This is column 1 by default.

- **X axis start value (optional)** (real)

Instead of taking X-values from the CSV file, this allows the user to define a value for the start of the X-axis.

- **X axis interval (optional)** (real)

User defined X-interval between points, to use together with the previous argument.

Returns

No return value

Example

To read an XYYY CSV file with X-values in column 3, named "example.csv"

```
Read.CSV("example.csv", Read.CSV_XYYY, 0, 0, Read.CSV_COMMA, 3);
```

Cur(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads a Curve file into T/HIS.

Arguments

- **Filename** (String)

Name of Curve file to read

- **Options (optional)** (object)

Options which give you greater control of reading a Curve file:

Object has the following properties:

Name	Type	Description
outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve.

Returns

No return value

Example

To read a Curve file named "example.cur"

```
Read.Cur("example.cur");
```

To read a Curve file named "example.cur" at the curve ID 15

```
var options = new Object();
options.outputOpt = 15;
Read.Cur("example.cur",options);
```

DIAdem(Filename*[String]*, X-axis channel*[integer]*, Options (optional)*[object]*) [static]

Description

Reads a DIAdem file into T/HIS.

Arguments

- **Filename** (String)

Name of DIAdem header file to read.

- **X-axis channel** (integer)

Index of the channel to use as X-axis values. If this is 0 then the X-values can be generated from a start value and an interval in the following two arguments.

- **Options (optional)** (object)

Options which give you greater control of reading the Diadem file:

Object has the following properties:

Name	Type	Description
filter (optional)	String	String to filter channel names/comments. Only channels whose names/comments contain the filter string will be read.
outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve. By default, this will be set to the highest free curve.
showChannelName (optional)	real	Option to select what is written to the curve tag. Can be Read.DIADEM_COMMENT or Read.DIADEM_NAME
xAxisInterval (optional)	real	User defined interval between points on the X-axis, to use together with the previous argument.
xAxisStartVal (optional)	real	Instead of taking X-values from a DIAdem channel, this allows the user to define a value for the start of the X-axis.

Returns

No return value

Example

To read DIAdem channels from "EXAMPLE.DAT", with channel comments filtered by "EXAMPLE" and X-values taken from channel 1, starting at curve 10 onwards sequentially:

```
 var options = new Object();
options.filter = "EXAMPLE";
options.outputOpt = 10;
Read.DIAdem("./files/DIAdem/EXAMPLE.DAT",1,options);
```

DIAdem(Filename*[String]*, X-axis channel *[integer]*, X-axis start value (optional)*[real]*, X axis interval (optional)*[real]*, Show channel names (optional)*[real]*, Filter (optional)*[String]*) [static] [deprecated]

This function is deprecated in version 18.1. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Reads a DIAdem file into T/HIS.

Arguments

- **Filename** (String)

Name of DIAdem header file to read.

- **X-axis channel** (integer)

Index of the channel to use as X-axis values. If this is 0 then the X-values can be generated from a start value and an interval in the following two arguments.

- **X-axis start value (optional)** (real)

Instead of taking X-values from a DIAdem channel, this allows the user to define a value for the start of the X-axis.

- **X axis interval (optional)** (real)

User defined interval between points on the X-axis, to use together with the previous argument.

- **Show channel names (optional)** (real)

Option to select what is written to the curve tag. Can be Read.DIADEM_COMMENT or Read.DIADEM_NAME

- **Filter (optional)** (String)

String to filter channel names/comments. Only channels whose names/comments contain the filter string will be read.

Returns

No return value

Example

To read DIAdem channels from "EXAMPLE.DAT", with channel comments filtered by "EXAMPLE" and X-values taken from channel 1:

```
Read.DIAdem("EXAMPLE.DAT",1,0,0,Read.DIADEM_COMMENT,"EXAMPLE");
```

Equation(Formula*[String]*, Options (optional)*[object]*) [static]

Description

Create a curve from a user-defined equation.

Arguments

- **Formula** (String)

Equation string.

- **Options (optional)** (object)

Options which give you greater control of reading the Diadem file:

Object has the following properties:

Name	Type	Description
curveID (optional)	integer	Allows you to control which curve ID the file will begin to read into. By default, this will be set to the highest free curve by default if the option is not selected.
xEndVal (optional)	real	Right endpoint of the x range. Default 1.0.
xInterval (optional)	real	Interval between points. Default 0.01.
xStartVal (optional)	real	Left endpoint of the x range. Default 0.0.

xValOpt (optional)	integer	Option to select how x values are determined for the given equation. Read.EQUATION_X_VALS, requires the xStartVal, xEndVal and xInterval options to also be set however these default to 0, 1 and 0.01 respectively. Read.EQUATION_CURVE_VARS will calculate it's x values from the curve variables that are used in the equation. This is the default if curve variables are used and no xValOpt has been provided. Read.EQUATION_X_OR_CURVE will use Rea.EQUATION_X_VALS if there are no curve variables in the equation otherwise Read.EQUATION_CURVE_VARS if there are. -ID to take x values from Curve #ID (e.g. -5 for curve ID 5)

Returns

No return value

Example

To plot the line y = x^2+2 for x in [-1,1] and an interval between points of 0.02 and set this curve as ID 3:

```
var options = new Object();
options.xStartVal = -1;
options.xEndVal = 1;
options.xInterval = 0.02;
options.xValOpt = Read.EQUATION_X_VALS;
options.curveID = 3;
Read.Equation("x^2+2",options);
```

Equation(Formula*[String]*, X values option (optional)*[integer]*, X start (optional)*[real]*, X end (optional)*[real]*, X interval (optional)*[real]*) [static] [deprecated]

This function is deprecated in version 18.1. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a curve from a user-defined equation.

Arguments

- **Formula** (String)

Equation string.

- **X values option (optional)** (integer)

Option to select what is written to the curve tag. Can be Read.EQUATION_X_VALS, Read.EQUATION_CURVE_VARS, Read.EQUATION_X_OR_CURVE or -ID to take x values from Curve #ID

- **X start (optional)** (real)

Left endpoint of the x range. Default 0.0.

- **X end (optional)** (real)

Right endpoint of the x range. Default 1.0.

- **X interval (optional)** (real)

Interval between points. Default 0.01.

Returns

No return value

Example

To plot the line y = x^2+2 for x in [-1,1] and an interval between points of 0.02:

```
Read.Equation("x^2+2",0,-1,1,0.02);
```

ISO(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads an ISO file into T/HIS.

Arguments

- **Filename** (String)

Name of ISO file to read

- **Options (optional)** (object)

Options which give you greater control of reading an ISO file:

Object has the following properties:

Name	Type	Description
fileFormat (optional)	integer	Format of ISO file. Can be Read.MULTIPLE_CHANNELS, Read.ISO_SINGLE_CHANNEL
labelType (optional)	integer	Label type to use. Can be Read.ISO_CHANNEL_LABEL, Read.ISO_CHANNEL_CODE
outputOpt (optional)	integer/string	Allows you to control which curve ID the file will begin to read to. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve. By default, this will be set to the highest free curve.

Returns

No return value

Example

To read a single channel ISO file named "example.001" to curve ID 7

```
var options = new Object();
options.fileFormat = Read.ISO_SINGLE_CHANNEL;
options.outputOpt = 7;
Read.ISO("example.001", options);
```

ISO(Filename*[String]*, File format (optional)*[integer]*, Label type (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 18.1. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Reads an ISO file into T/HIS.

Arguments

- **Filename** (String)

Name of ISO file to read

- **File format (optional)** (integer)

Format of ISO file. Can be Read.MULTIPLE_CHANNELS, Read.ISO_SINGLE_CHANNEL

- **Label type (optional)** (integer)

Label type to use. Can be Read.ISO_CHANNEL_LABEL, Read.ISO_CHANNEL_CODE

Returns

No return value

Example

To read a single channel ISO file named "example.001"

```
Read.ISO("example.001", Read.ISO_SINGLE_CHANNEL);
```

Key(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads a Keyword file into T/HIS.

Arguments

- **Filename** (String)

Name of Keyword file to read

- **Options (optional)** (object)

Options which give you greater control of reading a Keyword file:

Object has the following properties:

Name	Type	Description
outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve.

Returns

No return value

Example

To read a Keyword file named "example.key"

```
Read.Key("example.key");
```

To read a Keyword file named "example.key" starting at curve 5 and sequentially incrementing if the file contains multiple curves.

```
var options = new Object();
options.outputOpt = 5;
Read.Key("example.key",options);
```

LSPP(Filename*[String]*, Options (optional)*[object]*) [static]

Description

Reads an LS-PREPOST file into T/HIS.

Arguments

- **Filename** (String)

Name of LS-PREPOST file to read

- **Options (optional)** (object)

Options which give you greater control of reading a Keyword file:

Object has the following properties:

Name	Type	Description
fileFormat (optional)	integer	LSPP file format. Can be Read.LSPP_CURVE_FILE or Read.LSPP_XY_PAIRS

outputOpt (optional)	integer/string	Allows you to control which curve ID number the file will begin to read at. This can either be a whole number greater than 0 or specified as a string like "#3" for curve 3. There are also the special string characters "%", standing for highest free curve as well as "#", standing for the lowest free curve. By default, this will be set to the highest free curve.

Returns

No return value

Example

To read an LS-PREPOST XY pairs file named "example.xy"

```
var options = new Object();
options.fileFormat = Read.LSPP_XY_PAIRS;
Read.LSPP("example.xy", options);
```

LSPP(Filename*[String]*, File format (optional)*[integer]*) [static] [deprecated]

This function is deprecated in version 18.1. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Reads an LS-PREPOST file into T/HIS.

Arguments

- **Filename** (String)

Name of LS-PREPOST file to read

- **File format (optional)** (integer)

LSPP file format. Can be Read.LSPP_CURVE_FILE or Read.LSPP_XY_PAIRS

Returns

No return value

Example

To read an LS-PREPOST XY pairs file named "example.xy"

```
Read.LSPP("example.xy", Read.LSPP_XY_PAIRS);
```

Ssh class

The Ssh class allows you to connect to a remote computer using ssh, scp and sftp commands. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- AuthenticateWithPassword(password*[string]*)
- AuthenticateWithPublicKey(passphrase (optional)*[string]*)

- SftpRmdir(remote*[string]*)

Ssh constants

Constants for file bits

Name	Description
Ssh.SETGROUP_BIT	Set group bit
Ssh.SETUID_BIT	Set uid bit
Ssh.STICKY_BIT	sticky bit

Constants for file types

Name	Description
Ssh.DIRECTORY	Directory
Ssh.FILE	Regular file
Ssh.SOCKET	Socket
Ssh.SYMBOLIC_LINK	Symbolic link

Constants for permissions

Name	Description
Ssh.GROUP_EXECUTE	Group has execute permission
Ssh.GROUP_READ	Group has read permission
Ssh.GROUP_WRITE	Group has write permission
Ssh.OTHER_EXECUTE	Others have execute permission
Ssh.OTHER_READ	Others have read permission

Ssh.OTHER_WRITE	Others have write permission
Ssh.OWNER_EXECUTE	Owner has execute permission
Ssh.OWNER_READ	Owner has read permission
Ssh.OWNER_WRITE	Owner has write permission

Detailed Description

The Ssh class gives you simple functions to do secure connections to a remote computer using ssh. The Oasys Ltd LS-DYNA environment software is built with the OpenSSH library to support the ssh, scp and sftp protocols. The basic workflow is to create a connection using the Ssh constructor, authenticate the connection either by using a password and AuthenticateWithPassword or with a public key and AuthenticateWithPublicKey then the method Execute can be used to execute commands on the remote machine, the methods Get and Put can be used to copy files to and from the remote machine using scp, and the commands SftpGet, SftpList, SftpMkdir, SftpPut and SftpRmdir can be used to perform secure file transfer commands.
ssh uses a public and private key pair to do communication. The software uses RSA for the private and public keys and stores them in the files id_rsa and id_rsa.pub in the .oasys_ssh directory of your home directory (C:\Users\your.name\.oasys_ssh on Windows by default). A key length of 2048 bits is recommended. You keep your private key secure in your .oasys_ssh directory but the public key can be copied to the authorized_keys file on remote machines so that authentication can be done etc. The software also maintains fingerprints for the machines you connect to to ensure that you are connecting to the machine that you think you are. The first time you connect to a machine you are asked to confirm the remote machine is correct and the software stores the fingerprint for it in the known_hosts file in your .oasys_ssh directory. For second and subsequent connections the software checks the fingerprint of the remote machine against the one it has stored and will only connect if it matches.
When creating a new ssh connection to a remote machine and transferring files a small 'buffer' is required to transfer the data. The size of this buffer can be controlled using the Options.ssh_buffer_size property **before** the Ssh object is created.

Constructor

new Ssh(hostname*[string]*, username*[string]*)

Description

Create a new Ssh object for secure communication to a remote computer.

Arguments

- **hostname** (string)

The hostname of the machine that you want to connect to

- **username** (string)

The username on the machine that you want to connect to

Returns

Ssh object

Return type

Ssh

Example

To create a connection to machine "example" as user "username"

```
var s = new Ssh("example", "username");
```

Details of functions

AuthenticateWithPassword(password*[string]*)

Description

Authenticate the connection using password.

Arguments

- **password** (string)

The password for the username on the remote machine

Returns

no return value

Example

To prompt the user for a password and authenticate using it in SSH connection s:

```
var password = Window.GetPassword("Enter Password to connect", "Password");
s.AuthenticateWithPassword(password);
```

AuthenticateWithPublicKey(passphrase (optional)*[string]*)

Description

Authenticate the connection using your public key. Your public key from the file .oasys_ssh/id_rsa.pub must be in the file .oasys_ssh/authorized_keys on the remote machine.

Arguments

- **passphrase (optional)** (string)

The passphrase for authentication on the remote machine if required

Returns

no return value

Example

Authenticate using your public key in SSH connection s:

```
s.AuthenticateWithPublicKey();
```

Execute(data*[object]*)

Description

Execute a command in the ssh session and get the standard output and error streams.

Arguments

- **data** (object)

Execute data

Object has the following properties:

Name	Type	Description
arguments (optional)	Array of strings	The arguments to pass to the command

command	string	The command you want to run

Returns

Object with the following properties:

Name	Type	Description
status	integer	The exit code from the command
stderr	string	The standard error output from the command
stdout	string	The standard output from the command

Return type

object

Example

To run command "example.bat" with arguments "foo" and "bar" in SSH connection s:

```
var output = s.Execute( { command: 'example.bat', arguments: [ 'foo', 'bar' ]}
);
var text   = output.stdout;
var errors = output.stderr;
var ecode  = output.status;
```

Get(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "/path/to/file.txt", creating local file "C:\path\to\file.txt" in SSH connection s:

```
s.Get("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

Put(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using scp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "/path/to/file.txt" in SSH connection s:

```
s.Put("/path/to/file.txt", "C:\\path\\to\\file.txt");
```

SftpGet(remote*[string]*, local*[string]*)

Description

Gets a file from the ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to get

- **local** (string)

The path of the local file to write

Returns

no return value

Example

To get the remote file "file.txt", creating local file "C:\path\to\file.txt" in SSH connection s using sftp:

```
s.SftpGet("file.txt", "C:\\path\\to\\file.txt");
```

SftpList(remote*[string]*)

Description

Gets a listing from the ssh connection using sftp.

Arguments

- **remote** (string)

The remote path to get the listing from

Returns

Array of objects. Each object contains the following information for a file/directory:

Name	Type	Description
atime	integer	Access time for the file (seconds since epoch)
gid	integer	The group ID
info	constant	Bitwise information for the file/directory. See the permissions, file types and file bits constants
mtime	integer	Modification time for the file (seconds since epoch)
name	string	The name of the file/directory
size	integer	The size of the file
uid	integer	The user ID

Return type

object

Example

To get listing from the the remote path "temp" in SSH connection s using sftp:

```
var listing = s.SftpList("temp");
for (l=0; l<listing.length; l++)
{
    Message(listing[l].name + ":" + listing[l].size;
}
```

SftpMkdir(remote*[string]*, mode*[constant]*)

Description

Creates a directory in the remote ssh connection using sftp.

Arguments

- **remote** (string)

The remote directory to create

- **mode** (constant)

The mode/permissions for the directory. See the permissions constants for details. Note that the user's file-creation mask (umask) value will also be taken into account when creating the directory.

Returns

true if successful, false if not

Return type

Boolean

Example

To create the remote path "temp" with, create, write and execute permissions for only the owner, in SSH connection s using sftp:

```
var success = s.SftpMkdir("temp", Ssh.OWNER_READ|Ssh.OWNER_WRITE|Ssh.OWNER_
EXECUTE);
```

SftpPut(remote*[string]*, local*[string]*)

Description

Puts a file on the remote ssh connection using sftp.

Arguments

- **remote** (string)

The path of the remote file to put

- **local** (string)

The path of the local file to read

Returns

no return value

Example

To put the local file "C:\path\to\file.txt" to remote file "file.txt" in SSH connection s:

```
s.SftpPut("file.txt", "C:\\path\\to\\file.txt");
```

SftpRmdir(remote*[string]*)

Description

Deletes a directory in the remote ssh connection using sftp. If this fails it is probably because the directory is not empty.

Arguments

- **remote** (string)

The remote directory to delete

Returns

true if successful, false if not

Return type

Boolean

Example

To delete the remote path "temp" in SSH connection s using sftp:

```
var success = s.SftpRmdir("temp");
```

Symbol class

The Symbol class contains constants relating to curve symbols. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Symbol constants

Name	Description
Symbol.CIRCLE	Circle symbol
Symbol.CROSS	Cross symbol
Symbol.DIAMOND	Diamond symbol
Symbol.DOT	Dot symbol
Symbol.HOURGLASS	Hourglass symbol
Symbol.NONE	No symbol
Symbol.SQUARE	Square symbol
Symbol.STAR	Star symbol
Symbol.TRIANGLE	Triangle symbol

Detailed Description

The Symbol class is used to define the symbol style used by curves:

```
p.symbol = Symbol.TRIANGLE;
```

Units class

The Units class contains constants relating to curve units. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- USER(mass*[real]*, time*[real]*, length*[real]*, angle*[real]*, temperature*[real]*, current (optional)*[real]*)

Units constants

Name	**Description**
Units.ACCELERATION	Acceleration units
Units.AREA	Area units
Units.CONDUCTIVITY	Conductivity units
Units.CURRENT	Current units
Units.DENSITY	Density units
Units.DISPLACEMENT	Displacement units
Units.ELECTRIC_FIELD_VECTOR	Electric Field Vector units
Units.ENERGY	Energy units
Units.ENERGY_DENSITY	Energy Density units
Units.FLUX	Thermal Flux units
Units.FORCE	Force units
Units.FORCE_WIDTH	Force per unit width units
Units.FREQUENCY	Frequency units
Units.LENGTH	Length units
Units.MAGNETIC_FLUX_VECTOR	Magnetic Flux Vector units
Units.MASS	MAss units
Units.MASS_FLOW	Mass Flow rate units
Units.MOMENT	Moment units
Units.MOMENTUM	Momentum units
Units.MOMENT_WIDTH	Moment per unit width units
Units.NONE	No units
Units.POWER	Power units
Units.PRESSURE	Pressure units
Units.Q_CRITERION	Q Criterion units
Units.ROTATION	Rotation units

Units.ROTATIONAL_ACCELERATION	Rotational Acceleration units
Units.ROTATIONAL_VELOCITY	Rotational Velocity units
Units.STRAIN	Strain units
Units.STRESS	Stress units
Units.TEMPERATURE	Temperature units
Units.THERMAL_DIFFUSIVITY	Thermal Diffusivity units
Units.TIME	Time units
Units.UNKNOWN	Unknown units
Units.VECTOR_POTENTIAL	Vector Potential units
Units.VELOCITY	Velocity units
Units.VISCOSITY	Viscosity units
Units.VOLUME	Volume units
Units.VORTICITY	Vorticity units
Units.WORK	Work units

Detailed Description

The Units class is used to define the units for each axis of a curve:

```
p.x_axis_units = Units.LENGTH
```

Details of functions

USER(mass*[real]*, time*[real]*, length*[real]*, angle*[real]*, temperature*[real]*, current (optional)*[real]*) [static]

Description

Setup a user defined UNIT

Arguments

- **mass** (real)

Power for mass dimensions.

- **time** (real)

Power for time dimensions.

- **length** (real)

Power for length dimensions.

- **angle** (real)

Power for angle dimensions.

- **temperature** (real)

Power for temperature dimensions.

- **current (optional)** (real)

Power for current dimensions.

Returns

integer

Return type

Number

Example

To set the y-axis unit of curve l to (m/s)^2:

```
l.y_unit = Units.USER(0.0,2.0,-2.0,0.0,0.0,0.0);
```

UnitSystem class

The UnitSystem class contains constants relating to curve unit systems. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

UnitSystem constants

Name	Description
UnitSystem.U1	U1 unit system (m, kg, s)
UnitSystem.U2	U2 unit system (mm, t, s)
UnitSystem.U3	U3 unit system (mm, kg, ms)
UnitSystem.U4	U4 unit system (mm, g, ms)
UnitSystem.U5	U5 unit system (ft, slug, s)
UnitSystem.U6	U6 unit system (m, t, s)

Detailed Description

The UnitSystem class is used to define the Unit System for a curve:

```
p.UnitSystem = UnitSystem.U1
```

Utils class

The Utils class contains various useful utility functions. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- $example
- ABC_example

Class functions

- Ascii85Decode(encoded*[string]*)
- Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*)
- Build()
- CallPromiseHandlers()
- CheckinLicense(feature*[string]*)
- CheckoutLicense(feature*[string]*)
- GarbageCollect()
- HTMLBrowser()
- HiResTimer()
- PdfReader()
- TimerResolution()
- Version()

Detailed Description

The Utils class is used to provide various useful functions.

Details of functions

Ascii85Decode(encoded*[string]*) [static]

Description

Decodes an ASCII85 encoded string. See Utils.Ascii85Encode() for details on the method.

Arguments

- **encoded** (string)

An ASCII85 encoded string

Returns

ArrayBuffer object

Return type

ArrayBuffer

Example

To decode an ASCII85 encoded string:

```
var decoded = Utils.Ascii85Decode(encoded);
```

Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*) [static]

Description

Encodes an ASCII85 encoded string. This enables binary data to be represented by ASCII characters using five ASCII characters to represent four bytes of binary data (making the encoded size 1/4 larger than the original). By doing this binary data can be stored in JavaScript strings. Note that the method used by THIS to encode and decode strings differs from the standard ASCII85 encoding as that uses the ASCII characters ", ’ and \ which cannot be used in JavaScript strings as they have special meanings. The method in THIS uses
0-84 are !-u (ASCII codes 33-117) (i.e. 33 is added to it) with the following exceptions
v is used instead of " (ASCII code 118 instead of 34)
w is used instead of ’ (ASCII code 119 instead of 39)
x is used instead of \ (ASCII code 120 instead of 92)
If all five digits are 0 they are represented by a single character z instead of !!!!!

Arguments

- **data** (ArrayBuffer)

ArrayBuffer containing the data

- **length (optional)** (integer)

Length of data in array buffer to encode. If omitted the whole array buffer will be encoded

Returns

string

Return type

String

Example

To encode ArrayBuffer data:

```
var encoded = Utils.Ascii85Encode(data);
```

Build() [static]

Description

Returns the build number

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current build number

```
var build = Utils.Build();
```

CallPromiseHandlers() [static]

Description

Manually call any promise handlers/callbacks in the job queue

Arguments

No arguments

Returns

no return value

Example

To run any queued promise handlers/callbacks:

```
Utils.CallPromiseHandlers();
```

CheckinLicense(feature*[string]*) [static]

Description

Checks a license for a feature back in

Arguments

- **feature** (string)

feature to check license back in for

Returns

no return value

Example

To check in a license for "EXAMPLE":

```
Utils.CheckinLicense("EXAMPLE");
```

CheckoutLicense(feature*[string]*) [static]

Description

Checks out a license for a feature

Arguments

- **feature** (string)

feature to check license for

Returns

true if license available, false if not

Return type

Boolean

Example

To checkout a license for "EXAMPLE":

```
var got = Utils.CheckoutLicense("EXAMPLE");
if (got == false) Exit();
```

GarbageCollect() [static]

Description

Forces garbage collection to be done. This should not normally need to be called but in exceptional circumstances it can be called to ensure that garbage collection is done to return memory.

Arguments

No arguments

Returns

no return value

Example

To force garbage collection to be done:

```
Utils.GarbageCollect();
```

HTMLBrowser() [static]

Description

Returns the path to the default HTML browser

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default HTML browser

```
var path = Utils.HTMLBrowser();
```

HiResTimer() [static]

Description

A high resolution timer that can be used to time how long things take. The first time this is called the timer will start and return 0. Subsequent calls will return the time in nanoseconds since the first call. Note that the timer will almost certainly not have 1 nanosecond precision but, depending on the platform, should should have a resolution of at least 1 microsecond. The resolution can be found by using Utils.TimerResolution()

Arguments

No arguments

Returns

number

Return type

number

Example

To time how long something takes to nanosecond precision:

```
var start = Utils.HiResTimer();
do something that takes some time...
var end = Utils.HiResTimer();
Message("it took " + (end-start) + "nanoseconds");
```

PdfReader() [static]

Description

Returns the path to the executable of the default pdf reader

Arguments

No arguments

Returns

string of the path

Return type

String

Example

To get path to the default pdf reader

```
var path = Utils.PdfReader();
```

TimerResolution() [static]

Description

Returns the resolution (precision) of the Utils.HiResTimer() timer in nanoseconds

Arguments

No arguments

Returns

number

Return type

number

Example

To find the resolution of the timer in nanoseconds:

```
var resolution = Utils.TimerResolution();
```

Version() [static]

Description

Returns the version number

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the current version number

```
var version = Utils.Version();
```

Widget class

The Widget class allows you to create components for a graphical user interface. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- CtrlPressed()
- PixelsPerUnit()
- ShiftPressed()
- StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*)

Member functions

- AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)
- AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)
- Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)
- Clear()
- ClearSelection()
- Cross(colour (optional)*[constant]*)
- Delete()
- DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)
- DumpImageString(filename*[string]*, format (optional)*[constant]*)
- Hide()
- ItemAt(index*[integer]*)
- Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)
- Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)
- Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]
- ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)
- Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)
- RemoveAllWidgetItems()
- RemoveWidgetItem(item*[WidgetItem]*)
- Scroll(scroll*[constant or WidgetItem object]*)
- Show()
- Static()
- Tick(colour (optional)*[constant]*)
- TotalItems()
- WidgetItems()

Widget constants

Name	Description
Widget.BUTTON	Button widget
Widget.CHECKBOX	Checkbox widget
Widget.COMBOBOX	Combobox widget
Widget.LABEL	Label widget
Widget.LISTBOX	Listbox widget

Widget.RADIOBUTTON	Radiobutton widget
Widget.SLIDER	Slider widget
Widget.TEXTBOX	Text input widget
Widget.TREE	Tree widget

Constants for Colour

Name	Description
Widget.BLACK	Colour black
Widget.BLUE	Colour blue
Widget.COLOUR_CONTRAST	A contrasting colour in the 3 user interface themes (Green, Purple, and Blue in the Dark, Light, and Classic themes respectively). Blue in the legacy theme.
Widget.COLOUR_CONTRAST_2	Another contrasting colour in the 3 user interface themes (Yellow, Red, and Red in the Dark, Light, and Classic themes respectively). Red in the legacy theme.
Widget.COLOUR_INVERSE	Inverse colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_LABEL	Label text colour in the 3 user interface themes (Black or white depending on theme). Black in the legacy theme.
Widget.COLOUR_LATENT	Latent colour in the 3 user interface themes (Different shade of Cyan in every theme). Light Cyan in the legacy theme.
Widget.COLOUR_NEUTRAL	Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme.
Widget.COLOUR_SAFE	Safe colour in the 3 user interface themes (Different shade of green in every theme). Dark green in the legacy theme.
Widget.COLOUR_TITLE	Title colour in the 3 user interface themes (Different shade of grey in every theme). Dark blue in the legacy theme.
Widget.COLOUR_WARNING	Warning colour in the 3 user interface themes (Different shade of red in every theme). Dark red in the legacy theme.
Widget.CYAN	Colour cyan
Widget.DARKBLUE	Colour dark blue
Widget.DARKGREEN	Colour dark green
Widget.DARKGREY	Colour dark grey
Widget.DARKGREY_NEUTRAL	Only valid in the function 'Line'. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Dark grey in the legacy theme
Widget.DARKRED	Colour dark red
Widget.DEFAULT	Default colour for widgets
Widget.GREEN	Colour green
Widget.GREY	Colour grey
Widget.LIGHTGREY	Colour light grey
Widget.LIGHTGREY_NEUTRAL	Only valid in the function 'Line'. Used to keep the 3D effect in the legacy theme and not in the other themes. Neutral colour in the 3 user interface themes (Different shade of grey in every theme). Light grey in the legacy theme
Widget.MAGENTA	Colour magenta
Widget.ORANGE	Colour orange

Widget.RED	Colour red
Widget.WHITE	Colour white
Widget.YELLOW	Colour yellow

Constants for Image RGB format

Name	Description
Widget.RGB24	24 bits for RGB data in widget images
Widget.RGB8	8 bits for RGB data in widget images

Constants for Justification

Name	Description
Widget.BOTTOM	Bottom justification
Widget.CENTRE	Centre (horizontal) justification
Widget.LEFT	Left justification
Widget.MIDDLE	Middle (vertical) justification
Widget.RIGHT	Right justification
Widget.SCALE	Image will be scaled to fit widget
Widget.TOP	Top justification

Constants for Orientation

Name	Description
Widget.HORIZONTAL	Horizontal orientation (for sliders)
Widget.VERTICAL	Vertical orientation (for sliders)

Constants for Selection

Name	Description
Widget.SELECT_ENHANCED	Multiple WidgetItems in a ListBox or tree Widget can be selected. When the user selects a WidgetItem the selection is cleared and the new WidgetItem selected. However, if the user presses the Ctrl key when clicking on a WidgetItem, the clicked WidgetItem gets toggled and all other WidgetItems are left untouched. If the user presses the Shift key while clicking on a WidgetItem, all WidgetItems between the last selected WidgetItem and the clicked WidgetItem are selected or unselected, depending on the state of the clicked WidgetItem.
Widget.SELECT_MULTIPLE	Multiple WidgetItems in a ListBox Widget can be selected. When the user selects a WidgetItem, the selection status of that WidgetItem is toggled and the other WidgetItems are left alone. Not valid for tree widgets. Widget.SELECT_ENHANCED will be used.
Widget.SELECT_NONE	No WidgetItem in a ListBox or tree Widget can be selected
Widget.SELECT_SINGLE	A single WidgetItem in a ListBox or tree Widget can be selected. When the user selects a WidgetItem, any already-selected WidgetItem becomes unselected, and the user cannot unselect the selected WidgetItem by clicking on it.

Constants for Tree relations

Name	Description

Widget.AFTER	Add a WidgetItem after the existing WidgetItem for a tree widget.
Widget.BEFORE	Add a WidgetItem before the existing WidgetItem for a tree widget.
Widget.CHILD	Add a WidgetItem as a child of the existing WidgetItem for a tree widget.

Constants for Tree scrolling

Name	Description
Widget.SCROLL_BOTTOM	Scroll tree widget to bottom.
Widget.SCROLL_DOWN	Scroll tree widget down one.
Widget.SCROLL_PAGE_DOWN	Scroll tree widget down one page.
Widget.SCROLL_PAGE_UP	Scroll tree widget up one page.
Widget.SCROLL_TOP	Scroll tree widget to top.
Widget.SCROLL_UP	Scroll tree widget up one.

Constants for User interface categories

Name	Description
Widget.CATEGORY_APPLY	Apply buttons
Widget.CATEGORY_BUTTON_BOX	A button box panel that contains other widgets
Widget.CATEGORY_CANCEL	Buttons which cancel the current operation
Widget.CATEGORY_DATA_ ENTRY_HEADER	Header for data entry cells, e.g. PRIMER create panels
Widget.CATEGORY_DISMISS	Buttons to close or dismiss panels
Widget.CATEGORY_ENTITY	Entity types in T/HIS
Widget.CATEGORY_GENERIC	A generic button that isn’t a special category
Widget.CATEGORY_GENERIC_2	An alternative to the generic category that has a complementary colour
Widget.CATEGORY_HELP	Help buttons
Widget.CATEGORY_KEYWORD	A PRIMER keyword button
Widget.CATEGORY_LABEL	A text label
Widget.CATEGORY_LABEL_BOX	Text label with a border
Widget.CATEGORY_LABEL_ POPUP	Text label with a popup that blends into the background
Widget.CATEGORY_MENU_BOX	A menu box
Widget.CATEGORY_MESSAGE	For displaying a temporary warning message
Widget.CATEGORY_OPERATE	Operate buttons in T/HIS
Widget.CATEGORY_POPUP_BOX	A popup box that can contain buttons and plain text
Widget.CATEGORY_SAFE_ ACTION	Buttons (usually green) to indicate a safe action
Widget.CATEGORY_SEL_ALL	Select all

Widget.CATEGORY_TAB	Tab
Widget.CATEGORY_TABLE_HEADER	Table (column) header
Widget.CATEGORY_TABLE_ROW	Table row
Widget.CATEGORY_TEXT_BOX	A text box
Widget.CATEGORY_TICKBOX	A tick box
Widget.CATEGORY_TITLE	Title text
Widget.CATEGORY_TOGGLE	Buttons that can be toggled, e.g. On/Off
Widget.CATEGORY_TOOL	Buttons within the tools area
Widget.CATEGORY_UNDO	Buttons which undo the last operation
Widget.CATEGORY_UNSEL_ALL	Unselect/deslect all
Widget.CATEGORY_UPDATE	Update buttons which update the screen but leave the panel open
Widget.CATEGORY_WARNING_ACTION	Buttons (usually red) to indicate a dangerous action
Widget.NO_CATEGORY	No styling is applied. Widget colour controlled by foreground/background properties and is the same in all themes

Widget properties

Name	Type	Description
active	logical	If widget is active (true) or disabled (false)
arrows	boolean	Whether arrows will be shown for a slider (default is true). Slider Widgets only.
background	constant	Widget background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, Note, background colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the background colour. To override this behaviour and use this background colour first set the widget category to Widget.NO_CATEGORY.
bottom	integer	Widget bottom coordinate
category	constant	The button category which determines the button's appearance when using the new user interface, see Window.Theme()
currentItem	WidgetItem object	The current WidgetItem for a tree Widget. The current WidgetItem in a tree is shown with a dashed border.
fontSize	integer	Widget font size in points. Currently only supports the following sizes: 6, 7, 8, 10, 12, 14, 18, 24. Can be used only with Widget.LABEL and Widget.BUTTON. Both LATIN1 and UTF-8 encoding is supported on Windows but Linux only supports LATIN1 encoding at the moment.

foreground	constant	Widget foreground colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY, Widget.ORANGE, Widget.DEFAULT, Widget.COLOUR_NEUTRAL, Widget.COLOUR_CONTRAST, Widget.COLOUR_CONTRAST_2, Widget.COLOUR_WARNING, Widget.COLOUR_SAFE, Widget.COLOUR_TITLE, Widget.COLOUR_LABEL, Widget.COLOUR_INVERSE, Widget.DARKGREY_NEUTRAL, Widget.LIGHTGREY_NEUTRAL Widget.COLOUR_LATENT, Note, foreground colours in the Window.THEME_DARK, Window.THEME_LIGHT, and Window.THEME_CLASSIC themes will be determined by the category of the widget not the foreground colour. To override this behaviour and use this foreground colour first set the widget category to Widget.NO_CATEGORY.
hover	string	Widget hover text
imageHeight (read only)	integer	Height of widget image (pixels)
imageWidth (read only)	integer	Width of widget image (pixels)
justify	constant	Widget justification. Can be: Widget.LEFT, Widget.RIGHT or Widget.CENTRE (default).
left	integer	Widget left coordinate
lineWidth	integer	Width of lines when drawing graphics (initially 1; values 1-100 allowed).
macroTag	string	Tag to use for this widget when recording a macro. If empty then the text property value will be used.
maximum	integer	The maximum value allowed for a slider (default is 100). Slider Widgets only.
minimum	integer	The minimum value allowed for a slider (default is 0). Slider Widgets only.
monospace	boolean	true if the widget uses a monospace font instead of a proportional width font (default). Label and button Widgets only.
onChange	function	Function to call when the text in a TEXTBOX widget, the selection in a COMBOBOX widget or the value of a SLIDER is changed. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually types something into the textbox, selects an item in the combobox or moves the slider, NOT when the Widget.text or Widget.value property changes**.
onClick	function	Function to call when a BUTTON, CHECKBOX, COMBOBOX, LABEL, RADIOBUTTON or TREE widget is clicked. The Widget object is accessible in the function using the 'this' keyword (see the example below for more details of how to define the function and how to use the 'this' keyword). To unset the function set the property to null. **Note that this function is called when the user actually clicks on the button, NOT when the Widget.pushed property changes**. For the COMBOBOX widget the function is called **before** the list of items is mapped.
onPopup	function	Function to call when a BUTTON, LABEL, TEXTBOX or TREE widget is right clicked to map a popup. The Widget object is accessible in the function using the 'this' keyword. The PopupWindow can then be found by using the popupWindow property of the Widget. The function is called **before** the popup is mapped so you can change the widgets in the popup as required.
onTimer	function	Function to call for a widget when timerDelay ms have elapsed after setting this. Additionally if timerRepeat is set this function will be called repetitively, every timerDelay ms. The Widget object is accessible in the function using the 'this' keyword. To unset the function set the property to null. **Note that as soon as this property is set the timer starts!**

orientation	constant	The orientation of a slider. Can be: Widget.VERTICAL or Widget.HORIZONTAL (default). Slider Widgets only.
popupDirection	constant	How PopupWindow will be mapped relative to this widget. Can be Widget.LEFT, Widget.RIGHT, Widget.TOP or Widget.BOTTOM (default). For tree widgets this will be ignored as the popup is always shown on the WidgetItem that is right clicked.
popupSymbol	logical	TRUE (default) if a symbol will be shown for a PopupWindow.
popupWindow	PopupWindow object	PopupWindow for this Widget. Only available for Button, Label and Textbox Widgets. To remove a PopupWindow from a Widget set to null.
pushed	logical	If widget is pushed (true) or not (false). This only affects Widget.BUTTON with the Widget.toggle property set, and Widget.CHECKBOX widgets.
right	integer	Widget right coordinate
select	constant	Selection method for ListBox and tree Widgets. Can be: Widget.SELECT_NONE, Widget.SELECT_SINGLE or Widget.SELECT_MULTIPLE or Widget.SELECT_ENHANCED (default).
selectedItem	WidgetItem object	WidgetItem that is currently selected for a ComboBox or Radiobutton, Widget. If null no WidgetItem is selected. For a ListBox Widget this property contains the last WidgetItem that was (de)selected. To get a list of all of the selected WidgetItems use WidgetItems() to return all of the WidgetItems and inspect the WidgetItem selected property.
shown (read only)	boolean	true if the widget is visible. To alter the visibility of a widget use the Show() and Hide() methods.
step	integer	The step value of a slider (default is 1). Slider Widgets only.
text	string	Widget text. For a ComboBox Widget this will be the text for the currently selected WidgetItem
textHidden	boolean	true if the widget text is hidden and replaced by asterisks. This may be used to create textboxes to type passwords in. TextBox Widgets only.
timerDelay	integer	Delay in ms before the function set for onTimer will be called. The initial value is 1000 (ms). Also see timerRepeat.
timerRepeat	logical	If the function set for onTimer will be called once (false) or repeatedly (true). The initial value is false. Also see timerDelay.
toggle	logical	If widget can be toggled (true) or not (false). This only affects Widget.BUTTON widgets.
top	integer	Widget top coordinate
type (read only)	integer	Type of the widget. The widget type could be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE
value	integer	The current value of a slider (initially will be the minimum value). Slider Widgets only.
window (read only)	Window object	The Window that this widget is defined in
xResolution	integer	X resolution of button when drawing lines, circles, polygons and rectangles (initially 100). X coordinates on the Widget can be from 0 (on the left of the widget) to xResolution (on the right of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.
yResolution	integer	Y resolution of button when drawing lines, circles, polygons and rectangles (initially 100). Y coordinates on the Widget can be from 0 (on the top of the widget) to yResolution (on the bottom of the widget). Available for Widget.LABEL and Widget.BUTTON Widgets.

Detailed Description

The Widget class allows you to create Widgets (buttons, textboxes etc) in a Window for a graphical user interface. Callback functions can be declared for widgets to give actions when a button is pressed or the text in a textbox is selected etc. The following example displays various widgets in a window. Several callback methods are used. The exit button allows the user to exit the script but the button is only made active if the checkbox widget is ticked. If the button widgets are pressed feedback is given to the user

```
var count = 0;
// Create window
var w = new Window("Test", 0.8, 1.0, 0.5, 0.6);
// Create all of the widgets
var l = new Widget(w, Widget.LABEL,    1, 30, 1, 7, "Text:");
var t = new Widget(w, Widget.TEXTBOX, 31, 80, 1, 7, "Enter text");
var b = new Widget(w, Widget.BUTTON,   1, 30, 8, 14, "Press me");
var b2= new Widget(w, Widget.BUTTON,  31, 61, 8, 14, "Don't press me");
var c = new Widget(w, Widget.CHECKBOX,62, 68, 8, 14);
var l2= new Widget(w, Widget.LABEL,    1, 80, 15, 21, "You haven't pressed the
button yet...");
var e = new Widget(w, Widget.BUTTON,   1, 21, 22, 28, "Exit");
// Allow button widget b2 to toggle
b2.toggle = true;
// The exit button is initially inactive
e.active = false;
// Assign the callback functions
b.onClick  = clicked;
b2.onClick = clicked;
c.onClick  = clicked;
t.onChange = changed;
e.onClick  = confirm_exit;
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If checkbox is clicked then set the state of the exit button
    if (this === c)
    {
        Message("Checkbox clicked");
        e.active = c.pushed;
    }
// If the "Don't press me' button is pressed then change the colour if the
button is pressed in.
    else if (this === b2)
    {
        Message("I said don't press!!!");
        if (b2.pushed) b2.background = Widget.WHITE;
        else           b2.background = Widget.DEFAULT;
    }
// If the "Press me" button is pressed then update the text in the label widget
// with how many times the button has been pressed.
    else
    {
        Message("You pressed...");
        count++;
        l2.text = "Button pressed " + count + " times";
    }
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If the user has changed the text in the textbox then give a message in
// the dialogue box
    Message("Text has changed to " + this.text);
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
```

```
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

In version 20 a tree widget was added. A simple tree widget example is shown below.

```
Window.Theme(Window.THEME_CURRENT);
let wi, cwi;
// Create a popup window and some widgets
let pw = new PopupWindow();
let pw_l1 = new Widget(pw, Widget.LABEL, 1, 61,  1,  7, "");
let pw_l2 = new Widget(pw, Widget.LABEL, 1, 61,  7, 13, "");
let pw_l3 = new Widget(pw, Widget.LABEL, 1, 61, 13, 19, "");
let pw_l4 = new Widget(pw, Widget.LABEL, 1, 61, 19, 25, "");
let pw_l5 = new Widget(pw, Widget.LABEL, 1, 61, 25, 31, "");
let pw_l6 = new Widget(pw, Widget.LABEL, 1, 61, 31, 37, "");
// Create window
let w = new Window("JavaScript Tree widget test", 0.85, 1.0, 0.75, 1.0);
// Create tree widget
let t = new Widget(w, Widget.TREE, 1, 61, 1, 51, "Suite");
// Add a root node to tree
let env_wi = new WidgetItem(t, "Oasys Ltd LS_DYNA Environment");
// Add a child to the root node
wi  = new WidgetItem(t, "PRIMER", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Prepare", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Efficient, reliable model setup with support for all of the latest
LS-DYNA features";
wi  = new WidgetItem(t, "LS-DYNA", Widget.CHILD, env_wi);
cwi = new WidgetItem(t, "Analyse", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
// Add a sibling node after LS-DYNA
wi  = new WidgetItem(t, "REPORTER", Widget.AFTER, wi);
cwi = new WidgetItem(t, "Report", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Automatic report generation for LS-DYNA simulations";

// Add a sibling node before REPORTER
wi  = new WidgetItem(t, "T/HIS", Widget.BEFORE, wi);
cwi = new WidgetItem(t, "Process", Widget.CHILD, wi);
wi.onMouseOver = wi_onmouseover;
cwi.hover = "Plot, manipulate and process XY data from LS-DYNA";

// Alternatively, create WidgetItem without parent and add
let d3plot_wi   = new WidgetItem(null, "D3PLOT");
t.AddWidgetItem(d3plot_wi, Widget.BEFORE, wi);
cwi = new WidgetItem(null, "Visualise");
t.AddWidgetItem(cwi, Widget.CHILD, d3plot_wi);
d3plot_wi.onMouseOver = wi_onmouseover;
cwi.hover = " In-depth 3D visualisation of LS-DYNA results";
// Expand root node
env_wi.expanded = true;
// Link popup to tree widget
t.popupWindow = pw;
// Assign callbacks
t.onClick = click_tree;
t.onPopup = do_popup;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function do_popup()
{
    pw_l1.text = this.currentItem.text;
    if (this.currentItem.selected) pw_l2.text = "Selected";
    else                           pw_l2.text = "Not selected";
    if (this.currentItem.Parent())
        pw_l3.text = "Parent: " + this.currentItem.Parent().text;
    else
        pw_l3.text = "No parent";
    if (this.currentItem.FirstChild())
        pw_l4.text = "First child: " + this.currentItem.FirstChild().text;
    else
```

```
        pw_l4.text = "No children";
    if (this.currentItem.PreviousSibling())
        pw_l5.text = "Previous: " + this.currentItem.PreviousSibling().text;
    else
        pw_l5.text = "No previous";
    if (this.currentItem.NextSibling())
        pw_l6.text = "Next: " + this.currentItem.NextSibling().text;
    else
        pw_l6.text = "No next";
}
////////////////////////////////////////////////////////////////////////////
function click_tree()
{
    Message("Clicked on "+this.currentItem.text+" in tree");
}
////////////////////////////////////////////////////////////////////////////
function wi_onmouseover()
{
    Message("Called onMouseOver for WidgetItem "+this.text+" in tree");
}
```

Graphics (lines, circles, rectangles etc) can be drawn on Widget.LABEL and Widget.BUTTON widgets. If these methods are used the resolution of the widget is 100 units in x and y and the origin is at the top left of the widget. See the documentation below and the WidgetItem and Window classes for more details.

Constructor

new Widget(window*[Window or PopupWindow]*, type*[constant]*, left*[integer]*, right*[integer]*, top*[integer]*, bottom*[integer]*, text (optional)*[string]*)

Description

Create a new Widget object.

Arguments

- **window** (Window or PopupWindow)

Window or PopupWindow that widget will be created in

- **type** (constant)

Widget type. Can be Widget.BUTTON, Widget.CHECKBOX, Widget.COMBOBOX, Widget.LABEL, Widget.LISTBOX, Widget.RADIOBUTTON, Widget.SLIDER, Widget.TEXTBOX or Widget.TREE

- **left** (integer)

left coordinate of widget

- **right** (integer)

right coordinate of widget

- **top** (integer)

top coordinate of widget

- **bottom** (integer)

bottom coordinate of widget

- **text (optional)** (string)

Text to show on widget (optional for LABEL, BUTTON, TEXTBOX and TREE, not required for CHECKBOX, COMBOBOX, LISTBOX, RADIOBUTTON and SLIDER). For a TREE widget the text will be used as a macroTag.

Returns

Widget object

Return type

Widget

Details of functions

AddWidgetItem(item*[WidgetItem]*, position (optional)*[integer]*)

Description

Adds a WidgetItem to a ComboBox ListBox or Radiobutton Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **position (optional)** (integer)

Position on Widget to add the WidgetItem. Any existing WidgetItems will be shifted down as required. If omitted the WidgetItem will be added to the end of the existing ones. **Note that positions start at 0**.

Returns

No return value

Example

To add WidgetItem wi to widget w:

```
w.AddWidgetItem(wi);
```

AddWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem]*)

Description

Adds a WidgetItem to a Tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to add

- **relationship** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem** (WidgetItem)

Existing WidgetItem to add item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be added to the root node of the tree.

Returns

No return value

Example

To add WidgetItem wi to tree widget w after existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.AFTER, ewi);
```

To add WidgetItem wi to tree widget w as a child of existing WidgetItem ewi:

```
w.AddWidgetItem(wi, Widget.CHILD, ewi);
```

Circle(colour*[constant]*, fill*[boolean]*, xc*[integer]*, yc*[integer]*, radius*[integer]*)

Description

Draws a circle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of circle. See foreground for colours.

- **fill** (boolean)

If circle should be filled or not.

- **xc** (integer)

x coordinate of centre of circle.

- **yc** (integer)

y coordinate of centre of circle.

- **radius** (integer)

radius of circle.

Returns

no return value

Example

To draw a red filled circle, radius 25, at (50, 50) on widget w:

```
w.Circle(Widget.RED, true, 50, 50, 25);
```

Clear()

Description

Clears any graphics on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

No arguments

Returns

no return value

Example

To clear any graphics for widget w:

```
w.Clear();
```

ClearSelection()

Description

Clears selection of any WidgetItems on the widget. Only possible for Widget.COMBOBOX, Widget.LISTBOX, Widget.RADIOBUTTON and Widget.TREE widgets.

Arguments

No arguments

Returns

no return value

Example

To clear selection of any WidgetItems for widget w:

```
w.ClearSelection();
```

Cross(colour (optional)*[constant]*)

Description

Draws a cross symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of cross symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red cross symbol on widget w:

```
w.Cross(Widget.RED);
```

CtrlPressed() [static]

Description

Check to see if the Ctrl key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Ctrl key pressed:

```
if (Widget.CtrlPressed()) { ... }
```

Delete()

Description

Deletes the widget from T/HIS (removing it from the window it is defined in) and returns any memory/resources used for the widget. This function should not normally need to be called. However, sometimes a script may want to recreate widgets in a window many times and unless the old widgets are deleted T/HIS will reach the maximum number of widgets for a window (Options.max_widgets). To avoid this problem this method can be used to force T/HIS to delete and return the resources for a widget. **Do not use the Widget object after calling this method**.

Arguments

No arguments

Returns

no return value

Example

To delete widget w:

```
w.Delete();
```

DirectoryIcon(line_colour*[constant]*, fill_colour*[constant]*)

Description

Draws a directory icon on the widget. Only possible for Widget.BUTTON widgets.

Arguments

- **line_colour** (constant)

Colour of lines of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

- **fill_colour** (constant)

Colour of fill of folder (only used in the old UI - in the new UI it will be ignored, a standard icon is always used). See foreground for colours.

Returns

no return value

Example

To draw a directory icon on widget btn:

```
btn.DirectoryIcon(Widget.BLACK, Widget.YELLOW);
```

DumpImageString(filename*[string]*, format (optional)*[constant]*)

Description

Dumps a string representation of an image for a widget to a file in a form that can be used by Widget.ReadImageString(). Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **filename** (string)

Filename to dump string representation to

- **format (optional)** (constant)

Can be Widget.RGB8 or Widget.RGB24. Before version 15 T/HIS only used 8 bits to store RGB (red, green and blue)

colour information for widget images. In version 15 widget images have been changed to use 24 bits to store RGB information (8 bits for red, 8 bits for green and 8 bits for blue). Both formats are supported. If omitted the new Widget.RGB24 format will be used. See Widget.ReadImageString() for more details.

Returns

no return value

Example

To dump the image data to file 'image_data' for widget w with the old 8 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB8);
```

To dump the image data to file 'image_data' for widget w with 24 bit RGB representation:

```
w.DumpImageString('image_data', Widget.RGB24);
```

Hide()

Description

Hides the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To hide widget *w*

```
w.Hide();
```

ItemAt(index*[integer]*)

Description

Returns the WidgetItem object used at *index* in this Widget. See also Widget.TotalItems() and Widget.WidgetItems(). Note that for tree Widgets the items will not be returned in the order that they are displayed in, they will be returned in the order they were added to the tree.

Arguments

- **index** (integer)

index to return WidgetItem for. **Note that indices start at 0**.

Returns

WidgetItem object.

Return type

WidgetItem

Example

To loop over the WidgetItems used in Widget *w*

```
for (i=0; i<w.TotalItems(); i++)
{
    wi = w.ItemAt(i);
}
```

Line(colour*[constant]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a line on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of line. See foreground for colours.

- **x1** (integer)

x coordinate of start of line.

- **y1** (integer)

y coordinate of start of line.

- **x2** (integer)

x coordinate of end of line.

- **y2** (integer)

y coordinate of end of line.

Returns

no return value

Example

To draw a red line from (10, 90) to (90, 10) on widget w:

```
w.Line(Widget.RED, 10, 90, 90, 10);
```

MoveWidgetItem(item*[WidgetItem]*, relationship*[constant]*, relitem*[WidgetItem or null]*)

Description

Moves an existing WidgetItem in a tree Widget. Also see Widget.RemoveAllWidgetItems and Widget.RemoveWidgetItem.

Arguments

- **item** (WidgetItem)

WidgetItem to move

- **relationship** (constant)

What relationship (relative to relitem) to use when moving item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.AFTER.

- **relitem** (WidgetItem or null)

Existing WidgetItem to move item relative to. If relationship is Widget.CHILD then relitem can be null and then the WidgetItem will be moved to the root node of the tree.

Returns

No return value

Example

To move WidgetItem wi in tree widget w after existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.AFTER, ewi);
```

To move WidgetItem wi in tree widget w as a child of existing WidgetItem ewi:

```
w.MoveWidgetItem(wi, Widget.CHILD, ewi);
```

PixelsPerUnit() [static]

Description

Returns the number of pixels per unit coordinate. This will vary depending on the monitor T/HIS is running on.

Arguments

No arguments

Returns

pixels/unit (real)

Return type

Number

Example

To return how many pixels there are per unit coordinate:

```
var ppu = Widget.PixelsPerUnit();
```

Polygon(colour*[constant]*, fill*[boolean]*, points*[array]*)

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **points** (array)

Array of point coordinates

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
var a = new Array(20, 20, 50, 80, 80, 20);
w.Polygon(Widget.RED, true, a);
```

Polygon(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Draws a polygon on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show(). The number of points (x, y pairs) is limited to 500. Any extra points will be ignored.

Arguments

- **colour** (constant)

Colour of polygon. See foreground for colours.

- **fill** (boolean)

If polygon should be filled or not.

- **x1** (integer)

x coordinate of point 1.

- **y1** (integer)

y coordinate of point 1.

- **x2** (integer)

x coordinate of point 2.

- **y2** (integer)

y coordinate of point 2.

- **... xn** (integer)

x coordinate of point n.

- **... yn** (integer)

y coordinate of point n.

Returns

no return value

Example

To draw a red filled triangle with corners (20, 20) and (50, 80) and (80, 20) on widget w:

```
w.Polygon(Widget.RED, true, 20, 20, 50, 80, 80, 20);
```

ReadImageFile(filename*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a file to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text. Note that due to the way that colours are used for menus in T/HIS only a small number of colours are available for Widget images. Black and white images will display without any issues but colour images will be displayed with a reduced set of colours.

Arguments

- **filename** (string)

Image file (BMP, GIF, JPEG or PNG) to read. To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in T/HIS. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255).
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image example.png for widget w and place it at the top left:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT);
```

To read image example.png for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image example.png for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageFile("example.png", Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageFile(null);
```

ReadImageString(string*[string]*, justify (optional)*[constant]*, transparent (optional)*[colour value (integer)]*, tolerance (optional)*[integer]*)

Description

Reads an image from a JavaScript string previously created by Widget.DumpImageString() to show on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The image will be shown on the widget underneath any text.
Note, prior to version 15 of T/HIS only a small number of colours were available for Widget images. In version 14 and earlier the RGB (red, green and blue) information for each pixel in the image was packed into a single byte (8 bits) with 3 bits for red, 3 for green and 2 for blue. Widget.DumpImageString() always returned the string beginning with "RRRGGGBB_RLE" which is this 8 bit format with run length encoding. This is format Widget.RGB8.
In version 15 support for Widget images was enhanced to give 24bit support for colours. The RGB information for each pixel has 8 bits for red, 8 bits for green and 8 bits for blue. This is format Widget.RGB24.
From version 15 Widget.DumpImageString() can either return the the old 8 bit format Widget.RGB8 (string beginning with "RRRGGGBB_RLE") or return the the new 24bit format Widget.RGB24 (string beginning with "RGB24_Z"). ReadImageString supports both formats.

Arguments

- **string** (string)

String containing the image data previously created by Widget.DumpImageString(). To remove an image use null.

- **justify (optional)** (constant)

Widget justification. Can be a bitwise or of Widget.LEFT, Widget.RIGHT or Widget.CENTRE and Widget.TOP, Widget.MIDDLE or Widget.BOTTOM. Additionally Widget.SCALE can be used to scale the image (either reducing or enlarging it) so that it fills the widget. If omitted the default is Widget.CENTRE|Widget.MIDDLE without scaling.

- **transparent (optional)** (colour value (integer))

Transparent colour. Must be a colour returned by Colour.RGB() in T/HIS. If given then this colour will be replaced by a transparent colour. i.e. the widget background colour will be shown. If omitted or null no transparency will be used.

- **tolerance (optional)** (integer)

Tolerance for transparent colour (0-255). Only used for the new 24bit format Widget.RGB24 (strings beginning with "RGB24_Z"). Ignored for the old 8 bit format Widget.RGB8 (strings beginning with "RRRGGGBB_RLE").
Any pixels in the image that have a red, green and blue colour value within *tolerance* of the transparent colour will be transparent.
For example if the transparent colour was given as Colour.RGB(255, 0, 0) and *tolerance* is 0 only pixels which have red value 255 **and** green value 0 **and** blue value 0 will be made transparent.
If *tolerance* is 4, pixels which have red values between 251 and 255 **and** green values between 0 and 4 **and** blue values between 0 and 4 will be made transparent.
If omitted a value of 8 will be used.

Returns

no return value

Example

To read image data from string s for widget w and place it at the top left:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT);
```

To read image data from string s for widget w and place it at the top left, scaling it to fit the widget:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT|Widget.SCALE);
```

To read image data from string s for widget w and place it at the top left, replacing red with a transparent colour:

```
w.ReadImageString(s, Widget.TOP|Widget.LEFT, Colour.RGB(255, 0, 0));
```

To remove an image from widget w:

```
w.ReadImageString(null);
```

Rectangle(colour*[constant]*, fill*[boolean]*, x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draws a rectangle on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets. The coordinates are local to the Widget, not the Window. See properties xResolution and yResolution for more details. Note that the widget graphics will only be updated when the widget is redrawn. This is to allow the user to do multiple drawing commands on a widget. To force the widget to be redrawn call Show().

Arguments

- **colour** (constant)

Colour of rectangle. See foreground for colours.

- **fill** (boolean)

If rectangle should be filled or not.

- **x1** (integer)

x coordinate of first corner of rectangle.

- **y1** (integer)

y coordinate of first corner of rectangle.

- **x2** (integer)

x coordinate of second (opposite) corner of rectangle.

- **y2** (integer)

y coordinate of second (opposite) corner of rectangle.

Returns

no return value

Example

To draw a red filled rectangle with corners (20, 20) and (80, 80) on widget w:

```
w.Rectangle(Widget.RED, true, 20, 20, 80, 80);
```

RemoveAllWidgetItems()

Description

Removes any WidgetItems from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveWidgetItem.

Arguments

No arguments

Returns

No return value

Example

To remove all WidgetItems from widget w:

```
w.RemoveAllWidgetItems();
```

RemoveWidgetItem(item*[WidgetItem]*)

Description

Removes a WidgetItem from the Widget. Also see Widget.AddWidgetItem and Widget.RemoveAllWidgetItems.

Arguments

- **item** (WidgetItem)

WidgetItem to remove

Returns

No return value

Example

To remove WidgetItem wi from widget w:

```
w.RemoveWidgetItem(wi);
```

Scroll(scroll*[constant or WidgetItem object]*)

Description

Scrolls a tree widget

Arguments

- **scroll** (constant or WidgetItem object)

How to scroll the tree widget. Can be: Widget.SCROLL_TOP, Widget.SCROLL_BOTTOM, Widget.SCROLL_UP, Widget.SCROLL_DOWN, Widget.SCROLL_PAGE_UP or Widget.SCROLL_PAGE_DOWN in which case the tree widget will be scrolled by that value or a WidgetItem, in which case the tree will be scrolled to make the WidgetItem visible, expanding any branches as necessary to do so..

Returns

No return value

Example

To scroll tree widget w to the top:

```
w.Scroll(Widget.SCROLL_TOP);
```

To scroll tree widget w so that WidgetItem wi is visible in the tree:

```
w.Scroll(wi);
```

ShiftPressed() [static]

Description

Check to see if the Shift key is pressed

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To test if someone has the Shift key pressed:

```
if (Widget.ShiftPressed()) { ... }
```

Show()

Description

Shows the widget on the screen

Arguments

No arguments

Returns

No return value

Example

To show widget w:

```
w.Show();
```

Static()

Description

Windows have two different regions for Widgets. A 'normal' region which can be scrolled if required (if the window is made smaller scrollbars will be shown which can be used to scroll the contents) and a 'static' region at the top of the Window which is fixed and does not scroll. For an example of a static region in a Window see any of the keyword editing panels. The 'Dismiss', 'Create', 'Reset' etc buttons are in the static region. By default Widgets are put into the normal region of the Window. This method puts the Widget to the static region of the Window.

Arguments

No arguments

Returns

No return value

Example

To put widget w in the static part of the window:

```
w.Static();
```

StringLength(text*[string]*, monospace (optional)*[boolean]*, fontSize (optional)*[integer]*) [static]

Description

Returns the length of a string in Widget units. This can be used to find what size a Widget must be to be able to display the string.

Arguments

- **text** (string)

Text to find the width of

- **monospace (optional)** (boolean)

If true then width will be calculated using a monospace font. If false (default) then the normal proportional width font will be used

- **fontSize (optional)** (integer)

Calculation can be based on a defined font size, at the moment support is added only for font sizes of 6, 7, 8, 10, 12, 14, 18 and 24.

Returns

integer

Return type

Number

Example

To get the width of string 'Example':

```
var len = Widget.StringLength('Example');
```

Tick(colour (optional)*[constant]*)

Description

Draws a tick symbol on the widget. Only possible for Widget.LABEL and Widget.BUTTON widgets.

Arguments

- **colour (optional)** (constant)

Colour of tick symbol. See foreground for colours. If omitted, current foreground colour is used.

Returns

no return value

Example

To draw a red tick symbol on widget w:

```
w.Tick(Widget.RED);
```

TotalItems()

Description

Returns the number of the WidgetItem objects used in this Widget (or 0 if none used). See also Widget.ItemAt() and Widget.WidgetItems().

Arguments

No arguments

Returns

integer

Return type

Number

Example

To return the total number of WidgetItems used for Widget *w*

```
var total = w.TotalItems();
```

WidgetItems()

Description

Returns an array of the WidgetItem objects used in this Widget (or null if none used). See also Widget.ItemAt() and Widget.TotalItems().

Arguments

No arguments

Returns

Array of WidgetItem objects

Return type

Array

Example

To return WidgetItems used for Widget *w*

```
var wi = w.WidgetItems();
```

WidgetItem class

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- FirstChild()
- NextSibling()
- Parent()
- PreviousSibling()

WidgetItem properties

Name	Type	Description
background	constant	Widget background colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
expanded	logical	If the widget item is expanded (true) or not (false) in a tree. Only available for widgetitems used in TREE widgets.
foreground	constant	Widget foreground colour. Not used for RADIOBUTTON widgets. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
hover	string	WidgetItem's hover text. Not used for RADIOBUTTON widgets.
index (read only)	integer	The index of this widgetitem in the parent widget (undefined if widgetitem is not assigned to a widget).
monospace	boolean	true if the widgetitem uses a monospace font instead of a proportional width font (default). Not used for RADIOBUTTON and TREE widgets.
onClick	function	Function to call when a widget item in a COMBOBOX, LISTBOX or TREE widget is clicked. The Widgetitem object is accessible in the function using the 'this' keyword.
onMouseOver	function	Function to call when the mouse moves over a widget item in a COMBOBOX, LISTBOX or TREE widget. The Widgetitem object is accessible in the function using the 'this' keyword.
selectable	logical	If the widget item can be selected (true) or not (false). Not used for RADIOBUTTON and TREE widgets.
selected	logical	If the widget item is selected (true) or not (false).
text	string	Widget text. If the WidgetItem is used in a tree widget then the tree will not automatically redraw (this is in case you want to change lots of tree nodes at once). In this case, use the Window Redraw method to redraw the window.
visible	logical	If the widget item is visible (true) or not (false) in a tree. A widgetitem will not be visible if it is a child of a widgetitem that is not expanded. Only available for widgetitems used in TREE widgets.

widget (read only)	Widget object	The widget that this item is defined for (null if not set)

Detailed Description

The WidgetItem class allows you to create items for combobox, listbox, radio button and tree Widgets in a Window for a graphical user interface. The following example shows how WidgetItems are used to create a Combobox Widget and how to assign callbacks to determine when the selection has been changed.

```
var items = ["D3PLOT", "PRIMER", "SHELL", "REPORTER", "T/HIS"]
// Create window
var w = new Window("Combobox example", 0.8, 1.0, 0.5, 0.6);
// A simple combobox with a few items
var cl= new Widget(w, Widget.LABEL,   1, 30, 1, 7, "Programs:");
var cb= new Widget(w, Widget.COMBOBOX,  31, 61, 1, 7);
// Add WidgetItems to Combobox
for (i=0; i<items.length; i++)
    var wi = new WidgetItem(cb, items[i]);
// A combobox with many items showing a slider.
var li= new Widget(w, Widget.LABEL,   1, 30, 8, 14, "Long list:");
var ci= new Widget(w, Widget.COMBOBOX,  31, 61, 8, 14);
// Add WidgetItems to Combobox
// As an example we also make some of the WidgetItems unselectable and
// change the background colour
for (i=1; i<=100; i++)
{
    var wi = new WidgetItem(ci, "Item "+i);
    if ( (i % 10) == 5)
    {
        wi.selectable = false;
        wi.background = Widget.WHITE;
    }
}
var e = new Widget(w, Widget.BUTTON,   1, 21, 15, 21, "Exit");
// Assign callbacks
cb.onClick  = clicked;
cb.onChange = changed;
ci.onClick  = clicked;
ci.onChange = changed;
e.onClick   = confirm_exit
// Show the window and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function clicked()
{
// If combobox is clicked then print the current selection
    if (this.selectedItem)
        Message("selection is currently '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function changed()
{
// If combobox selection is changed then print the new selection
    if (this.selectedItem)
        Message("selection is now '"+this.selectedItem.text+"'");
}
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm box
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered yes then exit from the script.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Window and Widget classes for more details.

Constructor

new WidgetItem(widget*[Widget]*, text*[string]*, selectable (optional)*[boolean]*)

Description

Create a new WidgetItem object for a combobox, listbox or radio button widget.

Arguments

- **widget** (Widget)

Combobox, listbox or radio button Widget that the widget item will be created in. This can be null in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned later by using Widget.AddWidgetItem().

- **text** (string)

Text to show on widget item

- **selectable (optional)** (boolean)

If the widget item can be selected. If omitted the widget item will be selectable. Not used for RADIOBUTTON and TREE widgets.

Returns

WidgetItem object

Return type

WidgetItem

new WidgetItem(widget*[Widget]*, text*[string]*, relationship (optional)*[constant]*, relitem (optional)*[WidgetItem]*)

Description

Create a new WidgetItem object for a tree widget. If the widget argument is given and the relationship and relitem arguments are omitted then the widget item will be added as a root node in the tree. If the relationship and relitem arguments are also used then the item can be added at a specific location in the tree. Alternatively, the widget argument can be null, and the relationship and relitem arguments omitted, in which case the WidgetItem will be created but not assigned to a Widget. It can be assigned to the tree later using Widget.AddWidgetItem()

Arguments

- **widget** (Widget)

Tree Widget that the widget item will be created in or null (if the relationship and relitem arguments are omitted)

- **text** (string)

Text to show on widget item

- **relationship (optional)** (constant)

What relationship (relative to relitem) to use when adding item to the Widget. Can be:
Widget.BEFORE,
Widget.AFTER or
Widget.CHILD.

- **relitem (optional)** (WidgetItem)

Existing WidgetItem to add item relative to

Returns

WidgetItem object

Return type

WidgetItem

Details of functions

FirstChild()

Description

Returns the first child WidgetItem or null if the WidgetItem has no children. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the first child widget item in a tree widget for widget item wi:

```
var cwi = wi.FirstChild();
```

NextSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the next sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.NextSibling();
```

Parent()

Description

Returns the parent WidgetItem or null if the WidgetItem has no parent. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the parent widget item in a tree widget for widget item wi:

```
var pwi = wi.Parent();
```

PreviousSibling()

Description

Returns the next sibling WidgetItem or null if the WidgetItem has no further siblings. Only possible for WidgetItems used in Widget.TREE widgets.

Arguments

No arguments

Returns

WidgetItem object

Return type

WidgetItem

Example

To get the previous sibling widget item in a tree widget for widget item wi:

```
var pwi = wi.PreviousSibling();
```

Window class

The Window class allows you to create windows for a graphical user interface. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- BottomBorder()
- BuildGUIFromString(guistring*[string]*)
- EndLoop()
- Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*)
- GetDirectory(initial (optional)*[string]*)
- GetFile(extension (optional)*[string]*, save (optional)*[boolean]*, initial (optional)*[string]*)
- GetFilename(title*[string]*, message*[string]*, extension (optional)*[string]*, initial (optional)*[string]*, save (optional)*[boolean]*)
- GetFiles(extension (optional)*[string]*)
- GetInteger(title*[string]*, message*[string]*, initial (optional)*[integer]*)
- GetNumber(title*[string]*, message*[string]*, initial (optional)*[real]*)
- GetPassword(title*[string]*, message*[string]*)
- GetString(title*[string]*, message*[string]*, initial (optional)*[string]*)
- Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*)
- MasterResolution()
- Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*)
- MiddleBorder()
- Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*)
- RightBorder()
- StartLoop()
- Theme(theme (optional)*[constant]*)
- TopBorder()
- UpdateGUI()
- Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*)

Member functions

- Delete()
- Hide()
- Recompute()
- Redraw()
- Show(modal (optional)*[boolean]*)

Window constants

Name	Description
Window.CANCEL	Show CANCEL button
Window.NO	Show NO button
Window.NONMODAL	Allow Window.Error, Window.Question, Window.Warning etc windows to be non modal
Window.OK	Show OK button
Window.YES	Show YES button

Constants for Resizing/positioning

Name	Description

Window.BOTTOM	Bottom resizing/positioning of window
Window.CENTRE	Centre (horizontal) positioning of window
Window.LEFT	Left resizing/positioning of window
Window.MIDDLE	Middle (vertical) positioning of window
Window.REDUCE	Window is allowed to reduce in size when resizing
Window.RIGHT	Right resizing/positioning of window
Window.TOP	Top resizing/positioning of window

Constants for Themes

Name	Description
Window.THEME_CLASSIC	Use the Classic theme (Note: Not only the script will use this theme, the whole interface of the program will switch to classic)
Window.THEME_CURRENT	Use the current theme
Window.THEME_DARK	Use the Dark theme (Note: Not only the script will use this theme, the whole interface of the program will switch to dark)
Window.THEME_LIGHT	Use the Light theme (Note: Not only the script will use this theme, the whole interface of the program will switch to light)
Window.USE_OLD_UI_JS	Use the original, pre v17, theme (default). (Note:The interface of the program will NOT switch to old)

Window properties

Name	Type	Description
active	boolean	If true (default) then the window then the window is active and widgets in the window can be used. If false then the window is inactive and the widgets cannot be used.
background	constant	Window background colour. Can be: Widget.BLACK, Widget.WHITE, Widget.RED, Widget.GREEN, Widget.BLUE, Widget.CYAN, Widget.MAGENTA, Widget.YELLOW, Widget.DARKRED, Widget.DARKGREEN, Widget.DARKBLUE, Widget.GREY, Widget.DARKGREY, Widget.LIGHTGREY or Widget.DEFAULT
bottom	real	bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)
height	real	height of window
keepOnTop	boolean	If true then the window will be kept "on top" of other windows. If false (default) then the window stacking order can be changed.
left	real	left coordinate of window in range 0.0 (left) to 1.0 (right)
maxWidgets (read only)	integer	The maximum number of widgets that can be made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see totalWidgets
onAfterShow	function	Function to call **after** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that certain actions are done after the window is shown. It can also be used to show another window so this enables multiple windows to be shown. To unset the function set the property to null.
onBeforeShow	function	Function to call **before** a Window is shown. The Window object is accessible in the function using the 'this' keyword. This may be useful to ensure that buttons are shown/hidden etc before the window is shown. Note that it cannot be used to show another window. Use onAfterShow for that. To unset the function set the property to null.

onClose	function	Function to call when a Window is closed by pressing the X on the top right of the window. This may be useful to ensure that certain actions are done after the window is closed. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
onHide	function	Function to call when a Window is hidden by calling Hide(). This may be useful to ensure that certain actions are done after the window is hidden. The Window object is accessible in the function using the 'this' keyword. To unset the function set the property to null.
resize	constant	Window resizing. By default when a Window is shown it is allowed to resize on all sides (left, right, top and bottom) to try to make enough room to show the Widgets. The behaviour can be changed by using this property. It can be any combination (bitwise OR) of Window.LEFT, Window.RIGHT, Window.TOP or Window.BOTTOM or 0. In addition Window.REDUCE can also be added to allow the window to reduce in size when resizing. Note that when Window.Show is called this property is set to 0 (i.e. not to resize on any side).
right	real	right coordinate of window in range 0.0 (left) to 1.0 (right)
showClose	boolean	If true (default) then a close (X) button will automatically be added on the top right of the window. If false then no close button will be shown.
shown (read only)	boolean	true if window is currently shown, false if not
title	string	Window title
top	real	top coordinate of window in range 0.0 (bottom) to 1.0 (top)
totalWidgets (read only)	integer	The total number of widgets that have been made in this window. This can be changed **before** the window is created by using Options.max_widgets. Also see maxWidgets
width	real	width of window

Detailed Description

The Window class allows you to make windows that you can place Widgets in to create a graphical user interface. The Widget class also gives a number of static methods for convenience. e.g. Window.GetInteger(). The following very simple example displays some text in a window with a button that unmaps the window when it is pressed and the user confirms that they want to exit.

```
// Create window with title "Text" from 0.8-1.0 in x and 0.5-0.6 in y
var w = new Window("Text", 0.8, 1.0, 0.5, 0.6);
// Create label widget
var l = new Widget(w, Widget.LABEL,   1, 40, 1,  7, "Press OK to exit");
// Create button widget
var e = new Widget(w, Widget.BUTTON, 11, 30, 8, 14, "OK");
// Assign the onClick callback method to the function confirm_exit'
e.onClick  = confirm_exit;
// Show the widget and start event loop
w.Show();
////////////////////////////////////////////////////////////////////////////
function confirm_exit()
{
// Map confirm window
    var ret = Window.Question("Confirm exit", "Are you sure you want to quit?");
// If the user has answered Yes then exit.
    if (ret == Window.YES) Exit();
}
```

See the documentation below and the Widget class for more details.

Constructor

new Window(title*[string]*, left*[real]*, right*[real]*, bottom*[real]*, top*[real]*)

Description

Create a new Window object.

Arguments

- **title** (string)

Window title to show in title bar

- **left** (real)

left coordinate of window in range 0.0 (left) to 1.0 (right)

- **right** (real)

right coordinate of window in range 0.0 (left) to 1.0 (right)

- **bottom** (real)

bottom coordinate of window in range 0.0 (bottom) to 1.0 (top)

- **top** (real)

top coordinate of window in range 0.0 (bottom) to 1.0 (top)

Returns

Window object

Return type

Window

Example

To create a Window 'Example' in the top right half of the screen:

```
var w = new Window('Example', 0.5, 1.0, 0.5, 1.0);
```

Details of functions

BottomBorder() [static]

Description

Returns the vertical position of the bottom border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the bottom border:

```
var b = Window.BottomBorder();
```

BuildGUIFromString(guistring*[string]*) [static]

Description

Builds a GUI from a JSON string created by the GUI builder.

Arguments

- **guistring** (string)

The string to create the GUI from

Returns

object containing the GUI

Return type

Object

Example

To create a GUI from the string json_string:

```
var gui = Window.BuildGUIFromString(json_string);
```

Delete()

Description

Deletes the window from T/HIS and returns any memory/resources used for the window. **This function should not normally need to be called**. However, in exceptional circumstances if a script recreates windows many times T/HIS may run out of USER objects on Microsoft Windows because of the way T/HIS creates and shows windows. To avoid this problem this method can be used to force T/HIS to return the resources for a window. **Do not use the Window object after calling this method**.

Arguments

No arguments

Returns

No return value

Example

To delete window w:

```
w.Delete();
```

EndLoop() [static]

Description

Ends an event loop started by Window.StartLoop()

Arguments

No arguments

Returns

No return value

Example

To end a blocking event loop started by Window.StartLoop():

```
Window.EndLoop();
```

Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*) [static]

Description

Show an error message in a window.

Arguments

- **title** (string)

Title for window.

- **error** (string)

Error message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show error *Critical error!\nAbort?* in window with title *Error* with Yes and No buttons:

```
var answer = Window.Error("Error", "Critical error!\nAbort?", Window.YES |
Window.NO);
if (answer == Window.YES) Exit();
```

GetDirectory(initial (optional)*[string]*) [static]

Description

Map the directory selector box native to your machine, allowing you to choose a directory. On Unix this will be a Motif selector. Windows will use the standard windows directory selector.

Arguments

- **initial (optional)** (string)

Initial directory to start from.

Returns

directory (string), (or null if cancel pressed).

Return type

String

Example

To select a directory:

```
var dir = Window.GetDirectory();
```

GetFile(extension (optional)*[string]*, save (optional)*[boolean]*, initial (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose a file. See also Window.GetFiles() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

- **initial (optional)** (string)

Initial directory to start from.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To select a file using extension '.key':

```
var file = Window.GetFile(".key");
```

GetFilename(title*[string]*, message*[string]*, extension (optional)*[string]*, initial (optional)*[string]*, save (optional)*[boolean]*) [static]

Description

Map a window allowing you to input a filename (or select it using a file selector). OK and Cancel buttons are shown. See also Window.GetFile().

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **extension (optional)** (string)

Extension to filter by.

- **initial (optional)** (string)

Initial value.

- **save (optional)** (boolean)

If true the file selector is to be used for saving a file. If false (default) the file selector is for opening a file. Due to native

operating system file selector differences, on linux new filenames can only be given when saving a file. On windows it is possible to give new filenames when opening or saving a file.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To create an file input window with title *Choose file* and message *Choose the file to open* and return the filename input:

```
var filename = Window.GetFilename("Choose file", "Choose the file to open");
```

GetFiles(extension (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose multiple files. See also Window.GetFile() and Window.GetFilename().

Arguments

- **extension (optional)** (string)

Extension to filter by.

Returns

Array of filenames (strings), or null if cancel pressed.

Return type

String

Example

To select multiple files using extension '.key':

```
var files = Window.GetFiles(".key");
```

GetInteger(title*[string]*, message*[string]*, initial (optional)*[integer]*) [static]

Description

Map a window allowing you to input an integer. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (integer)

Initial value.

Returns

value input (integer), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input integer* and return the value input:

```
var value = Window.GetInteger("Input", "Input integer");
```

GetNumber(title*[string]*, message*[string]*, initial (optional)*[real]*) [static]

Description

Map a window allowing you to input a number. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (real)

Initial value.

Returns

value input (real), or null if cancel pressed.

Return type

Number

Example

To create an input window with title *Input* and message *Input number* and return the value input:

```
var value = Window.GetNumber("Input", "Input number");
```

GetPassword(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input a password. OK and Cancel buttons are shown.
This is identical to Window.GetString except the string is hidden and no initial value can be given.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns

value input (string), or null if cancel pressed.

Return type

String

Example

To create an input window with title *Input* and message *Input password* and return the value input:

```
var value = Window.GetPassword("Input", "Input password");
```

GetString(title*[string]*, message*[string]*, initial (optional)*[string]*) [static]

Description

Map a window allowing you to input a string. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **initial (optional)** (string)

Initial value.

Returns

value input (string), or null if cancel pressed.

Return type

String

Example

To create an input window with title *Input* and message *Input string* and return the value input:

```
var value = Window.GetString("Input", "Input string");
```

Hide()

Description

Hides (unmaps) the window. Also see the Window onHide property.

Arguments

No arguments

Returns

No return value

Example

To hide window w:

```
w.Hide();
```

Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*) [static]

Description

Show information in a window.

Arguments

- **title** (string)

Title for window.

- **info** (string)

Information to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show information *Information* in window with title *Example* with OK and Cancel buttons:

```
var answer = Window.Information("Example", "Information", Window.OK |
Window.CANCEL);
if (answer == Window.CANCEL) Message("You pressed the Cancel button");
```

MasterResolution() [static]

Description

Returns the resolution of the master programme window in pixels

Arguments

No arguments

Returns

Array of numbers containing x and y resolution in pixels

Return type

Number

Example

To get the resolution of the main window:

```
var res = Window.MasterResolution();
```

Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a message in a window.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show message *Press YES or NO* in window with title *Example* with YES and NO buttons:

```
var answer = Window.Message("Example", "Press YES or NO", Window.YES |
Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

MiddleBorder() [static]

Description

Returns the vertical position of the middle border (in range 0-1). The middle border is the border between the tools/keywords window and the docked windows. This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the middle border:

```
var b = Window.MiddleBorder();
```

Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a question in a window.

Arguments

- **title** (string)

Title for window.

- **question** (string)

Question to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted Yes and No button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show question *Do you want to continue?* in window with title *Question*:

```
var answer = Window.Question("Question", "Do you want to continue?");
if (answer == Window.NO) Message("You pressed No");
```

Recompute()

Description

Recomputes the positions of widgets in the window. If you have static widgets and 'normal' widgets in a window and you show and/or hide widgets the window needs to be recomputed to refresh the graphics, scroll bars etc. Calling this method will recompute and redraw the window.

Arguments

No arguments

Returns

No return value

Example

To recompute window w:

```
w.Recompute();
```

Redraw()

Description

Redraws the window. Sometimes if you show, hide or draw graphics on widgets the window needs to be redrawn to refresh the graphics. Calling this method will redraw the window refreshing the graphics.

Arguments

No arguments

Returns

No return value

Example

To redraw window w:

```
w.Redraw();
```

RightBorder() [static]

Description

Returns the horizontal position of the right border (in range 0-1). This can be used to help position windows on the screen.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the right border:

```
var b = Window.RightBorder();
```

Show(modal (optional)*[boolean]*)

Description

Shows (maps) the window and waits for user input.

Arguments

- **modal (optional)** (boolean)

If this window is modal (true) then the user is blocked from doing anything else in T/HIS until this window is dismissed). If non-modal (false) then the user can still use other functions in T/HIS.
If omitted the window will be modal.
Note that making a window modal will stop interaction in all other windows and may prevent operations such as picking from working in any macros that are run from scripts.
Before version 21 T/HIS would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In T/HIS version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in T/HIS. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. In this case use Window.StartLoop().

Returns

No return value

Example

To show window w:

```
w.Show();
```

To show window w allowing the user to use other functions in T/HIS:

```
w.Show(false);
```

StartLoop() [static]

Description

Starts a blocking event loop in T/HIS. Before version 21 T/HIS would create a blocking event loop when the Window Show method was called (the call to the Window Show method would not return until the window was hidden again). In T/HIS version 21 the logic has been changed so that Window Show maps the window and returns straight away. The window is managed from the main event loop in T/HIS. In most cases this will make no differences to scripts but there may be rare cases where you specifically want the blocking behaviour. An example of this is using a keyout hook script, or if you want to give aprompt/question similarly to Window.Message() where you do **not** want to return to the main event loop. You want to block until the user has specified the action.
Window.StartLoop() can be used to start a local blocking, event loop. To terminate the event loop and resume execution of the script use Window.EndLoop()
Note that only a single loop can be active in T/HIS at any one time. i.e. they cannot be nested. Window.StartLoop() should be used as sparingly as possible and only used for specific short events (e.g. something like the equivalent of Window.Message() where you really do need to block) as if it is used in one script it will prevent it from being used in another script.

Arguments

No arguments

Returns

No return value

Example

To start a blocking event loop:

```
Window.StartLoop();
```

Theme(theme (optional)*[constant]*) [static]

Description

Set or get a user interface theme.

Arguments

- **theme (optional)** (constant)

If it is provided it is used to set the current theme. Can be either Window.USE_OLD_UI_JS, Window.THEME_CURRENT, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC.

Returns

Integer. When getting the theme one of: Window.USE_OLD_UI_JS, Window.THEME_DARK, Window.THEME_LIGHT, Window.THEME_CLASSIC

Return type

Number

Example

To determine the current theme:

```
var ui = Window.Theme();
      if(ui == Window.THEME_DARK)
      {
          print("Theme is dark\n");
      }
      else if(ui == Window.THEME_LIGHT)
      {
          print("Theme is light\n");
      }
      else if(ui == Window.THEME_CLASSIC)
      {
          print("Theme is classic\n");
      }
      else
      {
          print("Theme is not set\n");
      }
```

To keep the original (pre v17) appearance of your JavaScript (default):

```
Window.Theme(Window.USE_OLD_UI_JS);
```

To use the current user interface theme:

```
Window.Theme(Window.THEME_CURRENT);
```

To use the dark user interface theme:

```
Window.Theme(Window.THEME_DARK);
```

TopBorder() [static]

Description

Returns the vertical position of the top border (in range 0-1). This can be used to help position windows on the screen. This is no longer used in T/HIS and will always be 1 but is left for backwards compatibility.

Arguments

No arguments

Returns

real in range 0-1

Return type

Number

Example

To obtain the position of the top border:

```
var b = Window.TopBorder();
```

UpdateGUI() [static]

Description

Force GUI to be updated. This function is not normally needed but if you are doing a computationally expensive operation and want to update the GUI it may be necessary as the GUI update requests are cached until there is spare time to update them. Calling this function forces any outstanding requests to be flushed.

Arguments

No arguments

Returns

No return value

Example

To force update of GUI:

```
Window.UpdateGUI();
```

Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a warning message in a window.

Arguments

- **title** (string)

Title for window.

- **warning** (string)

Warning message to show in window. The maximum number of lines that can be shown is controlled by the Options.max_window_lines option.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used. By default the window will be modal. If Window.NONMODAL is also given the window will be non-modal instead.

Returns

Button pressed

Return type

Number

Example

To show warning *Title is blank\nSet to ID?* in window with title *Warning* with Yes and No buttons:

```
var answer = Window.Warning("Warning", "Title is blank\nSet to ID?", Window.YES
| Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

Workflow class

The Workflow class allows you to read and write workflow files. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*)
- NumberOfSelectedModels(workflow_name (optional)*[string]*)
- Refresh()
- WorkflowDefinitionFilename(workflow_name (optional)*[string]*)
- WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*)

Workflow constants

Constants for UnitSystem

Name	Description
Workflow.UNIT_SYSTEM_NONE	No unit system
Workflow.UNIT_SYSTEM_U1	U1 unit system (m, kg, s)
Workflow.UNIT_SYSTEM_U2	U2 unit system (mm, t, s)
Workflow.UNIT_SYSTEM_U3	U3 unit system (mm, kg, ms)
Workflow.UNIT_SYSTEM_U4	U4 unit system (mm, g, ms)
Workflow.UNIT_SYSTEM_U5	U5 unit system (ft, slug, s)
Workflow.UNIT_SYSTEM_U6	U6 unit system (m, t, s)

Detailed Description

The Workflow class gives you simple functions to read and write workflow files

Details of functions

ModelIdFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the id of a model selected by the user by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the unit system for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the model id for.

Returns

integer

Return type

Number

Example

To get the id of the first model selected by the user

```
var id = Workflow.ModelIdFromIndex(0);
```

To get the id of the second model and workflow name "Automotive Assessment"

```
var id = Workflow.ModelIdFromIndex(1, "Automotive Assessment");
```

ModelUnitSystemFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the unit system of a model selected by the user by index (starting at 0). Will be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Arguments

- **model_index** (integer)

The index of the model to return the unit system for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the unit system for.

Returns

integer

Return type

Number

Example

To get the unit system for the workflow selected from the menu, for the first model selected by the user

```
var unit_system = Workflow.ModelUnitSystemFromIndex(0);
```

To get the unit system of the second model and workflow name "Automotive Assessment"

```
var unit_system = Workflow.ModelUnitSystemFromIndex(1, "Automotive Assessment");
```

ModelUserDataBuildFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the build number of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program build number for.

- **workflow_name (optional)** (string)

The workflow name to return the build number for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the build number for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the build number of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var build = Workflow.ModelUserDataBuildFromIndex(0);
```

To get the build number of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var build = Workflow.ModelUserDataBuildFromIndex(1, "Automotive Assessment");
```

ModelUserDataFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the user data associated with a model by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the user data for. If the workflow is run from the workflow menu and the name argument is not defined, it is the index in the list of models selected by the user. If the workflow is run from the workflow menu and the name argument is defined, it is the index of the model that has user data for the named workflow, out of the list of models selected by the user. If the workflow is run from REPORTER, it is the index in the

list of all the models loaded in the session that have user data for the named workflow.

- **workflow_name (optional)** (string)

The workflow name to return the user data for.

Returns

object

Return type

Object

Example

To get the user data for the workflow selected from the menu, for the first model selected by the user

```
var user_data = Workflow.ModelUserDataFromIndex(0);
```

To get the user data for the second model that has user data for the workflow name "Automotive Assessment"

```
var user_data = Workflow.ModelUserDataFromIndex(1, "Automotive Assessment");
```

ModelUserDataProgramFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the name of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program name for.

- **workflow_name (optional)** (string)

The workflow name to return the program name for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the program name for the first user data associated with the model is returned (this is the ’normal’ case where a user launches a workflow from the workflow menu).

Returns

string

Return type

String

Example

To get the name of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var program = Workflow.ModelUserDataProgramFromIndex(0);
```

To get the name of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var program = Workflow.ModelUserDataProgramFromIndex(1, "Automotive
Assessment");
```

ModelUserDataVersionFromIndex(model_index*[integer]*, workflow_name (optional)*[string]*) [static]

Description

Returns the version of the program that was used to write out the user data of a model for the selected workflow by index (starting at 0).

Arguments

- **model_index** (integer)

The index of the model to return the program version for.

- **workflow_name (optional)** (string)

The workflow name to return the version for. This is required when a PRIMER item is generated from REPORTER. If it is not specified the version for the first user data associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

number

Return type

number

Example

To get the version of the program that was used to write user data for the first model that has data for the workflow selected by the user

```
var version = Workflow.ModelUserDataVersionFromIndex(0);
```

To get the version of the program that was used to write user data for the second model that has data for the "Automotive Assessment" workflow

```
var version = Workflow.ModelUserDataVersionFromIndex(1, "Automotive
Assessment");
```

NumberOfSelectedModels(workflow_name (optional)*[string]*) [static]

Description

Returns the number of models selected by the user.

Arguments

- **workflow_name (optional)** (string)

The workflow name to return the number of models for. If it's not defined the number of models that were selected by the user on the workflow menu is returned. If it's defined and the workflow was run from the workflow menu, the number of models, out of the models selected by the user, that have data for the named workflow is returned. If it's defined and the workflow is run from REPORTER, the number of models, out of all the models loaded in the session, that have data for the named workflow is returned.

Returns

integer

Return type

Number

Example

To get the number of models selected by the user in the workflow menu

```
var n = Workflow.NumberOfSelectedModels();
```

To get the number of models that have user data for the "Automotive Assessment" workflow

```
var n = Workflow.NumberOfSelectedModels("Automotive Assessment");
```

Refresh() [static]

Description

Scan for fresh workflow data

Arguments

No arguments

Returns

No return value

Example

```
Workflow.Refresh();
```

WorkflowDefinitionFilename(workflow_name (optional)*[string]*) [static]

Description

Returns the workflow definition filename

Arguments

- **workflow_name (optional)** (string)

The workflow name to return the workflow defintion filename for. This is required when a POST item is generated from REPORTER. If it is not specified the first workflow user data associated with the model is returned (this is the 'normal' case where a user launches a workflow from the workflow menu).

Returns

string

Return type

String

Example

To get the worklow definition filename that the script has been run with

```
var workflow_definition_filename = Workflow.WorkflowDefinitionFilename();
```

WriteToFile(user_data*[object]*, output_filename*[string]*, workflow_definition_filename*[string]*, extra (optional)*[object]*) [static]

Description

Writes a workflow to a JSON file. If the file already exists the workflow is added to the file (or updated if it is already in the file).

Arguments

- **user_data** (object)

Object containing user data required for the workflow.

- **output_filename** (string)

Filename to write to.

- **workflow_definition_filename** (string)

Filename of the workflow definition file.

- **extra (optional)** (object)

Extra workflow information

Object has the following properties:

Name	Type	Description
model_unit_system (optional)	integer	The model unit system. Can be Workflow.UNIT_SYSTEM_NONE or Workflow.UNIT_SYSTEM_U1 or Workflow.UNIT_SYSTEM_U2 or Workflow.UNIT_SYSTEM_U3 or Workflow.UNIT_SYSTEM_U4 or Workflow.UNIT_SYSTEM_U5 or Workflow.UNIT_SYSTEM_U6

Returns

No return value

Example

To write the file "C:\my_workflow.json" with some user data and the contents of the workflow definition file "C:\workflows\my_workflow_definition.json"

```
      var user_data = { part_ids: [1, 2, 10, 100], node_ids: [12, 23, 24] };
      Workflow.WriteToFile(user_data, "C:\\my_workflow.json",
"C:\\workflows\\my_workflow_definition.json");
```

XMLParser class

The XMLParser class enables reading data from XML files. More...

The T/HIS JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- Parse(filename*[string]*)

XMLParser properties

Name	Type	Description
characterDataHandler	function	Function to call when character data is found. The function will be called with 1 argument which is a string containing the character data
commentHandler	function	Function to call when a comment is found. The function will be called with 1 argument which is a string containing the text inside the comment
endCDATAHandler	function	Function to call at the end of a CDATA section. The function does not have any arguments.
endElementHandler	function	Function to call when an element end tag is found. The function will be called with 1 argument which is a string containing the name of the element
startCDATAHandler	function	Function to call at the start of a CDATA section. The function does not have any arguments.
startElementHandler	function	Function to call when an element start tag is found. The function will be called with 2 arguments. Argument 1 is a string containing the name of the element. Argument 2 is an object containing the element attributes

Detailed Description

The XMLParser class provides a stream-oriented parser to enable you to read XML files. You register callback (or handler) functions with the parser and then parse the document. As the parser recognizes parts of the document, it will call the appropriate handler for that part (if you've registered one.) The document is fed to the parser in pieces. This allows you to parse really huge documents that won't fit into memory.
There are currently 6 handlers which can be set: XMLParser.startElementHandler, XMLParser.endElementHandler, XMLParser.characterDataHandler, XMLParser.commentHandler, XMLParser.startCDATAHandler and XMLParser.endCDATAHandler.
The following simple example shows how the parser could be used.

```
// Create a new parser object
var p = new XMLParser();
// assign handlers
p.startElementHandler  = startElem;
p.endElementHandler    = endElem;
p.characterDataHandler = text;
p.commentHandler       = comment;
// parse the file
p.Parse("/data/test.xml");
////////////////////////////////////////////////////////////////////////
function startElem(name, attr)
{
// handler to be called when a start element is found
// Print element name
```

```
    Println("START: " + name);
// Print attributes
    for (n in attr)
    {
        Println(" attr: " + n + "=" + attr[n]);
    }
}
function endElem(name)
{
// handler to be called when an end element is found
// Print element name
    Println("END: " + name);
}
function text(str)
{
// handler to be called when text is found
// Print text
    Println("TEXT: '" + str + "'");
}
function comment(str)
{
// handler to be called when a comment is found
// Print comment
    Println("COMMENT: '" + str + "'");
}
```

See the documentation below for more details.

Constructor

new XMLParser()

Description

Create a new XMLParser object for reading XML files.

Arguments

No arguments

Returns

XMLParser object

Return type

XMLParser

Example

To create a new XMLParser object

```
var p = new XMLParser();
```

Details of functions

Parse(filename*[string]*)

Description

starts parsing an XML file

Arguments

- **filename** (string)

XML file to parse

Returns

No return value

Example

To parse XML file "/data/test.xml"

```
var p = new XMLParser();
p.Parse("/data/test.xml");
```

global class

The global class is the root object in Javascript. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Batch()
- Debug(string*[Any valid javascript type]*)
- Exit()
- GetCurrentDirectory()
- LogError(message*[Any valid javascript type]*)
- LogPrint(message*[Any valid javascript type]*)
- LogWarning(message*[Any valid javascript type]*)
- Output(string*[Any valid javascript type]*)
- SetCurrentDirectory(directory*[string]*)
- System(string*[Any valid javascript type]*)
- Unix()
- Windows()
- debug() [deprecated]
- exit() [deprecated]
- output() [deprecated]

global properties

Name	Type	Description
reporter	Reporter	This property is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. [deprecated]

Detailed Description

When Reporter is started a **single** global class object is created. All of the standard JavaScript functions and properties are available from it.
In addition an instance of a Reporter class is available, from the global reporter property. The reporter object allows you to access the properties and templates used in Reporter.

Details of functions

Batch() [static]

Description

This method can be used to test whether REPORTER is running in batch mode or not.

Arguments

No arguments

Returns

true/false

Return type

Boolean

Example

To check if REPORTER is running in batch mode

```
if (Batch()) { do something }
```

Debug(string*[Any valid javascript type]*) [static]

Description

Print a string to log file for debugging. Anything that you call the debug method on will be 'printed' to the log file window. **Note that a carriage return will automatically be added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to debug

Returns

No return value

Example

To print string "Hello, world!" to the debug log file

```
Debug("Hello, world!");
```

Exit() [static]

Description

Stop execution and exit from script

Arguments

No arguments

Returns

No return value

Example

Exit from script with

```
Exit();
```

GetCurrentDirectory() [static]

Description

Return the current working directory for REPORTER.

Arguments

No arguments

Returns

string

Return type

String

Example

To return the current directory

```
var dir = GetCurrentDirectory();
```

LogError(message*[Any valid javascript type]*) [static]

Description

Print an error to log file. Anything that you print will be output to the log file window in bold red text. **Note that a carriage return will automatically be added**.

Arguments

- **message** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To give error "Error: something has gone wrong" to the log file

```
LogError("Error: something has gone wrong");
```

LogPrint(message*[Any valid javascript type]*) [static]

Description

Print a string to log file. Anything that you print will be output to the log file window. **Note that a carriage return will automatically be added**.

Arguments

- **message** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To print string "Hello, world!" to the log file

```
LogPrint("Hello, world!");
```

LogWarning(message*[Any valid javascript type]*) [static]

Description

Print a warning to log file. Anything that you print will be output to the log file window in red text. **Note that a carriage return will automatically be added**.

Arguments

- **message** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To give warning "Warning: something has gone wrong" to the log file

```
LogWarning("Warning: something has gone wrong");
```

Output(string*[Any valid javascript type]*) [static]

Description

Output a string from a script. **Note that a carriage return is not automatically added**.

Arguments

- **string** (Any valid javascript type)

The string/item that you want to print

Returns

No return value

Example

To output string "Hello, world!" with a carriage return:

```
Output("Hello, world!\n");
```

SetCurrentDirectory(directory*[string]*) [static]

Description

Set the current working directory for REPORTER.

Arguments

- **directory** (string)

The directory that you want to change to

Returns

true if successful, false if not

Return type

Boolean

Example

To set the current directory to C:\temp

```
var status = SetCurrentDirectory("C:\\temp");
```

System(string*[Any valid javascript type]*) [static]

Description

Do a system command outside REPORTER.

Arguments

- **string** (Any valid javascript type)

The system command that you want to do

Returns

integer (probably zero if command successful but is implementation-dependant)

Return type

Number

Example

To make the directory "example"

```
System("mkdir example");
```

Unix() [static]

Description

Test whether script is running on a Unix/Linux operating system. See also Windows()

Arguments

No arguments

Returns

true if Unix/Linux, false if not

Return type

Boolean

Example

To test if the OS is Unix

```
if ( Unix() )
```

Windows() [static]

Description

Test whether script is running on a Windows operating system. See also Unix()

Arguments

No arguments

Returns

true if Windows, false if not

Return type

Boolean

Example

To test if the OS is Windows

```
if ( Windows() )
```

debug() [static] [deprecated]

This function is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use Debug() instead

Arguments

No arguments

Returns

No return value

exit() [static] [deprecated]

This function is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use Exit() instead

Arguments

No arguments

Returns

No return value

output() [static] [deprecated]

This function is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Please use Output() instead

Arguments

No arguments

Returns

No return value

Colour class

The Colour class gives access to colours in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Black()
- Blue()
- Cyan()
- Green()
- Grey10()
- Grey20()
- Grey30()
- Grey40()
- Grey50()
- Grey60()
- Grey70()
- Grey80()
- Grey90()
- Magenta()
- None()
- RGB(red*[integer]*, green*[integer]*, blue*[integer]*)
- Red()
- White()
- Yellow()

Colour properties

Name	Type	Description
blue (read only)	integer	Colour blue component (0-255)
green (read only)	integer	Colour green component (0-255)
name (read only)	string	Colour name
red (read only)	integer	Colour red component (0-255)

Detailed Description

The Colour class is used to define colours, either by predefined colours or by RGB values. The easiest way to set the colour of something is to use the predefined colour methods. e.g. to set the text colour of item i to red:

```
i.textColour = Colour.Red();
```

For other colours use Colour.RGB().

Details of functions

Black() [static]

Description

Creates a black colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to black:

```
i.textColour = Colour.Black();
```

Blue() [static]

Description

Creates a blue colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to blue:

```
i.textColour = Colour.Blue();
```

Cyan() [static]

Description

Creates a cyan colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to cyan:

```
i.textColour = Colour.Cyan();
```

Green() [static]

Description

Creates a green colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to green:

```
i.textColour = Colour.Green();
```

Grey10() [static]

Description

Creates a 10% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 10% grey:

```
i.textColour = Colour.Grey10();
```

Grey20() [static]

Description

Creates a 20% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 10% grey:

```
i.textColour = Colour.Grey20();
```

Grey30() [static]

Description

Creates a 30% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 30% grey:

```
i.textColour = Colour.Grey30();
```

Grey40() [static]

Description

Creates a 40% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 40% grey:

```
i.textColour = Colour.Grey40();
```

Grey50() [static]

Description

Creates a 50% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 50% grey:

```
i.textColour = Colour.Grey50();
```

Grey60() [static]

Description

Creates a 60% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 60% grey:

```
i.textColour = Colour.Grey60();
```

Grey70() [static]

Description

Creates a 70% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 70% grey:

```
i.textColour = Colour.Grey70();
```

Grey80() [static]

Description

Creates a 80% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 80% grey:

```
i.textColour = Colour.Grey80();
```

Grey90() [static]

Description

Creates a 90% grey colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to 90% grey:

```
i.textColour = Colour.Grey90();
```

Magenta() [static]

Description

Creates a magenta colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to magenta:

```
i.textColour = Colour.Magenta();
```

None() [static]

Description

No colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the fill colour of item i to no colour:

```
i.fillColour = Colour.None();
```

RGB(red*[integer]*, green*[integer]*, blue*[integer]*) [static]

Description

Creates a colour from red, green and blue components

Arguments

- **red** (integer)

red component of colour (0-255).

- **green** (integer)

green component of colour (0-255).

- **blue** (integer)

blue component of colour (0-255).

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to red:

```
i.textColour = Colour.RGB(255, 0, 0);
```

Red() [static]

Description

Creates a red colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to red:

```
i.textColour = Colour.Red();
```

White() [static]

Description

Creates a white colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to white:

```
i.textColour = Colour.White();
```

Yellow() [static]

Description

Creates a yellow colour

Arguments

No arguments

Returns

Colour object

Return type

Colour

Example

To set the text colour of item i to yellow:

```
i.textColour = Colour.Yellow();
```

File class

The File class allows you to read and write from text files. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- ConvertSeparators(filename*[string]*)
- Copy(source*[string]*, dest*[string]*)
- Delete(filename*[string]*)
- Directory(filename*[string]*)
- DriveMapFilename(filename*[string]*, format*[constant]*)
- Exists(filename*[string]*)
- FindFiles(directory*[string]*, pattern*[string]*, recursive*[boolean]*)
- IsAbsolute(filename*[string]*)
- IsDirectory(filename*[string]*)
- IsFile(filename*[string]*)
- Mkdir(name*[string]*)
- Move(source*[string]*, dest*[string]*)
- SimplifyName(filename*[string]*)
- Size(filename*[string]*)

Member functions

- Close()
- FindLineContaining(contain*[string]*)
- FindLineMatching(regex*[RegExp]*)
- FindLineStarting(start*[string]*)
- Flush()
- ReadChar()
- ReadLine()
- ReadLongLine()
- Seek(position*[integer]*)
- Write(string*[Any valid javascript type]*)

File constants

Name	Description
File.APPEND	Flag to open file for appending
File.EOF	Flag to indicate end of file
File.READ	Flag to open file for reading
File.WRITE	Flag to open file for writing

Detailed Description

The File class allows you to read text and write text to files. There are various functions available that allow to to find lines matching specific strings or regular expressions when reading.
Additionally, there are a number of utility functions to check if a file exists or is a directory etc.

Constructor

new File(filename*[string]*, mode*[constant]*)

Description

Create a new File object for reading and writing text files.

Arguments

- **filename** (string)

Filename of the file you want to read/write. If reading, the file must exist. If writing, the file will be overwritten if it already exists

- **mode** (constant)

The mode to open the file with. Can be File.READ, File.WRITE or File.APPEND

Returns

File object

Return type

File

Example

To create a new file object to read file "/data/test/file.txt"

```
var f = new File("/data/test/file.txt", File.READ);
```

Details of functions

Close()

Description

Close a file opened by a File object.

Arguments

No arguments

Returns

No return value

Example

To close File object f.

```
f.Close();
```

ConvertSeparators(filename*[string]*) [static]

Description

Convert directory separators to the correct type for this operating system

Arguments

- **filename** (string)

Filename you want to convert separators on.

Returns

string filename

Return type

String

Example

e.g. on windows the filename "c:/test/file.key" would be converted to "c:\test\file.key" by

```
var converted = File.ConvertSeparators("c:/test/file.key");
```

Copy(source*[string]*, dest*[string]*) [static]

Description

Copy a file

Arguments

- **source** (string)

Source filename you want to copy.

- **dest** (string)

Destination filename you want to copy source file to. Note that if a file with the name dest already exists it will not be overwritten. Delete the file first with File.Delete().

Returns

true if copy successful, false otherwise.

Return type

Boolean

Example

To copy the file "/data/test/file.txt" to "/data/test/file.txt_backup"

```
var copied = File.Copy("/data/test/file.txt", "/data/test/file.txt_backup");
```

Delete(filename*[string]*) [static]

Description

Delete a file

Arguments

- **filename** (string)

Filename you want to delete.

Returns

true if successful, false if not

Return type

Boolean

Example

To delete the file "/data/test/file.txt"

```
var deleted = File.Delete("/data/test/file.txt");
```

Directory(filename*[string]*) [static]

Description

Extract directory name from an absolute filename

Arguments

- **filename** (string)

Absolute filename you want to extract directory from.

Returns

string directory

Return type

String

Example

To extract the directory "/data/test/" from file "/data/test/file.key"

```
var directory = File.Directory("/data/test/file.key");
```

DriveMapFilename(filename*[string]*, format*[constant]*) [static]

Description

Changes a filename or directory name to the correct format for a specific operating system using the directory mappings (if present).

Arguments

- **filename** (string)

Filename you want to drive map.

- **format** (constant)

The format for the file/directory name. Can be Include.NATIVE, Include.UNIX, or Include.WINDOWS.

Returns

string containing drive mapped filename.

Return type

String

Example

If REPORTER has drive S:\ mapped to /data/ (by using the oasys*drive_s preference)

```
var mapped = File.DriveMapFilename("/data/test/file.ptf", Include.WINDOWS);
```

mapped will be "S:\test\file.ptf".

```
var mapped = File.DriveMapFilename("S:\\test\\file.ptf", Include.UNIX);
```

mapped will be "/data/test/file.ptf",

Exists(filename*[string]*) [static]

Description

Check if a file exists

Arguments

- **filename** (string)

Filename you want to check for existance.

Returns

true/false

Return type

Boolean

Example

To see if the file "/data/test/file.key" exists

```
if (File.Exists("/data/test/file.key")) { do something }
```

FindFiles(directory*[string]*, pattern*[string]*, recursive*[boolean]*) [static]

Description

Find any files in a directory (and subdirectories if required) matching a pattern

Arguments

- **directory** (string)

Directory to look for files in

- **pattern** (string)

Pattern to use to find matching files

- **recursive** (boolean)

If Reporter should look for files recursively or not

Returns

array filenames

Return type

String

Example

To find all of the files matching the pattern "*.key" recursively from directory /data/test

```
var filelist = File.FindFiles("/data/test/", "*.key", true);
```

FindLineContaining(contain*[string]*)

Description

Reads a line from a file which contains contain, opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 256 characters is used. If you expect a file to have lines longer than 256 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must contain that string. If more than one argument is used then lines which contain any of the arguments will be returned

Arguments

- **contain** (string)

String which matching lines must contain (maximum length of 256 characters).

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading lines from File object f which contain 'example'.

```
var line;
while ( (line = file.FindLineContaining("example") ) != File.EOF)
{
}
```

FindLineMatching(regex*[RegExp]*)

Description

Reads a line from a file opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 256 characters is used. If you expect a file to have lines longer than 256 characters then use ReadLongLine which allows lines of any length. Note that this may be much slower than FindLineStarting or FindLineContaining, especially if the regular expression is very complicated.

Arguments

- **regex** (RegExp)

Regular expression which matching lines must match with.

Returns

string read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading lines from File object f which contain digits.

```
var line;
var regex = new RegExp("\\d+");
while ( (line = file.FindLineMatching(regex) ) != File.EOF)
{
}
```

FindLineStarting(start*[string]*)

Description

Reads a line from a file which starts with start, opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 256 characters is used. If you expect a file to have lines longer than 256 characters then use ReadLongLine which allows lines of any length. If one argument is used then the line must start with that string. If more than one argument is used then lines which start with any of the arguments will be returned

Arguments

- **start** (string)

String which matching lines must start with (maximum length of 256 characters).

This argument can be repeated if required
Alternatively a single array argument containing the multiple values can be given

Returns

string read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading lines from File object f which start 'example'.

```
var line;
while ( (line = file.FindLineStarting("example") ) != File.EOF)
{
}
```

Flush()

Description

Flushes a file opened for writing by a File object.

Arguments

No arguments

Returns

No return value

Example

To flush File object f.

```
f.Flush();
```

IsAbsolute(filename*[string]*) [static]

Description

Check if a filename is absolute

Arguments

- **filename** (string)

Filename you want to test if absolute.

Returns

true/false

Return type

Boolean

Example

To see if the file "/data/test/file.key" is absolute

```
if (File.IsAbsolute("/data/test/file.key")) { do something }
```

IsDirectory(filename*[string]*) [static]

Description

Check if a filename is a directory

Arguments

- **filename** (string)

Filename you want to test to see if it is a directory.

Returns

true/false

Return type

Boolean

Example

To see if "/data/test" is a directory

```
if (File.IsDirectory("/data/test")) { do something }
```

IsFile(filename*[string]*) [static]

Description

Check if a filename is a file

Arguments

- **filename** (string)

Filename you want to test to see if it is a file (i.e. not a directory).

Returns

true/false

Return type

Boolean

Example

To see if "/data/test" is a file

```
if (File.IsFile("/data/test")) { do something }
```

Mkdir(name*[string]*) [static]

Description

makes a directory

Arguments

- **name** (string)

Directory you want to create.

Returns

true if successful

Return type

Boolean

Example

To make directory "/data/test" if it does not exist:

```
if (!File.IsDirectory("/data/test")) File.Mkdir("/data/test");
```

Move(source*[string]*, dest*[string]*) [static]

Description

Move a file

Arguments

- **source** (string)

Source filename you want to move.

- **dest** (string)

Destination filename you want to move (rename) source file to. Note that if a file with the name dest already exists it will not be overwritten. Delete the file first with File.Delete().

Returns

true if move successful, false otherwise.

Return type

Boolean

Example

To move the file "/data/test/file.txt" to "/data/test/file.txt_backup"

```
var moved = File.Move("/data/test/file.txt", "/data/test/file.txt_backup");
```

ReadChar()

Description

Reads a single character from a file opened for reading by a File object.

Arguments

No arguments

Returns

character read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading characters from File object f.

```
var c;
while ( (c = f.ReadChar()) != undefined) { ... }
```

ReadLine()

Description

Reads a line from a file opened for reading by a File object. To enable this function to be as fast as possible a maximum line length of 256 characters is used. If you expect a file to have lines longer than 256 characters then use ReadLongLine which allows lines of any length.

Arguments

No arguments

Returns

string read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = file.ReadLine() ) != File.EOF)
{
}
```

ReadLongLine()

Description

Reads a line from a file opened for reading by a File object. The line can be any length. If your file has lines shorter than 256 characters then you may want to use ReadLine instead which is faster.

Arguments

No arguments

Returns

string read from file or `File.EOF` if end of file

Return type

String

Example

Loop, reading lines from File object f.

```
var line;
while ( (line = file.ReadLongLine() ) != File.EOF)
{
}
```

Seek(position*[integer]*)

Description

Sets the file position for reading a file

Arguments

- **position** (integer)

Position you want to seek to.

Returns

No return value

Example

To seek to position 1000 in file object f:

```
f.Seek(1000);
```

SimplifyName(filename*[string]*) [static]

Description

Simplify the name of a file by removing //, /./ and /../

Arguments

- **filename** (string)

Filename you want to simplify.

Returns

string filename

Return type

String

Example

To simplify the filename "/data/test//../file.key"

```
var simple = File.SimplifyName("/data/test//../file.key");
```

This simplifies to "/data/file.key"

Size(filename*[string]*) [static]

Description

Get the size of a file

Arguments

- **filename** (string)

File you want to find the size of.

Returns

integer

Return type

Number

Example

To find the size of file "/data/test"

```
var size = File.Size("/data/test");
```

Write(string*[Any valid javascript type]*)

Description

Write a string to a file opened for writing by a File object

Arguments

- **string** (Any valid javascript type)

The string/item that you want to write

Returns

No return value

Example

To write string "Hello, world!" to File object f

```
f.Write("Hello, world!\n");
```

To write the title of model 2 to File object f

```
f.Write("The title of model 2 is " + models[2].title + "\n");
```

Image class

The Image class allows you to create bitmaps in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.

Image constants

Name	Description
Image.BMP	Save image as BMP
Image.JPG	Save image as JPG
Image.PNG	Save image as PNG

Image properties

Name	Type	Description
antialiasing	bool	Whether or not lines, shapes and text are drawn with antialiasing (true by default).
fillColour	string	Colour to use when filling shapes on the Image. Can be "none", a valid colour from the X colour database (For Linux users, see /etc/X11/rgb.txt) e.g. "Blue", or #RRGGBB (each of R, G and B is a single hex digit) e.g. "#0000FF" for blue.
font	string	Font to use when drawing text on the Image e.g. "Courier". Can be any font accessible by REPORTER.
fontAngle	integer	Angle (degrees) text is drawn at on the Image. Can be between -360 and 360 degrees.
fontColour	string	Colour to use when drawing text on the Image. Can be "none", a valid colour from the X colour database (For Linux users, see /etc/X11/rgb.txt) e.g. "Blue", or #RRGGBB (each of R, G and B is a single hex digit) e.g. "#0000FF" for blue.
fontJustify	constant	Justification to use when drawing text on the Image. Can be Reporter.JUSTIFY_CENTRE, Reporter.JUSTIFY_LEFT or Reporter.JUSTIFY_RIGHT
fontSize	integer	Size of font (in points) to use when drawing text on the Image

fontStyle	constant	Style of font to use when drawing text on the Image. Can be any combination of Reporter.TEXT_NORMAL, Reporter.TEXT_BOLD, Reporter.TEXT_ITALIC and Reporter.TEXT_UNDERLINE
height	integer	Height of the Image
lineCapStyle	constant	Style to use for the end of lines on an Image. Can be Reporter.CAP_FLAT, Reporter.CAP_SQUARE or Reporter.CAP_ROUND
lineColour	string	Colour to use when drawing lines on the Image. Can be "none", a valid colour from the X colour database (For Linux users, see /etc/X11/rgb.txt) e.g. "Blue", or #RRGGBB (each of R, G and B is a single hex digit) e.g. "#0000FF" for blue.
lineJoinStyle	constant	Style to use for the line join at vertices of polygons and polylines on an Image. Can be Reporter.JOIN_MITRE, Reporter.JOIN_BEVEL or Reporter.JOIN_ROUND
lineStyle	constant	Style to use when drawing lines on an Image. Can be Reporter.LINE_NONE, Reporter.LINE_SOLID, Reporter.LINE_DASH, Reporter.LINE_DOT, Reporter.LINE_DASH_DOT or Reporter.LINE_DASH_DOT_DOT
lineWidth	integer	Width to use when drawing lines on an Image value
width	integer	Width of the Image

Detailed Description

The Image class allows you to create, load and save bitmaps. There are various functions available that allow to to draw lines, rectangles, ellipses, text etc on a bitmap.

Constructor

new Image(width*[integer]*, height*[integer]*, backgroundColour (optional)*[string]*)

Description

Create a new Image object for creating an image. If only 2 arguments are given they are used as the width and height of the image. The third argument can be used to define the initial background colour (the default is white).

Arguments

- **width** (integer)

Width of image

- **height** (integer)

Height of image

- **backgroundColour (optional)** (string)

Initial background colour for the image (default is white). Can be "none", a valid colour from the X colour database (For Linux users, see /etc/X11/rgb.txt) e.g. "Blue", or #RRGGBB (each of R, G and B is a single hex digit) e.g. "#0000FF" for blue.

Returns

Image object

Return type

Image

Example

To create a new image object 100 pixels wide by 50 pixels high

```
var img = new Image(100, 50);
```

Details of functions

Ellipse(x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draw an ellipse on an image

Arguments

- **x1** (integer)

X coordinate of start position for ellipse

- **y1** (integer)

Y coordinate of start position for ellipse

- **x2** (integer)

X coordinate of end position for ellipse

- **y2** (integer)

Y coordinate of end position for ellipse

Returns

no return value

Example

To draw an ellipse with no fill and solid red border line width 2 pixels, on image 'idata', starting at point 30, 20 and finishing at point 100, 50

```
idata.lineColour = "red";
idata.fillColour = "none";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_SOLID;
idata.Ellipse(30, 20, 100, 50);
```

Fill(x*[integer]*, y*[integer]*, tol (optional)*[integer]*)

Description

Fill an area in an image with a colour.

Arguments

- **x** (integer)

X coordinate of start position for fill

- **y** (integer)

Y coordinate of start position for fill

- **tol (optional)** (integer)

Tolerance for colour matching (0-255). Default is 0. When filling a shape if the red, green and blue components are within tol of the colour of pixel (x, y) the pixel will be filled with the current fill colour.

Returns

no return value

Example

To fill an area of image ’idata’, starting at point 30, 20 with red:

```
idata.fillColour = "red";
idata.Fill(30, 20);
```

Line(x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draw a line on an image

Arguments

- **x1** (integer)

X coordinate of start position for line

- **y1** (integer)

Y coordinate of start position for line

- **x2** (integer)

X coordinate of end position for line

- **y2** (integer)

Y coordinate of end position for line

Returns

no return value

Example

To draw a blue, dashed line width 2 pixels, on image ’idata’, starting at point 30, 20 and finishing at point 100, 50

```
idata.lineColour = "blue";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_DASH;
idata.Line(30, 20, 100, 50);
```

Load(filename*[string]*)

Description

Load an image file (gif, png, bmp or jpeg)

Arguments

- **filename** (string)

Imagename you want to load.

Returns

no return value

Example

To load the image file "/data/test/image.jpg" into the image object ’idata’

```
idata.Load("/data/test/image.jpg");
```

PixelCount(colour*[string]*, tol (optional)*[integer]*)

Description

Count the number of pixels in an image that have a specific colour.

Arguments

- **colour** (string)

A valid colour from the X colour database (For Linux users, see /etc/X11/rgb.txt) e.g. "Blue", or #RRGGBB (each of R, G and B is a single hex digit) e.g. "#0000FF" for blue

- **tol (optional)** (integer)

Tolerance for colour matching (0-255). Default is 0. When looking at pixels if the red, green and blue components are within tol of the colour of pixel (x, y) the pixel will be counted.

Returns

Number of pixels (integer) with the colour.

Return type

Number

Example

To count the number of red pixels in image 'idata':

```
var nred = idata.PixelCount("red");
```

Polygon(points*[array]*)

Description

Draw a polygon on an image. The last point is always connected back to the first point.

Arguments

- **points** (array)

Array of point coordinates

Returns

no return value

Example

To draw a blue polygon with a solid red border line width 2 pixels, on image 'idata', connecting points (10,10) (20,10) (20,20) (10,20)

```
idata.fillColour = "blue";
idata.lineColour = "red";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_SOLID;
var a = new Array(10,10, 20,10, 20,20, 10,20);
idata.Polygon(a);
```

Polygon(x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Draw a polygon on an image. The last point is always connected back to the first point.

Arguments

- **x1** (integer)

X coordinate of point 1

- **y1** (integer)

Y coordinate of point 1

- **x2** (integer)

X coordinate of point 2

- **y2** (integer)

Y coordinate of point 2

- **... xn** (integer)

X coordinate of point n

- **... yn** (integer)

Y coordinate of point n

Returns

no return value

Example

To draw a blue polygon with a solid red border line width 2 pixels, on image 'idata', connecting points (10,10) (20,10) (20,20) (10,20)

```
idata.fillColour = "blue";
idata.lineColour = "red";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_SOLID;
idata.Polygon(10,10, 20,10, 20,20, 10,20);
```

Polyline(points*[array]*)

Description

Draw a line with multiple straight segments on an image

Arguments

- **points** (array)

Array of point coordinates

Returns

no return value

Example

To draw a blue, dashed polyline width 2 pixels, on image 'idata', connecting points (10,10) (20,10) (20,20) (10,20)

```
idata.lineColour = "blue";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_DASH;
var a = new Array(10,10, 20,10, 20,20, 10,20);
idata.Polyline(a);
```

Polyline(x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*, ... xn*[integer]*, ... yn*[integer]*) [deprecated]

This function is deprecated in version 21.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Draw a line with multiple straight segments on an image

Arguments

- **x1** (integer)

X coordinate of point 1

- **y1** (integer)

Y coordinate of point 1

- **x2** (integer)

X coordinate of point 2

- **y2** (integer)

Y coordinate of point 2

- **... xn** (integer)

X coordinate of point n

- **... yn** (integer)

Y coordinate of point n

Returns

no return value

Example

To draw a blue, dashed polyline width 2 pixels, on image 'idata', connecting points (10,10) (20,10) (20,20) (10,20)

```
idata.lineColour = "blue";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_DASH;
idata.Polyline(10,10, 20,10, 20,20, 10,20);
```

Rectangle(x1*[integer]*, y1*[integer]*, x2*[integer]*, y2*[integer]*)

Description

Draw a rectangle on an image

Arguments

- **x1** (integer)

X coordinate of start position for rectangle

- **y1** (integer)

Y coordinate of start position for rectangle

- **x2** (integer)

X coordinate of end position for rectangle

- **y2** (integer)

Y coordinate of end position for rectangle

Returns

no return value

Example

To draw a rectangle with no fill and solid red border line width 2 pixels, on image 'idata', starting at point 30, 20 and finishing at point 100, 50

```
idata.lineColour = "red";
idata.fillColour = "none";
idata.lineWidth = 2;
idata.lineStyle = Reporter.LINE_SOLID;
idata.Rectangle(30, 20, 100, 50);
```

Save(filename*[string]*, filetype*[constant]*)

Description

Save an image to file (png, bmp or jpeg)

Arguments

- **filename** (string)

Imagename you want to save.

- **filetype** (constant)

Type you want to save as. Can be: Image.BMP, Image.JPG or Image.PNG

Returns

no return value

Example

To save the image object 'idata' to file "/data/test/image.jpg" as a jpeg

```
idata.Save("/data/test/image.jpg", Image.JPG);
```

Star(x*[integer]*, y*[integer]*, r*[integer]*)

Description

Draw a star on an image

Arguments

- **x** (integer)

X coordinate of centre of star

- **y** (integer)

Y coordinate of centre of star

- **r** (integer)

Radius of star

Returns

no return value

Example

To draw a blue star with yellow fill, on image ’idata’, centred at point 30, 20 with radius 10

```
idata.lineColour = "blue";
idata.fillColour = "yellow";
idata.Star(30, 20, 10);
```

Text(x*[integer]*, y*[integer]*, text*[string]*)

Description

Draw text on an image

Arguments

- **x** (integer)

X position for text

- **y** (integer)

Y position for text

- **text** (string)

Text to write on image

Returns

no return value

Example

To write the text ’Test’ in Helvetica 12pt bold underlined, coloured red on image ’idata’, at point 30, 20

```
idata.fontColour = "red";
idata.fontSize = 12;
idata.fontStyle = Reporter.TEXT_BOLD | Reporter.TEXT_UNDERLINE;
idata.Text(30, 20, "Test");
```

Include class

The Include class allows you to access the include files in a model. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Include constants

Constants for Directory separators

Name	Description
Include.NATIVE	Use directory separators native to this machine when writing directory names.
Include.UNIX	Use unix directory separators when writing directory names.
Include.WINDOWS	Use windows directory separators when writing directory names.

Detailed Description

Originally developed for use in PRIMER, the Include class allows a user to create and query include files in a model. A stripped-back version of this class has been added to T/HIS and REPORTER for consistency between the programs.
See File.DriveMapFilename for the current use of this class in REPORTER.

Item class

The Item class gives access to items in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetAll(page*[Page]*)
- GetFromName(page*[Page]*, name*[string]*)

Member functions

- GetColumnProperties(column*[integer]*, header*[constant]*)
- GetColumnWidth(row*[integer]*)
- GetCondition(index*[integer]*)
- GetCondition(index*[integer]*, column*[integer]*)
- GetCondition(index*[integer]*, row*[integer]*, column*[integer]*)
- GetGeneratedData(row_index*[integer]*, column_index*[integer]*)
- GetRowHeight(row*[integer]*)
- InsertColumn(column*[integer]*)
- InsertRow(row*[integer]*)
- MergeCells(topLeftRow*[integer]*, topLeftColumn*[integer]*, rows*[integer]*, columns*[integer]*)
- SetCellProperties(properties*[object]*, row*[integer]*, column*[integer]*)
- SetColumnProperties(properties*[object]*, column*[integer]*, header*[constant]*)
- SetColumnWidth(column*[integer]*, width*[real]*)
- SetCondition(condition*[integer]*, properties*[object]*)
- SetCondition(condition*[integer]*, column*[integer]*, properties*[object]*)
- SetCondition(condition*[integer]*, row*[integer]*, column*[integer]*, properties*[object]*)
- SetRowHeight(row*[integer]*, height*[real]*)
- UnmergeCells(row*[integer]*, column*[integer]*)

Item constants

Name	Description
Item.ARROW	Arrow item
Item.AUTO_TABLE	Automatic table item
Item.D3PLOT	D3Plot item
Item.ELLIPSE	Ellipse item
Item.IMAGE	Image item
Item.IMAGE_FILE	Image file item
Item.LIBRARY_IMAGE	Library image item
Item.LIBRARY_PROGRAM	Library program item
Item.LINE	Line item
Item.NOTE	Note item

Item.PLACEHOLDER	Placeholder item
Item.PRIMER	Primer item
Item.PROGRAM	Program item
Item.RECTANGLE	Rectangle item
Item.SCRIPT	Script item
Item.SCRIPT_FILE	Script File item
Item.TABLE	Table item
Item.TEXT	Text item
Item.TEXTBOX	Textbox item
Item.TEXT_FILE	Text file item
Item.THIS	T/HIS item

Item properties

Name	Type	Description
active	logical	If item is active or not. Inactive items will be skipped during report/page/item generation.
autotableType	constant	Autotable type (whether the data is sourced from a file or a directory). Can be Reporter.AUTO_TABLE_DIRECTORY or Reporter.AUTO_TABLE_FILE. Valid for item type Item.AUTO_TABLE.
bottomCrop	integer	Bottom cropping value. Valid for item types Item.IMAGE, Item.IMAGE_FILE, Item.D3PLOT, Item.PRIMER and Item.THIS.
bottomMargin	real	Bottom margin width. Valid for item types Item.TEXTBOX, Item.TEXT_FILE, Item.TABLE and Item.AUTO_TABLE
columns (readonly)	integer	The number of columns in the table. Valid for item types Item.TABLE and Item.AUTO_TABLE
conditions (readonly)	integer	The number of conditions assigned to the item. Valid for item types Item.PROGRAM, Item.TEXT_FILE, Item.TEXT and Item.TEXTBOX
embed	logical	If image is embedded or not. Valid for item types Item.IMAGE
file	string	File or directory for item. Valid for item types: Item.AUTO_TABLE Item.D3PLOT Item.IMAGE Item.IMAGE_FILE Item.PRIMER Item.PROGRAM Item.SCRIPT_FILE Item.TEXT_FILE Item.THIS
filetype (read only)	string	Output file type. Read-only but can be updated by changing the file extension on the item property "file". Valid for item types Item.D3PLOT Item.PRIMER and Item.THIS.
fillColour	Colour object	Colour of fill for the item. Valid for item types Item.RECTANGLE, Item.ELLIPSE, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE
fontName	string	Font for the item e.g. "Courier". Can be any font accessible by REPORTER. Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE

fontSize	integer	Font size for the item (6 <= fontSize <= 72). Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE
fontStyle	constant	Font style for the item. Can be a combination of Reporter.TEXT_NORMAL, Reporter.TEXT_BOLD, Reporter.TEXT_ITALIC or Reporter.TEXT_UNDERLINE Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE
generatedRowHeight	real	The height of each generated row in an Autotable. Valid for item type Item.AUTO_TABLE.
headerHeight	real	The height of the header in an Autotable. Valid for item type Item.AUTO_TABLE.
height	real	Height for "rectangular" items (absolute difference between y and y2)
job	string	Input job file. Valid for item types Item.D3PLOT and Item.THIS.
justify	constant	Text justification for the item. Can be Reporter.JUSTIFY_CENTRE, Reporter.JUSTIFY_LEFT or Reporter.JUSTIFY_RIGHT combined with Reporter.JUSTIFY_TOP, Reporter.JUSTIFY_MIDDLE or Reporter.JUSTIFY_BOTTOM Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE
leftCrop	integer	Left cropping value. Valid for item types Item.IMAGE, Item.IMAGE_FILE, Item.D3PLOT, Item.PRIMER and Item.THIS.
leftMargin	real	Left margin width. Valid for item types Item.TEXTBOX, Item.TEXT_FILE, Item.TABLE and Item.AUTO_TABLE
lineColour	Colour object	Colour of outline for the item. Valid for item types Item.LINE, Item.ARROW, Item.RECTANGLE, Item.ELLIPSE, Item.TEXTBOX, Item.D3PLOT, Item.PRIMER, Item.THIS, Item.PROGRAM, Item.TEXT_FILE, Item.IMAGE_FILE, Item.TABLE and Item.AUTO_TABLE.
lineStyle	constant	Style of outline for the item. Can be Reporter.LINE_NONE, Reporter.LINE_SOLID, Reporter.LINE_DASH, Reporter.LINE_DOT, Reporter.LINE_DASH_DOT or Reporter.LINE_DASH_DOT_DOT Valid for item types Item.LINE, Item.ARROW, Item.RECTANGLE, Item.ELLIPSE, Item.TEXTBOX, Item.D3PLOT, Item.PRIMER, Item.THIS, Item.PROGRAM, Item.TEXT_FILE and Item.IMAGE_FILE.
lineWidth	real	Width of outline for the item in mm. Valid for item types Item.LINE, Item.ARROW, Item.RECTANGLE, Item.ELLIPSE, Item.TEXTBOX, Item.D3PLOT, Item.PRIMER, Item.THIS, Item.PROGRAM, Item.TEXT_FILE, Item.IMAGE_FILE, Item.TABLE and Item.AUTO_TABLE
name	string	Name of the Item
resolution	integer	Image resolution. Larger values yield a smaller image representation on screen. Valid for item type Item.IMAGE.
rightCrop	integer	Right cropping value. Valid for item types Item.IMAGE, Item.IMAGE_FILE, Item.D3PLOT, Item.PRIMER and Item.THIS.
rightMargin	real	Right margin width. Valid for item types Item.TEXTBOX, Item.TEXT_FILE, Item.TABLE and Item.AUTO_TABLE
rows (readonly)	integer	The number of rows in the table. Valid for item type Item.TABLE
saveCSV	bool	Whether or not a CSV file of the table contents is written when the item is generated. Valid for item types Item.TABLE and Item.AUTO_TABLE
saveCSVFilename	string	The path and filename of the CSV file written when the item is generated. Valid for item types Item.TABLE and Item.AUTO_TABLE

saveXlsx	bool	Whether or not a Excel file of the table contents is written when the item is generated. Valid for item types Item.TABLE and Item.AUTO_TABLE
saveXlsxFilename	string	The path and filename of the Excel file written when the item is generated. Valid for item types Item.TABLE and Item.AUTO_TABLE
script	string	The script source text for the item. Only valid for item type Item.SCRIPT. For Item.SCRIPT_FILE, use the *file* property.
text	string	The text for the item. Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM, Item.TEXT_FILE and Item.SCRIPT
textColour	Colour object	Colour of text for the item. Valid for item types Item.TEXT, Item.TEXTBOX, Item.PROGRAM and Item.TEXT_FILE
topCrop	integer	Top cropping value. Valid for item types Item.IMAGE, Item.IMAGE_FILE, Item.D3PLOT, Item.PRIMER and Item.THIS.
topMargin	real	Top margin width. Valid for item types Item.TEXTBOX, Item.TEXT_FILE, Item.TABLE and Item.AUTO_TABLE
type (read only)	constant	type of the Item. Can be Item.LINE, Item.TEXT etc.
width	real	Width for "rectangular" items (absolute difference between x and x2)
x	real	X coordinate
x2	real	Second X coordinate for "rectangular" items
y	real	Y coordinate
y2	real	Second Y coordinate for "rectangular" items

Detailed Description

The Item class allows you to access the items in templates that Reporter currently has open.

Constructor

new Item(page*[Page]*, type*[constant]*, name (optional)*[string]*, x (optional)*[real]*, x2 (optional)*[real]*, y (optional)*[real]*, y2 (optional)*[real]*)

Description

Create a new Item. The name and coordinates arguments are optional. Item.TABLE items are constructed with two rows and two columns by default. If you require only one row or column, use DeleteRow and DeleteColumn.

Arguments

- **page** (Page)

Page to create item in

- **type** (constant)

Item type. Can be Item.LINE, Item.ARROW, Item.RECTANGLE, Item.ELLIPSE, Item.TEXT, Item.TEXTBOX, Item.IMAGE, Item.PROGRAM, Item.D3PLOT, Item.PRIMER, Item.THIS, Item.TEXT_FILE, Item.IMAGE_FILE, Item.LIBRARY_IMAGE, Item.LIBRARY_PROGRAM, Item.TABLE, Item.AUTO_TABLE, Item.SCRIPT, Item.SCRIPT_FILE, Item.NOTE or Item.PLACEHOLDER.

- **name (optional)** (string)

Name of item

- **x (optional)** (real)

X coordinate

- **x2 (optional)** (real)

Second X coordinate for "rectangular" items

- **y (optional)** (real)

Y coordinate

- **y2 (optional)** (real)

Second Y coordinate for "rectangular" items

Returns

Item object

Return type

Item

Example

To create a new blank Item object:

```
var i = new Item();
```

Details of functions

DeleteColumn(column*[integer]*)

Description

Delete a column from a table. Valid for item type Item.TABLE and Item.AUTO_TABLE.

Arguments

- **column** (integer)

The index of the column to delete. Note that indices start from 0.

Returns

No return value

Example

To delete the second column from table item i:

```
i.DeleteColumn(1);
```

DeleteRow(row*[integer]*)

Description

Delete a row from a table. Valid for item type Item.TABLE.

Arguments

- **row** (integer)

The index of the row to delete. Note that indices start from 0.

Returns

No return value

Example

To delete the second row from table item i:

```
i.DeleteRow(1);
```

Generate()

Description

Generate an item.

Arguments

No arguments

Returns

No return value

Example

To generate item i:

```
i.Generate();
```

GetAll(page*[Page]*) [static]

Description

Get all of the items on a page.

Arguments

- **page** (Page)

Page to get items from.

Returns

Array of Item objects

Return type

Array

Example

To get all of the items on page p:

```
var items = Item.GetAll(p);
```

GetCellProperties(row*[integer]*, column*[integer]*)

Description

Get the properties of the specified cell. Valid for item type Item.TABLE.

Arguments

- **row** (integer)

The row index of the cell of interest. Note that indices start from 0.

- **column** (integer)

The column index of the cell of interest. Note that indices start from 0.

Returns

Object with the following properties:

Name	Type	Description
bottomBorderWidth	real	Cell bottom border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
colspan	integer	Number of columns this cell spans (for merged cells). 1 if not merged. Use columnMergeOrigin to find top-left cell.
column (read only)	integer	The column index
columnMergeOrigin	integer	The column index of the top-left cell in this merge cell group (if cell not merged then == column).
conditions	integer	Number of conditions assigned to this cell.
fillColour	Colour object	Fill colour
fontName	string	Font name (e.g. "Courier").
fontSize	integer	Font size (between 6 and 72).
fontStyle	integer	Font style. See Text style constants for details.
height	real	Cell height. Modifying this property will modify the height of all cells in the row.
hyperlinkHTML	string	Hyperlink destination for HTML.
hyperlinkPDF	string	Hyperlink destination for PDF.
hyperlinkReport	string	Hyperlink destination for Report or page within Report.
justify	integer	Text justification for the item. Same rules as justify property of Item Class.
output	string	The output text from a Program or Library Program cell.
prefix	string	Prefix text to appear before Library Program output.
program	string	Path and filename for a Program cell, or the filename (e.g. *title.js*) for a Library Program cell.
programArgs	Array of strings	Program arguments
rightBorderWidth	real	Cell right border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
row (read only)	integer	The cell row index.
rowMergeOrigin	integer	The row index of the top-left cell in this merge cell group (if cell not merged then == row).
rowSpan	integer	Number of rows this cell spans (for merged cells). == 1 if not merged. Use rowMergeOrigin to find top-left cell.
suffix	string	Suffix text to appear after Library Program output.
text	string	The cell text. For Program and Library Program cells, use the **prefix**, **output** and **suffix** properties.
textColour	Colour object	Colour of text
topBorderWidth	real	Cell top border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
type	integer	Can be Item.TEXT,Item.LIBRARY_PROGRAM or Item.PROGRAM.
variable	string	REPORTER variable for library program output.
width	real	Cell width. Modifying this property will modify the width of all cells in the column.

Return type

object

Example

To get the properties of the top-left cell in a table:

```
i.GetCellProperties(0, 0);
```

GetColumnProperties(column*[integer]*, header*[constant]*)

Description

Get an autotable column properties. Valid for item type Item.AUTO_TABLE.

Arguments

- **column** (integer)

The index of the column of interest. Note that indices start from 0.

- **header** (constant)

An argument to signify to get the properties of the header or the generated rows. Can be Reporter.AUTO_TABLE_HEADER or Reporter.AUTO_TABLE_ROWS.

Returns

Object with the following properties:

Name	Type	Description
conditions	integer	Number of conditions assigned to this cell.
fillColour	Colour object	Fill colour
fontName	string	Font name (e.g. "Courier").
fontSize	integer	Font size (between 6 and 72).
fontStyle	integer	Font style. Same rules as fontStyle property of
hyperlinkHTML	string	Hyperlink destination for HTML.
hyperlinkPDF	string	Hyperlink destination for PDF.
hyperlinkReport	string	Hyperlink destination for Report or page within Report.
justify	integer	Text justification for the item. Same rules as justify property of Item Class.
program	string	Path and filename for a Program cell, or the filename (e.g. *title.js*) for a Library Program cell.
programArgs	Array of strings	Program arguments
text	string	The cell text. For Program and Library Program cells, use the **prefix**, **output** and **suffix** properties.
textColour	Colour object	Colour of text
type	integer	Can be Item.TEXT,Item.LIBRARY_PROGRAM or Item.PROGRAM.
width	real	Cell width. Modifying this property will modify the width of all cells in the column.

Return type

object

Example

Returns the column properties of the header of the first column:

```
i.GetColumnProperties(0, Reporter.AUTO_TABLE_HEADER);
```

GetColumnWidth(row*[integer]*)

Description

Get the width of a table column. Valid for item types Item.TABLE or Item.AUTO_TABLE.

Arguments

- **row** (integer)

The index of the column of interest. Note that indices start from 0.

Returns

Integer. The width of the specified column.

Return type

Number

Example

To get the width of the first column in a table:

```
i.GetColumnWidth(0);
```

GetCondition(index*[integer]*)

Description

Get the conditional formatting data for an item. Valid for item types Item.TEXT_FILE, Item.PROGRAM, Item.TEXT or Item.TEXTBOX (for Item.AUTO_TABLE and Item.TABLE, see GetCondition functions with additional arguments below).

Arguments

- **index** (integer)

The index of the condition to get. Note that indices start from 0. See conditions for the total number of comditions

Returns

Object with the following properties:

Name	Type	Description
fillColour	Colour object	Fill colour
fontName	string	Font name (e.g. "Courier").
fontSize	integer	Font size (between 6 and 72).
fontStyle	integer	Font style. See Text style constants for details.
justify	integer	Text alignment for the item. See Justification constants for details.
name	string	Condition name
textColour	Colour object	Colour of text
type	integer	See Condition types constants for details.

value	string	First condition value
value2	string	Second condition value (where relevant)

Return type

object

Example

To get the data for the 2nd condition in item i:

```
var condition = i.GetCondition(1);
```

GetCondition(index*[integer]*, column*[integer]*)

Description

Get the conditional formatting data for an Item.AUTO_TABLE item.

Arguments

- **index** (integer)

The index of the condition to get. Note that indices start from 0.

- **column** (integer)

The column to get the condition from. Note that indices start from 0.

Returns

Object with the following properties:

Name	Type	Description
fillColour	Colour object	Fill colour
fontName	string	Font name (e.g. "Courier").
fontSize	integer	Font size (between 6 and 72).
fontStyle	integer	Font style. See Text style constants for details.
justify	integer	Text alignment for the item. See Justification constants for details.
name	string	Condition name
textColour	Colour object	Colour of text
type	integer	See Condition types constants for details.
value	string	First condition value
value2	string	Second condition value (where relevant)

Return type

object

Example

To get the data for the 2nd condition from the 3rd column in autotable item i:

```
var condition = i.GetCondition(1, 2);
```

GetCondition(index*[integer]*, row*[integer]*, column*[integer]*)

Description

Get the conditional formatting data for an Item.TABLE item.

Arguments

- **index** (integer)

The index of the condition to get. Note that indices start from 0.

- **row** (integer)

The cell row to get the condition from. Note that indices start from 0.

- **column** (integer)

The cell column to get the condition from. Note that indices start from 0.

Returns

Object with the following properties:

Name	Type	Description
fillColour	Colour object	Fill colour
fontName	string	Font name (e.g. "Courier").
fontSize	integer	Font size (between 6 and 72).
fontStyle	integer	Font style. See Text style constants for details.
justify	integer	Text alignment for the item. See Justification constants for details.
name	string	Condition name
textColour	Colour object	Colour of text
type	integer	See Condition types constants for details.
value	string	First condition value
value2	string	Second condition value (where relevant)

Return type

object

Example

To get the data for the 2nd condition from the 4th row, 3rd column in table item i:

```
var condition = i.GetCondition(1, 3, 2);
```

GetFromName(page*[Page]*, name*[string]*) [static]

Description

Get an Item from its name.

Arguments

- **page** (Page)

Page to get item from

- **name** (string)

Item name

Returns

Item object (or null if item cannot be found)

Return type

Item

Example

To get the item with name test on page p:

```
var item = Item.GetFromName(p, "test");
```

GetGeneratedData(row_index*[integer]*, column_index*[integer]*)

Description

Get the text that appears in an autotable cell once generated. Valid for item type Item.AUTO_TABLE.

Arguments

- **row_index** (integer)

The index of the row of interest. Note that indices start from 0.

- **column_index** (integer)

The index of the column of interest. Note that indicies start from 0.

Returns

String: the text displayed in the specified row and column.

Return type

String

Example

Get the data from the first cell in the first row and column in an autotable.

```
i.GetGeneratedData(0, 0);
```

GetRowHeight(row*[integer]*)

Description

Get the height of a table row. Valid for item type Item.TABLE.

Arguments

- **row** (integer)

The index of the row of interest. Note that indices start from 0.

Returns

integer

Return type

Number

Example

To get the height of the first row in a table:

```
i.GetRowHeight(0);
```

InsertColumn(column*[integer]*)

Description

Insert a column into a table. Valid for item types Item.TABLE and Item.AUTO_TABLE.

Arguments

- **column** (integer)

The index of the position where the inserted column will end up. Note that indices start from 0. If no argument is given, a column will be added to the bottom of the table.

Returns

No return value

Example

To insert a column that will become the second column from the left of the table:

```
i.InsertColumn(1);
```

InsertRow(row*[integer]*)

Description

Insert a row into a table. Valid for item type Item.TABLE.

Arguments

- **row** (integer)

The index of the position where the inserted row will end up. Note that indices start from 0. If no argument is given, a row will be added to the bottom of the table.

Returns

No return value

Example

To insert a row that will become the second row from the top of the table:

```
i.InsertRow(1);
```

MergeCells(topLeftRow*[integer]*, topLeftColumn*[integer]*, rows*[integer]*, columns*[integer]*)

Description

Merge specified cells in a table. Valid for item types Item.TABLE and Item.AUTO_TABLE.

Arguments

- **topLeftRow** (integer)

The row index of the top-left cell in the group of cells to be merged. Note that indices start from 0.

- **topLeftColumn** (integer)

The column index of the top-left cell in the group of cells to be merged. Note that indices start from 0.

- **rows** (integer)

The number of rows of cells to be merged (measured from the topLeftRow position).

- **columns** (integer)

The number of columns of cells to be merged (measured from the topLeftColumn position).

Returns

No return value

Example

To merge the cells in first row and the first two columns in the table:

```
i.MergeCells(0, 0, 1, 2);
```

SetCellProperties(properties*[object]*, row*[integer]*, column*[integer]*)

Description

Set the properties of the specified cell. Valid for item type Item.TABLE.

Arguments

- **properties** (object)

An object containing the cell properties.

Object has the following properties:

Name	Type	Description
bottomBorderWidth (optional)	real	Cell bottom border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
fillColour (optional)	Colour object	Fill colour
fontName (optional)	string	Font name (e.g. "Courier").
fontSize (optional)	integer	Font size (between 6 and 72).
fontStyle (optional)	integer	Font style. See Text style constants for details.
hyperlinkHTML (optional)	string	Hyperlink destination for HTML.
hyperlinkPDF (optional)	string	Hyperlink destination for PDF.
hyperlinkReport (optional)	string	Hyperlink destination for Report or page within Report.
justify (optional)	integer	Text justification for the item. Same rules as justify property of Item Class.
prefix (optional)	string	Prefix text to appear before Library Program output.
program (optional)	string	Path and filename for a Program cell, or the filename (e.g. *title.js*) for a Library Program cell.
programArgs (optional)	Array of strings	Program arguments
rightBorderWidth (optional)	real	Cell right border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
suffix (optional)	string	Suffix text to appear after Library Program output.
text (optional)	string	The cell text. For Program and Library Program cells, use the **prefix**, **output** and **suffix** properties.

textColour (optional)	Colour object	Colour of text
topBorderWidth (optional)	real	Cell top border width. Can be 0.0, 0.1, 0.5, 0.75, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, 5.0. Other values will result in no border.
type (optional)	integer	Can be Item.TEXT,Item.LIBRARY_PROGRAM or Item.PROGRAM.
variable (optional)	string	REPORTER variable for library program output.

- **row** (integer)

The row index of the cell to be modified. Note that indices start from 0.

- **column** (integer)

The column index of the cell to be modified. Note that indices start from 0.

Returns

No return value

Example

To set the properties of the cell object to those of the object *cell_obj*:

```
i.SetCellProperties(cell_obj, 0, 0);
```

SetColumnProperties(properties*[object]*, column*[integer]*, header*[constant]*)

Description

Set the properties of an autotable column. Valid for item type Item.AUTO_TABLE.

Arguments

- **properties** (object)

Set the properties of an autotable column. Valid for item type Item.AUTO_TABLE.

Object has the following properties:

Name	Type	Description
fillColour (optional)	Colour object	Fill colour
fontName (optional)	string	Font name (e.g. "Courier").
fontSize (optional)	integer	Font size (between 6 and 72).
fontStyle (optional)	integer	Font style. Same rules as fontStyle property of
hyperlinkHTML (optional)	string	Hyperlink destination for HTML.
hyperlinkPDF (optional)	string	Hyperlink destination for PDF.
hyperlinkReport (optional)	string	Hyperlink destination for Report or page within Report.
justify (optional)	integer	Text justification for the item. Same rules as justify property of Item Class.
program (optional)	string	Path and filename for a Program cell, or the filename (e.g. *title.js*) for a Library Program cell.
programArgs (optional)	Array of strings	Program arguments
text (optional)	string	The cell text. For Program and Library Program cells, use the **prefix**, **output** and **suffix** properties.

textColour (optional)	Colour object	Colour of text
type (optional)	integer	Can be Item.TEXT,Item.LIBRARY_PROGRAM or Item.PROGRAM.

- **column** (integer)

The index of the column of interest. Note that indices start from 0.

- **header** (constant)

An argument to signify to set the properties of the header or the generated rows. Can be Reporter.AUTO_TABLE_HEADER or Reporter.AUTO_TABLE_ROWS.

Returns

No return value

Example

Sets the column properties of the header of the first column with the properties of the object *column_obj*.

```
i.SetColumnProperties(column_obj, 0, Reporter.AUTO_TABLE_HEADER);
```

SetColumnWidth(column*[integer]*, width*[real]*)

Description

Set the width of a table column. Valid for item type Item.TABLE.

Arguments

- **column** (integer)

The index of the column of interest. Note that indices start from 0.

- **width** (real)

The column width.

Returns

No return value

Example

To set the width of the first column in a table to 10.0:

```
i.SetColumnWidth(0, 10.0);
```

SetCondition(condition*[integer]*, properties*[object]*)

Description

Set the specified condition for an item. Valid for item types Item.TEXT_FILE, Item.PROGRAM, Item.TEXT or Item.TEXTBOX (for Item.AUTO_TABLE and Item.TABLE, see SetCondition functions with additional arguments below).

Arguments

- **condition** (integer)

The index of the condition you wish to set. Note that indices start at 0. If a condition already exists at the specified index, it will be replaced. To add a new condition, specify an index equal to the number of existing conditions.

- **properties** (object)

The index of the condition you wish to set. Note that indices start at 0. If a condition already exists at the specified index, it will be replaced. To add a new condition, specify an index equal to the number of existing conditions.

Object has the following properties:

Name	Type	Description
fillColour (optional)	Colour object	Fill colour
fontName (optional)	string	Font name (e.g. "Courier").
fontSize (optional)	integer	Font size (between 6 and 72).
fontStyle (optional)	integer	Font style. See Text style constants for details.
justify (optional)	integer	Text alignment for the item. See Justification constants for details.
name (optional)	string	Condition name
textColour (optional)	Colour object	Colour of text
type (optional)	integer	See Condition types constants for details.
value (optional)	string	First condition value
value2 (optional)	string	Second condition value (where relevant)

Returns

No return value

Example

To set the conditions for the condition index 1 in item i to those of the object obj:

```
var obj = { name:"example", type:Reporter.CONDITION_EQUAL_TO, value:"Test",
textColour:Colour.Red() };
i.SetCondition(1, obj);
```

SetCondition(condition*[integer]*, column*[integer]*, properties*[object]*)

Description

Set the specified condition for an Item.AUTO_TABLE item.

Arguments

- **condition** (integer)

The index of the condition you wish to set. Note that indices start at 0. If a condition already exists at the specified index, it will be replaced. To add a new condition, specify an index equal to the number of existing conditions.

- **column** (integer)

The column to set the condition for. Note that indices start from 0.

- **properties** (object)

The column to set the condition for. Note that indices start from 0.

Object has the following properties:

Name	Type	Description
fillColour (optional)	Colour object	Fill colour
fontName (optional)	string	Font name (e.g. "Courier").
fontSize (optional)	integer	Font size (between 6 and 72).
fontStyle (optional)	integer	Font style. See Text style constants for details.
justify (optional)	integer	Text alignment for the item. See Justification constants for details.
name (optional)	string	Condition name

textColour (optional)	Colour object	Colour of text
type (optional)	integer	See Condition types constants for details.
value (optional)	string	First condition value
value2 (optional)	string	Second condition value (where relevant)

Returns

No return value

Example

To set the conditions for condition index 1 in the third column in item i to those of the object obj:

```
var obj = { name:"example", type:Reporter.CONDITION_EQUAL_TO, value:"Test",
textColour:Colour.Red() };
i.SetCondition(1, 2, obj);
```

SetCondition(condition*[integer]*, row*[integer]*, column*[integer]*, properties*[object]*)

Description

Set the specified condition for an Item.TABLE item.

Arguments

- **condition** (integer)

The index of the condition you wish to set. Note that indices start at 0. If a condition already exists at the specified index, it will be replaced. To add a new condition, specify an index equal to the number of existing conditions.

- **row** (integer)

The row to set the condition for. Note that indices start from 0.

- **column** (integer)

The column to set the condition for. Note that indices start from 0.

- **properties** (object)

The column to set the condition for. Note that indices start from 0.

Object has the following properties:

Name	Type	Description
fillColour (optional)	Colour object	Fill colour
fontName (optional)	string	Font name (e.g. "Courier").
fontSize (optional)	integer	Font size (between 6 and 72).
fontStyle (optional)	integer	Font style. See Text style constants for details.
justify (optional)	integer	Text alignment for the item. See Justification constants for details.
name (optional)	string	Condition name
textColour (optional)	Colour object	Colour of text
type (optional)	integer	See Condition types constants for details.
value (optional)	string	First condition value
value2 (optional)	string	Second condition value (where relevant)

Returns

No return value

Example

To set the conditions for condition index 1 in the fourth row, third column in item i to those of the object obj:

```
var obj = { name:"example", type:Reporter.CONDITION_EQUAL_TO, value:"Test",
textColour:Colour.Red() };
i.SetCondition(1, 3, 2, obj);
```

SetRowHeight(row*[integer]*, height*[real]*)

Description

Set the height of a table row. Valid for item type Item.TABLE and Item.AUTO_TABLE.

Arguments

- **row** (integer)

The index of the row of interest. Note that indices start from 0.

- **height** (real)

The row height.

Returns

No return value

Example

To set the height of the first row in a table to 10.0:

```
i.SetRowHeight(0, 10.0);
```

UnmergeCells(row*[integer]*, column*[integer]*)

Description

Unmerge the specified cell in a table. All cells merged to the specified cell will be unmerged. Valid for item types Item.TABLE and Item.AUTO_TABLE.

Arguments

- **row** (integer)

The row index of the cell to be unmerged. Note that indices start from 0.

- **column** (integer)

The column index of the cell to be unmerged. Note that indices start from 0..

Returns

No return value

Example

To unmerge the top-left cell in a table:

```
i.UnmergeCells(0, 0);
```

Options class

The Options class enables you to access several options in REPORTER. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Options constants

Constants for Promises

Name	Description
Options.RUN_PROMISE_CONSTRUCTOR	Allow/run promises when an API constructor is called
Options.RUN_PROMISE_METHOD	Allow/run promises when an API method is called
Options.RUN_PROMISE_PROPERTY	Allow/run promises when an API property getter/setter is done
Options.RUN_PROMISE_SCRIPT	Allow/run promises when a script is run
Options.RUN_PROMISE_WINDOW_LOOP	Allow/run promises in a window event loop

Options class properties

Name	Type	Description
run_ promises	constant	When any promise callbacks/handlers are allowed to run. Can be a bitwise OR of: Options.RUN_ PROMISE_WINDOW_LOOP, Options.RUN_PROMISE_CONSTRUCTOR, Options.RUN_ PROMISE_METHOD and Options.RUN_PROMISE_PROPERTY Options.RUN_PROMISE_ SCRIPT The default is for all to be allowed. Promise handlers can also be run manually by using Utils.CallPromiseHandlers()

Detailed Description

The Options class is used to get/set options that REPORTER uses for certain functions. The options are available as **class** properties. See the documentation for more details. An example: Options.run_promises = Options.RUN_ PROMISE_WINDOW_LOOP

Page class

The Page class gives access to pages in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Member functions

- DeleteItem(index*[integer]*)
- Duplicate(index (optional)*[integer]*)
- Generate()
- GetAllItems()
- GetItem(index*[integer]*)
- ImportItem(filename*[string]*)

Page properties

Name	Type	Description
items (read only)	integer	The total number of items on the page
master (read only)	logical	true if this is a master page object.
name	string	Name of the Page

Detailed Description

The Page class allows you to access the pages in templates that Reporter currently has open.

Constructor

new Page(template*[Template]*, options (optional)*[object]*)

Description

Create a new Page..

Arguments

- **template** (Template)

Template to create page in

- **options (optional)** (object)

Options specifying various page properties, including where the page should be created. If omitted, the default values below will be used.

Object has the following properties:

Name	Type	Description
colour (optional)	Colour object	Page background colour (white if omitted)

index (optional)	integer	The page index at which the new page will be inserted (indices start from zero). You cannot create pages prior to the current page i.e. the index must be greater than the index of the current page. If omitted, the new page will be created immediately after the current page. Note that the current page continues to be the page that the Script item is running on (it does not change to the newly-created page).
name (optional)	string	Name for page (empty if omitted)

Returns

Page object

Return type

Page

Example

To create a new blank Page object in template *t*:

```
var page = new Page(t);
```

To create a new red page named "Last page" as the last page in template *t*:

```
var page = new Page(t, {name:"Last page", colour:Colour.Red(),
index:t.GetAllPages().length});
```

new Page(template*[Template]*, name (optional)*[string]*) [deprecated]

This function is deprecated in version 17.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Create a new Page.

Arguments

- **template** (Template)

Template to create page in

- **name (optional)** (string)

Name for page (empty if omitted)

Returns

Page object

Return type

Page

Example

To create a new blank Page object in template t:

```
var page = new Page(t);
```

Details of functions

DeleteItem(index*[integer]*)

Description

Deletes an item from a page.

Arguments

- **index** (integer)

The index of the item that you want to delete. Note that indices start at 0.

Returns

No return value

Example

To delete the first item of page *p*:

```
p.DeleteItem(0);
```

Duplicate(index (optional)*[integer]*)

Description

Duplicate a page

Arguments

- **index (optional)** (integer)

The page index that you want to insert the duplicate page at in the template. Note that indices start at 0. If omitted the duplicate page will be put after the one that you are duplicating.

Returns

Page object

Return type

Page

Example

To duplicate page p:

```
var dp = p.Duplicate();
```

To duplicate page p putting the duplicate as the first page in the template:

```
var dp = p.Duplicate(0);
```

Generate()

Description

Generate a page

Arguments

No arguments

Returns

no return value

Example

To generate page p:

```
p.Generate();
```

GetAllItems()

Description

Gets all of the items from a page.

Arguments

No arguments

Returns

Array of Item objects

Return type

Array

Example

To get all of the items on page p:

```
var items = p.GetAllItems();
```

GetItem(index*[integer]*)

Description

Get an item from a page.

Arguments

- **index** (integer)

The index of the item on the page that you want to get. Note that indices start at 0.

Returns

Item

Return type

Item

Example

To get the 1st item on page p:

```
p.GetItem(0);
```

ImportItem(filename*[string]*)

Description

Import an item from a file onto the page.

Arguments

- **filename** (string)

File containing the object to import

Returns

Item

Return type

Item

Example

To read an item from file "item.oro" and put it on page p:

```
p.ImportItem("item.oro");
```

Reporter class

The Reporter class contains constants for use in REPORTER. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Reporter constants

Name	Description
Reporter.CapFlat	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.CAP_FLAT instead [deprecated]
Reporter.CapRound	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.CAP_ROUND instead [deprecated]
Reporter.CapSquare	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.CAP_SQUARE instead [deprecated]
Reporter.JoinBevel	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JOIN_BEVEL instead [deprecated]
Reporter.JoinMitre	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JOIN_MITRE instead [deprecated]
Reporter.JoinRound	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JOIN_ROUND instead [deprecated]
Reporter.JustifyBottom	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_BOTTOM instead [deprecated]
Reporter.JustifyCentre	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_CENTRE instead [deprecated]
Reporter.JustifyLeft	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_LEFT instead [deprecated]

Reporter.JustifyMiddle	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_MIDDLE instead [deprecated]
Reporter.JustifyRight	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_RIGHT instead [deprecated]
Reporter.JustifyTop	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.JUSTIFY_TOP instead [deprecated]
Reporter.LineDash	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_DASH instead [deprecated]
Reporter.LineDashDot	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_DASH_DOT instead [deprecated]
Reporter.LineDashDotDot	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_DASH_DOT_DOT instead [deprecated]
Reporter.LineDot	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_DOT instead [deprecated]
Reporter.LineNone	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_NONE instead [deprecated]
Reporter.LineSolid	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.LINE_SOLID instead [deprecated]
Reporter.TextBold	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.TEXT_BOLD instead [deprecated]
Reporter.TextItalic	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.TEXT_ITALIC instead [deprecated]
Reporter.TextNormal	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.TEXT_NORMAL instead [deprecated]
Reporter.TextUnderline	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.TEXT_UNDERLINE instead [deprecated]
Reporter.ViewDesign	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.VIEW_DESIGN instead [deprecated]

Reporter.ViewPresentation	This constant is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Reporter.VIEW_PRESENTATION instead [deprecated]

Constants for Autotable source and row types

Name	Description
Reporter.AUTO_TABLE_DIRECTORY	Autotable data is generated from a directory.
Reporter.AUTO_TABLE_FILE	Autotable data is generated from a file.
Reporter.AUTO_TABLE_HEADER	Represents the header row in an Autotable.
Reporter.AUTO_TABLE_ROWS	Represents the rows with generated data in an Autotable.

Constants for Condition types

Name	Description
Reporter.CONDITION_BETWEEN	Treats the value as a number. True if value is between the two condition values
Reporter.CONDITION_CONTAINS_STRING	Treats the vlue as a string. True if the value contains the string
Reporter.CONDITION_DOESNT_CONTAIN_STRING	Treats the vlue as a string. True if the value does not contain the string
Reporter.CONDITION_DOESNT_MATCH_REGEX	Treats the value as a regular expression. True if the regular expression does not match
Reporter.CONDITION_EQUAL_TO	Treats the value as a string. True if the strings are equal
Reporter.CONDITION_GREATER_THAN	Treats the value as a number. True if value is greater than the condition value
Reporter.CONDITION_LESS_THAN	Treats the value as a number. True if value is less than the condition value
Reporter.CONDITION_MATCHES_REGEX	Treats the value as a regular expression. True if the regular expression matches
Reporter.CONDITION_NOT_BETWEEN	Treats the value as a number. True if value is between the two condition values
Reporter.CONDITION_NOT_EQUAL_TO	Treats the value as a string. True if the strings are not equal

Constants for Justification

Name	Description
Reporter.JUSTIFY_BOTTOM	Bottom justification of text
Reporter.JUSTIFY_CENTRE	Centre justification of text
Reporter.JUSTIFY_LEFT	Left justification of text
Reporter.JUSTIFY_MIDDLE	Middle justification of text
Reporter.JUSTIFY_RIGHT	Right justification of text
Reporter.JUSTIFY_TOP	Top justification of text

Constants for Line cap style

Name	Description
Reporter.CAP_FLAT	A square line ending at the end point of the line
Reporter.CAP_ROUND	A rounded line ending
Reporter.CAP_SQUARE	A square line that extends beyond the end point of the line by half the line width

Constants for Line join style

Name	Description
Reporter.JOIN_BEVEL	The triangular notch where the line segments meet is filled
Reporter.JOIN_MITRE	The outer edges of the line segments are extended to meet at an angle and this is filled
Reporter.JOIN_ROUND	A circular arc between the two line segments is filled

Constants for Line style

Name	Description
Reporter.LINE_DASH	A dashed line (dashes separated by a few pixels)
Reporter.LINE_DASH_DOT	A line drawn with alternate dashes and dots
Reporter.LINE_DASH_DOT_DOT	A line drawn with one dash and two dots
Reporter.LINE_DOT	A dotted line (dots separated by a few pixels)
Reporter.LINE_NONE	Invisible line
Reporter.LINE_SOLID	A simple continuous line

Constants for Text style

Name	Description
Reporter.TEXT_BOLD	Text drawn in a bold font
Reporter.TEXT_ITALIC	Text drawn in an italic font
Reporter.TEXT_NORMAL	Text drawn in a normal font
Reporter.TEXT_UNDERLINE	Text drawn underlined

Constants for View

Name	Description
Reporter.VIEW_DESIGN	Show template in design view
Reporter.VIEW_PRESENTATION	Show template in presentation view

Reporter properties

Name	Type	Description
currentTemplate	Template	This property is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Template.GetCurrent() instead [deprecated]

templates	array	This property is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Please use Template.GetAll() instead [deprecated]

Detailed Description

The Reporter class allows you to access constants used in REPORTER.

Template class

The Template class gives access to templates in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetAll()
- GetCurrent()

Member functions

- Close()
- DeletePage(index*[integer]*)
- DeleteTemporaryVariables()
- EditVariables(title (optional)*[string]*, message (optional)*[string]*, update (optional)*[boolean]*, variables (optional)*[array]*, columns (optional)*[constant]*, alphabetical (optional)*[boolean]*)
- ExpandVariablesInString(string*[string]*)
- Generate()
- GetAllPages()
- GetMaster()
- GetPage(index*[integer]*)
- GetVariableDescription(name*[string]*)
- GetVariableValue(name*[string]*)
- Html(filename*[string]*)
- Pdf(filename*[string]*)
- Ppt(filename*[string]*) [deprecated]
- Pptx(filename*[string]*)
- Print(printer*[string]*)
- Save()
- SaveAs(filename*[string]*)
- Update()

Template properties

Name	Type	Description
filename (read only)	string	Filename (without path) of the Template.
name (read only)	string	This property is deprecated in version 15.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Name of the Template. This property has been preserved for compatability with older scripts. It either contains the absolute path and filename, or just the filename, depending on how the Template was opened. Please use the filename and path properties for consistent results. [deprecated]
pages (read only)	integer	Number of Pages in template
path (read only)	string	Absolute path (without filename) of the Template. If the Template is new and has not yet been saved, this property will be empty.
variables	array	This property is deprecated in version 12.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions. Array of Variable objects for this template. Please use Variable.GetAll() and Variable.GetFromName() instead. [deprecated]

view	constant	Current view type (presentation or design view) for this Template. Can be: Reporter.VIEW_DESIGN or Reporter.VIEW_PRESENTATION.

Detailed Description

The Template class allows you to access the templates that Reporter currently has open.
Note that if you want to get a list of the current templates in Reporter you should see the templates array in the reporter object.
The currently active template is stored in the currentTemplate property of the reporter object.

Constructor

new Template(filename (optional)*[string]*)

Description

Create a new Template. The filename argument is optional. If present it is a file to open

Arguments

- **filename (optional)** (string)

Name of template file to open

Returns

Template object

Return type

Template

Example

To create a new blank Template object

```
var template = new Template();
```

Details of functions

Close()

Description

Close a template.
Note that if you call this function for a Template object, the Template data will be deleted, so you should not try to use it afterwards!.

Arguments

No arguments

Returns

no return value

Example

To close template data:

```
data.Close();
```

DeletePage(index*[integer]*)

Description

Deletes a page from a template.

Arguments

- **index** (integer)

The index of the page that you want to delete. Note that indices start at 0.

Returns

No return value

Example

To delete the first page of template t:

```
t.DeletePage(0);
```

DeleteTemporaryVariables()

Description

Deletes any temporary variables from a template.

Arguments

No arguments

Returns

No return value

Example

To delete all the temporary variables from template t:

```
t.DeleteTemporaryVariables();
```

EditVariables(title (optional)*[string]*, message (optional)*[string]*, update (optional)*[boolean]*, variables (optional)*[array]*, columns (optional)*[constant]*, alphabetical (optional)*[boolean]*)

Description

Start a dialog to edit the template variables

Arguments

- **title (optional)** (string)

Title for dialog. If omitted, null or an empty string is given then the default title will be used.

- **message (optional)** (string)

Message to show in dialog. If omitted, null or an empty string is given then the default message will be used.

- **update (optional)** (boolean)

Whether the variables in the template will be updated with the new values if OK is pressed. Setting this to be false allows you to check variable values before updating them from a script. If omitted the default is true

- **variables (optional)** (array)

A list of variables to show in the dialog. If omitted, null or an empty array, all variables will be shown

- **columns (optional)** (constant)

Columns to show in the dialog (as well as the variable value column). Can be a bitwise OR of Variable.NAME, Variable.TYPE, Variable.DESCRIPTION, Variable.FORMAT, Variable.PRECISION and Variable.TEMPORARY. If omitted columns will be shown for name and description

- **alphabetical (optional)** (boolean)

Whether to sort variables in the table by alphabetical order. If false, variables are listed in the order they are passed in the optional variables argument. If no variables are passed to the function, all template variables will be shown in alphabetical order. If omitted, the default value is true.

Returns

Object containing the variable names and values or null if cancel was pressed.

Return type

Object

Example

To edit all of the variables in template:

```
var variables = template.EditVariables();
```

To edit variables TEST and EXAMPLE in template giving a title and a message, returning the edited values but **not** updating them in the template:

```
var variables = template.EditVariables("Edit variables", "Type in the values",
false, ["TEST", "EXAMPLE");
```

ExpandVariablesInString(string*[string]*)

Description

Replaces any variables in a string with their current values

Arguments

- **string** (string)

The string you want to expand variables in.

Returns

String (string) with variables expanded. If a variable in a string does not exist it is replaced by a blank.

Return type

String

Example

If the variable FRED in template contains the value "test", then the following

```
var value = template.ExpandVariablesInString("This is a %FRED%");
```

will return "This is a test" in variable value.

Generate()

Description

Generate a template

Arguments

No arguments

Returns

no return value

Example

To generate template data:

```
data.Generate();
```

GetAll() [static]

Description

Get all of the open templates

Arguments

No arguments

Returns

array of Template objects or null if no open templates

Return type

Array

Example

To get all of the templates open in REPORTER:

```
var templates = Template.GetAll();
```

GetAllPages()

Description

Gets all of the pages from a template.

Arguments

No arguments

Returns

Array of Page objects

Return type

Array

Example

To get all of the pages from template t:

```
var pages = t.GetAllPages();
```

GetCurrent() [static]

Description

Get the currently active template

Arguments

No arguments

Returns

Template object or null if no active template

Return type

Template

Example

To get the current template open in REPORTER:

```
var current_template = Template.GetCurrent();
```

GetMaster()

Description

Get the master page from a template.

Arguments

No arguments

Returns

Page object

Return type

Page

Example

To get the master page of template t:

```
var m = t.GetMaster();
```

GetPage(index*[integer]*)

Description

Get a page from a template.

Arguments

- **index** (integer)

The index of the page that you want to get. Note that indices start at 0.

Returns

Page object

Return type

Page

Example

To get the first page of template t:

```
var p = t.GetPage(0);
```

GetVariableDescription(name*[string]*)

Description

Get the description for a variable

Arguments

- **name** (string)

Variable name you want to get description for.

Returns

Variable description (string) or null if variable does not exist

Return type

String

Example

To get description for variable FRED in template:

```
var description = template.GetVariableDescription("FRED");
```

GetVariableValue(name*[string]*)

Description

Get the value for a variable

Arguments

- **name** (string)

Variable name you want to get value for.

Returns

Variable value (string) or null if variable does not exist

Return type

String

Example

To get value for variable FRED in template:

```
var value = template.GetVariableValue("FRED");
```

Html(filename*[string]*)

Description

Save a template as HTML

Arguments

- **filename** (string)

Filename you want to save.

Returns

no return value

Example

To save template data as file /data/test/template.html:

```
data.Html("/data/test/template.html");
```

Pdf(filename*[string]*)

Description

Save a template as Adobe Acrobat PDF

Arguments

- **filename** (string)

Filename you want to save.

Returns

no return value

Example

To save template data as file /data/test/template.pdf:

```
data.Pdf("/data/test/template.pdf");
```

Ppt(filename*[string]*) [deprecated]

This function is deprecated in version 18.0. It is only provided to keep old scripts working. We strongly advise against using it in new scripts. Support may be removed in future versions.

Description

Save a template as PowerPoint. This function is deprecated. Use Template.Pptx instead.

Arguments

- **filename** (string)

Filename you want to save.

Returns

no return value

Example

To save template data as file /data/test/template.pptx:

```
data.Ppt("/data/test/template.pptx");
```

Pptx(filename*[string]*)

Description

Save a template as PowerPoint

Arguments

- **filename** (string)

Filename you want to save.

Returns

no return value

Example

To save template data as file /data/test/template.pptx:

```
data.Pptx("/data/test/template.pptx");
```

Print(printer*[string]*)

Description

Print template on a printer

Arguments

- **printer** (string)

Printer you want to print to.

Returns

no return value

Example

To print template data on printer myprinter:

```
data.Print("myprinter");
```

Save()

Description

Save a template

Arguments

No arguments

Returns

no return value

Example

To save template data:

```
data.Save();
```

SaveAs(filename*[string]*)

Description

Save a template/report with a new name

Arguments

- **filename** (string)

Filename you want to save. Note if you use the .orr extension the template will be saved as a report if generated.

Returns

no return value

Example

To save template data as file /data/test/template.opt:

```
data.SaveAs("/data/test/template.opt");
```

Update()

Description

Update/redraw a template

Arguments

No arguments

Returns

no return value

Example

To update template data:

```
data.Update();
```

Utils class

The Utils class contains various useful utility functions. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Ascii85Decode(encoded*[string]*)
- Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*)
- Build()
- CallPromiseHandlers()
- GarbageCollect()
- HiResTimer()
- TimerResolution()
- Version()

Detailed Description

The Utils class is used to provide various useful functions.

Details of functions

Ascii85Decode(encoded*[string]*) [static]

Description

Decodes an ASCII85 encoded string. See Utils.Ascii85Encode() for details on the method.

Arguments

- **encoded** (string)

An ASCII85 encoded string

Returns

ArrayBuffer object

Return type

ArrayBuffer

Example

To decode an ASCII85 encoded string:

```
var decoded = Utils.Ascii85Decode(encoded);
```

Ascii85Encode(data*[ArrayBuffer]*, length (optional)*[integer]*) [static]

Description

Encodes an ASCII85 encoded string. This enables binary data to be represented by ASCII characters using five ASCII characters to represent four bytes of binary data (making the encoded size 1/4 larger than the original). By doing this binary data can be stored in JavaScript strings. Note that the method used by PRIMER to encode and decode strings differs from the standard ASCII85 encoding as that uses the ASCII characters ", ’ and \ which cannot be used in JavaScript strings as they have special meanings. The method in PRIMER uses
0-84 are !-u (ASCII codes 33-117) (i.e. 33 is added to it) with the following exceptions
v is used instead of " (ASCII code 118 instead of 34)
w is used instead of ’ (ASCII code 119 instead of 39)
x is used instead of \ (ASCII code 120 instead of 92)
If all five digits are 0 they are represented by a single character z instead of !!!!!

Arguments

- **data** (ArrayBuffer)

ArrayBuffer containing the data

- **length (optional)** (integer)

Length of data in array buffer to encode. If omitted the whole array buffer will be encoded

Returns

string

Return type

String

Example

To encode ArrayBuffer data:

```
var encoded = Utils.Ascii85Encode(data);
```

Build() [static]

Description

Returns the build number

Arguments

No arguments

Returns

integer

Return type

Number

Example

To get the current build number

```
var build = Utils.Build();
```

CallPromiseHandlers() [static]

Description

Manually call any promise handlers/callbacks in the job queue

Arguments

No arguments

Returns

no return value

Example

To run any queued promise handlers/callbacks:

```
Utils.CallPromiseHandlers();
```

GarbageCollect() [static]

Description

Forces garbage collection to be done. This should not normally need to be called but in exceptional circumstances it can be called to ensure that garbage collection is done to return memory.

Arguments

No arguments

Returns

no return value

Example

To force garbage collection to be done:

```
Utils.GarbageCollect();
```

HiResTimer() [static]

Description

A high resolution timer that can be used to time how long things take. The first time this is called the timer will start and return 0. Subsequent calls will return the time in nanoseconds since the first call. Note that the timer will almost certainly not have 1 nanosecond precision but, depending on the platform, should should have a resolution of at least 1 microsecond. The resolution can be found by using Utils.TimerResolution()

Arguments

No arguments

Returns

number

Return type

number

Example

To time how long something takes to nanosecond precision:

```
var start = Utils.HiResTimer();
do something that takes some time...
var end = Utils.HiResTimer();
Message("it took " + (end-start) + "nanoseconds");
```

TimerResolution() [static]

Description

Returns the resolution (precision) of the Utils.HiResTimer() timer in nanoseconds

Arguments

No arguments

Returns

number

Return type

number

Example

To find the resolution of the timer in nanoseconds:

```
var resolution = Utils.TimerResolution();
```

Version() [static]

Description

Returns the version number

Arguments

No arguments

Returns

real

Return type

Number

Example

To get the current version number

```
var version = Utils.Version();
```

Variable class

The Variable class gives access to variables in Reporter. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- GetAll(template*[Template]*)
- GetFromName(template*[Template]*, name*[string]*)

Member functions

- Remove()

Variable constants

Name	Description
Variable.DESCRIPTION	Show variable description when editing variables with Template.EditVariables()
Variable.FORMAT	Show variable format when editing variables with Template.EditVariables()
Variable.FORMAT_FLOAT	Variable has floating point number format
Variable.FORMAT_GENERAL	Variable has general format
Variable.FORMAT_INTEGER	Variable has integer format
Variable.FORMAT_ LOWERCASE	Variable has lower case format
Variable.FORMAT_NONE	Variable has no format
Variable.FORMAT_SCIENTIFIC	Variable has scientific format
Variable.FORMAT_UPPERCASE	Variable has upper case format
Variable.NAME	Show variable name when editing variables with Template.EditVariables()
Variable.PRECISION	Show variable precision when editing variables with Template.EditVariables()
Variable.READONLY	Show variable readonly status when editing variables with Template.EditVariables()
Variable.TEMPORARY	Show variable temporary status when editing variables with Template.EditVariables()
Variable.TYPE	Show variable type when editing variables with Template.EditVariables()
Variable.VALUE	Show variable value when editing variables with Template.EditVariables()

Variable properties

Name	Type	Description
description	string	Variable description

format	constant	Variable format. Can be Variable.FORMAT_NONE, Variable.FORMAT_FLOAT, Variable.FORMAT_SCIENTIFIC, Variable.FORMAT_GENERAL, Variable.FORMAT_INTEGER, Variable.FORMAT_UPPERCASE or Variable.FORMAT_LOWERCASE
name	string	Variable name
precision	integer	Variable precision for floating point numbers.
readonly	logical	If Variable is read only or not.
temporary	logical	If Variable is temporary or not.
type	string	Variable type. Predefined types are "Directory", "File(absolute)", "File(basename)", "File(extension)", "File(tail)", "General", "Number" and "String". Alternatively give your own type. e.g. "NODE ID"
value	string	Variable value

Detailed Description

The Variable class allows you to access the name, description and value of a variable inside Reporter.
Note that if you want to get a list of the variables used in a Template you should see the variables array in the Template object.
The name, description and value properties give access to the variable name, description and value respectively.

Constructor

new Variable(template*[Template]*, name*[string]*, description (optional)*[string]*, value (optional)*[string]*, type (optional)*[string]*, readonly (optional)*[boolean]*, temporary (optional)*[boolean]*)

Description

Create a new Variable. The template and name arguments MUST be given, all others are optional

Arguments

- **template** (Template)

Template object to create variable in

- **name** (string)

Name of variable

- **description (optional)** (string)

Description of variable

- **value (optional)** (string)

Variable value

- **type (optional)** (string)

Type of variable. Predefined types are "Directory", "File(absolute)", "File(basename)", "File(extension)", "File(tail)", "General", "Number" and "String". Alternatively give your own type. e.g. "NODE ID". If omitted default is "General"

- **readonly (optional)** (boolean)

If variable is readonly or not. If omitted default is false.

- **temporary (optional)** (boolean)

If variable is temporary or not. If omitted default is true.

Returns

Variable object

Return type

Variable

Example

To create a new Variable object called TEST with description 'test variable', type of "Number" and value '10' which is not readonly for template, templ

```
var variable = new Variable(templ, "TEST", "test variable", "10", "Number",
false);
```

Details of functions

GetAll(template*[Template]*) [static]

Description

Returns an array of Variable objects for all of the variables in a Template.

Arguments

- **template** (Template)

Template to get the variables from

Returns

Array of Variable objects

Return type

Array

Example

To get all the variables in template t:

```
var v = Variable.GetAll(t);
```

GetFromName(template*[Template]*, name*[string]*) [static]

Description

Returns the Variable object for a variable name.

Arguments

- **template** (Template)

Template to find the variable in

- **name** (string)

name of the variable you want the Variable object for

Returns

Variable object (or null if variable does not exist)

Return type

Variable

Example

To get the Variable object for variable EXAMPLE in template t:

```
var v = Variable.GetFromName(t, "EXAMPLE");
```

Remove()

Description

Remove a variable
Note that if you call this function for a Variable object, the Variable data will be deleted, so you should not try to use it afterwards!.

Arguments

No arguments

Returns

no return value

Example

To remove variable data:

```
data.Remove();
```

Window class

The Window class gives access to windows for a graphical user interface. More...

The REPORTER JavaScript API provides many class constants, properties and methods. For Arup to be able to extend and enhance the API in the future any constant, property or method names beginning with a lowercase or uppercase letter are reserved.
If you need to add your own properties or methods to one of the existing classes then to avoid any potential future conflict you should ensure that the name begins with either an underscore (_) or a dollar sign ($) or the name is prefixed with your own unique identifier.
For example if company 'ABC' need to add a property called 'example' then to avoid any potential future conflict use one of:

- _example
- $example
- ABC_example

Class functions

- Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*)
- GetDirectory(initial (optional)*[string]*)
- GetFile(extension (optional)*[string]*, allow new (optional)*[boolean]*, initial (optional)*[string]*)
- GetFiles(extension (optional)*[string]*)
- GetInteger(title*[string]*, message*[string]*)
- GetNumber(title*[string]*, message*[string]*)
- GetOptions(title*[string]*, message*[string]*, options*[object]*)
- GetString(title*[string]*, message*[string]*)
- Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*)
- Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*)
- Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*)
- Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*)

Window constants

Name	Description
Window.CANCEL	Show CANCEL button
Window.NO	Show NO button
Window.OK	Show OK button
Window.YES	Show YES button

Detailed Description

The Window class is used to define several standard windows that can be used to read data, give messages and provide feedback

Details of functions

Error(title*[string]*, error*[string]*, buttons (optional)*[constant]*) [static]

Description

Show an error message in a window.

Arguments

- **title** (string)

Title for window.

- **error** (string)

Error message to show in window.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is

omitted an OK button will be used.

Returns

Button pressed

Return type

Number

Example

To show error *Critical error!\nAbort?* in window with title *Error* with Yes and No buttons:

```
var answer = Window.Error("Error", "Critical error!\nAbort?", Window.YES |
Window.NO);
if (answer == Window.YES) Exit();
```

GetDirectory(initial (optional)*[string]*) [static]

Description

Map the directory selector box native to your machine, allowing you to choose a directory.

Arguments

- **initial (optional)** (string)

Initial directory to start from.

Returns

directory (string), (or null if cancel pressed).

Return type

String

Example

To select a directory:

```
var dir = Window.GetDirectory();
```

GetFile(extension (optional)*[string]*, allow new (optional)*[boolean]*, initial (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose a file. See also Window.GetFiles()

Arguments

- **extension (optional)** (string)

Extension to filter by.

- **allow new (optional)** (boolean)

Allow creation of new file.

- **initial (optional)** (string)

Initial directory to start from.

Returns

filename (string), (or null if cancel pressed).

Return type

String

Example

To select a file using extension '.key':

```
var file = Window.GetFile(".key");
```

GetFiles(extension (optional)*[string]*) [static]

Description

Map a file selector box allowing you to choose multiple files. See also Window.GetFile()

Arguments

- **extension (optional)** (string)

Extension to filter by.

Returns

Array of filenames (strings), or null if cancel pressed.

Return type

String

Example

To select multiple files using extension '.key':

```
var files = Window.GetFiles(".key");
```

GetInteger(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input an integer. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns

Integer. Value input, (or null if cancel pressed).

Return type

Number

Example

To create an input window with title *Input* and message *Input integer* and return the value input:

```
var value = Window.GetInteger("Input", "Input integer");
```

GetNumber(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input a number. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns

Real. Value input, (or null if cancel pressed).

Return type

Number

Example

To create an input window with title *Input* and message *Input number* and return the value input:

```
var value = Window.GetNumber("Input", "Input number");
```

GetOptions(title*[string]*, message*[string]*, options*[object]*) [static]

Description

Map a window allowing you to input various options. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **options** (array of objects)

Array of objects listing options that can be set. If OK is pressed the objects will be updated with the values from the widgets. If cancel is pressed they will not.

Object has the following properties:

Name	Type	Description
selected (optional)	boolean	If checkbox is selected or not
text	string	Text to show next to option
type	string	Type of option. Can be "label" (plain text), "text" (a one line text widget), "textbox" (a multi line text widget) or "checkbox" (a checkable option)
value	string	Text to show for option

Returns

false if cancel pressed, true if OK pressed.

Return type

Boolean

Example

To create a window with title *Options* , message *Please give the options* with label, text, textbox and checkbox widgets:

```
var options = [
                  { text:"Label example", type:"label", value:"banana" },
                  { text:"Text example", type:"text", value:"single line of text"
},
                  { text:"Textbox example", type:"textbox",
value:"Multiple\\nlines\\nof\\ntext" },
                  { text:"Checkbox example", type:"checkbox", value:"Do this?",
selected:true }
                 ];
ok = Window.GetOptions("Options", "Please give the options", options);
```

GetString(title*[string]*, message*[string]*) [static]

Description

Map a window allowing you to input a string. OK and Cancel buttons are shown.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

Returns

String. Value input, (or null if cancel pressed).

Return type

String

Example

To create an input window with title *Input* and message *Input string* and return the value input:

```
var value = Window.GetString("Input", "Input string");
```

Information(title*[string]*, info*[string]*, buttons (optional)*[constant]*) [static]

Description

Show information in a window.

Arguments

- **title** (string)

Title for window.

- **info** (string)

Information to show in window.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used.

Returns

Button pressed

Return type

Number

Example

To show information *Information* in window with title *Example* with OK and Cancel buttons:

```
var answer = Window.Information("Example", "Information", Window.OK |
Window.CANCEL);
if (answer == Window.CANCEL) Message("You pressed the Cancel button");
```

Message(title*[string]*, message*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a message in a window.

Arguments

- **title** (string)

Title for window.

- **message** (string)

Message to show in window.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used

Returns

Button pressed

Return type

Number

Example

To show message *Press YES or NO* in window with title *Example* with YES and NO buttons:

```
var answer = Window.Message("Example", "Press YES or NO", Window.YES |
Window.NO);
if (answer == Window.NO) Message("You pressed No");
```

Question(title*[string]*, question*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a question in a window.

Arguments

- **title** (string)

Title for window.

- **question** (string)

Question to show in window.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted Yes and No button will be used.

Returns

Button pressed

Return type

Number

Example

To show question *Do you want to continue?* in window with title *Question*:

```
var answer = Window.Question("Question", "Do you want to continue?");
if (answer == Window.NO) Message("You pressed No");
```

Warning(title*[string]*, warning*[string]*, buttons (optional)*[constant]*) [static]

Description

Show a warning message in a window.

Arguments

- **title** (string)

Title for window.

- **warning** (string)

Warning message to show in window.

- **buttons (optional)** (constant)

The buttons to use. Can be bitwise OR of Window.OK, Window.CANCEL, Window.YES or Window.NO. If this is omitted an OK button will be used.

Returns

Button pressed

Return type

Number

Example

To show warning *Title is blank\nSet to ID?* in window with title *Warning* with Yes and No buttons:

```
var answer = Window.Warning("Warning", "Title is blank\nSet to ID?", Window.YES
| Window.NO);
if (answer == Window.NO) Message("You pressed No");
```
