Table of Contents

| 1. Title | 15 |
|---|----|
| 2. Preamble | |
| 2.1. Text Conventions Used in this Manual | 16 |
| 3. Themes for the Graphical User Interface | 18 |
| 3.1. Setting the Theme | 19 |
| 4. Introduction | 21 |
| 4.1. Program Limits | 22 |
| 4.2. Running T/HIS | |
| 4.3. Command Line Options | 27 |
| 5. Using Screen Menus | |
| 5.1. Basic Screen Menu Layout | |
| 5.2. Mouse and Keyboard Usage for Screen Menu Interface | |
| 5.3. Dialogue Input in the Screen Menu Interface | |
| 5.4. Window Management in the Screen Interface | |
| 5.5. Common Borders for graphics windows | 40 |
| 5.6. Dynamic Viewing (Using the Mouse to Change Views) | 45 |
| 5.7. "Tool Bar" Options | 47 |
| 5.8. Colours | |
| 6. Graphs and Pages | 54 |
| 6.1. Creating Graphs | 55 |
| 6.2. Page Size | 56 |
| 6.3. Page Layouts | 57 |
| 6.3.1. Basic Mode | 58 |
| 6.3.2. Advanced Mode | 61 |
| 6.4. Pages | 64 |
| 6.5. Active Graphs | 65 |
| 7. Global Commands and Pages | 66 |
| 8. Main Menu | 69 |
| 8.1. Selecting Curves | |
| 8.1.1. Input Curves | 70 |
| 8.1.2. Output Curves | |
| 8.1.3. Curve Operations | 74 |

| 8.2. READ Options | 77 |
|----------------------------------|-----|
| 8.2.1. Ansys LS-DYNA | |
| 8.2.2. GROUPS | 93 |
| 8.2.3. T/HIS Curve | |
| 8.2.4. KEYWORD | 97 |
| 8.2.5. BULK | |
| 8.2.6. KEYBOARD | 99 |
| 8.2.7. CSV | |
| 8.2.8. SCREEN | |
| 8.2.9. ISO | 104 |
| 8.2.10. LS-PREPOST | 107 |
| 8.2.11. DIAdem | |
| 8.2.12. NASTRAN | 111 |
| 8.2.13. CURVOUT | |
| 8.2.14. Equation | 115 |
| 8.2.15. HDF | |
| 8.3. WRITE Options | |
| 8.3.1. WRITE TO FILE | 130 |
| 8.3.2. WRITE TO SCREEN | |
| 8.4. Curve Manager | |
| 8.4.1. Reordering Curves | |
| 8.4.2. Blank | 164 |
| 8.4.3. Delete | 165 |
| 8.4.4. Table | |
| 8.4.5. Summary | 176 |
| 8.4.6. List | 177 |
| 8.4.7. Scan | 178 |
| 8.4.8. CURVE RANGE SELECTION | |
| 8.4.9. CURVE TAGS | |
| 8.5. Model Manager | |
| 8.5.1. Select | 181 |
| 8.5.2. Re-Read | |
| 8.5.3. Delete | |
| 8.5.4. Convert Binout | 185 |
| 8.6. EDIT Options | |
| 8.6.1. Interactive Curve Editing | |
| 8.6.2. Command Line Mode | |

| 8.6.3. Curve Labels | 193 |
|---|-----|
| 8.7. LINE STYLES | 194 |

| 8.24. The JavaScript Interface | |
| 8.24.1. Introduction | |
| 8.24.2. Using JavaScript in T/HIS | |
| 8.24.3. Running a JavaScript in "batch" mode | |
| 8.24.4. Running a JavaScript from within a FAST-TCF script | |
| 8.24.5. ECMAScript 6 Modules | |
| 8.24.6. Scripts using GUIs | |
| 8.24.7. Examples | |
| 8.24.8. MADM Correlation Tool | |
| 8.24.9. The T/HIS JavaScript API | |
| 8.24.10. CORA (CORrelation and Analysis) Tool | |
| 8.25. Datum Lines | |
| 8.25.1. List | |
| 8.25.2. Create/Edit | |
| 8.25.3. Read | |
| 8.25.4. Save | 353 |
| 8.26. T/HIS Session Save and Retrieve | |
| 8.26.1. Save Session | |
| 8.26.2. Retrieve Session | |
| 8.27. Workflows | |
| 8.27.1. Workflows Updates | |
| 8.27.2. Workflows menu in T/HIS | |
| 9. Other Options | |
| 9.1. Tool Bar | |
| 9.1.1. File | |
| 9.1.2. Graphs | |
| 9.1.3. Plotting | |
| 9.1.4. Functions | |
| 9.1.5. Images | |
| 9.1.6. Display | |
| 9.1.7. Options | |
| 9.1.8. Quick Pick | |
| 9.2. Graph Tool Bar | |
| 9.2.1. Graph Selection | |
| 9.2.2. Plotting | |
| 9.2.3. Display | |

| 9.2.4. Auto_Blank | |
|---|-----|
| 9.2.5. Curve Locking | |
| 9.2.6. AB | |
| 9.3. CURVE INFORMATION | |
| 9.3.1. Properties | |
| 9.3.2. Edit Labels | |
| 9.3.3. Functions | |
| 9.4. Curve Histories | |
| 9.4.1. Viewing | |
| 9.4.2. Modifying | |
| 9.4.3. Inserting New Operations | |
| 9.4.4. Update Curve | 403 |
| 9.4.5. Update Curve Dependants | |
| 9.4.6. List Dependants | 405 |
| 9.4.7. Reset Curve | |
| 9.5. Keyboard Shortcuts | |
| 9.6. Preferences | |
| 9.6.1. Save Preferences Popup | 413 |
| 9.7. PRIMER: Synchronising with PRIMER | 414 |
| 9.7.1. The PRE panel | 415 |
| 9.7.2. Locating keyword deck in T/HIS | |
| 9.7.3. Highlight output database cards in PRIMER | 418 |
| 9.7.4. Synchronising Operations | |
| 9.8. REPORTER: Integrating with REPORTER | |
| 10. FAST-TCF | 426 |
| 10.1. FAST-TCF Overview | |
| 10.1.1. New Features | |
| 10.2. FAST-TCF Introduction | |
| 10.2.1. General Rules | |
| 10.2.2. Running FAST-TCF | |
| 10.2.3. Input Files Needed, and Output and Intermediate Files Created | 432 |
| 10.2.4. Debugging FAST-TCF Files | 433 |
| 10.2.5. Creating FAST-TCF Files | |
| 10.3. Page/Graph Layout and Selection | |
| 10.4. Input Syntax to Load Other Files | 442 |
| 10.5. Input for Data Extraction Requests | |
| 10.5.1. Selecting Models | |
| | |

| 10.5.2. Data Extraction Options | |
|---|-----|
| 10.5.3. Defining Groups of Parts | 450 |
| 10.5.4. Specifying Surfaces, Integration Points and Nodal Locations for Data Extraction | 451 |
| 10.5.5. Data Extraction Reference Table | 454 |
| 10.6. Units | 485 |
| 10.7. Curve Tags | 488 |
| 10.8. Curve Groups | 492 |
| 10.9. Performing FAST-TCF Curve Operations | |
| 10.9.1. Standard Operation Commands | |
| 10.9.2. Maths Operation Commands | |
| 10.9.3. Automotive Operation Commands | 499 |
| 10.9.4. Seismic Operation Commands | 502 |
| 10.9.5. Range of Curve Operation Commands | 503 |
| 10.10. Applying Extra Options to Data Requests | 504 |
| 10.11. Setting Properties for Curves | 506 |
| 10.12. Defining Datums | 510 |
| 10.12.1. Creating Datum Definitions | 510 |
| 10.12.2. Adding Datum Lines to Graphs | 512 |
| 10.12.3. Removing Datum Lines from Graphs | 513 |
| 10.13. FAST-TCF Image Output Options | 514 |
| 10.13.1. Setting Curve Styles | 515 |
| 10.13.2. Setting Curve Styles by Model | 517 |
| 10.13.3. Plot Setup | 518 |
| 10.13.4. Curve Display | 524 |
| 10.13.5. Image Generation | |
| 10.13.6. Pre 9.3 Image Output | 529 |
| 10.14. Outputting Curve Properties to Text Files, Variables and REPORTER | 531 |
| 10.14.1. Available Curve Properties | 533 |
| 10.14.2. Writing Out Curve Properties to a Text "Tabulation" File | 535 |
| 10.14.3. Writing Out REPORTER Variables | |
| 10.14.4. Setting Up New FAST-TCF Variables to Contain Curve Properties | |
| 10.14.5. Format | |
| 10.14.6. Description | 539 |
| 10.15. FAST-TCF Curve Output | |

1. Title

Oasys 🔅 LS-DYNA Environment

Oasys LS-DYNA Environment X/Y Data Processing

Version 22.0, Copyright Arup Digital Products Ltd, 2025 8 Fitzroy Street | London | W1T 4BJ

LS-DYNA, LS-OPT and LS-PrePost are registered trademarks of ANSYS, Inc.

2. Preamble

2.1. Text Conventions Used in this Manual

Text conventions used in this manual

Typefaces

Three different typefaces are used in this manual:

| Manual text | This typeface is used for text in this manual. |
|---------------|---|
| Computer type | This one is used to show what the computer types. It is also used for equations, keywords (eg *PART) etc. |
| Operator type | This one is used to show what you must type. |
| Button text | This one is used for screen menu buttons (eg APPLY) |

Notation

Triangular, round and square brackets have been used as follows:

• Triangular

To show generic items, and special keys. For example: <list of integers> <filename> <data component><return> <control Z> <escape>

Round

To show optional items during input. For example: <command> (<optional command>) (<optional number>)

And also to show defaults when the computer prompts you, e.g.:

Give new value (10) :

Give model number (12) :

• Square

To show advisory information at computer prompts, e.g.:

Give filename: [.key] :

THIS >>> [H for Help] :

3. Themes for the Graphical User Interface

Themes for the Graphical User Interface

3 themes are available for Oasys LS-DYNA Environment software. Users can select a **Light**, a **Dark** or a **Classic** theme. The latter uses the colours of the old user interface (used prior to version 17 of the software).

The themes offer different colour and contrast options for comfort and accessibility.

3.1. Setting the Theme

Setting the theme

The default software theme in Oasys 22.0 is **Light**. This can be changed from the Oasys SHELL by choosing from the **Themes** pop-up. This automatically saves the selected theme as your preference for all programs.

| SH SHELL | | | | | – 🗆 X |
|-----------------|----------------|---------------|----------|----------|-------------|
| • | | | | | |
| Uas | /S 🤔 LS- | DARK | Themes ► | | |
| | | CLASS | IC | | |

| | | | | | Status |
| Options | | Options | Options | Batch | Support |
| Oasys Ltd LS-DY | NA Environment | | | | |

The theme can also be set for individual programs from the **Display** menu in PRIMER, D3PLOT and T/HIS or the **Preferences** menu (**File**->**Preferences**...) in REPORTER. This choice is not automatically retained after exiting the program, so you must select a theme, then select **Save pref** to ensure a theme is used for all future sessions.

4. Introduction

Introduction

T/HIS is an x/y plotting program, specifically written to perform two functions:

- 1. To produce time-history plots from transient analyses, such as those performed using Ansys LS-DYNA.
- 2. To plot any form of x/y data that is produced either by a program or by directly typing in values.

T/HIS is a graphically driven, interactive program. Input and manipulation of data is through a graphical user interface on systems capable of running X-Windows applications; selections are made through "pressing buttons" using a mouse. On machines not capable of running X-Windows it is also possible to use T/HIS in a "command line" mode of operation; instructions are entered through the keyboard to perform the required operations.

4.1. Program Limits

Program Limits

There are a number of limits in T/HIS of which the user should be aware. These are listed below:

| Number of graphs | T/HIS can have a maximum of 32 graphs | | | |
|---------------------|--|--|--|--|
| Number of curves | The number of curves is unlimited | | | |
| Number of points | The number of points that can be defined per curve is unlimited. | | | |
| Time-history blocks | In the interface to the Ansys LS-DYNA time-history (.thf) file there is a limit of 100,000 items in each of the node, solid, beam, shell and thick shell time-history blocks: thus 500,000 items overall. | | | |
| | In the interface to the Ansys LS-DYNA extra time- history (.xtf) file up to 100,000 nodal reactions (or groups of reactions) may be processed. | | | |
| Number of colours | By default, T/HIS curves wrap around the following six colours in order: | | | |
| | WHITE RED GREEN BLUE CYAN MAGENTA | | | |
| | However, a further 24 predefined colours are available if required and 6 user defined ones can be created. | | | |
| Title | The title can contain up to 80 characters. | | | |
| Labels | Labels for axes and lines can contain up to 80 characters. | | | |

4.2. Running T/HIS

Running T/HIS

Starting the code

For users on a device with a window manager T/HIS is run from the **T/HIS** button in the SHELL:

| Sн | SH SHELL – 🗆 X | | | | | | | | | | |
|----|--|--|----------|--|----------|---------|--|----------|--|-----------|---|
| | Modion 🔅 Themes 🕨 | | | | | | | Þ | | | |
| | Prepare · Analyse · Visualise · Process · Report | | | | | | | es | | | |
| | rioparo | | | | neddiloo | 1100000 | | | | Manuals | • |
| | PRIMER | | ls-dyna® | | D3PLOT | T/HIS | | REPORTER | | Utilities | Þ |
| | | | | | | | | | | Status | |
| | Options | | | | Options | Options | | Batch | | Suppor | t |
| | | | | | | | | | | | |

If your system has been customised locally you may have to use some other command or icon: consult your system manager in this case.

Graphics Driver

T/HIS 9.3 onwards uses a OpenGL graphics driver.

T/HIS uses 32 bit (single-precision) numbers to store and plot data.

"Batch" Mode

T/HIS can run in "batch" mode where the main application window is not displayed on the screen. "Batch" mode is available on all platforms.

To start T/HIS in batch mode use the command line option "-batch".

```
e.g. this14_64.exe -tcf=script.inp -batch
```

When running in "batch" mode T/HIS will automatically exit at the end of the script regardless of whether or not "-exit" is specified.

NOTE : All image, postscript and PDF outputs require a DISPLAY on UNIX / LINUX systems. If you are running T/HIS in "batch" mode as part of a automatic post processing script then T/HIS must have a X Windows DISPLAY even though the main window is not displayed. If the machine you are using is a server or part of a cluster without an X-Server then T/HIS can be used with the Xvfb software.

Selecting a device when a window manager is not running

If you are running on a non-window device, for example a Tektronix display or emulator, you may not be able to use screen menus. Instead you will have to run in "command-line" mode.

It is very unlikely that a user on a modern workstation will see these options, since the machine will have a window manager and will be running in "screen menu" mode. If they do appear it suggests that the machine and/or software are wrongly set up: see below for suggested remedies.

If T/HIS will not start in screen-menu mode

You may be running on a device with a window manager, but still only get the command-line prompt (and probably no menu driven _93 shell either).

This is almost certainly because of one or both of the following setup errors:

(1) The DISPLAY environment variable has not been set up, or has been set incorrectly. This tells the X11 window manager where to place windows, and it must be set to point to your screen. Its generic setup string is:

setenv DISPLAY <hostname>:<display number> (C shell syntax)

Where <hostname> is your machine's name or internet address, for example:

| setenv DISPLAY :0 | (Default display :0 on this machine) |
|------------------------------|--|
| setenv DISPLAY tigger:0 | (Default display :0 on machine "tigger") |
| setenv DISPLAY 69.177.15.2:0 | (Default display :0, address 69.177.15.2) |

You may have to use the raw network address if the machine name has not been added to your /etc/hosts file, or possibly the "yellow pages" server hosts file.

(2) Your machine (strictly the X11 "server") has not been told to accept window manager requests from remote machines. This is usually the case when you are

trying to display from a remote machine over a network, and you get the message similar to:

Xlib: connection to "<hostname>" refused by server

Xlib: Client is not authorised to connect to server

In this case go to a window with a Unix prompt on your machine, and type:

xhost +

Which tells your window manager to accept requests from any remote client. It will produce a confirmatory message, which will be something like:

access control disabled, clients can connect from any host

If T/HIS still fails to work then please contact your system manager, or contact Oasys Ltd Support for advice and help.

Command Line Mode

Command line mode is the main method of data input on non X-Windows devices. Command line mode is also available within the X-Windows screen interface and is accessed through the dialogue window. In command line mode the user will be presented with a prompt which also indicates which level of the menu structure the user is at. For example:

Defaults >

In response to the prompt a valid option must be given. These are usually a two or three letter abbreviation of a command; for example PL is the command to plot a graph. A list of the commands available is provided by typing M (for Menu). In addition to commands specific to one menu there are a number of commands which have the same effect throughout T/HIS.

- ^Q (Quit) Abort and return to current menu
- ! Go up a level in the menu structure
- / Return to the top level menu
- ; Equivalent to a <carriage return> in a string of commands
- M Lists menu.

Several commands can be strung together on one line, separated by spaces, for example:

/DE GR ON

Numeric data can also be included in the command line if required, for example:

/OP ADX #1 7.2

Commands can be in upper or lower case.

As well as menu level commands you will be asked questions such as:

THF file to read (filename_1)?

The default response, if one exists, is given in parentheses.

4.3. Command Line Options

Command Line Options

Instead of starting T/HIS using the Command shell it is also possible to start T/HIS from the command line with a number of optional input parameters. Starting T/HIS from the command line offers a number of advantages.

- Faster start-up is possible by pre-selecting the device type.
- The input filename can be specified and opened automatically.
- Faster start-up is possible by pre-selecting the device type

Argument format:

<application name> (<arg 1>) (<arg n>) (<input filename>)

| T/HIS 22.0 can be started with a number of optional command line options | T/HIS 22.0 can | be started with | a number of o | ptional comman | d line options |
|--|----------------|-----------------|---------------|----------------|----------------|
|--|----------------|-----------------|---------------|----------------|----------------|

| Graphics | -d= <device type=""></device> | Valid device types are: | | | |
|------------------------|--------------------------------|---|------------------------|--|--|
| device type | eg-d=default | opengl | OpenGL | | |
| | | tty | No windows | | |
| | | default | OpenGL | | |
| Command file | -cf= <filename></filename> | Any valid T/HIS | command file | | |
| name | eg-cf=run_1.tcf | filename | | | |
| | -tcf= <filename></filename> | 2 | FAST-TCF command | | |
| FAST-TCF input file | eg-tcf=run_1.inp | file filename | | | |
| | -set= <filename></filename> | Any valid T/HIS settings file | | | |
| Settings file | eg-set=this001.set | | | | |
| JavaScript | -js= <filename></filename> | Any valid T/HIS J | avaScript file | | |
| | eg-js=sort_curve.js | | | | |
| JavaScript | -js_arg= <argument></argument> | Any valid string. | | | |
| Arguments | €g-js_arg=abc | The arguments can be accessed in script by using the global argument array. | | | |
| | | Multiple argume | ents can be given to a | | |

| | | script by using more than one – js_arg command line argument. |
|---|--|--|
| Ansys LS-DYNA Model | <filename></filename> | Any filename from the analysis |
| All the files associated with the model are opened and the contents scanned. | eg run_1.thf | This should be the last argument on the command line. |
| Ansys LS-DYNA Model list Specify a file containing a list of models for T/HIS to automatically open. | -model_list= <filename> eg -model_List=job_list</filename> | The model list file should contain the full pathname of one file from each model that T/HIS should open. Each file should be on a seperate line and it should be the first item on each line (other items seperated with commas can be specified on the same line for use with REPORTER). |
| Model Database file Specify the name of the default model database file. | -mdb= <filename> eg -mdb=database.xml</filename> | The model database file is an XML format file that contains information on where models are located along with a brief description of each model The model database can be used to easily select multiple models |
| T/HIS curve file Specify a T/HIS curve file | -cur= <filename> Of -curve=<filename></filename></filename> | |
| containing one or more curves for T/HIS to automatically open. | eg-cur=test.cur | |
| T/HIS curve file list | -curve_list= <filename> Or -curve=<filename></filename></filename> | The curve list file should contain the full pathname of each cure file that you want T/HIS to open. Each file |
| Specify a file containing a list of curve | eg-cur=test.cur | should be on a separate line. |

| | | |
|-------------------|-------------------------------|---|
| files for T/HIS | | |
| to | | |
| automatically | | |
| open. | | |
| T/HIS bulk data | -bdf= <filename></filename> | |
| file | | |
| | eg-bdf=test.cur | |
| Specify a T/HIS | | |
| BDF file | | |
| containing one | | |
| or more curves | | |
| for T/HIS to | | |
| automatically | | |
| open. | | |
| | -maximise | |
| Automatically | | |
| maximises the | | |
| T/HIS window | | |
| so that it | | |
| occupies the | | |
| full screen. | | |
| Read THF file | -thf= <yes no=""></yes> | |
| Read XTF file | -xtf= <yes no=""></yes> | |
| Read LSDA | -lsda= <yes no=""></yes> | |
| (binout) file | - · | |
| | | |
| Read ASCII files | -ascii= <yes no=""></yes> | |
| Specifying a | -pref= <filename></filename> | <filename> must be a valid "oa_pref"</filename> |
| custom | | file. |
| "oa_pref" file. | | |
| | | If it has no path prefixed, the file is |
| This causes an | | assumed to be in the OA_INSTALL |
| extra, optional | | directory. Any legal filename may be |
| "oa_pref" file to | | used. |
| be read. | | |
| | -use elout= <yes no=""></yes> | By default T/LUS uses the FLOUTDET |
| Use ELOUT | | By default T/HIS uses the ELOUTDET |
| instead of | | part of the LSDA file in preference to |
| ELOUTDET | | ELOUT if the LSDA file contains both. |
| | | This option can be used to force T/HIS |
| | | to use the ELOUT data when reading |
| | | Shell and ThickShell data as the |
| | | ELOUT data can be in the global |

| | | coordinate system instead of the element local coordinate system. |
|---|--|--|
| Write out data in the ISO-MME format (See <u>WRITE Options</u>) | -write_iso_mme | This option should be used in conjunction with the - iso_output_dir and -iso_config options. A model to extract the data from also needs to be specified. As an example: this.exe -write_iso_mme - iso_output_dir= <directory> - iso_config=<filename> <model_filename></model_filename></filename></directory> |
| Specify the output directory to write data to for the - write_iso_mme option. | - iso_output_dir= <directory></directory> | |
| Specify the configuration file to use for the - write_iso_mme option. | -iso_config= <filename></filename> | |
| Specify a directory for T/HIS to start in. | -start_in= <directory></directory> | Any valid directory |
| Set the width of the T/HIS graph window (in pixels) | -xres= <size> eg -xres=800</size> | |
| Set the height of the T/HIS graph window (in pixels) | -yres= <size> eg -yres=600</size> | |
| Run T/HIS without the console window. | -noconsole | Windows only. |
| Run T/HIS in "batch" mode | -batch | For this option to work you must also specify a command file " – |

| where the main | | cf=filename " and the name of the PTF file to open. |
|---|--|--|
| application | | · |
| window is not | | This option will automatically set " – |
| displayed on | | exit " so that D3PLOT terminates |
| the screen. | | after playing the command file. |
| Redirect output | | -eo= <filename> is designed for the</filename> |
| from the | -eo -eo=default | user to suppress the console and |
| console | | redirect logfile output to the specified |
| window to a | | filename. In order to permit multiple |
| file on | | sessions to coexist on the same |
| Windows. | | machine the process ID will be |
| | | appended to the <name> part of the</name> |
| To redirect | | filename to give <name>_pid.<ext>.</ext></name> |
| output on | | |
| Unix/Linux use the shell | | If plain "-eo" Or "-eo=default" are |
| redirection | | found then filename generation is automatic, and the first valid of: |
| options | | automatic, and the mist valid of. |
| (typically > for | | %TEMP%\this_log_ <pid>.txt</pid> |
| <stdout>, & for</stdout> | | <pre>%TMP%\this_log_<pid>.txt</pid></pre> |
| <stderr>)</stderr> | | <pre>%HOMESHARE%\this_log_<pid>.txt %USERPROFILE%\this log <pid>.txt</pid></pid></pre> |

| the checkpoint files upon T/HIS startup Read checkpoint files and Show checkpoint playback panel upon T/HIS startup. | <pre>show_checkpoint_files=< TRUE/FALSE > checkpoint_dir=< directory ></pre> | TRUE/FALSE, turn off the initial checkpoint files panel (default is FALSE) If the writing of the checkpoint files is OFF, the reading will also be OFF. <directory> must be a valid directory name on your system. If the value is <none> then the checkpoint files are not recorded for</none></directory> |

| Stop and exit | -exit | |
|---------------|-------|--|
| after command | | |
| file | | |

Some examples for T/HIS might be:

```
pathname/this12.exe -d=x run_2.thf (Use device X, open a .thf file)
pathname/this12.exe -d=tty
cf=batch.tcf -exit (No graphics, run command file)
```

Note that no spaces should be left in the syntax <arg>=<value>.

| For example: | " $-d = x$ " is illegal. |
|--------------------|--------------------------|
| Correct syntax is: | "-d=x " |

5. Using Screen Menus

Using Screen Menus

Versions of T/HIS prior to release 6.1 only had a "command-line" interface. This has been preserved for backwards compatibility, but a "screen-menu" interface has been added which allows you to drive the program almost entirely with the mouse.

5.1. Basic Screen Menu Layout

Basic screen menu layout

T/HIS runs within a single window, owned by the window manager, which has several sub-windows inside it. A typical T/HIS session will look like this:

The various sub-windows always exist within the master window, and may be moved and resized at will inside it. They will keep their relative size and position as the master window is changed in size and/or shape, and will reappear after the main window is deiconised.

The default layout of the main sub-windows is as follows:

| T/HIS | |
|-------|--|
| | |

| | | Main Menu Options |
|-------------------|-----------------|-------------------|
| Graphics Area | | Menu Area |
| Dialogue and List | Global Commands | |

These windows cannot be dismissed. A brief description of their functions is:

| Main Menu Options | Provides access to the majority of the commands and options available in T/HIS through a series of sub menus (see <u>Main Menu</u>). |
|----------------------|--|
| Graphics area | Is where graphs are drawn. In T/HIS 22.0 this area can contain a maximum of 32 graphs (see <u>Graphs and Pages</u>). Alternatively if graphs have been organised into pages (see <u>Page Layout</u>) then this area will display a single page of graphs. |
| Dialogue & list | Allows "command-line" input and output, also provides a listing area for messages. |
| Menu Area | Displays the commands and options associated the current selection from the main menu options. |
| Global Commands | Gives access to commonly used commands (see <u>Global Commands</u> <u>and Pages</u>). |

While you are free to reposition these master windows it is recommended that you keep to this default layout. This is because when further sub-windows appear their position and size is designed assuming this layout, and aims to obscure as little useful information as possible.

5.2. Mouse and Keyboard Usage for Screen Menu Interface

Mouse and keyboard usage for screen-menu interface

All screen-menu operations are driven with the left mouse button, with the following exceptions:

(a) Text in the dialogue area and text boxes requires keyboard entry.

(b) Text strings saved in the cursor "cut" buffer may be "pasted" into dialogue areas and text boxes using the middle mouse button.

The primitive "widgets" in the menu interface are used as follows:

BUTTONS:

Screen buttons are depressed by clicking on them, but action only takes place when the mouse button is released, so it is safe to drag the (depressed) mouse around the screen.

Buttons may also be greyed out to indicate that the option is not currently available. Buttons with " ... " after them will usually invoke sub-menus.

"Popup" window invocation : Buttons with an " > " symbol may be selected normally with the left mouse button, but if the *right* mouse button is depressed over them it will invoke a "popup" window. Holding the right mouse button down move the cursor into this window to make a selection, or move elsewhere and release the button to deactivate the popup.

SLIDERS:

Sliders are moved by clicking on the slider button itself, and then dragging it to a new position. They may also be moved automatically

by clicking on, and holding down, one of the arrows at either end.

TEXT BOXES:

To enter text in a text box: first make it "live" by clicking on it, then type in text, then type **<return>** to enter the string. Clicking on a "live" box for a second time is exactly the same as typing <return>, so clicking twice on a box effectively enters its current contents. You can use the left and right arrow keys for line editing within a box: text entry takes place after the current cursor position.

RADIO BOXES

A "radio" set is provided where only one selection is possible from a range of options. In this example the postscript laser output has been set to a single image per page.

MENU SELECTIONS:

Menus of items are used when you need to make one or more selections from a (potentially) long list. Click on the row you want to select: clicking on a row that is already selected will have the effect of unselecting it. When the list is too long to display in the window you can use the vertical scroll-bars to move up and down it.

A range of items may be selected by either

 Click on the first item and hold down the mouse key, drag the mouse to the last item in the list. All items between the first and last including the first and last are selected.

or

37 / 900

2) Click on the first item, hold down the SHIFT key and click on the last item in the list. All items between the first and last including the first and last are selected.

| □ 1×1 | |

| □ 3×3 | |
| ☐ 4×4 | |

Contact Tes

5.3. Dialogue Input in the Screen Menu Interface

Dialogue input in the screen menu interface

The full command-line capability is preserved when T/HIS is running in screen-menu mode, and you are free to mix command-line and mouse-driven input at will. There are some situations in which command-line input is more efficient: for example when entering lists of explicit entities.

Commands are entered in the dialogue box:

As this example shows the dialogue box is also used for listing messages, warnings and errors to the screen. It can be scrolled back and forth (its buffer is 200 lines long) to review earlier messages. The following colours are used:

| Normal messages and prompts | Yellow |
|--------------------------------|---------|
| prompts | |
| Text typed in by you | White |
| Warning messages | Magenta |
| Error messages | Red |

There is a minor limitation when mixing command-line and screen-menu mode: you cannot perform the same function simultaneously in both modes. If you attempt to do so you will get the message:

WARNING: recursive access attempted

And you will not be permitted to continue.

For T/HIS 20.0 onwards, we have now also added the ability to use the Up and Down arrow keys in order to cycle through previously issued commands that you have entered into the Dialogue window. Currently only the last 50 commands are stored in memory. Commands issued after this 50 limit will remove the oldest issued commands first from the list.

5.4. Window Management in the Screen Interface

Window management in the screen interface

Moving, resizing and scrolling of windows is based on the conventions used in the Motif Window Manager.

| To move a window: | Click down on its title bar, then drag the window to where you want it to be. A "rubber-band" outline moves to show the window's current position. | |
|--------------------------|--|--|
| To resize a window: | Either | |
| | Click on a border bar to move just that side, or on a corner bar to move both sides attached to that corner. Again, a rubber-band outline shows you the new shape. | |
| | or | |
| | Use the MAXIMISE button in the top right hand corner of the window to increase the size of the window to the largest possible size. | |
| To scroll a window: | If a window has got too small for its contents then horizontal and/or vertical scrollbars will appear. Click on a scrollbar slider and move it to the desired position, the window contents will scroll as you do so. Alternatively click on the arrows at either end of the scrollbar for timed motion in that direction. | |
| To minimise a window: | Click on the button in the top right hand corner of the window. When a window has been iconised it will appear in the ICON area at the bottom of the screen. | |
| To restore a window: | Iconised windows may be restored by clicking on the icon in the ICON area. | |

5.5. Common Borders for graphics windows

Common Borders for graphics windows

When a page contains more than one graphics window these are laid out in a cellular grid as defined in the <u>Window Layout</u> section. This leads to "common borders" between adjacent windows. From T/HIS 19.0 onwards it is possible to drag this common border with the mouse in a way that resizes windows on both sides of the border as shown in the following images.

Move the mouse (don't depress a button) over a border region between two windows. This will highlight the drag areas in which a "click and drag" operation will move borders. In order to control which borders are dragged, three zones – coloured pink, blue and green – are shown and these have the following meanings:

| (Both green zones have the same effect, it doesn't matter which end you use.) | |
|---|---|
| Dragging in the green zone moves all windows on either side of the border in the appropriate direction. In this example, all four windows are moved. | G1 Plotting Display Auto_Blank 0.8 0.8 0.0 0. |

| In this example, the mouse is at the bottom left of G1 / top left of G3 and it can be seen that the borders that are highlighted for dragging are those which intersect at this point. | |
|--|---|
| Switching common borde | er Graph Layout ? 🗙 |
| dragging on/off | Create Graph(s) |
| | 1 Number of graphs to create |
| | O Create using preference settings |
| Common borders are on by defau | It, but O Create using current settings |
| they can be controlled from the G | (C) Copy settings from graph 1 |
| Layout panel. | Page Size Width 727 pixels |
| - | Height 671 pixels |
| The default behaviour may also be | e set by Common borders between windows ? |
| the preference: | ✓ Snap dragged window to grid Insert ▼ |

```
this*common_window_borders: true |
false
```

Window "snap to grid" and other options.

When dragging an entire window with the mouse to move its position on the screen (i.e. not resizing it) there are several possible outcomes:

- 1. **Snap to Grid**: The window is moved from one "cell" in a multi-window page to a different cell, shifting the contents of one or more cells out of the way.
- 2. **Free positioning #1**: The window is moved from inside the T/HIS master window to a new user-defined position within that window, i.e. positioned where it is "dropped".
- 3. **Free positioning #2**: The window is moved from inside the T/HIS master window and out onto the desktop.

The behaviour of "Snap to Grid" is illustrated in the following figure:

| In this example, G4 is being dragged and | Releasing the mouse in this example |
|--|--|
| the cursor is | causes G4 to |
| at the "+" position inside G1. The borders | move to the "cell" of G1, and windows G1 |

٦

Г

Switching "Snap to grid" on/off

Snap to grid is on by default, but itcan be controlled from the <u>Graph Layout</u> panel.

The default behaviour may also be set by the preference

```
this*snap_window_position: true |
  false
```

If turned off, the window positioning within the master T/HIS window reverts to "Free positioning #1" mode with the window positioned where it is dropped with the mod

| | Graph La | yout | ? 🗙 | |
|--------------------------------------|--------------|------|--------|--|
| Create Graph(s) | | | | |
| 1 Number of graphs to create | | | | |
| O Create using preference settings | | | | |
| Create using | current sett | ings | | |
| O Copy settings from graph 1 | | | | |
| Page Size | Width | 727 | pixels | |
| | Height | 671 | pixels | |
| ✓ Common borders between windows ? | | | | |
| Snap dragged window to grid Insert 🔻 | | | | |

positioned where it is dropped with the mouse.

The behaviour of the other windows when a window is moved into a new position depends on whether the mode is **Insert** or **Swap**:

| Insert | Other windows circulate either up or down, as in the example above. |
|--------|---|
| Swap | The window being dragged and its destination window swap places |

Dragging a window from inside the T/HIS master window onto the desktop, "Free positioning #2", is independent of the "snap to grid" setting: once on the desktop the window does not have any cell membership.

The ordering of windows within cells can also be controlled explicitly within the the **<u>Graph Layout</u>** panel.

5.6. Dynamic Viewing (Using the Mouse to Change Views)

Dynamic Viewing (Using the mouse to change views).

"Dynamic" viewing is the name given to the process in which you perform viewing transformations by moving the mouse around the screen.

Dynamic Translation.

Dynamic translation uses <mid mouse> + <left shift>

The cursor symbol is yellow, and looks like:

The relationship between mouse and image motion is intuitive: the object tracks the mouse motion in the screen XY plane. The initial position of the mouse is irrelevant.

Dynamic Magnification (Scaling).

Dynamic scaling uses <right mouse> + <left shift>

The cursor symbol is green, and looks like:

Mouse motion to the right and up makes the image larger, left and down smaller. The initial position of the mouse is irrelevant. A horizontal movement will scale just the x-axis while a vertical movement will scale just the yaxis.

5.7. "Tool Bar" Options

"Tool Bar" Options

Across the top of the main graphics window are a number of buttons that can be used to access other T/HIS menus (see <u>Tool Bar</u>) for more details..

File Graphs Plotting Functions Display Images Options Style ----- 0.053386 : 577.3046

If the graphics box is <u>maximised</u> to take up the whole of the main window these buttons can be used to access the rest of the T/HIS menus without having to resize the graphics box between commands. Almost all of the options and functions in these menus may also be accessed from other menu locations, e.g. the Main Menu area.

5.8. Colours

Colours

The colour popup allows users to select a standard colour or set-up and use a userdefined colour.

For some menus special context colours are available, for example "Entity", "Default" or "Background". These options are explained in more detail in the sections of the manual about that menu.

Standard Core Colours

The top two rows show the 30 standard core colours.

When you hover over the colour the name is shown.

| Colour | | Save Colours |
|---------|-------------|--------------|
| | | |
| | Indigo | |
| | | |
| + + + + | + + + + + | + + + + |
| Entity | Screen Pick | Current |

This name can be used to specify this colour in preferences and dialogue inputs.

In T/HIS this name can be used in JavaScript and FAST-TCF.

When using the name, "_" is used instead of " ", for example "Hot Pink" becomes "HOT_PINK".

The top two rows show the 30 standard core colours.

| c | Colour | Save Colours |
|---------|-------------|--------------|
| | | |
| | | |
| | | |
| + + + + | + + + + | + + + + + |
| Entity | Screen Pick | Current |

The standard core colours available are very similar in D3PLOT and T/HIS. The following colours are a similar shade but have different names:

| D3PLOT | T/HIS |
|--------------|-------------|
| Red/Magenta | Orange |
| Green/Cyan | Turquoise |
| Yellow/Green | Lime |
| Light Blue | Sky |
| Dark Orange | Pink |
| Cyan/Blue | Medium Blue |
| Red/Orange | Light Pink |
| Grey | Medium Grey |

User-Defined Colours

The lower rows show the user-defined colours. There can be up to 150 user-defined colours.

| Colour | | Save Colours |
|---------|-------------|--------------|
| | | |
| | | |
| + + + + | + + + + | + + + + + |
| Entity | Screen Pick | Current |

The top two rows show the 30 standard core colours.

Click on a user-defined colour to apply it, or click on an empty slot to create a new user-defined colour.

User-defined colours can be used in the dialogue input by specifying their name.

In T/HIS user-defined colours can be used in FAST-TCF.

The top two rows show the 30 standard core colours.

Creating

To create a new user colour click on an empty slot. This maps a colour palette.

The colour can be edited a number of ways:

- Using sliders to set the red, green and blue value,
- Inputting a hex colour code,
- Clicking on the colour wheel and cone, or
- Using sliders to set the hue, light and saturation levels.

When you create a colour it is applied.

Editing

| С | Save Colours | | | | |
|---------|--------------|-----------|--|--|--|
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| + + + + | + + + + | + + + + + | | | |
| Entity | Screen Pick | Current | | | |

The top two rows show the 30 standard core colours.

Hover over a user colour to edit it. You have the choice to change the name of the colour, **Edit** it, or **Delete** it.

| | Save Colours | | | |
|--------|--------------|-----------|--|--|
| | | | | |
| | | | | |
| russet | | | | |
| | + + + + | + + + + + | | |
| Edit | | | | |
| Delete | Screen Pick | Current | | |

The user-defined colours are given the standard name, for example "user_1". They can be renamed. The name must start with a letter and gets set to all lower case. If the name is not unique, a number will be appended to it, for example "green_1".

Edit maps the colour palette. If you edit a colour it is then applied.

Delete removes a colour. The colour is no longer available when you next open the colour popup.

Saving

The user-defined colours can be saved. The same user-defined colour are then available when you next run D3PLOT or T/HIS.

| Ca | Save Colours | | | |
|---------|--------------|-----------|--|--|
| | | | | |
| | | | | |
| | | | | |
| + + + + | + + + + | + + + + + | | |
| Entity | Current | | | |

The top two rows show the 30 standard core colours.

The user-defined colours are stored in the user_colours.xml file. If the user has permission to modify things in the INSTALL directory, the user is given the option to either save the user colours to the INSTALL directory (which is sometimes visible to multiple users) or their HOME directory.

Alternatively, the preference **user_colour_file** can be set to specify an .xml file.

When D3PLOT or T/HIS is next started the user_colours.xml file is read in.

If the same colour, for example "user_1", is defined in the user_colours.xml file in both the INSTALL and HOME directory, the HOME directory user_colours.xml file takes precedence.

If the preference **user_colour_file** has been set, any user_colours.xml file in the HOME directory is ignored. If a colour is also defined in the user_colours.xml file in the INSTALL directory, the **user_colour_file** .xml file takes precedence.

For T/HIS, if a user colour was previously set-up using a preference, for example this*user_colour1, and that colour slot is also defined in a user_colours.xml file, the user_colours.xml file takes precedence.

T/HIS Link

When running the T/HIS link any user colours created in D3PLOT (or in T/HIS) will be available in the other program. When T/HIS is first opened it sets-up the user colours to match the current D3PLOT session, rather than using a saved user_colours.xml file.

6. Graphs and Pages

Graphs and Pages

T/HIS 22.0 can display a maximum of 32 graphs. Each graph can have a different appearance and they can display different curves.

Graphs can be laid out using a number of different formats and they can be organised into Pages.

| Graph Layout ? 🗙 |
|--|
| Create Graph(s) |
| 1 Number of graphs to create |
| Create using preference settings |
| Create using current settings |
| Copy settings from graph |
| Page Size Width 1621 pixels |
| Height 937 pixels |

| |
| () 1x1 () 2x2 |
| O 3x3 |
| O X x Y X: 1 Y: 1 |
| Window Order (drag to reorder) |
| T/HIS Graph 1 |
| T/HIS Graph 2 |
| T/HIS Graph 3 |
| T/HIS Graph 4 |

6.1. Creating Graphs

Creating Graphs

Create Graphs Create a new graph.

The <u>shortcut key</u> 'G' can also be used to create new graphs.

Number of graphs to create

This option can be used to create multiple graphs.

| Create | Graph(s) |
|--------|---------------------------------|
| 1 | Number of graphs to create |
| Oc | reate using preference settings |
| Oc | reate using current settings |
| () C | opy settings from graph 1 |

When new graphs are created, the initial settings for each graph can be copied from three different sources:

| Create using preference settings | The <u>Display</u> and <u>Axis Settings</u> are copied from the preference file. |
|----------------------------------|---|
| Create using current settings | The <u>Display</u> and <u>Axis Settings</u> are copied from the current settings in the Display and Axis menus. |
| Copy settings from graph n | The <u>Display</u> and <u>Axis Settings</u> are copied from the specified graph. |

6.2. Page Size

Page Size

These options can be used to specify the total size of the area (in pixels) used by the graph windows.

| Page Size | Width | 1621 | pixels |
|-----------|--------|------|--------|
| | Height | 937 | pixels |

6.3. Page Layouts

Layout

Graphs can be laid out in a number of different formats and can be organised into Pages.

From D3PLOT and T/HIS 19.0, the Graph Layout menu is split into separate **<u>Basic</u>** and **<u>Advanced</u>** modes.

| Basic | Advanced |
|-------|----------|
| | |

6.3.1. Basic Mode

Basic Mode

In Basic mode, the menu can be used to select a page layout that is automatically applied to all of the pages.

Automatic Page Layout

If an Automatic page layout is used and the layout is set to <u>Tile Wide</u> or <u>Tile Tall</u> then all Graphs are automatically added to page 1.

In all other layouts, Graphs are automatically added to pages and as many pages as needed are created to hold all the Graphs.

Tile Wide

All of the graphs are positioned on a single page.

Tile Tall

All of the graphs are positioned on a single page.

1 x 1

Each graph is positioned on its own page.

2 x 2

Graphs are arranged in a 2 by 2 grid. If there are more than 4 graphs, then graphs 1 to 4 are positioned on page 1, graphs 5 to 8 on page 2, etc.

3 x 3

Graphs are arranged in a 3 by 3 grid. If there are more than 9 graphs then graphs 1 to 9 are positioned on page 1, graphs 10 to 18 on page 2, etc.

XxY

Graphs are arranged in a X by Y grid.

Window Order

By default, Graphs are added to pages in the order they are created.

The order of Graphs can be changed by clicking on a row and dragging it up or down the list to a new position.

Window Order (drag to reorder) T/HIS Graph 1 T/HIS Graph 2 T/HIS Graph 3 T/HIS Graph 4 T/HIS Graph 5 T/HIS Graph 6 T/HIS Graph 7 T/HIS Graph 8

Any Graphs that have been dragged out onto the desktop are removed from the list (Graphs 3 and 4 in the example on the right).

If Graphs are on the desktop, the menu will display additional rows that can be used to add the graphs back into the list so that they are displayed on a page again.

Right-clicking on an << Add item >> row will

6.3.2. Advanced Mode

Advanced Mode

Advanced mode can be used to give more control over which graphs appear on which page. Unlike in Basic mode, a graph can appear on more than one page.

Advanced mode works in a similar way to Basic mode except that it controls the settings for the current page only.

In Advanced mode, the layout and content of each page can be set for that page, and the order of the items displayed on each page can also be controlled by clicking on an item and dragging it up or down to a new position.

Right-clicking on **<< Add item >>** will display a popup menu that can be used to select any Graph that is not currently on the page.

| Basic | Advanced |
|---------------------------|---------------------|
| Current Page Layout | Tile Wide |
| | X: 1 Y: 1 |
| All Pages | |
| Current Page Window Order | r (drag to reorder) |
| Т/ніз | S Graph 1 🔹 🔻 |
| T/HIS | S Graph 2 🔹 🔻 |
| T/HIS | S Graph 3 🔹 🔻 |
| T/HIS | S Graph 4 🔹 🔻 |
| << A(| dd item >>▼ |
| Add Item To Pa | ige |
| Add T/HIS Graph | Graph 5 |
| | Graph 6 |
| | Graph 7 |
| | Graph 8 |
| | Graph 9 |
| | Graph 10 |

Right-clicking on a row containing a Graph will display a popup menu that can be used to remove the Graph from the current page.

Alternatively, the same popup can also be used to change an item to a different Graph that is not already on the current page.

| Current Page Window Order (drag to rea | order) |
|--|----------|
| T/HIS Graph 1 | V |
| T/HIS Graph 2 | V |
| T/HIS Graph 3 | ▼ |
| T/HIS Graph 4 | • |
| Modify Item | ▼ |
| Remove From Page | |
| Change to T/HIS Graph | Graph 5 |
| | Graph 6 |
| | Graph 7 |
| | Graph 8 |
| | Graph 9 |
| | Graph 10 |

All Pages menu

In Advanced mode, the **All Pages...** button can be used to display a separate menu that shows the layout and contents of all pages:

This Page Layout menu can be used to select which graphs appear on each page. Each graph can appear on more than one page.

| _ | | | | | Page Lay | yout | | | | | ? | |
|--------|--------|-------------|-------|-------|----------|--------|--------|--------|--------|--------|--------|--------|
| Close | | Page Number | | | | | | | | | | |

| | | +All | +All | +All | +All | +All | +All | +All | +All | +All | +All | +All |
| | | G1 ► | G1 ► | G6 🕨 | G1 ► | G1 ► | G1 ► | G1 ► | Add ► | Add ► | Add ► | Add ► |
| | | G2 ► | G2 🕨 | G7 🕨 | G2 ► | G2 🕨 | G2 🕨 | G2 🕨 | | | | |
| | | G5 ► | G3 🕨 | G8 🕨 | G3 ► | G3 🕨 | G3 🕨 | G3 🕨 | | | | |
| ÷ | | G6 🕨 | G4 ► | Add ► | G4 ► | G5 🕨 | G4 ► | G4 🕨 | | | | |
| Graph | | Add ► | | | G5 🕨 | Add ► | G5 🕨 | G5 🕨 | | | | |
| _ | | | | | G6 ► | | G6 ► | G6 🕨 | | | | |
| | | | | | G7 ► | | G7 ► | G7 🕨 | | | | |
| | | | | | G8 ► | | G8 🕨 | G8 🕨 | | | | |
| | | | | | Add ► | | G9 🕨 | G9 🕨 | | | | |
| | | | | | | | G10 ► | G10 ► | | | | |
| | | | | | | | | | | | | |
| | | | | | | | | | | | | |
| | | | | | | | | | | | | |

The options to reorder or change

the contents of each page are similar to those in the Window Order section of the Layout menu:

- Drag the buttons in each column up and down to reorder graphs on a page
- Use the popup menus to edit page contents

6.4. Pages

Pages

T/HIS can have a maximum of 32 pages, each page can contain multiple graphs. For more information on selecting the currently displayed page <u>Global Commands and</u> <u>Pages</u>. The <u>Image Output</u> options and the <u>FAST-TCF Create</u> option can produce output for either a single page or multiple pages if graphs are located on more than one page.

6.5. Active Graphs

Active Graphs

If T/HIS contains more than one graph then each graph can be toggled between being active or inactive.

All the graphs can be activated using the **All** button or deactivated using the **None** button.

There is a popup menu attached to each button that can be used to select that graph **Only**, **Raise** the graph so that it is in front of any others or to **Delete** the graph.

When a graph is deleted any graphs with higher numbers are renumbered downwards to remove any gaps in the graph numbering.

Graphs can also be activated / deactivated using the button located in the top left hand corner or each graph.

| G1 | Plotting | Display | |
|----|----------|---------|--|
| | | | |

7. Global Commands and Pages

Global Commands and Pages

| Global Commands ? | | |

| PLOT | POINT | CLEAR |
| ZOOM | AUTOSCALE | CENTRE |
| MANUAL STOP TIDY | | TIDY |
| Page Number : | | |

The following commands are to be found as buttons on the **GLOBAL MENU** panel. (The command line codes are given in parentheses.)

All of the commands in the GLOBAL MENU can also be accessed via the **PLOTTING** button at the top of the graphics window.

Page Number

If T/HIS contains more than one graph (<u>see Creating Graphs</u>) then the graphs can be positioned on separate Pages within T/HIS. This menu can be used to select a specific page or it can be used to step through the pages one by one.

| | Shortcut Key |
|----------------|--------------|
| Goto Page 1 | Home |
| Go back 1 Page | Page Up |
| Goto Page (n) | N/A |
| Go back 1 Page | Page Down |
| Goto Page 32 | End |

This option will plot all the curves that are currently UNBLANKED (see <u>Curve Manager</u>).

POINT (PT)

When selected this option waits for the user to pick a point in the main graphics screen.

Once a point has been picked the <x> and <y> values of the point picked are reported along with the ID of the nearest curve and the nearest point on that curve.

| | Pick Screen Point(s | ;) 🛛 🛛 🗙 |
|---------|-----------------------|----------|
| Curve: | 1 - Internal energy - | Airbag 1 |
| Nearest | Point: 0.0781994 1 | 1900125. |
| 1 | Point Number | 1000 |
| | 78 | 3 |
| | | |

After a point has been selected on the screen the slider may be used to move to other points along the same curve.

CLEAR (CL)

Clears the graphics screen.

ZOOM (ZM)

The cursor appears on the screen and may be used to select the required plot area by choosing opposite corners of a box. The graphs are then replotted. Using **ZOOM** implicitly turns autoscaling off.

AUTOSCALE (AU)

Autoscales the plot size for all current unblanked curves in the graphics window and re-displays the plot.

CENTRE (CE)

Pick a point on the screen using the cursor to be the new plot centre. It affects the x/y offsets but not the scales.

MANUAL

Displays the online (HTML) version of the manual

STOP

Some operations, like reading a file containing many curves in to T/HIS, can take a long time. This button can be used to stop some long opertaions without having to exit from T/HIS.

TIDY

This option can be used to reset the menu layout to the default settings.

Additional Commands

A number of additional global commands exist in command line mode. These functions exist in screen menu mode within other menu levels.

- (PF) Creates a postscript plot file. Either A4 landscape or A4 portrait formats may be chosen. A title and figure number are also requested. Other plot setting may be made in the command line mode UTILITIES menu.
- (BL) Blank a currently displayed curve.
- (UB) Unblank a curve that has been blanked.
- (RM) Remove (delete) a curve. Once a curve has been removed it is lost from the system.
- (ER) Erase (delete) all existing curves from T/HIS. (Equivalent to the command RM *.)
- (GS) Global status: displays the current number of curves, their labels and whether they are blanked.
- (co) Condense: renumbers all curves to fill any gaps in curve numbers.
- (LM) Gives the current program limits.
- (FT) File tracking: lists the 20 files which have been accessed most recently by T/HIS, giving details of the type of file and whether it was read from or written to.
- (EX) Exits (leaves) the program.

8. Main Menu

Main Menu

| — Read | VVrite | Curves | Models |
|--------------|----------|------------|---------|
| Edit | Style | Properties | Images |
| Operate | Maths | Automotive | Seismic |
| Macros | FAST-TCF | Title/Axes | Display |
| Settings | Measure | Groups | Graphs |
| Command File | Units | JavaScript | Datum |

The **MAIN MENU** provides access to a number of separate menus that perform most of the operations available within T/HIS from reading in data to producing postscript laser files.

8.1. Selecting Curves

8.1.1. Input Curves

Input Curves

By Curve ID

A number of the menus require a range of curves to be selected. When a range of curves has to be selected a menu containing a list of the available curves will be displayed (see figure, below).

A range or curves may be selected by either

- 1. Click on the first item and hold down the mouse key, drag the mouse to the last item in the list. All items between the first and last including the first and last are selected.
- 2. Click on the first item, hold down the SHIFT key and click on the last item in the list. All items between the first and last including the first and last are selected.

| Apply | Output: | % (highe | st+1) | |
|--|------------------------------|------------|--------------|------|
| Group 1:#0 | All | None | Visible(P) ► | Pick |
| Filter | Show G | roups | Key in: | ? |
| #1 : (M1) Disp | x - Node | 1343 : (Pe | lvis) | |
| #2 : (M1) Disp |) x - Node | 1344 | | |
| #3 : (M1) Disp | x - Node | 1345 : (Ch | est) | |
| #4 : (M1) Disp | x - Node | 1346 : (Ne | ck) | |
| #5 : (M1) Disp x - Node 1347 : (Head CofG) | | | | |
| #6 : (M1) Disp | #6 : (M1) Disp x - Node 1348 | | | |
| #7 : (M1) Disp x - Node 1349 | | | | |
| #8 : (M1) Disp x - Node 1350 | | | | |
| #9 : (M1) Disp x - Node 1351 | | | | |
| #10 : (M1) Disp x - Node 1352 | | | | |
| #11 : (M1) Dis | spix - Node | e 1353 | | |
| #12 : (M1) Disp x - Node 1354 | | | | |
| #13 : (M1) Dis | sp x - Node | e 1355 | | |

VISIBLE (P)age

| This option will select all of the curves that | Visible (Page) 🗠 | Visible on Page |
|--|------------------|-------------------|
| are unblanked in any graph on the current | | Visible All Pages |
| page. | | Explain This |

VISIBLE (A)II Pages

This option will select all curves that are unblanked in at least one graph.

PICK

Alternatively curves may be picked from the screen. With this option the left mouse button is used to select curves while the right button deselects curves. As each curve is selected/deselected its name and number will be reported to the user and it will be highlighted on the screen.

A range of curves can be selected interactively by dragging out an area on the screen while holding down the left mouse button.

FILTER...

This option can be used to filter the list of curves displayed by model. When this option is selected a list containing all of the current models in T/HIS is displayed and the models can be selected or deselected. Any curves that belong to a deselected model will then be filtered out of the curve list.

SHOW GROUPS

This option will display a list of the currently defined curve groups instead of curves

By Curve Group

In addition to selecting individual curves it is also possible to select curves by <u>Curve Group</u> if they have been defined.

> If a curve is defined in more than one group then it will be selected if

% (highest+1) Apply Output: Visible(P) 🖻 Pick Group 1:#0 All None Key in: Filter... Show Curves CURVE GROUP LIST #1 : Model 1 #2 : Displacements #3 : Velocities #4 : Accelerations

at least one of the groups is selected.

• If more than one group containing the same curve is selected then the curve will only be counted once as an input curve.

By Command Line

In command line mode a single curve may be selected by typing in a range. A valid syntax is:

| A single curve number | e.g. #27 |
|-------------------------|---|
| A "from":"to" range | e.g. #10: #30 (no gaps, " : " mandatory) |
| A compound list in "()" | e.g.(#1 #2 #10:#30 #3 #97) |

In all contexts the order in which a group is defined does NOT influence the order in which it is processed. It is ALWAYS processed in ascending sequential order.

Thus the addition operation

/OP ADD (#30 #20 #10) (#1 #2 #3) #40

will produce the results

#40 = #10 + #1#41 = #20 + #2#42 = #30 + #3

8.1.2. Output Curves

Output Curves

All operations that generate new curves must have a target curve defined. This must be one of the following:

- #nnn a specific curve number nnn
- # meaning "the lowest free curve"
- * meaning "the highest free curve"

In all cases output will start at the relevant curve number, however defined, and will rise sequentially with no gaps. This can cause an existing curve to be overwritten, or the output curve number to exceed the limit of 999. Both conditions are checked for: a warning is given if either will occur should the operation go ahead, and an opportunity given to modify or abort the pending operation.

There is a further output option that is only valid for operations where the input is a curve group:

• meaning "overwrite the input curve(s)"

In this case the input curves are overwritten without warning. For example, this option might be used to integrate a set of curves, overwriting the original results with the integrated values.

Any curve number between 1 and 999 may be used as an input or output curve. It is not necessary to use curves sequentially; gaps are permitted in curve number usage. Therefore curves #1 and #10 can be used, for example, without having to use the intervening curves #2 to #9. Likewise, deleting a curve will no longer cause those above it to be renumbered downwards to fill the gap.

8.1.3. Curve Operations

Curve Operations

The functions available fall into four distinct groups,

1) Separate functions involving two groups of curves, where the result is of the form:

<Rn> = <G1n> [OP] <G2n>

2) Separate functions involving only one group of curves, where the result is of the form:

<Rn> = [OP] <G1n>

3) Single output from only one group of curves, where the result is of the form:

<R> = [OP] <G1(1...n)>

4) Separate functions involving three groups of curves, where the result is of the form:

<Rn> = <G1n> [OP] <G2n>[OP] <G3n>

Currently the only function that has 3 curves groups as input is the VEC operation

1) Separate Functions On Two Groups

These functions display a menu in which **two** groups of curves may be selected, (see right).

You must define one or more curves in group #1, and group #2 must be:

- either A group of as many curves as there are in group #1.
- or A single curve. Every curve in group #1 is applied to this curve.
- or A constant value, entered in the **Key in** : text box.

You can pick curves in either group from their menus, or type a range into the **Key in:** box.

NOTE : the order in which they are processed is ascending sequential, **not the order in which you define them**.

| Apply | Output: | % (highe | est+1) | |
|----------------|------------|------------|--------------|-------------------|
| Group 1:#0 | All | None | Visible(P) 🖻 | Pick |
| Filter | Show G | roups | Key in: | ? |
| | x - Node | | elvis) | |
| | x - Node | | | |
| | x - Node | | | |
| | x - Node | | eck) | |
| | o x - Node | | ead CofG) | |
| | o x - Node | | | |
| | o x - Node | | | |
| #8 : (M1) Disp | | | | |
| #9 : (M1) Disr | x - Node | 1351 | |) |
| Group 2:#0 | All | None | Visible(P) ► | Pick |
| Filter | Show G | roups | Key in: | ? |
| #1 : (M1) Disp | x - Node | 1343 : (Pe | elvis) | |
| #2 : (M1) Disp | o x - Node | 1344 | | |
| #3 : (M1) Disp | o x - Node | 1345 : (Cl | nest) | |
| #4 : (M1) Disp | x - Node | 1346 : (Ne | eck) | |
| #5 : (M1) Disp | x - Node | 1347 : (He | ead CofG) | |
| #6 : (M1) Disp | x - Node | 1348 | | |
| #7 : (M1) Disp | x - Node | 1349 | | |
| #8 : (M1) Disp | x - Node | 1350 | | |
| #9 · (M1) Disr | x - Node | 1351 | | $\langle \rangle$ |

2) Separate Functions On A Single Group

These functions display a menu in which one group of curves may be selected, (see right).

Operations apply separately and uniquely to each selected curve.

As before, the order of processing is ascending sequential, not the order in which you define them.

| Apply | Output: | % (highe | st+1) | | | |
|----------------|-------------|------------|---------|-------|------|---|
| Group 1:#0 | All | None | Visible | (P) ► | Pick | |
| Filter | Show G | roups | Key in: | | | ? |
| #1 : (M1) Disp |) x - Node | 1343 : (Pe | elvis) | | | |
| #2 : (M1) Disp | o x - Nodel | 1344 | | | | |
| #3 : (M1) Disp | x - Node | 1345 : (Cł | iest) | | | |
| #4 : (M1) Disp | x - Node | 1346 : (Ne | eck) | | | |
| #5 : (M1) Disp | x - Node i | 1347 : (He | ad CofG |) | | |
| #6 : (M1) Disp | x - Node | 1348 | | | | |
| #7 : (M1) Disp | x - Node | 1349 | | | | |
| #8 : (M1) Disp | x - Node | 1350 | | | | |
| #9 : (M1) Disp | | | | | | |
| #10 : (M1) Dis | sp x - Node | 1352 | | | | |
| #11 : (M1) Dis | sp x - Node | 1353 | | | | |
| #12 : (M1) Dis | sp x - Node | 1354 | | | | |
| #13 : (M1) Dis | sp x - Node | 1355 | | | | |

3) Single Output From A Single Group

These functions require a single group of curves as input like the functions above. The output is a single curve.

8.2. READ Options

READ Options

T/HIS can **READ** data from a number of sources including Ansys LS-DYNA binary output files, Ansys LS-DYNA ASCII files and tabulated x/y data files. In addition this menu allows data for new curves to be entered directly using the keyboard.

8.2.1. Ansys LS-DYNA

Ansys LS-DYNA

This topic includes:

- Ansys LS-DYNA
 - <u>Selecting Models</u>
 - <u>Select Model</u>
 - Search Directories Recursively
 - <u>Select Models From Database</u>
 - Selecting Models
 - Modifying the Database
 - <u>Creating a new Database</u>
 - Database Format
 - <u>Automatic extraction of model results</u>
 - Model Unit System
 - Entity Types
 - Data Components
 - <u>Entities</u>
 - <u>Surfaces/Integration Points</u>
 - Shell and ThickShell Data Components

Users are strongly advised to run each Ansys LS-DYNA analysis in a separate directory. Some of the default names for the files generated by Ansys LS-DYNA that T/HIS can read are not unique and T/HIS can not tell which files belong to which model. If you do read multiple models from the same directory T/HIS will generate a warning message if you read the same file for more than 1 model.

| Read Data | | | ? 🗙 |
|-----------|------------|---------|-------------|
| LS-DYNA | Groups | Keyword | T/HIS Curve |
| Bulk Data | Keyboard | CSV | Screen |
| ISO | LS-PREPOST | DIAdem | NASTRAN |

Selecting Models

There are three ways to select the Ansys LS-DYNA models that you want to read into T/HIS

- (i) Select a single model (see <u>Select Model</u>)
- (ii) Search directories for results and open open multiple models (see <u>Search</u> <u>Directories Recursively</u>)

(iii) Open a model database and select the models you want to read (see <u>Select</u> <u>Models From Database</u>)

| Read Data 🔹 🎽 | | | | |
|---------------|--------------------------------------|---------------|-------------|--|
| LS-DYNA | Groups Keyword | | T/HIS Curve | |
| Bulk Data | Keyboard | CSV | Screen | |
| ISO | LS-PREPOST | DIAdem | NASTRAN | |
| Open : | Single Model | | 7 | |
| Filename : | Single Model | | | |
| Extract c | Multiple Models (Search Directories) | | | |
| Overwrite | Select models | from database | | |

Select Model

Select ANY results file from a model. T/HIS will then search for all the results files in that directory produced by the same analysis as the selected file (as illustrated below) and display a list of all the files found. The user can then select which files to open. The default is to open all the available results files.

If you are using Oasys Ltd SHELL to submit jobs then the default filenames will be "jobname.thf", "jobname.xtf", "binout", "abstat" etc. If you use the standard Ansys LS-DYNA output file names then the filenames will be "d3thdt", "xtfile", "binout", "abstat".

The T/HIS preference option "this*file_names" can be used to set the default filenames that T/HIS searches for to either the ARUP set or the LST names.

When the user selects **Apply**, the selected files are then opened and the contents scanned. After the files have been scanned the list of available data types will automatically be displayed (<u>see Data Components</u>)

| | Read | l Data | ? X |

| sleout | | spcforc | |
| ZTF - Addition | | | |
| E:\test\s | :led\new_lg09.z | .11 | |

Search Directories Recursively

Multiple models can be opened by using the option to search directories recursively.

After a directory has been specified T/HIS will display a list of all the models it can find in the directory structure and each file can be selected. The order in which the models are read in can be specified by selecting the models in the order required. The selection buttons will display the model number that each model will be read into. The model numbering begins from the next free model number and is then sequential.

Select Models From Database

From T/HIS 10.0 onwards users can select models from a model database. The database file is an XML format file that contains information on where models are located along with a brief description of each model, (see <u>below</u> for more details on the file format).

| | Read | Data | ? × |
|---------------|-----------------|---------------|-------------|
| LS-DYNA | Groups | Keyword | T/HIS Curve |
| Bulk Data | Keyboard | CSV | Screen |
| ISO | LS-PREPOST | DIAdem | NASTRAN |
| Open : | Select models | from database | 🔻 Create |
| Database : | | | Copen |
| Extract cu | rves to match r | model : 1 | V |
| Overwrite | existing curves | | |
| 🗸 Copy curv | e styles | Use default | : styles |
| Set styles | Colour | Width Sty | /le Symbol |

| THF/d3th | idt File | XTF/xtfile | File |
| LSDA/bir | nout Database | ASCII Fil | es |
| | | | |
| A | | | |
| 7 | | | |

To select a model database either enter it's name in the text box or use the file selector.

The default model database can be specified as a command line argument (see <u>Command Line Options</u> for more details). The default database filename and location can also be specified in the preference file (see <u>Format of the oa pref File</u> for more details)

```
this*database_dir:
this*database_file:
```

After a database file has been selected it's contents will be read and T/HIS will display a Tree Like menu showing the contents of the database.

As each item is displayed T/HIS will check to see if the files that it refers to exist.

| _ | | Model Data | base | ? - _ X |

Selecting Models

Models can be selected and deselected by clicking on each row. Multiple models can be selected by clicking on the 1st model and holding down SHIFT while selecting the last model in the range.

As each model is selected, the model number that it will be read in as is automatically displayed alongside the model description.

A complete branch can be selected/deselected by selecting the branch label (Iteration 1).

| ⊟model_database | |

| L 🗸 (M3) Run 4 | |
| Hiteration_2 | |

Modifying the Database

Database entries can be added, removed and modified by right clicking on a branch label or a model description

Right clicking on a branch label will display 4 options

| Modify | Modify the branch label. |
|-----------|---|
| Add Model | Add a new model into the selected branch. A menu will be displayed to select a new model and to define the model description that is displayed for the new model. |
| Insert | Insert a new branch within the selected branch. |
| Delete | Delete this branch and everything within it. |

Right clicking on a model description will display 3 options

| Modify | Modify the model location and description. | ⊖nodel_dataixee |
|--------|--|---|
| Insert | Insert a new branch. The selected model will be moved into the new branch. | ⊡revelate Deno Electricion 1 - v7 Ban 1 - v7 Ban 1 - v7 Ban 3 - v7 Ban 4 |
| Delete | Delete the model | |

Saving the Database

After modifying the database use the **Save** option to save the changes for future sessions.

Creating a new Database

If you do not have a database or if you want to create a new one then T/HIS can create the new database for you. To create a new database click the **CREATE** button and simply enter the name of the new database file in the text box that appears, T/HIS will then check that the file does not already exist and if it doesn't it will create a new empty database.

Alternatively if you type in the name of a file in the main Open Plot File window that does not exist then T/HIS will ask if you want to create a new empty database using that filename.

Once you have done this you can use the <u>Modify</u> options above to add items into the database and then save the file before exiting.

Database Format

The Model Database uses an ASCII XML file format.

All items with the database are either branches or models. Each database entry has an **XML name** and a **LABEL element**. Models also contain a model element that contains the full pathname of one of the files belonging to the model.

The **XML name** should be unique and should obey the following rules

- Names can contain letters, numbers, and other characters
- Names must not start with a number or punctuation character

- Names must not start with the letters xml (or XML, or Xml, etc)
- Names cannot contain space

The **LABEL** is the string used to display an item within the tree view. Unlike the **XML name** the **LABEL** can contain any ASCII character.

```
<model database version="10.000000">
    <Template Demo label="Template Demo">
        <iteration_1 label="Iteration 1">
            <base label="Base"
                model="e:\release\meeting\crush\base\base.ptf"/>
            <run 1 label="Run 1"

        </Template Demo>
</model database>
```

Automatic extraction of model results

| Extract curves | to match | model : [| | 7 |
|-------------------|-----------------|---|---|--|
|] Overwrite exist | ting curves | | | |
| Copy curve sty | /les | Use d | efault style | es |
| Set styles | Colour | Width | Style | Symbol |
| | Сору ▷ | Сору ▷ | Сору ▷ | Сору ▷ |
| | Overwrite exist | Overwrite existing curves Copy curve styles Set styles Colour | Overwrite existing curves Copy curve stylesUse d Set stylesColour Width | Copy curve styles Use default style Set styles Colour Width Style |

This option can also be used if a model is re-read into T/HIS to extract the same curves as those that had already been read from the model.

By default this option will attempt to generate curves that match those already read from model 1. If results have already been read from more than one model then the model to match the curves form can be set to any of the existing models.

This option can be used to overwrite

Overwrite existing curves

the existing curves from a model. If a model has been read into T/HIS and curves have been read from the model while the analysis was still running then this option can be used to automatically update the curves.

When the curves from the 2nd or subsequent model are automatically generated then by default they will be given the same colours, and line

| 🗸 Copy curve sty | les | Use default styles | | |
|------------------|--------|--------------------|--------|--------|
| Set styles | Colour | Width | Style | Symbol |
| | Сору 🖻 | Сору 🖻 | Сору 🖻 | Сору 🕨 |

styles as the curves in the original model.

Instead of copying the curve styles a new style for all the automatically generated curves can be specified. This make it very easy to set the same style for all of the curves that are read from a model. Alternatively the default T/HIS curve styles can be used.

Model Unit System

Model Unit System : Undefined 💡

This option can be used to set the default Unit System that will be applied to the model. For more information on Units see <u>UNITS</u>

Entity Types

Items are shown in bright green if they occur in all the models that have been read into T/HIS and are currently selected. If they occur in at least one model but not all models then they are shown in a duller green (in the case shown in the adjacent picture Beams, Shells, Stonewalls, Springs, Seatbelts, Retractors, Sliprings and SPCs can be found in some but not all of the models).

Data Components

When reading data from any of the Ansys LS-DYNA binary files or the Ansys LS-DYNA ASCII files multiple components and entities may be selected at the same time.

Each data extraction menu consists of a list of available data components and a list of entities.

Data Components

Individual data components can be selected using the mouse. If a component has been selected and a second item is subsequently selected the first item will be deselected.

Multiple components may be selected by

- 1. Holding down the **CTRL** key when selecting items to add individual items to the list of selected components.
- 2. Holding down the **SHIFT** key when selecting items to add a range of items to the list of selected components.
- 3. Clicking on the first item to be selected and then dragging down the list of items without letting go of the mouse button.

Entities

Individual entities can be selected/deselected using the mouse.

Multiple entities may be selected by

- 1. Holding down the **CTRL** key when selecting items to add them to the list of selected entities.
- 2. Holding down the **SHIFT** key when selecting items to add a range of items to the list of selected entities.
- 3. Clicking on the first item to be selected and then dragging down the list of items without letting go of the mouse button.

| | | | | |

Entities can be sorted in four ways:

| Sort by model | will list all entities in the lowest number model in order of ascending ID number, then all entities in the next-lowest model, and then move through the rest of the models in ascending order. |
|---------------|--|
| Sort by ID | will list all entities in ascending order showing the model ID for each entity |
| Common IDs | will list only the entities with IDs that are common to all models without showing the model ID's |
| Sort by Name | arranges the entities in alphabetical order based on their names. |

Surfaces/Integration Points

Some BEAM, SHELL, and THICKSHELL data components can be read from multiple integration points.

If a data component is available for multiple integration points then an additional **Select Surface** options is displayed.

Select Surface

This option will display a separate menu listing all of the integration points that are available to read data from.

For Shell and Thick Shell elements the menu will include all of the through thickness integration points plus 3 additional options; TOP, MIDDLE and BOTTOM.

For Beam elements the menu will just display the integration points.

In plane int points

In addition to the through thickness integration points recent versions of Ansys LS-DYNA can also output data for multiple in-plane integration points for fully integrated Shell and Thick Shell elements. If T/HIS can identify that the model contains data for multiple in-plane integration points then these options can be used to select the individual in-plane integration points or to average the 4 in-plane points.

For more information on selecting integration points for beams, shells and thick shells see <u>Beam</u> <u>Data Components</u>, <u>Shell Data</u> <u>Components</u> and <u>Thick Shell Data</u> <u>Components</u>.

Shell and ThickShell Data Components

If Shell and ThickShell data is being read from the LDSA (binout) file then the file can contain data components in both the ELOUT and ELOUTDET branches.

By default T/HIS uses the data from ELOUTDET as ELOUT only contains a subset of the data in ELOUDET.

In some versions of Ansys LS-DYNA it is possible to change the Shell and ThickShell data components written to the ELOUT so that they are defined using the global coordinate system (see

| 3 | Global | | Parts | Part (| Groups | Nodes | |

| | Shell and Thick | Shel | l results w | hile EL | OUTDE | T is using a | |
| | Local coordinate system. | | | | | | |

EOCS on *CONTROL_OUTPUT) instead of the default element local coordinate system. If this option is used then only the ELOUT file is modified, the ELOUDET file is still written using the local coordinate system.

Use ELOUT instead of ELOUTDET

If T/HIS detects that the LSDA file contains both ELOUT and ELOUDET and that they are using different coordinate systems then this option can be used to force T/HIS to use the ELOUT file data components using the global coordinate system.

This option can also be set via the preference file (see <u>Appendix H</u> for more details) and via the command line (see <u>Command Line Options</u>)

8.2.2. GROUPS

GROUPS

This option can be used to read a file containing PART group definitions. If a model is read in which contains PART information then the PART groups can be used to read in and sum energies for a group of PARTS in one go.

The 1st time T/HIS finds a group file (groupXXX.asc) in a directory it will automatically read the file and create the PART groups.

After reading the 1st group file T/HIS will by default ignore any other group files it finds in directories when it opens a model.

This option can be changed as follows.

| Ignore | This option (the default) will make T/HIS ignore any more group files it finds |
|-----------|---|
| Delete | If T/HIS finds a group file when a new model is read in then all existing group definitions will be deleted before the new file is read |
| Overwrite | If T/HIS finds a group file when a new model is read in then all the new group definitions will be added to the existing ones. If the new file contains a group with the same ID as an existing group then the old definition will be overwritten. |
| Increment | If T/HIS finds a group file when a new model is read in then all the new group definitions will be added to the existing ones but the group ID's will be incremented to ensure that they do not clash with existing ones. |

The default option can be changed using the preference option

this*read_group_files:

(see <u>Format of the oa_pref File</u> for more details)

If the option to read groups files is set and the directory contains more than one group file then T/HIS will use the newest file.

| | ? 🔀 | | | | | | |
|--------------|------------------------------------|---------|-------------|--|--|--|--|
| LS-DYNA | Groups | Keyword | T/HIS Curve | | | | |
| Bulk Data | Keyboard | CSV | Screen | | | | |

| Group File : | roup File : E:\test\sled\group.asc | | | | | | |
| Read | | List | Delete | | | | |

Auto-Read Options

If T/HIS finds a group file when opening a model

✓ Ignore the Group file

Delete existing groups and read the file

Overwrite Groups with matching IDs

Increment all Group IDs

Do you want T/HIS to

✓ Use this option for all group files

Prompt for each group file

8.2.3. T/HIS Curve

T/HIS Curve

This option can be used to read in curves stored in T/HIS curve file format (see <u>Appendix</u> <u>B</u> for more details)

By default this option can be used to select a single file. After selecting the file it will automatically be opened and read and all of the curves in the file will be read in.

| << Undock | Read | Data | ? 🗙 | | | |
|--|----------------|------------|-------------|--|--|--|
| LS-DYNA | Groups | Keyword | T/HIS Curve | | | |
| Bulk Data | Keyboard | CSV | Screen | | | |
| ISO | LS-PrePost | DIAdem | NASTRAN | | | |
| CURVOUT | Equation | HDF | | | | |
| 🔘 Curve File : | | | | | | |
| O Search Di | rectories Recu | rsively : | *.cur | | | |
| | | | ▼ 😑 | | | |
| Output Curve | : % (highe | st+1) | | | | |
| Curve Unit System : Undefined V | | | | | | |
| Read | Read | Style Data | | | | |
| Filter : | | | | | | |

In addition to reading a single file this option can also be used to search directories recursively for multiple files.

After the search has finished a list showing all of the files that have been found will be displayed so that multiple files can be selected and read in one operation.

By default T/HIS will search for files with the file extension .cur, this can be changed if required.

In addition to changing the default file extension the list of files can also be filtered. The filter string can contain the following wildcards

- * matches multiple characters
- ? matches a single character

Note: The filtering ignores case.

The units system of the curves read from the Curve file can be set using the **Curve Unit System** dropdown. If a units system is defined in the Curve file itself, then T/HIS applies that Unit

| Curve Unit Syste | em : | Undefined | • |
|------------------|------|-------------------|---|
| Deed | | U1: m, kg, s (SI) | |
| Read | | U2: mm, t, s | |
| Filter : | | U3: mm, kg, ms | |
| | | U4: mm, g, ms | |
| | | U5: ft, slug, s | |
| | | U6: m, t, s | |

System to the curves. Otherwise, the units system selected from this dropdown is applied to the curves read from the file. Defining the units system when reading curves enables T/HIS to scale any constants in subsequent curve operations correctly.

8.2.4. KEYWORD

KEYWORD

Read data into T/HIS from an Ansys LS-DYNA KEYWORD input file. All X/Y data defined using ***DEFINE_CURVE** will be read in from the specified input file. Any X and Y axis scaling or offsets defined within the ***DEFINE_CURVE** definition will be applied to the X,Y as it is read in. If the **_TITLE** option has been used the the title will be used as the curve label otherwise the curve ID number will be used.

From version 9.3 onwards this option will also process any files specified using the ***INCLUDE** option.

| | ? 🔀 | | |

| Bulk Data | Keyboard | CSV | Screen |
| ISO | LS-PREPOST | DIAdem | NASTRAN |
| Data File : | | | |
| Curve : | % (highest+1) | | |
| Read | | | |

8.2.6. KEYBOARD

KEYBOARD

Key in curve information directly. A dialogue window is displayed upon requesting this option where the user will be prompted for title, x and y axis labels, a curve identifier and then a series of points. Once all the points required have been entered carriage return should be pressed. The user will then be prompted for the curve or file in which to store this data : # means use the next free curve.

8.2.7. CSV

CSV

The **CSV** menu (see right) can be used to read comma separated variable file(s) into T/HIS. This menu allows to read single CSV file or all the CSV files in a selected directory both recursively and nonrecursively.

Each file may contain up to 1000 columns of data (separated by commas).

The maximum line length supported by this option is × 10240 characters.

CSV files written from the D3PLOT Write Menu are automatically detected by T/HIS and sets the appropriate read options. The options can be changed, but the data may not read in as expected. Both the **Write->Entity** and **Write->Scan** formats are supported. The first column of data containing the entity IDs is ignored for both formats. For files written from the **Write->Scan** menu the third column is ignored as this also contains entity IDs.

The CSV menu can also read in multiple CSV files in a given directory and also all the sub-directories recursively by changing the **Open** option from **CSV**

|)pen : | CSV File | T |

preference file (see Format of the oa_pref File for more
details) this*csv_separator:

Read X ValuesThis option can be used to specify a column within the file
that contains the X-axis data values that should be used for
all of the other columns of data.

Generate X ValuesThis option can be used to automatically generate the X-axisvalues if none of the columns within the file contain the data.

Read LabelsThis option can be used to specify a row within the file that
contains labels for each of the columns of data that can be
used as the curve labels within T/HIS.

Generate Labels This option can be used to automatically generate labels for each set of data. A single string can be specified which will then have the column number appended to it to generate unique labels.

Read Axis Labels This option can be used to specify a row within the file that contains the axis labels.

This option can be used to set the units system for the curves read from the CSV file. If a units system is defined in the CSV file itself, then T/HIS

| Curve Unit System : | Undefined | • |
|---------------------|-------------------|---|
| Deed | U1: m, kg, s (SI) | |
| Read | U2: mm, t, s | |
| | U3: mm, kg, ms | |
| | U4: mm, g, ms | |
| | U5: ft, slug, s | |
| | U6: m, t, s | |

applies that units system to the curves. Otherwise, the units system selected from this dropdown is applied to the curves read in from the file. Defining the units system when reading curves enables T/HIS to scale any constants in subsequent curve operations correctly.

Curve Unit System

8.2.8. SCREEN

SCREEN

The **SCREEN** menu (see right) can be used to interactively create a curve T/HIS by selecting points using the mouse.

| | Read | Data | ? 🗙 |
|-------------|---------------|---------|-------------|
| LS-DYNA | Groups | Keyword | T/HIS Curve |

| Start Curve | End (| Curve | Quit Curve |
| Undo Last | t | | |

Start CurveThis option will start point selection process. Once you have
started creating a curve all the other T/HIS menus will be
disabled until you end the point selection using either the
End Curve or Quit Curve options.

Dynamic viewing will still be available.

| End Curve | This option will end the current curve creation and save the curve. |
|------------|--|
| Quit Curve | This option will end the current curve creation without saving the curve. |
| Undo Last | This option can be used delete the last point created (the middle mouse button will also delete the last point). |

8.2.9. ISO

ISO

This option can be used to read in curves from files written using the ISO/TS 13499:2003 file format. Two versions of the format are supported; v1.6 and v2.0.

The default option in T/HIS is to read in an Index file containing information on multiple channels. After the file has been opened and read a list of all the available channels will be displayed so the required channels can be selected.

When listing the channels the default is to display the filenames for each of the channel files. Alternatively the channel names (read from the Index) file can be displayed.

The **Curve Unit System** dropdown can be used to set the units system for the curves read from the ISO-MME file. Defining the units system when reading curves enables T/HIS to scale any constants in subsequent curve operations correctly.

8.2.10. LS-PREPOST

LS-PREPOST

This option can be used to read in curves from files written out from LS-PREPOST.

Two different file formats are supported

LS-PREPOST Curve Files

LS-PREPOST XY Pairs

| Read Data | | | | | | |
|----------------|------------|-------------------------|---------|-------------|--|--|
| LS-DYNA | Groups | | Keyword | T/HIS Curve | | |

| File Format : | | LS-PREPOST Curve File 💡 | | | | |
| Read | | LS-PREPOST Curve File | | | | |
| | | LS-PREPOST XY Pairs | | | | |

8.2.11. DIAdem

DIAdem

This option can be used to read in data from DIAdem format data files. After selecting a DIAdem header file a list of all the available channels will be displayed so the required channels can be selected.

Version 11.0 of T/HIS supports the following DIAdem data file formats

REAL32 REAL48 REAL64 INT16 INT32 WORD8 WORD32 ASCII

The MSREAL32, TWOC12 and TWOC16 are not supported.

| Read Data 🕴 🤱 | | | | | | | |
|--|------------|------------------|-------------|--|--|--|--|
| LS-DYNA | Groups | Keyword | T/HIS Curve | | | | |
| Bulk Data | Keyboard | CSV | Screen | | | | |
| ISO | LS-PREPOST | DIAdem | NASTRAN | | | | |
| Header File : | A\Roger\D | DIAdem\3.1\R3 | 2.DAT | | | | |
| Output Curve : % (highest+1) | | | | | | | |
| Display | Char | Channel Comments | | | | | |
| X Axis 1 : :TIME CHANNEL | | | | | | | |
| 0.0000E+00 Start 1.0000E+00 Inter | | | | | | | |
| Read | | | | | | | |
| Filter : | | | | | | | |
| 🖞 🔽 🗙 All Channels | | | | | | | |
| | | | | | | | |
| 2 : :SLED CENTRE:X:ACC | | | | | | | |
| 3 : VEHICLE: FRONT LH DOOR TOP: Y: ACC | | | | | | | |
| 4 : FRONT LH EUROSID:HEAD:Z:ACC | | | | | | | |

By default T/HIS will display the channel comments (header block 201) for each channel. This can be changed to the channel names (header block 200) using the popup menu if required.

When channels are read in this option is also used to create the labels for each curve.

| Display | Channel Comments | Ŧ |
|---------|------------------|---|
| | Channel Names | |
| | Channel Comments | |

As well as displaying either the channel comments or the channels names the list of channels can also be filtered if required .

The filter string can contain the following wildcards

- * matches multiple characters
- ? matches a single character

Note: The filtering ignores case.

| Filter : | *front Ih [*]] |
|-----------------|-------------------------------------|
| A 🗖 🗙 | All Channels |
| | 3 : VEHICLE:FRONT LH DOOR TOP:Y:ACC |
| | 4 : FRONT LH EUROSID:HEAD:Z:ACC |
| | 5 : FRONT LH EUROSID:HEAD:X:ACC |
| | 6 : FRONT LH EUROSID:HEAD:Y:ACC |

Normally one of the DIAdem data channels contains the x-axis (time) values. By default T/HIS assumes this is channel 1 but this can be changed using the button labelled ...

| X Axis | | | | |
|--------|---------|-------|------------|----------|
| 0.0 | 000E+00 | Start | 1.0000E+00 | Interval |

If none of the channels contain the x-axis values then a start value and an increment can be specified to generate curves with evenly spaced x-axis values.

Supported DIAdem header file blocks

The following DIAdem header file data blocks are supported. All other data blocks are ignored.

| GLOBAL HEADER | |
|----------------|-------------------------------------|
| 111 | Value for NoValues in the data file |
| 112 | Interchange high- and low-bytes |
| | |
| CHANNEL HEADER | |
| 200 | Channel name |
| 201 | Channel comment |

210 Channel type

- 211 File from which channel data is read
- 213 Method of storing the data
- 214 Data type
- 220 No. of values in the channel
- 221 Pointer to the 1st value in the channel
- 222 Offset for ASCII block files
 - Offset for binary block files with header
- 223 Local ASCII-pointer in the case of ASCII block files
- 230 Separator character for ASCII-block files
- 231 Decimal character in ASCII-files
- 232 Exponential character in ASCII-files
- 240 Exponential character in ASCII-files
- 241 Step width / Factor
- 252 Keyword for NoValues in the channel
- 254 Value for NoValues in the channel

8.2.12. NASTRAN

NASTRAN

This option can be used to read in data from from NASTRAN PCH files.

| Read Data | | | | | |
|--------------------------------------|-----------------|----------------|---------|--|--|
| LS-DYNA | Groups | Groups Keyword | | | |
| Bulk Data | Keyboard | CSV | Screen | | |
| ISO | LS-PREPOST | DIAdem | NASTRAN | | |
| Filename : EVPHASE_MAGV2dof_mt.pch 🦳 | | | | | |
| Search Dir | rectories Recur | sively : | *.pch | | |
| | | | | | |
| Output Curve : % (highest+1) | | | | | |
| Read | | | Options | | |
| Filter : | | | | | |

Currently the following types and data components are supported along with the SORT1, SORT2 and XYPUNCH file formats

| Nodal | Displacements |
|-------|----------------|
| Nodal | Velocities |
| Nodal | Accelerations |
| Nodal | SPC Forces |
| CBUSH | Element Forces |
| CDAMP | Element Forces |
| CELEM | Element Forces |
| CBAR | Element Forces |
| CQUAD | Element Forces |
| CTRI | Element Forces |

By default T/HIS will read in every curve that it finds in the file so if you read in a file containing nodal displacements from a SORT2 format file you will end up with 12 curves being produced in T/HIS for each node.

X,Y,Z translation (Real) / (Magnitude) X,Y,Z translation (Imaginary) / (Phase angle) X,Y,Z rotational (Real) / (Magnitude) X,Y,Z rotational (Imaginary) / (Phase angle)

The **Options...** button will display the following menu that will allow some components to be deselected before reading the file.

| Read Data ? | | | | | 2> | |
|---------------|-------|---------------|-----------|------------|---------|---|
| LS-DYNA | Gro | roups Keyword | | T/HIS Curv | /e | |
| Bulk Data | Key | board | CSV | / | Screen | |
| ISO | LS-PR | EPOST | DIAde | em | NASTRAN | V |
| Data Types to | Read: | | | | Done | |

| | | Imagina | ary / Pha | se An | gle | |
| 🔽 Nodal Data | э | | | | | |
| | | Displac | ements | | | |
| | | Velocities | | | | |
| | | Accelerations | | | | |
| | | SPC F | orces | | | |
| | | X Trans | ; | 🔽 X | Rot | |
| | | Y Trans | 3 | Γ γ | ' Rot | |
| | | Z Trans | ; | 🔽 Z | Rot | |
| V Element F | orces | | | | | |
| | | CBUSH | 4 | | | |
| | | CDAM | Þ | | | |
| | | CELEN | 1 | | | |
| | | CBAR | | | | |
| | | CQUAE |) | | | |
| | | CTRIA | | | | |

| Complex Data | For complex data components written out as a pair of real and imaginary numbers or as a magnitude and phase angle either of the components can be deselected. |
|-------------------|---|
| Nodal Data | For nodal data any of the 4 data types can be deselected along with any of the 6 translational/rotational directions. |
| Element Forces | For element forces each individual element type can be deselected. |

T/HIS will automatically create curve labels for each curve generated from the PCH file. The entity types, ID's and components will also be stored with the curves to allow the curves to be sorted using the curve table (see <u>Table</u>)

| Curve Table | | | | | | | | | |
|-------------|---|-----------------------------|-------------------|-------------|-------|---------------|-----------|-------|--------|
| Dist | miss | View 🔻 Update | Filter by : Model | v L | abel | т Туре | ··· 🔻 | Compo | nent 🔻 |

| | | | | | | | | | |

8.2.13. CURVOUT

CURVOUT

This option can be used to read in data from from a CURVOUT ASCII file (curves defined by *DEFINE_CURVE_FUNCTION).

All the curves defined in the file are read. However, CURVOUT data (from both ASCII and binout files) can now be read in via the Ansys LS-DYNA option in the read panel. The curves in the file will then be treated as entities, allowing them to be selected individually in the entities list.

| << Undock | Read Data | | | |
|--|------------|---------|-------------|--|
| LS-DYNA | Groups | Keyword | T/HIS Curve | |
| Bulk Data | Keyboard | CSV | Screen | |
| ISO | LS-PREPOST | DIAdem | NASTRAN | |
| CURVOUT | | | | |
| Curve File : vout\SMP\ten_digit_id\curvout | | | | |
| Output Curve : % (highest+1) | | | | |
| Read | | | | |

8.2.14. Equation

Equation

This option can be used to create a curve by definining an equation of the form 'y=f(x)'. Here 'x' can be replaced by any of x, X, t, T, time or TIME.

The usual operators + - * / ^ % can all be used. The following standard mathematical functions can be used: SIN, COS, TAN, SEC, CSC, COT, ASIN, ACOS, ATAN, ATAN2, SINH, COSH, TANH, ASINH, ACOSH, TANH, ASINH, ACOSH, ATANH, EXP, CEIL, FLOOR, LOG, LOG10, SQRT, MOD, MAX, MIN, SIGN, ABS, INT, AINT, NINT, FLOAT.

Additonally, some of the functions specified in the Ansys LS-DYNA manual under *DEFINE_CURVE_FUNCTION are also available. These are: IF, STEP, POLY, CHEBY, FORSIN, FORCOS, SHF.

This allows PRIMER to send *DEFINE_CURVE_FUNCTION definitions to T/HIS, as long as they only depend on TIME and no other values that change during the Ansys LS-DYNA run. In the *DEFINE_CURVE_FUNCTION edit panel, if the expression is suitable for evaluation, then the **T/HIS** button will be active and the equation can be sent across. The curve will be plotted from TIME = 0 until the termination time specified on the *DATABASE_CONTROL_TERMINATION card. The value of any parameters appearing in the expression will be maintained. The curve can be edited via right-clicking and selecting **Edit equation...** It can then be sent back to PRIMER by right-clicking and selecting **Update curve in PRIMER**.

Curves can be referenced in equations using variables of the form 'c1', 'C1' or '#1' to refer to curve #1. For example, equations such as 'y = 2*#1 + 3*#3' are valid. This allows multiple curve operations to be replaced by a single equation.

There are multiple options for defining the x-values used to plot the equation curve. There is an option to specify directly the start value, end value and interval between points. Alternatively, the X values can be copied from a specified curve. The final option is only relevant if the equation contains curve variables. The x-values from all of the

curves that appear in the equation will be combined to give one potentially larger set of x-values, which will then be used to plot the equation curve.

Equation curves can also be created using the JavaScript API, see 'Read.Equation' in the JavaScript API reference manual.

8.2.15. HDF

HDF

T/HIS can read HDF files. The version of HDF file supported in T/HIS is HDF5. HDF4 files require conversion to HDF5 before they can be read (see <u>Converting HDF4 to HDF5</u>). Currently, T/HIS supports Float data types within Atomic datasets and Float data types within Compound datasets. Reading HDF files is supported in FAST-TCF. We plan to improve our support for HDF in future releases of T/HIS, so please send us any feedback you have.

| << Undock | Read Data | | | | |
|-----------|------------|---------|-------------|--|--|
| LS-DYNA | Groups | Keyword | T/HIS Curve | | |
| Bulk Data | Keyboard | CSV | Screen | | |
| ISO | LS-PREPOST | DIAdem | NASTRAN | | |
| CURVOUT | Equation | HDF | | | |

An HDF5 file can be read by entering the path in the textbox or using the file selector:

| - | HDF Panel | ? - 🗆 🗙 |
|-----------|-----------|----------------|
| Read | | |
| Filename: | | ▼ 🚍 |
| | | |

Plot Y against X dataset

Once a valid HDF file is selected, the HDF panel will open with two navigation lists mapped in "Plot Y against X dataset" mode – one related to Y-Axis and the other for X-Axis – showing the contents in the root group (/). Using these navigation lists, the entire HDF5 file can be accessed. If the selected datasets have any associated attributes, they will be listed in the attributes lists below.

An example of a curve reading in from a HDF5 file has been shown below. The file that has been read in is a binout file converted to HDF5 format:

| - | HDF | Panel | | |
|-------------------------------|-------------------------|------------|--|---------------|
| Read | | | | |
| Filename: C:\S | OURCE\hdf5_dir\examples | \python\bi | inout_lasso.h5 | • |
| Apply | | | Plot Y against X | dataset |
| | | | O Plot Y against in | idex 0n |
| / <root></root> | Y-Axis | | / <root></root> | X-Axis |
| Q <search groups=""></search> | ter Dataset Column> | | Q <search groups<="" th=""><th>ter Dataset C</th></search> | ter Dataset C |
| / elout | | | / elout | |
| eloutdet | - | | eloutdet | |
| glstat | | - | glstat | |
| nodout | | | nodout | |
| | | | | |
| |] | | | |
| Y Dataset Attributes | 3 | | X Dataset Attributes | |
| | / | | | / |
| | | | _ | |
| | | | | |
| | | 1 | | |
| ▼ | | | ▼ | |
| | | | | |

Clicking on a dataset will map an adjecent list of the dataset contents. An empty dataset box or disabled rows just means that data is not readable into T/HIS or we do not support it yet.

In this example, for Y-Axis we have selected **elout** \rightarrow **elout** \rightarrow **shell** followed by **sig_xx** (which is a 2D dataset), and selected Column 2 in the dataset list. For X-Axis we have selected **elout** \rightarrow **elout** \rightarrow **shell** followed by **time** (which is a 1D dataset) and selected Column 1:

| | HDF Par | nel |
|-----------------------------|--------------------------------------|-------------------------------|
| Read | | |
| Filename: C:\SOU | RCE\hdf5_dir\examples\python\binout_ | qd.h5 |
| Apply | | Plot Y against X dataset |
| | | O Plot Y against index 0n |
| / <root></root> | Y-Axis | / <root> X-Axis</root> |
| <search groups=""></search> | <enter column="" dataset=""></enter> | Q <search groups=""></search> |
| /elout/elout/shell/ | sig_xx | /elout/elout/shell/ |
| mat | Column 1 | sig_zx Column 1 |
| nip | Column 2 | sig_zz |
| npl | Column 3 | state |
| opt | Column 4 | → states |
| plastic_strain | Column 5 | system |
| revision | | time |
| sig_xx | | title |
| sig_xy | | upper_eps_xx |
| sig_yy | | upper_eps_xy |
| sig_yz | | upper_eps_yy |
| aia av | | V UDDOF 000 1/7 |

| | 1 | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | ¥ |
| | | |
| | | |

When you click **Apply**, a curve will be mapped:

Plot Y against Index 0...n

The second mode available is "Plot Y against Index 0...n", where only the Y-Axis points need to be selected. Y-values will then be plotted against their index i.e. X-values of 0, 1, 2, 3, etc.

| × | | | | A | |

After clicking **Apply**, the curve label will show the Level and the Column selected:

Compound Datasets

For a compound dataset, the curve label shows the list label:

Navigation aids

Navigation aids have been introduced in order to traverse through the file easily and with minimum number of clicks.

Search

Let us consider the "Plot Y against X dataset" example above. We had to follow the sequence **elout** \rightarrow **elout** \rightarrow **shell** \rightarrow **sig_xx**. Instead, if you already know that you want to retrieve **sig_xx** you can search for it in the **<Search Groups>** textbox directly, and select from the matching paths listed:

| - HDF Panel | ? - □× |
|---|---|
| Read | |
| Filename: C:\SOURCE\hdf5_dir\examples\python\b | binout_lasso.h5 🔹 🔚 |
| Apply | Plot Y against X dataset Plot Y against index 0n |
| / <root> Y-Axis</root> | / <root> X-Axis</root> |
| Q sig ter Dataset Column> | Q Search Groups> |
| /elout/elout/shell/sig_xx/ /elout/elout/shell/sig_xy/ elout /elout/elout/shell/sig_yy/ glsta nodo /elout/elout/shell/sig_zx/ /elout/elout/shell/sig_zx/ /elout/elout/shell/sig_zz/ /glstat/sliding_interface_energy/ /glstat/system_damping_energy/ / | / elout eloutdet glstat nodout X Dataset Attributes / / |

Column selection

The **<Enter Dataset Column>** textbox allows you to select columns quickly. The following are all valid searches:

- "1" or "Column 1"
- "1-4" or "Column 1-4"
- "1, 2, 3, 5" or "1 2 3 5" or "Column 1, 2, 3, 5" or "Column 1 2 3 5"

| - | HDF Panel | ? — | × |
|--|--|---|---|
| Read | | | |
| Filename: C:\SC |)URCE\hdf5_dir\examples\python | \binout_lasso.h5 | |
| Apply | | Plot Y against X dataset Plot Y against index 0n | |
| / <root></root> | Y-Axis | / <root> X-Axis</root> | |
| Q sig | 1-4 | Q <search groups=""> ter Dataset Column></search> | |
| <pre>/elout/elout/shell/ opt plastic_strain revision sig_xx sig_xy sig_yy sig_yz</pre> | sig_xx Column 1 Column 2 Column 3 Column 4 Column 5 | elout eloutdet glstat nodout | |
| Y Dataset Attributes | | X Dataset Attributes | |
| × | | / | |

Copy path

The left and right arrows simply copy the Y-Axis path to X-Axis path and vice versa. This can make it quicker to plot *Y* versus *X* data. Supposing you wish to plot *x-stress* versus *time*. Once you have selected the **sig_xx** dataset for the Y-axis, you can copy the path to the X-Axis and quickly switch the X-Axis selection to **time** if it is in the same location in the file:

| - | HDF Panel | | ? - 🗆 🗙 |
|--|--|---|---------------------|
| Read | | | |
| Filename: C:\SC | OURCE\hdf5_dir\examples\pythor | n\binout_lasso.h5 | • |

| <pre>/elout/elout/shell/ opt plastic_strain revision sig_xx sig_xy sig_yy sig_yz</pre> | sig_xx Column 1 Column 2 Column 3 Column 4 Column 5 | <pre>/elout/elout/shell/ state states system time title upper_eps_xx upper_eps_xy</pre> | time Column 1 |
| Y Dataset Attributes | | X Dataset Attributes | / • |

Converting HDF4 to HDF5

To convert an HDF4 file to the HDF5 format, you need to install the h4h5tools application, which can be found on the <u>HDF Group website</u> (we tested *h4h5tools-1.10.6-2.2.5-win10_64-vs15.zip*). Once installed, you can use the **HDF4 to HDF5 Converter Tool** script included with T/HIS to aid file conversion. The script converts selected HDF4 files into HDF5 files, writing the new files in the same directory as the originals. The script can be found in the T/HIS **JavaScript** menu:

| Tools | | | R PR PRIMER | | |
|-------------------------------|-----------|------------|-------------|--|--|
| Read | Write | Curves | Models | | |
| Edit | Style | Properties | Images | | |
| Operate | Maths | Automotive | Seismic | | |
| Macros | FAST-TCF | Title/Axes | Display | | |
| Settings | Measure | Groups | Graphs | | |
| Command Fil | Units | JavaScript | Datum | | |
| All G1 None | | | | | |

| Encoding: LATIN1 Memory: 25 | | | | | |
| | | | | | |

We plan to improve our support for HDF in future releases of T/HIS, so please send us any feedback you have.

8.3. WRITE Options

WRITE Options

Writes a group of curves out to a file for later use or to the screen.

| | Write | 1 | |
|-----------------|---------------|---------------|---|
| Apply | | | |
| Curves Selected | : 0 | Select Curves | |
| Output Type: | | Write to file | ▼ |
| Output Format: | | T/HIS .cur | ▼ |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | _ |
| Output : | .\default.cur | | ▼ |

8.3.1. WRITE TO FILE

WRITE TO FILE

Output Type: Write to file

Writes a group of curves out to a file for later use if required. The user is prompted for the list of curves to write out after a filename has been specified.

 $\overline{\mathbf{v}}$

FILE FORMAT

Writes a group of curves out to a file for later use if required. The user is prompted for the list of curves to write out after a filename has been specified.

| T/HIS .cur | , |
|-----------------|---|
| T/HIS .cur | |
| LS-DYNA Keyword | |
| NASTRAN TABLED1 | |
| CSV X,Y,X,Y,X,Y | |
| CSV X,Y,Y,Y,Y,Y | |
| Summary | |
| Summary (CSV) | |
| ISO-MME | |

T/HIS .cur This option will write out curves using the default T/HIS curve format. format One curve file will be written containing all the selected curves along with their Titles, Axis Labels, Line Labels and styles. From version 9.4 onwards the curve file can also contain information on the UNIT system and the X and Y axis units for each curve (see Appendix B for more details on the curve file format) **Ansys LS-**One file will be written containing all the selected curves using the **DYNA** Ansys LS-DYNA *DEFINE_CURVE format so that the file is suitable for inclusion in a Ansys LS-DYNA keyword file. Keyword **NASTRAN** This option will write out curves using the NASTRAN TABLE D1 format. **TABLE D1** Curves are listed sequentially in the file. **CSV** This option will write out curves using as a CSV (comma separated variable) file that can be read into other programs like Microsoft X,Y,X,Y,X,Y EXCEL. The columns written are x-values for the 1st selected curve, y-

CSV X,Y,Y,Y,Y,Y

This option also writes out a CSV file. All the curves are output using a single consistent set of X values that can either be taken from one of the curves or they can be generated automatically.

| Time Values: | | | Use Cu | rve | ▼ |
|----------------|-----------|--------|---------|--------|-------|
| Curve for X-va | lues : | | | | |
| Time Values: | | | Genera | te | ▼ |
| Start Time : | 0.0000E+0 | 0 Inte | erval : | 1.0000 |)E+00 |

Summary Gives a summary of the curve. This includes the type of data being plotted and the maximum and minimum values in the curve.

Summary (CSV)

CSV (comma separated variable) version of the summary file.

ISO-MME

The ISO-MME format (ISO/TS 13499) is a data exchange format for crash analyses comprising a number of folders and files. Two methods exist based on the type of data source used: Curves or Models. Selecting Curves launches the Curve to ISO-MME script for export configuration which requires user input to select the curves and other options. Selecting Models requires choosing a model for T/HIS to extract the data from and provide a configuration file to specify what data should be written out.

This extra configuration is needed because the naming conventions of the output files, set out in the ISO standard, follow specific rules which require extra data that isn't present in the curves alone and they also contain lines at the top of the files which describe the data in more detail. The contents of the configuration file are described in <u>ISO-MME</u> <u>Configuration File</u>.

In addition, an output directory is specified rather than a output file since multiple files are written out.

A side by side comparison of the panel for output format ISO-MME with Data Source set to Curves and Models is shown below:

| Write | ? × |
|----------------|------------------------|
| Apply | |
| Output Type: | Write to file |
| Output Format: | ISO-MME ▼ |
| Data Source: | OCurves |
| | Model |
| Model #: | *** Select Model *** ▼ |
| Config file: | ▼ 🔛 |
| | |
| Output : | |
| Write | ? × |
| Next | |
| | |
| Output Type: | Write to file • |
| Output Format: | ISO-MME 🔻 |
| Data Source: | Curves |
| | Model |
| | |
| | |
| | |
| | |
| | |

And this is how the Curve to ISO-MME script popup that appears when the "Next" button is pressed looks like.

| | • | | • | | • | |
|---|-------------------|-----|-----------------|---|---|--|
| | - | | Curve to ISO-MM | Ξ | • | |
| • | Curves: | | Select curves | | | |
| | Test name: | | | | | |
| • | MME Filename: | | | | | |
| | Output directory: | | | | | |
| • | MME Header CSV: | | | | | |
| | ISO-MME Format: | 1.6 | ▼ | | | |
| • | Export | | | | | |
| 1 | 1 | | 1 | 1 | I | |

From version 9.4 onwards the CSV files generated by T/HIS can also contain information on the UNIT system and the X and Y axis units for each curve. If you don't want to output this information then you can turn it off.

| Output Format: | CSV (X,Y,X,Y,X,Y) | ▼ |
|-----------------------------|-------------------|---|
| ✓ Write UNIT information to | CSV file | |

The default setting for this option can be set via the preference option

this*write_csv_units:

This option can also be turned on and off in FAST-TCF scripts (see FAST-TCF)

ISO-MME Configuration File

The ISO-MME configuration file is a JSON format file which is used to tell T/HIS which curves to generate: the data to extract, from which entities to extract it, their locations in the model and whether any filtering or operations are required. This configuration file is required so T/HIS can write various ISO-MME files with the correct names and any additional data required at the top of the files.

To set the scene, the structure of the directory where various files get written out and the files it contains is:

| ISO-MME Version 1.6 | ISO-MME Version 2.0 |
|--|---|
| Output Dir <virtual td="" testing<=""><td>Output Dir <testname>.mme <= Test</testname></td></virtual> | Output Dir <testname>.mme <= Test</testname> |
| reference ID>.mme <= Test Data | information file |

|-- Channel |-- Channel |-- <testname> Channel.mmi <= |-- <Virtual Channel index file Testing reference | |--ID>.chn <= Channel index <testname>_<channel_code>.mmd <= Channel</pre> file data files |-- <Virtual |--Testing reference <testname>_<channel_code>.mmd | |--ID>.001 <= Channel data files <testname>_<channel_code>.mmd |-- <Virtual Testing reference |-- Object ID>.002 • |-- <Virtual |--Testing reference <testname>_<object_code>.mmi <= Object ID>.003 files |--<testname> <object code>.mmi • |--<testname> <object code>.mmi

Test information file (.mme file)

The test information file describes the test and the objects (vehicles, dummies, barriers) in it. As an example:

| ISO-MME Version 1.6 | ISO-MME Version 2.0 |
|----------------------------|----------------------------|
| Data format edition number | Type of data source |
| :1.6 | :Simulation |
| Customer name | Data format edition number |
| :ARUP | :2.0 |
| Customer test ref. number | Timestamp |
| :NOVALUE | :2020-11-10 |
| Customer project ref. | Laboratory name |
| number:9999 | :Arup |
| Title | Laboratory contact name |
| :NOVALUE | :NOVALUE |
| Timestamp | Laboratory contact phone |
| :2022-09-29 13:30:00 | :NOVALUE |
| Type of the test | Laboratory contact fax |
| :NOVALUE | :NOVALUE |
| Subtype of the test | Laboratory contact email |
| :NOVALUE | :NOVALUE |
| Virtual Testing reference | Laboratory test ref number |
| ID:NOVALUE | :NOVALUE |
| Regulation | Type of the test |
| :NOVALUE | :NOVALUE |
| Date of the test | Subtype of the test |
| :2022-10-02 | :NOVALUE |
| Name of test object 1 | Regulation |
| :NOVALUE | :NOVALUE |

| Ref. number of test object 1:NOVALUE | | Date of the test :NOVALUE | |
|---|-----------|---|----|
| Velocity test object 1 lon. :NOVALUE | | Number of test objects #Begin of testobject | :2 |
| Velocity test object 1 lat. :NOVALUE Mass test object 1 :1230 | | Type Filename :my_test_D0.mmi #End of testobject | :D |
| Driver position object 1 | | #Begin of testobject | |
| <pre>Impact side test object 1 Name of test object 2 :NOVALUE Ref. number of test object 2:NOVALUE Velocity test object 2 lon. :NOVALUE Velocity test object 2 lat. :NOVALUE Mass test object 2 :1230</pre> | LE | Type Filename :my_test_1.mmi #End of testobject | :1 |
| | :2 :LE | | |

Object files (.mmi file)

These files are only present in ISO-MME Version 2.0. The object files describe each object in the test, for example:

```
Name :H350
Velocity :NOVALUE
Mass :NOVALUE
Impact side :00
#Begin of biomechanical
Gender :male
Age :21
#End of biomechanical
```

Channel index file (.chn or .mmi file)

The channel index file lists the channel data files:

| ISO-MME Version 1.6 (.chn file) | | ISO-MME Version 2.0 (.mmi file) | | |
|---------------------------------|----|---------------------------------|----|--|
| Instrumentation standard | : | Number of channels | :3 | |
| Not applicable | | Data origin | :S | |
| Number of channels | :7 | Data source | : | |
| Name of channel 001 | | simulation | | |
| :13HEAD0000WSACX0 | | #Begin of channel | | |
| Name of channel 002 | | Extended channel code | | |
| :13HEAD0000WSACY0 | | :DOHEADMI000000B | | |
| Name of channel 003 | | #End of channel | | |
| :13HEAD0000WSACZ0 | | #Begin of channel | | |

| Name of channel 004 :13HEAD0000WSDCX0 | Extended channel code :DOCHSTMI0000000C #End of channel #Begin of channel Extended channel code :DOPELVMI0000000C #End of channel | |
|--|---|--|
|--|---|--|

Channel data files (.001 or .mmd file)

The channel data file that gives the details about the curve:

| ISO-MME Version 2.0 (.mmd file) | |
|---------------------------------|---|
| Data structure | |
| :Channel | |
| Instrumentation standard | |
| :NOVALUE | |
| Name of the channel | :Accel x |

| | |
| | |
| | |
| | Data structure :Channel Instrumentation standard :NOVALUE Name of the channel - Node 52503304 : (PelvisAccel_INJURY) (Reg 0 (C 180) Data source :simulation Data status Cut off frequency :NOVALUE Channel amplitude class :NOVALUE Channel amplitude class :NOVALUE Sampling interval :0.0001 Bit resolution :NOVALUE Time of first sample Number of samples Reference channel :implicit #Start of data -6.09125e-05 -1785.28 -3315.55 |

Configuration structure

Below is an illustration of the configuration file structure.

- **Test data:** At the top of the file is a list of test data properties, followed by a list of descriptors for the test.
- **Objects array:** Next is a list of objects (e.g. vehicles, dummies, barriers) and their properties and descriptors.

Channels and Operations arrays are used to specify the Curve properties to output required curves:

- **Channels array:** Each channel in the array is defined as an object with properties such as **entityType**, id, etc. to create a single curve with its ISO-MME channel code defined in properties like **mainLocation**, **fineLocation** etc.
- **Operations array:** Each operation object defines an operation to be performed on any previously defined or multiple curves. Operations can be chained together. The final output should be an ISO-MME channel code.

Configuration File Structure

Configuration file properties

The following tables list all the required and optional properties and what they can be set to. If they aren't set, the default value is used.

Some values should follow the guidance in the ISO Related Electronic Documents A and B (RED A and RED B) and they are indicated below. They can be found on the <u>ISO-MME</u> forum.

Test Data properties

The first Table specifies the Test Data properties which provide details about the test. It is necessary to include **testName** and **formatVersion**.

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|----------|---|--------------|---------|--------|---------------|
| testName | Name of test. This is used for the test directory name and in the filenames. | Any value | - | String | Require d |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|---------------------------|--|---|---------------|--------|---------------|
| formatVersion | Format Version specifies the ISO- MME output version required. | 1.6 or 2.0 | 2.0 | String | Require d |
| thisVersion | T/HIS Build Version | Any Numerical value. For Eg:- "21.0" | - | String | Require d |
| thisBuildNumber | T/HIS Build Number | Any numerical value. For Eg:- "6100" | - | String | Require d |
| timestamp | A timestam p dates. It is written in the header of the test informatio n *.mme file. | Any value, but the expected format is "yyyy-mm-dd". | "NOVALU E" | String | Optional |
| laboratoryName | The laboratory name. It is written in the header of the test informatio n *.mme file. | Any value. | "NOVALU E" | String | Optional |
| laboratoryContactN ame | The laboratory contact name. lt is written in | Any value. | "NOVALU E" | String | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|----------------------------|--|--------------|---------------|--------|---------------|
| | the header of the test informatio n *.mme file. | | | | |
| laboratoryContactPh one | The laboratory contact phone number. It is written in the header of the test informatio n *.mme file. | Any value. | "NOVALU E" | String | Optional |
| laboratoryContactFa x | The laboratory contact fax number. It is written in the header of the test informatio n *.mme file. | Any value. | "NOVALU E" | String | Optional |
| laboratoryContactE mail | The laboratory contact email. It is written in the header of the test informatio n *.mme file. | Any value. | "NOVALU E" | String | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|-------------------------------|--|--|---------------|--------|---------------|
| laboratoryTestRef | The laboratory test reference. It is written in the header of the test informatio n *.mme file. | Any value. | "NOVALU E" | String | Optional |
| typeOfTest | The test type. It is written in the header of the test informatio n *.mme file. | See the ISO Related Electronic Document A for valid values, e.g. "Frontal Impact". | "NOVALU E" | String | Optional |
| subtypeOfTest | The test subtype. It is written in the header of the test informatio n *.mme file. | See the ISO Related Electronic Document A for valid values, e.g. "0 Degree Active". | "NOVALU E" | String | Optional |
| virtualTestingRefere nceld | The virtual testing ref id is used to write the filename for channel index file and | Any value. | "NOVALU E" | string | Optional |

|-------------------|---|------------------------------------|---------|-------------|---------------|
| | as they were prior to write ISO-MME or undefined if units were not set. | | | | |
| unitSystemDisplay | Used to set up units for display. Will be set to SI if model units specified and display units not specified. | "U1","U2","U3","U4","U5 ","U6". | blank | String | Optional |
| xAxisInterval | Used to specify X Axis Interval for all curves to regularise d. | 0 to 1e-7 | blank | Num ber | Optiona I |
| mandatoryHeaders | Used to specify whether mandator y headers are to be included. | true or false | true | boole an | Optional |

Descriptor properties

Along with the predefined properties listed in the tables detailing about Test, Objects and Channels, you can define any additional descriptor you like by providing a description and value using the syntax in the table below.

The descriptor JSON object allows you to define any number of descriptors that can appear in the ISO MME files:

- Test data file (.mme) if defined in Test data block
- Object files (.mmi) if defined in Object blocks
- Data Files (.001 or. mmd) if defined in Channel or Operation blocks

To provide any valid description/value please see the see the details below.

| Property | Description | Valid values | Default | Туре | Necessity |
|-------------|---|---|---------|------------------------|-----------|
| description | The Name of the Property for which you are creating the description. | This is supposed to mentioned as String as required by protocols. For eg. "Time step setting", "Number of CPUs" | NOVALUE | String | Optional |
| value | The Property which is defined in the 'description' is specified a value in this section. | This can be either string or integer for example -0.2 or " Value" | NOVALUE | Number or String | Optional |

Object arrays

The table lists the 'Standard' object types that are supported by T/HIS. Currently T/HIS supports the following objects:

| Objects | Description | Properties | Definition String | Default TestObject |
|----------|--|--|----------------------|---------------------------------|
| vehicles | The vehicles array contains vehicle objects. | name, velocity, mass, impactSide | "vehicles" | Numerical starting from 1 |

| Objects | Description | Properties | Definition String | Default TestObject |
|----------------|---|--|----------------------|-----------------------|
| dummies | The dummies array contains dummy objects. | name, gender, age, position | "dummies" | 'D' |
| barriers | The barriers array contains barrier objects. | name, barrierWidth, barrierHeight, yawAngle | "barriers" | 'B' |
| mobileBarriers | The mobileBarriers array contains mobile barrier objects. | name, barrierWidth, barrierHeight, yawAngle | "mobileBarriers" | 'Μ' |

Object properties

This table lists the properties that are supported by T/HIS for different objects. The properties provide details about the object.

| Property | Description | Valid values | Default | Туре | Necessity |
|------------|--|---|--|--------|-----------|
| testObject | testObject classification. It is the first character in the ISO-MME channel code. This property is used to name Object files (.mmi) | See the 'Test Object' section in the ISO Related Electronic Document B for valid values, e.g. "1", "2", "D" etc. | "D" for Dummies "B" for Barriers "M" for mobileBarriers Numerical Value for Vehicle | String | Required |
| position | The dummy's position in the vehicle. It is the | See the 'Position' section in | "0" | String | Required |

| Property | Description | Valid values | Default | Туре | Necessity |
|------------|--|--|-----------|--------|-----------|
| | second character in the ISO-MME channel code. This property is used to name Object files(.mmi) | the ISO Related Electronic Document B for valid values, e.g. "1", "2". | | | |
| name | The test object name. It is written in the header of the object *.mmi file for Version 2.0 and mentioned in *.mme in Version 1.6. | Any value | blank | String | Optional |
| velocity | The object's velocity. It is written in the header of the object *.mmi file. | Any value | "NOVALUE" | Number | Optional |
| mass | The object's mass. It is written in the header of the object *.mmi file. | Any value | "NOVALUE" | Number | Optional |
| impactSide | lt is written in the header of the object *.mmi file. | See the 'Fine Location 1' section in the ISO Related Electronic Document B for valid values, e.g., "LE", "LO". | "00" | String | Optional |

| Property | Description | Valid values | Default | Туре | Necessity |
|---------------|--|-----------------|-----------|--------|-----------|
| gender | The dummy gender. It is written in the object *.mmi file. | Any value | "NOVALUE" | String | Optional |
| age | The dummy age. It is written in the object *.mmi file. | Any value | "NOVALUE" | Number | Optional |
| barrierWidth | The barrier width. lt is written in the object *.mmi file. | Any value | 0.0 | Number | Optional |
| barrierHeight | The barrier height. It is written in the object *.mmi file. | Any value | 0.0 | Number | Optional |
| yawAngle | The barrier yaw angle. It is written in the object *.mmi file. | Any value | 0.0 | Number | Optional |

Channel Data properties

Channel Properties are used to define details about the Channel.

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|------------|--|--|--|--------|---------------|
| testObject | testObjec t classificat ion. It is the first character in the ISO-MME | See the 'Test Object' section in the ISO Related Electronic Document B for valid values, e.g. "1", "2", "D" etc. | "D" for Dummies "B" for Barriers "M" for mobileBar riers | String | Require d |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|--------------|---|--|-----------------------------------|---|---------------|
| | channel code. | | Numerical Value for Vehicle | | |
| position | The dummy's position in the vehicle. It is the second character in the ISO-MME channel code. | See the 'Position' section in the ISO Related Electronic Document B for valid values, e.g. "1", "2". | "0" | String | Require d |
| mainLocation | Main location on the object. This is required for the channel code. | See the ISO Related Electronic Document B for valid values, e.g. "HEAD", "CHST". | - | String | Require d |
| entityType | The Ansys LS- DYNA entity types to extract data for. | <u>A FAST-TCF data</u> <u>extraction keyword</u> (<u>See Section 7.4.5), e.g.</u> "node", "beam" | - | String | Require d |
| id | The Ansys LS- DYNA entity ID to extract | This can be the numerical ID or a *DATABASE_HISTORY_ID name or an array of IDs or names. | - | Numbe r, String, Array of String or | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|---------------|--|--|--|-------------|---------------|
| | data for. | If an array is defined, the output generated is the sum of the individual curves. | | Numbe rs | |
| | | In either case, the IDs/names should be specified as a string or number, e.g. "100",100, "my_node_id", [100, 200, 101], ["my_node_id_1","my_no de_id_2"]. | | | |
| | | The <id> property is not required for global data (e.g. global kinetic energy).</id> | | | |
| component | The compone nt to read. | FAST-TCF data extraction component words (See Section 7.4.5), e.g. "displacement x", "energy" | - | String | Require d |
| source | The LS- DYNA file to read data from. | <u>A FAST-TCF file keyword</u> (<u>See Section 7.4.2.1), e.g.</u> " <u>Isda", "thf"</u> | Blank (will extract data from the default file for the specified entity type). | String | Optional |
| fineLocation1 | Fine location on the object. This is | See the 'Fine Location 1' section in the ISO Related Electronic Document B for valid values, e.g. "IN", "OU". | "00" | String | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|-----------------------|---|--|---------|--------|---------------|
| | used for the channel code. | | | | |
| fineLocation2 | Fine location on the object. This is used for the channel code. | See the 'Fine Location 2' section in the ISO Related Electronic Document B for valid values, e.g. "IN", "OU". | "00" | String | Optional |
| fineLocation3 | Fine location on the object. This is used for the channel code. | See the 'Fine Location 3' section in the ISO Related Electronic Document B for valid values, e.g. "IN", "OU". | "00" | String | Optional |
| physicalDimensio n | Physical dimensio n data is determin ed automati cally from the required "compon ent" property but can be overwritt en with this optional property. | See the 'Physical Dimension' section in the ISO Related Electronic Document B for valid values, e.g. "AN", "DS". | "00" | String | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|----------------|---|---|---------|------------|---------------|
| | This is used for the channel code. | | | | |
| direction | The data direction is determin ed automati cally from the required "compon ent" property but can be overwritt en with this optional property. This is used for the channel code. | See the 'Direction' section in the ISO Related Electronic Document B for valid values, e.g. "R", "X". | "0" | String | Optional |
| xAxis Interval | Used to specify x Axis Interval for the curve to be regularis ed. This will overridet he x Axis Interval | 0 to 1e-7 | blank | Numbe r | Optional |

| Property | Descripti on | Valid | values | Default | Туре | Necessi ty |
|----------|--|---|---------------------|---------------------------|-------------|---------------|
| | property specified in test info block | | | | | |
| | | The Filter Class Code are positioned 16 th in the ISO-MME Channel Code. The following Filter Class Code are supported by T/HIS: - | | | | |
| | | Filter Class Code | Description | | | |
| | | "0" | Unfiltered | | | |
| | A filter to | "1" | FIR100 | | | |
| filter | use on the extracted | "2" | Combined A and B | blank (UnFiltere d) | String | Optional |
| | data. | "A" | CFC1000 | , | | |
| | | "B" | CFC600 | | | |
| | | "C" | CFC180 | | | |
| | | "D" | CFC60 | | | |
| | | "E" | CFC1000 | | | |
| | | "F" | CFC600 | | | |
| | | "G" CFC180 | CFC180 | | | |
| | | "H" | CFC60 | | | |
| write | An option to select whether the curve should be written to ISO-MME format. | Acceptable values are 'true' and 'false'. The default case is taken as true. If set to false, at the end of the ISO-MME writing process in FAST-TCF, the curve is deleted. | | true | Boolea n | Optional |

| Property | Descripti on | Valid values | Default | Туре | Necessi ty |
|----------------------------|--|-------------------------------|-------------------------------------|--------|---------------|
| testObjectHeader Number | Variable to specify test Object Number | Any alphanumeric character | First Letter of the ISO- Code | String | Optional |

Operation Data properties

Some ISO-MME channels can be written directly from the Ansys LS-DYNA results data. However, many require further operations, for example to apply filtering or convert a rotation sensor to a displacement. Each operation takes one or more inputs, uses FAST-TCF to perform the underlying operation, and produces an output. You can "chain" several operations together to produce the desired final output. Intermediate outputs can be given any name; the final output names must match the desired ISO-MME channel code. The following table lists the properties required to define each operation.

| Property | Description | Valid values | Default | Туре | Necessity |
|-----------|--|--|---------|-----------------------------------|-----------|
| operation | The type of operation to be performed on the input curves. | The accepted values for the operation are FAST-TCF Operation values as mentioned in Section 7.8 operation commands (e.g. "muly", "add"). | - | String | Required |
| input | To process operations by FAST-TCF File, T/HIS requires arguments based on the type of operation. | Accepted inputs are ISO-MME channel codes for already created curves in the channel block or output curves created in Operation Block, or Numerical Values. The elements in the Input array are | | Array of strings or Numbers | Required |

| Property | Description | Valid values | Default | Туре | Necessity |
|---|---|---|---------|---------|-----------|
| | | required to be in same order as mentioned in FAST- TCF Manual 7.8. | | | |
| | | Eg:- ["11ABRIRI02WSAN#0", 1.570796] | | | |
| | The output | For intermediate operation outputs, this can be any string. | | | |
| output | property is used to specify the FAST-TCF curve tag. | For the final output, this should be a valid ISO-MME channel code. | - | String | Required |
| | | Eg:- "intermediate curve" or "11ABRIRI02WSANZC" | | | |
| | An option to select | Acceptable values are 'true' and 'false'. The default case is taken as true. | | | Optional |
| write whether the curve should be outputted. | curve should be | If set to false, at the end of the ISO-MME writing process in FAST-TCF, the curve is deleted. | true | Boolean | |

8.3.2. WRITE TO SCREEN

WRITE TO SCREEN

Writes data to a text window on the screen.

Output Type:

Write to screen

v

| OUTPUT FORM | |
|-------------|---|
| List | |
| Summary | |
| Scan | |
| LIST | This option will write out all the points in the selected curves. |
| Summary | Gives a summary of the curve. This includes the type of data being plotted and the maximum and minimum values in the curve. |
| SCAN | Scans a group of curves and reports the maxima and minima values for each individual curve along with the overall maxima and minima |

8.4. Curve Manager

Curve Manager

In screen menu mode curves are managed using the **CURVE MANAGER** window, shown in the figure (below).

By default the **CURVE MANAGER** menu only displays 1000 curves. An unlimited amount of curves can be used and these are displayed in the menu in blocks of 1000. If an attempt is made to use a curve higher than 1000 then the Range options are used to select which group of 1000 curves you wish to display.

Against each curve that currently contains information is a curve number button. The colour of this button indicates the current blanking status of a curve

The curve is unblanked in all active graphs (Active Graphs)

The curve is blanked in all active graphs

The curve is unblanked in some active graphs

The blanking status of each curve can be changed by clicking on this button. The <u>Curve</u> <u>Table</u> can also be used to change the blanking status of a curve.

A range of curves may either be blanked or unblanked by selecting the first button in the range and then holding down the **SHIFT** key while selecting the last button in the range. All buttons that lie between the first and last buttons selected will have their status changed to match that of the first button that was selected.

The line label for each curve may be changed by over-typing the label currently displayed in the line label box.

The button located between the curve number button and the curve label shows the current colour, line style and symbol that will be used to plot the curve. These properties can be modified by clicking on this button to display the line style menu, see <u>LINE STYLES</u>

The **CURVE CONTROL** window can also be accessed via the **File....Curves** option at the top of the graphics window or from the **Curves** button in the main menu.

| << Undock | Curve N | lanager | ? |
|-----------|--|------------|----------|

8.4.1. Reordering Curves

Reordering Curves

Attached to each of the curve number buttons is a popup menu that can be used to reorder curves by copying and moving them. This menu is accessed by clicking the right mouse button over the curve number buttons.

_

| | INSERT CURVE BEFORE |
|---------------------|---|
| | INSERT CURVE AFTER |
| | COPY CURVE |
| | COPY CURVE + STYLE |
| | MOVE CURVE |
| | MOVE CURVE + STYLE |
| | DELETE CURVE |
| INSERT CURVE BEFORE | Inserts the last curve copied to a scratch definition before the selected curve. |
| INSERT CURVE AFTER | Inserts the last curve copied to a scratch definition after the selected curve. |
| COPY CURVE | Copies the curve to a scratch definition. |
| COPY CURVE + STYLE | Copies the curve along with its line style settings to a scratch definition. |
| MOVE CURVE | Copies the curve to a scratch definition and then deletes the original curve |
| MOVE CURVE + STYLE | Copies the curve along with its line style settings to a scratch definition and then deletes the original curve |
| DELETE CURVE | Deletes the selected curve |
| | |

Block Moving/Copying Curves

Since version 16, T/HIS has had the option to move or copy a selection of curves and insert them before/after a given curve.

This can be done via selecting the first curve as per usual and then either:

- SHIFT + "Move/Copy Curve" - To select a block of curves
- CTRL + "Move/Copy Curve" - To add an additional curve to your previous selection

| | ID | | | Label |
|------------|----|---|----------------|---------------------------------------|
| $ \Delta $ | 1 | • | - | Time Step - Whole Model |
| | 2 | • | -8- | K.E Whole Model |
| | 3 | • | \ | I.E Whole Model |
| | 4 | • | <u>-X</u> | Spring/Damper Energy - Whole Model |
| | 5 | • | | HG.E Whole Model |
| | 6 | • | -0- | System damping Energy - Whole Mo |
| | 7 | Þ | -*- | Joint internal energy - Whole Model |
| | 8 | • | # | Sliding interface energy - Whole Mode |
| | 9 | Þ | | External work - Whole Model |
| | 10 | | | 1 |

At any time, the operation can be cancelled by right clicking a curve which is in its "pending" status (greyed out), and selecting either **Cancel Move/Copy** to cancel the curve selected or via **Cancel Move/Copy - All** which cancels all "pending" curves.

The order in which the curves are inserted is the same order in which they are currently in the list. For example, the image below has curves 3,6 and 8 as pending. When these are inserted they will be condensed so that they are next to one another. So, if this selection was inserted after curve 9, then these three curves will occupy slots 10,11 and 12 respectively.

| ID | Label |
|-------------------------------|---|
| | Time Step - Whole Model |
| 2 🎽 🕂 | K.E Whole Model |
| 3 🕨 🛶 | I.E Whole Model |

| All Visible in every graph | | urves that are unblanked ove active graph status (equivaler | | | | |
| All "Null" Curves | Delete any curv | e which is "NULL" | | | | |

-

8.4.4. Table

Table

The Table option can be used to give more control over which curves are blanked and unblanked in all of the currently defined graphs, as well as display curve properties and injury values in a tabulated format. By default the Curve Table displays a scrolling list of all of the currently defined curves and curve groups along with a set of tick boxes that display the status of the curve in the current graphs. Curves are displayed in BLUE text while curve groups are displayed in GREEN.

| | Curve Table | | | | | | | | |
|-----------------|-------------|-----------------------------|-----------------|-----------|-----------------|------------------|--------------------------------|--|--|
| Dis | smiss | View T Update Filter by : M | odel T | Label v | Туре т | Component v | Save as : 💼 | | |

| | | | | | | | | | |
| Γ^{\vee} | | | | | | | | | |
| L | | | | | | | | | |

For each curve the following information is displayed by default.

| ID | Curve ID or Group ID for curve groups |
|------------|--|
| Label | Curve Label or Group Name |
| Directory | If the curve has been read in from a model then this will be the directory that all all the model files are in, if the curve had been read in from a file (.curcsv) then this will be the file location. No information is displayed for curve groups. |
| Model/File | If the curve has been read in from a model then by default this will be the ID of the model. If the curve had been read in from a file then this will be the filename. No information is displayed for curve groups. |
| Туре | The entity type that the curve was generated from. If the curve was read in from a file then this will display "FILE". |
| Entity ID | ID of the item that the data was read from. If the curve was read from a file then this will be the index within the file for each curve. If the row represents more than one curve (e.g. curve groups) and the curves have different components then it will display '*' |
| Component | Data component name. |

| | If the row represents more than one curve (e.g. curve groups) and the curves have different components then it will display '*' |
|-------|---|
| Style | This will show the line colour, style and width used to display the curve. |

The column widths of any of the above columns can be adjusted by clicking on the bars between the header columns and the order of the columns can be changed by dragging the column headers.

The contents of the table can also be sorted by any column by clicking on the relevant header button. Clicking on the same header a 2nd time reverses the sort order for the column.

Adding / Removing Curves from graphs and Locking / Freezing

To add an individual curve (or curve group) to a graph the tick boxes on the right hand side of the curve table can be used.

The first column of tick boxes (under the *) can be used to add/remove a curve from all the currently defined graphs, while the top row of tick boxes can be used to add/remove all the currently defined curves from a graph.

- If all of the curves are unblanked in a graph then the tick box will display a black tick in a white box.
- If some of the curves are unblanked in a graph then the tick box will display a dark grey tick in a grey box.
- If none of the curves in a group are unblanked in a graph then the tick box will be empty.

Multiple tick boxes can be set/unset by clicking on the first one and then holding SHIFT while clicking on the last one.

These tickboxes can also be used to lock or freeze curves. If the 'Locking/Freezing' button, or the 'Locking/Freezing' option in the 'Graph buttons' popup is selected, then the tickboxes are repurposed. Locking a curve means fixing it as blanked in a graph so it cannot be made visible until it is unlocked. Freezing a curve is the equivalent for visible curves. The curve will be visible in that graph until it is unfrozen. These curves will no longer be affected by shortcut keys such as 'u', 'r' and 'b'.

Instead of changing the ticks, locking and freezing will change the background colour of the tickbox. When a curve is locked, the background will be red. When it it is frozen, the background will be green.

The buttons relating to multiple graphs or multiple curves behave in the same way as for blanking, as does multiple-selection using CTRL or SHIFT.

Individual curves can also be selected by clicking on them in the main part of the curve table. Multiple curves can be selected using either CTRL to select a single curve or SHIFT to select a range of curves. As curves are selected they are highlighted in blue and the tick boxes for any unselected curves are greyed out.

When multiple curves have been selected then clicking on a tick box sets the status for all the selected curves.

View Options

The viewing options popup, found in the top left of the curve table window, can be used to control which columns of data are displayed and what items are displayed in the curve table.

| Select Columns: | | | | ? |
|--|--|--|--|---|
| General | Curve properties | Injury values | Display | Show Models By |

| Component Style Directory | Min +ve X X @ Min Y X @ Max Y X @ Min +ve Y Average RMS # POINTS | PHD val OORR val | ☐ Groups Only | |
| Save to pref | | | | Dismiss |

By default all 8 columns of general information about each curve will be displayed, each column can be turned on and off but T/HIS will ensure that at least one column is always displayed. Curve properties and injury values can also be displayed, but this will be discussed further <u>below</u>.

The columns that are initially displayed can be specified in the preference file (see <u>Format of the oa_pref File</u> for more details). If the columns are changed then **Save to Pref** can be used to update the preference file.

Display

This option can be used to control how items are displayed in the curve table.

| Display |
|---------------------|
| All Items |
| Group By Model/File |
| Group Common Items |
| |

All Items

By default the curve table will contain one row for each curve and one row for each curve group.

| 1 | K.E Whole Model | E:\BASE | 1 | Model | 1 | K.E. | |
|------|---------------------|---------|-----|-------|-------|---------|-------|
| 2 | I.E Whole Model | E:\BASE | 1 | Model | 1 | I.E. | |
| 3 | K.E Whole Model | E:\RUN1 | 2 | Model | 1 | K.E. | |
| 4 | I.E Whole Model | E:\RUN1 | 2 | Model | 1 | I.E. | |
| 11 | Disp mag - Node 100 | E:\BASE | 1 | Node | 10000 | Disp ma | |
| 12 | Disp mag - Node 100 | E:\RUN1 | 2 | Node | 10000 | Disp ma | |
| 1 | Model_1 | N/A | N/A | GROUP | * | * | Mixed |
| 2 | Model_2 | N/A | N/A | GROUP | * | * | Mixed |
| Grou | p By Model/File | | | | | | |
| * | * | E:\BASE | 1 | * | * | * | Mixed |
| * | * | E:\RUN1 | 2 | * | * | * | Mixed |
| 1 | Model_1 | N/A | N/A | GROUP | * | * | Mixed |
| 2 | Model_2 | N/A | N/A | GROUP | * | * | Mixed |

This option will display a single row for all the curves that were read from the same model or file.

When this option is selected the columns for curve ID, Label, Type, Entity ID and component display a '*' as they represent multiple values.

This option can be used to quickly assign all of the curves from a single model or file to the same graph.

Group By Common Items

| * | * | * | * | Model | 1 | K.E. | Mixed |
|---|---------|-----|-----|-------|-------|---------|-------|
| * | * | * | * | Model | 1 | I.E. | Mixed |
| * | * | * | * | Node | 10000 | Disp ma | Mixed |
| 1 | Model_1 | N/A | N/A | GROUP | * | * | Mixed |
| 2 | Model_2 | N/A | N/A | GROUP | * | * | Mixed |

This option will display a single row for all the curves that were created using the same entity type, ID and component.

In the example opposite the 1st row represents all of the curves that contain a model Kinetic Energy while the 3rd row represents all the curves that contain a displacement magnitude for Node 10000.

This option can be used to quickly assign all of the curves for the same entity and component to the same graph when comparing results from multiple models.

Include

By default the curve table contains both curves and curve groups. This option can be used to display either just the curves only or just the curve groups.

Show Models By

☐ THF File

Model number ☐ Directory

User Defined.

Show Models By

If the column displaying the model ID is displayed in the curve table then by default it will display the model number.

This option can be used to display either.

| | | Filter b | y Model | | |
| Dismiss | | Select : | All | None | |
| Model 1 | | 🖌 Mode | el 2 | Model 3 | |
| Model 4 | | Mode | el 5 | | |

This option can be used to filter the list of curves by model number. If curves have been read in from a file then an "Other" option will be shown.

In the example opposite only curves that are either from model 1 or model 2 will be displayed.

Filter By Label

This option can be used to filter the list of curves by label. Up to 5 different strings can be entered and the list of curves displayed will be filtered using those strings. If multiple strings are entered then the strings can either be combined using either "AND" or "OR".

A separate option can be used to ignore the case so that "model" will match both "Model" and "model"

In the example opposite only curves that contain either the word "Model" OR the word "Node" in their labels will be displayed.

Filter By Type

Annotating Curves

Curves can be annotated with most of the properties and injury values by rightclicking the values in the table and selecting **Annotate**. Options for customising these annotations can be found in the **Annotation options** popup. The options include the format of the displayed value, i.e. whether it should appear as a single value (usually either an X or Y value depending on the property), or as a point (X,Y). The choice to highlight the value on the curve with a cross is also given, as well as the ability to add either an automatic or user-defined label to the annotation.

8.4.5. Summary

Summary

Displays a window from which a group of curves may be chosen. The maximum and minimum values of the selected curves are then displayed.

8.4.6. List

List

Displays a **LIST CURVES** window, from which a number of curves may be selected. The data point values for the selected curves are then listed in a listing box.

8.4.7. Scan

Scan

Displays a window from which a group of curves may be chosen. The maximum and minimum values of the selected curves are then displayed.

8.4.8. CURVE RANGE SELECTION

CURVE RANGE SELECTION

The range buttons in the Curve Control menu can be used to when you are working with more than 1000 curves to move between groups of 1000 curves. Pressing the green + button will display the next group of 1000 curves in the menu, whilst pressing the red - button will display the previous group of 1000 curves.

| << Undock | Curve M | lanager | ? |

| #1001:#2000 | | | | | | |
| #2001:#3000 | | | | | | |
| | | | | | | |

8.4.9. CURVE TAGS

CURVE TAGS

Curves can be given tags to act as internal identifiers within T/HIS which can be used to reference curves in order to perform operations on them.

In order to display the curve tags, toggle on the Show Labels arrow and select Show Tags. The tag names can be defined in the input boxes.

When a curve file is written, T/HIS will save the tags of all the tagged curves in the file.

When performing operations in the dialogue box, curves can be referenced by their tags. The tag must be placed in double quotes.

8.5. Model Manager

8.5.1. Select

Select

This allows the user to turn models on/off. Deselecting a model will result in removal of its entities as options when reading data. Models can be displayed according to their titles or alternatively by the directories they were read in from.

Clicking on the button displaying a model title will produce a menu similar to that illustrated below. The number of each type of item in the model and the sources T/HIS found for that item type's data will be shown. The user can select which file type is preferred for the data for each type of item (see <u>Settings</u>).

Prefix

This menu can also be used to define a user defined model prefix. This prefix can be added automatically to the start of curve labels to help identify which model they belong to.

| | Model | Manager | | ? X |
|-------------|--------------|---------|-----------|-------|
| Title | LG09 : LAR | GE TEST | 9: BELTED | SLED |
| Directory | E:\test\sled | | | |
| Prefix | M1 | | | |
| THF/d3thdt | new_lg09.th | ıf | | |
| XTF/xtfile | new_lg09.xt | f | | |
| LSDA/binout | binout | | | |
| ASCII | Present | | | |
| Done | THF | XTF | LSDA | ASCII |

| Contacts | - | 11 | 10 | 10 |
| Reactions | - | 0 | 0 | 0 |
| Airbags | - | 0 | 0 | 0 |

8.5.2. Re-Read

Re-Read

The re-read option can be used to rescan and update the model. This will find any new data written to disk since the file was last read.

8.5.3. Delete

Delete

This option allows the user to select and delete models from T/HIS. Any curves that have been read in from a model that is deleted are NOT deleted with the model. Any number of models to be deleted from T/HIS.

8.5.4. Convert Binout

Convert Binout

This option can be used to convert LSDA binout files into the older ASCII files. The menu allows a number of models to be selected.

The **Select Files** button allows the user to specify which ASCII files are to be created.

All of the ASCII files are written into the directory containing the LSDA file.

| Convert LSDA (binout) Files to ASCII 🛛 🛛 🖓 🕨 | | | | | | |
|--|------|--------------|----------|----------|--------------|-----|

8.6. EDIT Options

EDIT Options

This menu allows you to examine and make modifications to the curve data points. You are always working on a "scratch" copy of the curve. The permanent curve is only updated when you **Save** it explicitly.

Moving around the curve data is done through the use of scroll bars on the data panel.

| ∐ ∇ | | | | | |

Save

Saves the edited curve as either a new curve or overwrites the original.

Restart

Resets the curve being edited to the values at the start of the edit session.

Quit

186 / 900

Quits the Curve Editor without making any changes to the curve.

Labels...

Allows the title, axis and line label to be changed (see <u>Curve Labels</u> for more details).

Replace

Allows curve values to be changed by overtyping the x and y values.

Insert Before

Inserts a new point in the curve before the selected point.

Insert After

Inserts a new point in the curve after the selected point.

Delete

Deletes the selected point.

The **Command** text-box allows control by command line (see <u>Command line mode</u> for more details).

8.6.1. Interactive Curve Editing

Interactive Curve Editing

After a curve has been selected it is displayed using a thicker line to highlight it in any graphs that it is visible in.

As well as being highlighted the curve points can be edited interactively and the Quick Pick menu in the main Tool Bar (see <u>Tool Bar</u> for more details) is replaced with the EDIT menu.

LAST UPDATED 13 JUNE 2025

Modify

Drag Modify the point nearest to the screen pick

X,Y by dragging it's position in both the X and Y axis directions.

Drag Drag a point in the X axis direction only. **X**

Drag Drag a point in the Y axis direction only. Y

Insert

Insert (Between) ...
Between
At Cursor
Split segment 2
At Start
At End
Between
Finds the nearest segment to the point
selected on the screen and then projects
the point onto the segment.
At Cursor
Finds the nearest segment to the point

selected on the screen and then inserts the a point at the screen location between the 2 ends of the segment.

SplitFinds the nearest segment to the pointSegmentselected on the screen and then splits the
segment in 2 or more parts.

| At Start | Inserts a new point at the curve. | e screen location before the first point in the |
|----------|---|--|
| At End | Inserts a new point at the curve. | e screen location after the last point in the |
| Delete | | Point To End From Start |
| Point | Finds the nearest point to th | ne screen pick and deletes it. |
| To End | Finds the nearest point to th curve from that point onwar | ne screen pick and deletes all points in the rds. |
| E | | |

FromFinds the nearest point to the screen pick and deletes all points in theStartcurve up to that point.

Locate

Finds the nearest point to the screen pick and updates the list of points in the main edit panel so that the points either side of the picked point are displayed.

Restart

Resets the curve being edited to the values at the start of the edit session.

Save (Overwrite)

Overwrite the original curve with the edited one.

Save (Highest used + 1)

Save the edited curve as a new curve without overwriting the original curve.

Quit

Quits the Curve Editor without making any changes to the curve.

8.6.2. Command Line Mode

Command line mode

In command line mode editing of curves is done in a similar fashion using the following commands.

| Moving around the curve: | F | Forward | Move forward 16 lines |
|--------------------------------------|------------|-------------|--|
| | в | Back | Move back 16 lines |
| | Т | Тор | Move to the top of the curve |
| | Е | End | Move to the end of the curve |
| | N | Number | Move to given line number |
| Modifying the curve: | Cn | Change | Change line n |
| | In | Insert | Insert points before line n |
| | An | Append | Append points after line n |
| | D n1 n2 | Delete | Delete lines n1 to n2 |
| | L | Label | Change the line label |
| | R | Reset | Reset the curve back to the original curve |
| Saving and Plotting the curve: | W | Write | Write the curve |
| | S | Save | As write |
| | PE | Plot Edited | Plot the edited curve |
| | PA | Plot All | Plot the edited and original curve |
| | PL | Plot | Plot the current T/HIS curves |

Q Quit Quit the editor

In command line mode the EDIT menu is reached by typing /ED

8.6.3. Curve Labels

Curve Labels

Each curve has four labels associated with it:

The first three are only used on a plot if this curve is the first (or only) curve to be plotted, and the relevant labels are in "automatic" mode (see <u>TITLE and AXIS</u>).

You can change any of these by simply overtyping whatever is currently there. When you are happy with the result use the **APPLY** button to dismiss this box, saving the new values. The labels here are scratch values, current only in this editor, the permanent curve labels are only overwritten with them if you **SAVE** this edited curve.

RESET will restore the scratch labels to the original values of the permanent curve being edited.

The title, axis and line labels can also be modified using the dialogue box.

8.7. LINE STYLES

LINE STYLES

The **Line Style** menu is shown in the figure (right). This menu can be used to change the colour, width, style and symbol for any of the curves that are currently being used.

When a curve file is written, T/HIS will save the line style for each curve in the file.

The lower half of this panel contains a list of all the curves that are currently being used. By default the curve that was clicked on in the **Curve Manager** will be highlighted and the Colour and Symbol buttons in the top section of the menu will show the setting for that curve.

The **Save All** button can be used to save the current set of line styles to a file while the **Reload All** button can be used to reload a set from a previously saved file. The **Reset All.** button will reset all the curve styles to the original T/HIS settings.

If you wish to modify the colour/style of more than one curve at a time additional curves may be selected by pressing the

8.7.1. APPLY

APPLY

This button will **APPLY** the current line colour, symbol, width and style selection to all the curves that have been selected.

8.7.2. COLOUR

COLOUR

Pressing the right mouse button while over the colour button will invoke a colour popup menu.

T/HIS has a built in palette of 30 predefined colours and 6 user defined colours. Colours are defined using 6 digit Hexadecimal values using the format RRGGBB.

- RR Red Component (0-255)
- GG Green Component (0-255)
- BB Blue Component (0-255)

| Colour ID | Name | Alternative Name | Value |
|-----------|--------|------------------|--------|
| 1 | COL_1 | WHITE | FFFFF |
| 2 | COL_2 | RED | FF0000 |
| 3 | COL_3 | GREEN | 00FF00 |
| 4 | COL_4 | BLUE | 0000FF |
| 5 | COL_5 | CYAN | 00FFFF |
| 6 | COL_6 | MAGENTA | FF00FF |
| 7 | COL_7 | YELLOW | FFFF00 |
| 8 | COL_8 | ORANGE | FF9C00 |
| 9 | COL_9 | TURQUOISE | 21FF94 |
| 10 | COL_10 | INDIGO | 7B00FF |
| 11 | COL_11 | LIME | BDFF39 |
| 12 | COL_12 | SKY | 39BDFF |
| 13 | COL_13 | PINK | FF7B7B |
| 14 | COL_14 | BLACK | 000000 |
| 15 | COL_15 | PALE_YELLOW | FFFF9C |
| 16 | COL_16 | GOLD | FFCE00 |
| 17 | COL_17 | OLIVE | 787800 |

| 18 | COL_18 | DARK_MAGENTA | 9C3163 |
|----|--------|--------------|--------|
| 19 | COL_19 | MEDIUM_GREEN | 9CCE00 |
| 20 | COL_20 | MEDIUM_BLUE | 7B7BFF |
| 21 | COL_21 | HOT_PINK | FF9CCE |
| 22 | COL_22 | LIGHT_PINK | FFCE9C |
| 23 | COL_23 | SEA_GREEN | 317B63 |
| 24 | COL_24 | MAROON | 7B0000 |
| 25 | COL_25 | DARK_GREEN | 007B00 |
| 26 | COL_26 | PURPLE | 7B007B |
| 27 | COL_27 | NAVY | 00007B |
| 28 | COL_28 | DARK_GREY | 393939 |
| 29 | COL_29 | MEDIUM_GREY | 7B7B7B |
| 30 | COL_30 | LIGHT_GREY | BDBDBD |
| 31 | COL_31 | USER_1 | - |
| 32 | COL_32 | USER_2 | - |
| 33 | COL_33 | USER_3 | _ |
| 34 | COL_34 | USER_4 | - |
| 35 | COL_35 | USER_5 | - |
| 36 | COL_36 | USER_6 | - |

As well as the 36 colour options **Foreground** and **Background** can be selected to change the colour to the **Foreground** and **Background** colours defined in the <u>Display</u> menu.

If **No Change** is selected then the **Apply** button will have no effect on the colour of the currently selected curves..

8.7.3. SYMBOL

SYMBOL

Pressing the right mouse button while over the **Symbol** button will invoke a symbol popup menu that allow any of the 9 T/HIS symbols to be selected (the 9 th is a blank symbol that can be selected so that a curve can be plotted without a symbol). As well as the 9 symbols the menu also contains a **No Change** option.

The **Symbols Frequency** controls how often a symbol is drawn on a curve. By default, symbols are not drawn; they can be switched on using the <u>Display</u> menu.

8.7.4. WIDTH

WIDTH

Pressing the right mouse button while over the width button will invoke a popup menu that allows 10 different line widths to be selected or **No Change**.

8.7.5. STYLE

STYLE

Pressing the right mouse button while over the style button will invoke a popup menu that allows 8 different line styles to be selected (the 8th is actually a blank line that can be selected so that a curve can be plotted without a line).

As well as the 8 line styles the menu also contains a **No Change** option.

8.7.6. CURVE PALETTE

CURVE PALETTE

By default T/HIS uses 6 colours (White, Red, Green, Blue, Cyan and Magenta) for any curves that have not had a colour explicitly defined for them. Curves 1,7,13... will be White, 2,8,14... will be Red.

This option can be used to change the default number of colours T/HIS uses.

| Default 🕨 | Default (6) |
|-----------|----------------|
| | Extended (13) |
| | No Grey (27) |
| | Full (30+user) |

| Default | Use the default 6 colours |
|----------|---|
| Extended | Use the first 13 colours |
| No Grey | Use all 30 predefined colours except the 3 grey ones |
| Full | Use all 30 predefined colours plus any user defined ones. |

The default value for the curve palette can also be specified in the "preferences" file (see <u>Appendix H</u> for more details).

8.7.7. MODIFYING LABELS

MODIFYING LABELS

| Line L | abel 🕨 | Search | |
|--------|--------|---------|--|
| GO | UNDO | Replace | |

Multiple curve labels may be edited using the Search and Replace option to enter the string to search for and the string to replace it with ^ can be used to insert text at the beginning of a label while **\$** can be used to append to the end of a label. The table below shows the effect of 4 search and replace examples.

| | Example 1 | Example 2 | Example 3 | |
|----------------|---------------------------|-----------|--------------|----------------------------|
| Original Label | Displacement N1034 | Time | -a1.1- | iso18571 -a1.1- cae1 |
| Search String | N1 | \$ | * | * |
| Replace String | Node 1 | (s) | ISO_A1.1 | |
| Modified Label | Displacement Node 1034 | Time(s) | ISO_A1.1 | |

The **GO** button will initiate the search and replace on all the curves that are currently selected (highlighted in the bottom half of the menu), while the **UNDO** button can be used to reset the labels to what they were before the search and replace.

Pressing the right mouse button while over the **Line Label** button will invoke a popup menu that allows the label that is being modified to be swapped between the **Line Label**, **X-Axis Label** and the **Y-Axis Label**.

Line labels can also be modified by using the <u>dialogue box</u>.

8.7.8. SELECTING CURVES

SELECTING CURVES

| Select All | Deselect All | Show Curves | v |
|------------|--------------|-------------|---|
| | | Show Curves | |
| | | Show Groups | |
| | | Show Models | |

By default the Style menu will display a list of all the current defined curves so that the style for individual curves can be modified

| Select A | .II | Deselect All | Show Curves |
|-------------|-----------------|-----------------|-----------------|
| ∆ #1 | -8- | (M2) : Disp mag | - Node 100000 |
| #2 | - | (M3) : Disp mag | J - Node 100000 |
| #3 | - <u>X</u> | (M4) : Disp mag | j - Node 100000 |
| #4 | ~~ | (M5) : Disp mag | J - Node 100000 |
| #5 | -0 - | (M6) : Disp mag | J - Node 100000 |
| 110 | | (110) - 1 (-1 | |

Instead of displaying individual curves the style menu can be changed to display a list of any currently defined curve groups.

If curve groups are selected then the style will be applied to all of the curves in the curve group.

| Select All | Deselect All | Show Groups | v | | | | |
|------------------|---------------------------------------|-------------|---|--|--|--|--|
| 🛆 #1 : Curve Gro | / #1 : Curve Groiup 1 - Displacements | | | | | | |
| #2 : Curve Gro | #2 : Curve Group 2 - Velocities | | | | | | |
| #3 : Curve Gro | #3 : Curve Group 3 - Accelerations | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | S | | | | | | |

The style menu can also display a list of all the models currently loaded in T/HIS.

If models are selected then the style will be applied to any curve that was created using data from the model.

| Select All | Deselect All | Show Models | | | | |
|-----------------|----------------------|-------------|--|--|--|--|
| / #2 : BASE T = | / #2 : BASE T = 1.50 | | | | | |
| #3 : RUN 1 T = | #3 : RUN 1 T = 1.30 | | | | | |
| #4 : RUN 2 T = | #4 : RUN 2 T = 1.40 | | | | | |
| #5 : RUN 3 T = | #5 : RUN 3 T = 1.60 | | | | | |
| #6 : RUN 4 T = | #6 : RUN 4 T = 1.70 | | | | | |
| Othora | Othere | | | | | |

8.7.9. LINE STYLE EDITING IN THE DIALOGUE BOX

LINE STYLE EDITING IN THE DIALOGUE BOX

The dialogue box can be used to edit curve styles.

To access this feature, enter the command $/ \verb|style|$ at the Command Prompt.

| _ | HELP BOX | | |
|------------|---|---|--|
| ок | Using help., | Using windows | |
| | | | |
| Curve opt | tions are: | | |
| | | | |
| LA | - Set a curve | label | |
| ТІ | - Set a curve | title | |
| XL | | | |
| YL | - Set a curve | y-axis label | |
| TA | - Set a curve | tag | |
| | | | |
| [End of te | ext] | | |
| | | | |
| | Curve opt LA TI XL YL TA | OK Using help. Curve options are: LA - Set a curve TI - Set a curve XL - Set a curve YL - Set a curve | OK Using help. Using windows Curve options are: |

Enter M at the **STYLE** > command prompt for a list of all available dialogue box commands.

The following commands are available:

Enter the curve number (e.g #1 for curve 1) at the **select curve**? command prompt.

T/HIS will prompt the user to input the desired style properties in the order:

colour; Enter the colour for the line Line Width; Enter the desired line width for the line Line Style; Enter the desired line style (e.g. dashed) for the line Symbol Type; Enter the desired Symbol Type Symbol Frequency; Enter the desired frequency of the symbols in the format

READ

This option allows the user to read a style file containing style information and apply that style to a particular curve.

Enter the name of the style file at the style File? command prompt.

WRITE

This option allows the user to write a style file containing style information.

DEFAULT

This option allows the user to reset all the curve styles to the default settings.

FIX

This is an **ON** / **OFF** switch which resets the curve styles when they are plotted on the screen so that the curves cycle through the default T/HIS colours and styles as they are plotted. This will result in the first curve being plotted always being white, the second red, the third green, etc regardless of their curve numbers. The default is **OFF**.

GΜ

This option will display the Global Menu in a separate window.

8.7.10. LABEL AND TITLE EDITING IN THE DIALOGUE BOX

LABEL AND TITLE EDITING IN THE DIALOGUE BOX

The dialogue box can be used to edit curve labels, x-axis and y-axis labels and curve titles.

To access this feature, enter the command /cur at the Command Prompt.

| <mark>∠</mark> T/HIS > /cur | |
|-----------------------------|--|
| Curve ≻ /cur | |

| J | |
|---|----------------|
| Enter M at the CURVE OK Using help. | Using windows |
| > command prompt for a list of all | |
| available dialogue | |
| box commands. Curve options are: | |
| The following LA - Set a curve | lahal |
| The following commands are TI - Set a curve | |
| xL - Set a curve | e x-axis label |
| TA - Set a curve | e y-axis label |
| | , cuy |
| TI [End of text] | |
| | |
| <u>YL</u> TA | |

LA

This option allows the user to edit the Curve > la label for individual curves.

Enter the curve number at the select curve? prompt.

Enter the desired new label at the Label prompt, the current Label will be displayed in brackets.

ΤI

This option allows the user to edit the title for individual curves.

Enter the curve number at the select curve? prompt.

| _ | DIALOGUE |
|---|--|
| H | Curve ≻ ti |
| | Select curve? #5 |
| | Title (Acceleration time, Analysis) Acceleration vs time, Analysis |

Enter the desired new title at the Title prompt, the current title will be displayed in brackets.

XL

This option allows the user to edit the x-axis label for individual curves.

Enter the curve number at the select curve? prompt.

| | DIALOGUE |
|------------------------|----------|
| Curve > xl | |
| Select curve? #5 | |
| X-Axis (Time) Time (s) | |

Enter the desired new title at the X- Axis prompt, the current x-axis label will be displayed in brackets.

YL

This option allows the user to edit the y-axis label for individual curves.

Enter the curve number at the **select** curve? prompt.

Enter the desired new title at the Y- Axis prompt, the current y-axis label will be displayed in brackets.

TA

This option allows the user to edit the tag for individual curves.

Enter the curve number at the select curve? prompt.

| | _ | DIALOGUE |
|---|---|------------------|
| e | 4 | Curve > ta |
| | | Select curve? #5 |
| t | | Tag () Acc_1 |

Enter the desired new Tag at the Tag prompt, the current tag will be displayed in brackets.

8.8. Command/Session Files

Command / Session Files

Command and session files are used to drive or record a T/HIS session. Both session (save) and command (playback) files have been set up to act like tape recorders; and the concept of "recording" and "playing back" files will be used below.

These files ("button click" command files) are not easy to edit by hand and they are not always backwards compatible between versions of T/HIS. For these reasons most users prefer the newer <u>FAST-TCF</u> format, which can also be recorded and <u>played back</u> from within T/HIS.

| | ? X | | |
|------------|------------|--------|--|
| Playback | Record | | |
| Playback : | Pause | Resume | |
| Record : | Pause | Resume | |
| | | | |

In screen menu mode a command has a meaning beyond the simple command word. For example, **HELP** appears in many different places, with a distinct meaning (or relevance) in each place. Therefore, context information is stored when saving screen menu session files.

In practice the following information is saved:

- the command itself whether typed of inferred from a button
- the button identification (if any)
- the parent window identification
- the menu item (if relevant)
- the action type (screen pick, button press, etc)
- any x/y coordinates that may be relevant.

A choice of either writing ("recording") session files or executing ("playing back") command files is given. By default commands are not saved. If they are to be saved the session file record switch must be turned on.

8.8.1. Writing ("Recording") Session Files

Writing ("Recording") Session Files

To write a session file the **Record** tab must be pressed, displaying the **RECORD COMMAND FILES** menu shown below.

| | Command / Se | ession File | es 🤶 🗙 | | | |
|------------|---------------------------|-------------|-------------|--|--|--|
| Playback | Record | | | | | |
| Playback : | Pause | Resum | e | | | |
| Record : | Pause | Resum | e | | | |
| | File savin | g & mode | | | | |
| Review r | node | S | AVE TO DISK | | | |
| Record | node | DE | LETE TO EOF | | | |
| | File position and control | | | | | |
| << SEARCH | RECO | RD > | SEARCH >> | | | |
| < STEP | < STEP ST | | STEP > | | | |
| TOP | Goto line: | | END | | | |
| INDEX | SPE | ED | | | | |
| | Current com | imand stat | us | | | |
| Line no: | 2/2 | | | | | |
| Box name: | Top menu box | | | | | |
| Function: | Button Press | | | | | |
| Command: | Command File | | | | | |

Pressing the **RECORD** > button will start the session file. Thereafter, all commands (except those in the session/playback windows) are saved in an internal scratch file. In order to save these commands to disk they must be written explicitly using the **SAVE TO DISK** button. They can then be read back in and replayed

A variety of features are available to help move around the file. These are shown in the **FILE POSITION AND CONTROL** area of the panel. The file can be indexed at particular

user defined points using the **INDEX MARKS** menu is accessed by pressing the **INDEX...** button. These may be used as targets of a search and also to control recording.

The scratch file is random access, and can be moved back and forth and reviewed at will. To help with this it is possible to switch between **RECORD** and **REVIEW** modes in the session file control box:

RECORD records all your commands when running

REVIEW plays back your recorded commands

A command file can be stepped through or run backwards or forwards. It may also be searched for a particular command. As with a real tape recorder, if the pointer is moved backwards and recording continued the commands that were previously stored will be overwritten from that point.

The session file recording and command file playback operations are totally separate: they can be thought of as two separate tape recorders. As a consequence it is possible to record commands that are being played back: in effect it is possible to edit and combine files.

8.8.2. Executing ("Playing Back") Command Files

Executing ("Playing Back") Command Files

Similar to recording Session Files, the **PLAYBACK COMMAND FILES** menu, shown below, must be invoked from the **COMMAND/SESSION FILES** window.

This is done by pressing the **Playback** tab. An existing file must then be read. This is analogous to loading a tape into the tape recorder: it is then converted into an internal scratch format (random access, as above) and can be played back or previewed at will.

Once a file is read in either **PLAYBACK** or **PREVIEW** mode may be selected:

PLAYBACK actually executes the commands,

PREVIEW simply lists them without executing them.

The file may be stepped through backwards or forwards at will, and searches made for commands. Playback commences at the current line when **PLAY** is pressed, so it is possible to skip unwanted commands or repeat a sequence.

As with **RECORD** above, index marks can be inserted, which may be used as targets of a search and also to stop playback.

| (| Command / Se | ession File | es 🤶 🗙 | | | | |
|---------------------------|--------------|-------------|-------------|--|--|--|--|
| Playback | Record | | | | | | |
| Playback : | Pause | Resume | | | | | |
| Record : | Pause | Resun | ne | | | | |
| Filename and mode | | | | | | | |
| File: E:\roger.tcf | | | | | | | |
| Preview mode | | | REREAD FILE | | | | |
| Playback mode | | | DELETE FILE | | | | |

| Box name: | Top menu box | | | | | | |
| Function: | Button Press | | | | | | |
| Command: | Command File | | | | | | |

8.8.3. INDEX MARKS

INDEX MARKS

"Index marks" are optional flags that you can set at any line in a file. They are not interpreted as commands but rather treated as markers which are used as targets of <u>SEARCH</u> operation. Index mark functions are:

| SET | Set an index mark on this line; |
|------------|--|
| CLEAR | Clear an index mark set on this line |
| STOP | Stop in PLAY/REVIEW mode when index found |
| IGNORE | Ignore index marks during PLAY/REVIEW |
| FIND INDEX | Finds the next index mark: "<<" searching backwards, ">>" searching forwards |
| | |

8.8.4. SEARCH

SEARCH

The **SEARCH** buttons can be used to find a specific command when in **REVIEW** mode. You can search through the command file for a match to any permutation of the following:

| Box name | The name of a screen menu box inside which an event occurred |
|----------|---|
| Function | The screen menu function type. This is "button press", "dialogue", etc; |
| Command | The command word(s) to look for. |

The default for all of these is "<any>", i.e. a wildcard search, but you can specify a value by typing into the appropriate text box. When you have filled in all the fields you need, press **APPLY** to start the search. **Box name** and **Function** fields are unlikely to be of use to most users, you can list all valid events

| Search Specification | | | | | | | |
|----------------------|-------------|------|---|-----|--|--|--|
| Box name: | <any></any> | | ? | ANY | | | |
| Function: | <any></any> | | ? | ANY | | | |
| Command: | <any></any> | | | ANY | | | |
| APPLY DISMISS | | HELP | | | | | |

using the **?** button to provide a menu to pick from. The **ANY** button may be used for any field to restore it to its default (wildcard) status.

8.8.5. Command Line Mode Session/Command File Control

Command Line Mode Session / Command File Control

The available features in command line mode for command and session file control are very basic. A session file can recorded at any point by typing **sF** (in the **GLOBAL MENU**) followed by the desired filename. This is equivalent to the **RECORD** button in screen menu mode. The session file can be closed by typing **cs** and is automatically written to disk. This is equivalent to pressing the **STOP** and **SAVE TO DISK** buttons in screen menu mode.

To execute an existing command file in T/HIS simply type **cF**, followed by the filename.

No previewing/reviewing or editing of command/session files is possible in command line mode.

8.8.6. Command Files From Earlier Versions of T/HIS

Command Files From Earlier Versions Of T/HIS

Command files recorded in Version 9.0 or earlier will not work in T/HIS 22.0 .

8.9. IMAGE Options

IMAGE Options

| | Images | <mark>?</mark> × |
|-----------|----------------|------------------|

Resolution

All images can be output at either the screen resolution or at a resolution of either 2 or 4 times the screen resolution.

8.9.2. Postscript

Postscript

This menu can be used to save an image containing one or more graphs to either a PDF or Postscript file.

All PDF and Postscript files are generated using raster images so that the contents of the screen is exactly reproduced.

| | Images | ? × |

| Only Graph (| n) A single image containing the selected graph will be generated. | |
| White Background | Captures the image with a white background and black foreground. Once the image is captured the colours are reset to their original values. | |

File Format

All images can be output in either Postscript or PDF file format.

Title

By default PDF and Postscript files are not labeled and have no figure number, but you may add either or both of these. They are always put

at the bottom of each page, along the short edge, regardless of the orientation used for plots.

1.1

Resolution

All images can be output at either the screen resolution or at a resolution of either 2 or 4 times the screen resolution.

Orientation

All images can be output in either landscape or portrait format.

Aspect Ratio

By default all images are output using a fixed aspect ratio. This option can be used to stretch each image to fit the available space on the page. Different scaling factors will be applied to the horizontal and vertical directions and the image will be distorted.

Paper Size

The paper size can be set to be either A4 (210 x 296mm), A3 (296 x 420mm) or US (letter - 216 x 279mm). The default size is A4.

Layout

Multiple plots on a page are also available. In landscape format there is a choice of 1, 2x2, 3x3 and 4x4 plots to a page. In portrait format there is a choice of 1, 1x2, 2x3 and 2x4 plots on a page. By default there is a single plot on a page.

When multiple plots are requested the order in which they are performed can be defined.

Postscript

8.10. OPERATE Options

OPERATE

The **OPERATE** menu shown in the figure (below). If the mouse is left hovering over an option a short description of the function will appear.

For these functions, the user selects a range of curves to be operated on. A range may be one or more curves, making it possible to operate on multiple curves, for example add 20 curves to 20 curves.

| ABS | ADD (y) | ADD (x) | AVE | CAT | CLIP |
|---------|---------|---------|---------|--------|---------|
| COM | DIF | DIV (y) | DIV (x) | ENV | ERR |
| INT | LSQ | MAP | MAX | MIN | MON |
| MUL (y) | MUL (x) | NOR (y) | NOR (x) | ORDER | REC |
| RES | REV | R-AVE | SMO | SQR | STRESS |
| SUB (y) | SUB (x) | SUM | TRA | VEC | VEC(2D) |
| WINDOW | ZERO | dB | dBA | Octave | |

The options with the **OPERATE** menu are split into 3 groups. The first group require 2 sets of curves as input. The second group require a single set of curves as input. The third group also require a single set of curves as input but the output from these functions is a single curve. (See <u>Curve Operations</u> for more information on curve groups).

| ABS | Produces the absolute y-values of a curve. |
|---------|---|
| ADD (y) | Add the y axis values together for two curves or add a constant value to all the y-values. If two curves are being added together they must have identical x-axis values. If not, the resultant curve is generated by considering every x-coordinate on both curves and by interpolating the other curve as needed. Any duplicate points as well as points outside the range where the input curves overlap are culled as needed. |
| ADD (x) | Add the x axis values together for two curves or add a constant value to all the x-values. If two curves are being added together they must have identical y-axis values. If not, the nth x-value from the second curve is simply added to the corresponding x-value on the first curve and the y-value from the first curve gets used by the resultant as is. |
| AVE | Produces a single curve that is the average of the input curves. |

| CAT | Concatenate the second curve to the end of the first. | |
|---------|---|--|
| CLIP | Clip a curve to remove any points that exceed a set of specified minimum and maximum x & y axis value. The user is prompted for minimum and maximum values after the curves have been selected | |
| | -0.10000E+21X minimum valuePick Xmin0.10000E+21X maximum valuePick Xmax-0.10000E+21Y minimum valuePick Ymin0.10000E+21Y maximum valuePick YmaxSnap to curve pointsSelect by area | |
| | Instead of typing in values for the limits individual x and y axis minimum and maximum values can be selected by picking screen points. In addition to picking individual points an area can be dragged out interactively to set all 4 limits. When picking screen points the default is to allow any point to be selected. | |
| | Snap to curve points can be used to select the point on the nearest curve instead of the screen coordinates. | |
| СОМ | Two curves are combined to give a new curve. For example if a displacement/time curve is combined with a velocity/time curve a velocity/displacement curve will result. If the 2 curves do not contain points at the same x values then the curve with the larger x-axis intervals is automatically mapped on to the x-axis values of the other curve. | |
| | If the curves do not start and finish at the same x-axis values then only the points for which the two curve x-axes overlap are mapped onto each other. | |
| DIF | A curve is differentiated with respect to the x-axis variable. | |
| DIV (y) | Divide the y axis values of the first curve by the y axis values of the second curve (or a constant). If two curves are being used they must have identical x-axis values. If not, the resultant curve is generated by considering every x-coordinate on both curves and by interpolating the other curve as needed. Any duplicate points as well as points | |

| | outside the range where the input curves overlap are culled as needed. | | |
|---------|--|---|--|
| DIV (x) | Divide the x axis values of the first curve by the x axis values of the second curve (or a constant). If two curves are being used they must have identical y-axis values. If not, the nth x-value on the first curve is simply divided by the corresponding x-value on the second curve and the y-value from the first curve gets used by the resultant as is. | | |
| ENV | Produces a single curve that values of the group of input | t bounds the maximum and minimum curves. | |
| ERR | This option reports the degree of correlation between 2 input curves. The first curve selected is used as a reference curve and the following parameters are then reported : | | |
| | Maximum difference : | Value & Time Value as a %age of reference curve Value as a %age of reference curve peak value. | |
| | Average difference - | Value %age of reference curve peak value | |
| | Area Weighted Difference Correlation Parameter - | 0 to 1 | |
| | For more details on this function please see <u>Appendix G</u> . | | |
| INT | A curve is numerically integrated with respect to the x-axis variable using Simpson's rule. | | |
| LSQ | Fits a straight line through the points using the least squares method. | | |
| МАР | The second curve is mapped onto the first curve, the resulting curve has identical x-axis values to the reference (first) curve with y-axis values obtained from the mapped (second) curve. | | |
| MAX | Produces a single curve that bounds the maximum values of the group of input curves. | | |
| MIN | Produces a single curve that bounds the minimum values of the group of input curves. | | |
| MON | Sorts a curve into monotonically increasing x-axis values. | | |
| MUL (y) | Multiply the y axis values together for two curves or multiply all the y- values by a constant. If two curves are being multiplied together they must have identical x-axis values. If not, the resultant curve is generated by considering every x-coordinate on both curves and by interpolating the other curve as needed. Any duplicate points as well | | |

| | as points outside the range where the input curves overlap are culled | | |
|---------|--|--|--|
| | as needed. | | |
| MUL (x) | Multiply the x axis values together for two curves or multiply all the x- values by a constant. If two curves are being multiplied together they must have identical y-axis values. If not, the nth x-values on the two curves are simply multiplied together and the y-value from the first curve gets used by the resultant as is. | | |
| NOR (y) | Normalise a curve so that the y axis values lie in the range [-1, +1]. Manual normalizing range 0.0000E+00 Minimum Lock to Axis 1.4000E+06 Maximum Lock to Axis If the manual normalising range is checked then a custom value can be chosen to normalise with. The custom value chosen for normalising is calculated by taking the absolute maximum of the user-defined textbox values. In addition to this is the option to Lock to the specified Min and Max axis values which can be used for normalising the curve to the axis value. | | |
| | $y_{val} = \frac{y_{val}}{\max(\mathrm{MinV} , \mathrm{MaxV})}$ | | |
| | Where, | | |
| | MinV = Minimum Value | | |
| | MaxV = Maximum Value | | |
| NOR (x) | Normalise a curve so that the x axis values lie in the range [-1, +1]. Manual normalizing range 0.0000E+00 Minimum Lock to Axis 1.4000E+06 Maximum Lock to Axis If the manual normalising range is checked then a custom value can be chosen to normalise with. The custom value chosen for normalising is calculated by taking the absolute maximum of the user-defined textbox values. | | |

| | In addition to this is the option to Lock to the specified Min and Max axis values which can be used for normalising the curve to the axis value. |
|-------|---|
| | $x_{val} = \frac{x_{val}}{\max(\mathrm{MinV} , \mathrm{MaxV})}$ |
| | Where, |
| | MinV = Minimum Value |
| | MaxV = Maximum Value |
| ORDER | Reverse the order of all the points in the curve. |
| REC | Produces the reciprocal of the y-values of a curve. |
| RES | Calculate the vector magnitude from a group of input curves. |
| REV | Reverses the x and y axes of a curve. For example if you start with a curve with displacement (y axis) against time (x axis) you end up with a curve of time (y axis) against displacement (x axis). |
| R-AVE | Produces a single curve of the running average on the input curve. |
| | 0.0000 Averaging Window |
| | If the time window is set to 0 then the y values for the output curve are the average value of all the point up to that point. |
| | If the time window is non-zero (T) then the y values at each point are calculated by averaging the values between -T/2 and +T/2. |
| SMO | A moving average technique is used to smooth (filter) a curve. The user will be prompted for a smoothing factor. |
| | Smoothing Factor > 1 (integer) 7 |
| | The integer refers to the number of points included in the averaging of each point. The value you want will depend on the number of points in the curve and the amount of smoothing required. A certain amount of trial and error is necessary to get the required result. |
| SQR | Take the square root of the y-values of a curve. |

| STRESS | Converts a stress / strain curve between True and Engineering Stress /Strain. |
|---------|--|
| SUB (y) | Subtract the y axis value (or constant) of the second curve from the first curve. If two curves are being subtracted they must have identical x-axis values. If not, the resultant curve is generated by considering every x-coordinate on both curves and by interpolating the other curve the other curve as needed. Any duplicate points as well as points outside the range where the input curves overlap are culled as needed. |
| SUB (x) | Subtract the x axis value (or constant) of the second curve from the first curve. If two curves are being subtracted they must have identical y-axis values. If not, the nth x-value from the second curve is simply subtracted from the corresponding x-value on the first curve and the y-value from the first curve gets used by the resultant as is. |
| SUM | Calculates the sum of a group of curves. This "sums" up the y-axis values of a group of curves, and maps the result onto the x-axis of the first curve. |
| TRA | Translate a curve with respect to the x and y axes. The user is prompted for the x and y values. X Translation 0.0000 Y Translation 0.0000 |
| VEC | Calculate the vector magnitude from three input curves. |
| VEC(2D) | Calculate the vector magnitude from two input curves. |
| WINDOW | This function is typically used to modify a curve before carrying out an FFT on it. Hanning Cosine Taper Exponential Store Window Curve 10.000 %age Lead-in The y-axis values for each of the input curves is multiplied by a factor between 0 and 1. Three different window shapes are available. The Store Window Curve option can be used to output the multiplying factors to a separate curve if required. |

| ZERO | Translate a curve so that the first data point is moved to (0,0). | |
|--------|--|--|
| | Zero X and Y Zero X only Zero Y only By default this option will translate the curve in both X and Y, alternatively the curve can be translated in X only or Y only. | |
| dB | Converts a curve to dB. f(x) = 20log(y/ref) 1.0000 Reference Value | |
| dBA | Converts a curve from dB to dBA by applying "A" weighting factors to the curve values. Use "narrow band" A weighting Use 1/3rd Octave A weighting Narrow band A weighting values are calculated using a formula. 1/3 Octave A weighting values are calculated from a lookup table. | |
| Octave | Converts a curve from narrow band to either Octave bands or 1/3 rd Octave bands. | |
| Regres | Fits data with either a linear, polynomial (degree 1-4), logarithmic or exponential regression curve, using least squares. | |

| Linear Polynomial (degree 1-6) Logarithmic Exponential |
|--|
| The equation of the regression curve, as well as the value of Pearson's correlation coefficient, R^2 , can be found by right-clicking the output curve and selecting properties. The value of R^2 gives a measure of the goodness of fit of the regression curve, with a value close to 1 corresponding to a good fit. |
| In the case of linear regression, the standard deviation of the gradient, intercept and y values are also provided in the properties pop-up accessed through right-clicking the curve. Additionally, 95% confidence and prediction bands can be displayed around the linear regression curve by selecting Properties in the top-right Tools panel, then selecting All Curves and ticking Show CBands next to the output regression curve. The confidence band, which is the inner of the two bands, gives a 95% confidence interval at each x value for the best value of y. The prediction band gives a 95% confidence interval at each x value for predicting a new value of y. |
| Regression data |
| Curve equation y = -28.54094x + 0.38050 |
| Pearson's R^2 0.916936 |
| S.D. $y = bx + c$ 0.060093 |
| S.D. Gradient 0.608944 S.D. Intercept 0.007040 |
| S.D. Intercept 0.007040 |

8.11. MATHS Options

MATHS Options

The **MATHS** menu is shown in the figure (below). This menu allows mathematical operations to be applied to curves. These options are self explanatory and work on the y-value of the curve (except where explicitly stated).

Note: Trigonometrical functions expect the user to work in radians.

| SQRT | LOG | EXP | LOG10 | ** N | LOG(x) |
|---------|-------|------|-------|------|--------|
| LOG10(x | SIN | ASIN | COS | ACOS | TAN |
| ATAN | ATAN2 | | | | |

| SQRT | The square root of a curve. |
|----------|--------------------------------|
| LOG | Natural log (to base e) |
| EXP | e to power of |
| LOG10 | Log to base 10 |
| **n | Raise to power n |
| LOG(x) | Natural log (x-axis values) |
| LOG10(x) | Log to base 10 (x-axis values) |
| SIN | Sine (radians assumed) |
| ASIN | Arc sine |
| COS | Cosine |
| ACOS | Arc cosine |
| TAN | Tangent |
| ATAN | Arc tangent |
| ATAN2 | Arc tangent using two curves |

8.12. AUTOMOTIVE Options

AUTOMOTIVE Options

The **AUTOMOTIVE** menu is shown in the figure (below). The automotive options are a number of operations that can be performed on curves, typically finding their use in the Automotive industry. They consist of filters and injury criteria calculations, along with a number of other useful functions.

| << Undo | ck | Auto | motive | | ? 🗙 |
|---------|------|---------|----------|---------|---------|
| C60 | C180 | C600 | C1000 | BUT | BUT(p) |
| FIR | HIC | HIC(d) | 3ms CLIP | EXC | VC |
| ASI | THIV | NIJ | Π | NOR (y) | NOR (x) |
| REG | VEC | VEC(2d) | ACU | COR1 | COR2 |
| COR3 | WIF | BES | CORA | MADM | OLC |
| TI | DMG | | | | |

All the options in the **AUTOMOTIVE** menu require a single set of curves as input except the <u>VEC</u> and <u>VEC(2D)</u> options which require groups of 3 or 2 curves respectively as input but only output a single curve. (See <u>Curve Operations</u> for more information on curve groups).

Notes on using the various filters

When filtering curves the sampling rate of the data should be considered: it should be at least twenty times the filter cutoff frequency if good results are to be obtained.

T/HIS will reject attempts to filter curves for which the sampling rate is too low, if this happens the **<u>REG</u>** option can be used to increase the number of points. This will allow the filter to function although it is not a good substitute for obtaining data at a higher sampling rate.

For more information on the filters and injury criteria calculations see <u>Appendices D &</u> <u>E</u>.

All of the filters expect the input curve to have a consistent time interval. When using one of the filter options the user can specify a time interval for the curve to be automatically regularised to (**REG**) before filtering if the time interval is not consistent. The user can set a default time interval for regularising the input curves in the PREFERENCE menu. The PREFERENCE menu can also be used to automatically convert the x axis values from milliseconds to seconds before filtering and to convert the curve back to milliseconds afterwards.

| C60 | Filter a curve using a standard SAE Class 60 filter. |
|------------|--|
|------------|--|

| C180 | Filter a curve using a standard SAE Class 180 filter. |
|--------|---|
| C600 | Filter a curve using a standard SAE Class 600 filter. |
| C1000 | Filter a curve using a standard SAE Class 1000 filter. |
| BUT | The curve is passed through a Butterworth filter. The user is prompted for the cutoff frequency and the order of the filter. Cut-off frequency (Hz) 1000.0 Filter order (integer) 1 |
| BUT(p) | This passes a curve through a Pure Butterworth filter. This is the same as the BUT function above, but the two refinements, described in <u>Appendix</u> <u>D</u> , to minimise end-effects and phase change errors are not included. |
| FIR | Special filter for US "SID" dummy. |
| HIC | Calculates the Head Impact Criteria from an acceleration time history. The user is prompted for the time window and the acceleration conversion factor. Time Window (s) 0.36000E-01 Accel convertion factor 1.0000 Show HIC value Write To Screen Write To File File : default hic Normally this option writes the HIC value to the screen. If required the values may also be written out to a file using the WRITE TO FILE option. The time unit for the input curve should be seconds. T/HIS looks at the range of the x-axis values and if the range is >10 then T/HIS will assume the x-axis values are in ms and it will automatically divide the x-axis values by 1000. If the y-axis values are not in (G) then an optional factor can be specified that T/HIS will DIVIDE the y-axis values by to convert them to (G). Example factors for different units are : |

| | Clip Period (s) 0.30000E-02 Screen Label 3ms = value Show 3ms Clip value Write To Screen Write To File File : .\default.clp By default the screen value will be labeled as " 3ms = value ". This label can be modified by specifying a different Screen Label. If required the values may also be written out to a file using the WRITE TO FILE option. In addition to calculating and reporting the 3ms clip value |
|-----|--|
| | the time window and value can be displayed on the graph using the Show 3ms Clip Value option. See <u>Appendix E</u> for more details on the 3ms clip calculation. |
| EXC | Calculate and displays an EXC eedence plot. This is a plot of force (y-axis) versus cumulative time (x-axis) for which the force level has been exceeded. By default the Automatic option will create an exceedence plot using either the +ve OR the -ve values depending on which the input curve contains most of. The Positive option will calculate the exceedence plot using only the points with +ve y values. The Negative option will calculate the exceedence plot using only the points with +ve y values. The Negative option will calculate the exceedence plot using only the point using only the points with -ve y values. |
| VC | Calculates the V iscous C riteria from an acceleration time history. The user is prompted for the constants A and B. See <u>Appendix E</u> for more details. $VC = A[V(t) \times C(t)]$ A (constant) 1.3000 C(t) = D(t)/B B (constant) 0.22900 |

| ASI | A cceleration S everity Index. This value is used to assess the performanc of road side crash barriers. | | | | | |
|------|--|--|--|--|--|--|
| | This option requires 3 acceleration input curves. The user is prompted for the acceleration limits in the 3 directions. | | | | | |
| | The calculation method can be set to 2010 (BS EN 1317-1:2010) or 1998 (BS EN 1317-1:1998). See <u>Appendix E</u> for more details on this calculation. | | | | | |

| TTI | Thorax Trauma Index: This option requires 3 input curves. 1 to represent the Upper Rib Acceleration, 1 to represent the Lower Rib Acceleration and a third to represent the Lower Spine (T12) Acceleration. Enter these curves in the corresponding input boxes. Apply Upper Rib Acceleration #6 Lower Rib Acceleration #7 T12 Acceleration #8 Write To Screen Write To File File : default.tti The output can either be written to the screen, appearing in a listing box, | | | | |
| | or written to a file specified in the File: input box, or both. If the Write To Screen option is toggled on, the following window will appear: | | | | |

| | LISTING BOX CONTINUE NEXT_PAGE HELP MANUAL Max Rib Accel : 7.02475E+05 at t= Max T12 Accel : 7.25456E+05 at t= TTI value : 7.13966E+05 [End of list] | | | | | |
|---------|---|--|--|--|--|--|
| | | | | | | |
| | For more information on the calculation of TTI, refer to <u>The Thoracic</u> <u>Trauma Index (TTI)</u> . | | | | | |
| NOR(y) | Normalise the curve so that the Y values are within the range [-1, +1]. | | | | | |
| NOR(x) | Normalise the curve so that the X values are within the range [-1, +1]. | | | | | |
| REG | Make a curve have a constant time step. It is necessary for a curve to have a constant time step between points for it to be filtered. This option takes an existing curve and prompts the user for a new time step. The points of the output curve are calculated by linear interpolation. Regularising a curve may alter its peak values, and could change filtered output slightly. | | | | | |
| VEC | Calculate the vector magnitude of three input curves. | | | | | |
| VEC(2D) | Calculate the vector magnitude of two input curves. | | | | | |
| ACU | Airbag Control Unit This option evaluates the following equation: \(ACU(T) = \int_{T-n}^{T} (a(t) - m)dt \\ \begin{align*} \textrm{Where } m &= \textrm{user-defined offset} \\ n &= \textrm{time to integrate over} \end{align*} \) | | | | | |
| COR1 | Curve correlation function. The Correlation function provides a measure of the degree to which two curves match. When comparing curves by eye, the quality of correlation may be judged on the basis of how well matched are the patterns of | | | | | |

| | peaks, the overall shapes of the curves, etc, and can allow for differences of timing as well as magnitude. Thus a simple function based on the difference of Y-values (such as T/HIS <u>ERR function</u>) does not measure correlation in the same way as the human eye. The T/HIS correlation function attempts to include and quantify the more subtle ways in which the correlation of two curves may be judged. The input parameters for the COR1 function have been chosen so as to | | | | | |
|------|---|--|--|--|--|--|
| | produce a strict judgement of the correlation (see <u>Appendix F</u> for more details). | | | | | |
| COR2 | The COR2 function is the same as COR1 except the input parameters have been chosen so as to produce a less strict judgement of the correlation (see <u>Appendix F</u> for more details). | | | | | |
| COR3 | Another curve correlation function. | | | | | |
| | This function first normalises the curves using two factors either specified by the user or defaults calculated by the program (the maximum absolute X and Y values of both graphs). For each point on the first normalised curve, the shortest distance to the second normalised curve is calculated. The root mean square value of all these distances is subtracted from 1 and then multiplied by 100 to get an index between 0 and 100. The process is repeated along the second curve and the two indices are averaged to get a final index. The higher the index the closer the correlation between the two curves. | | | | | |
| | Note that the choice of normalising factors is important. Incorrect factors may lead to a correlation index outside the range of 0 to 100 (see <u>Appendix F</u> for more details). | | | | | |
| WIF | Weighted Integrated Factor (WIFAC) curve correlation function. Compares curves using the Weighted Integrated Factor method (WIFAC). A value between 0 and 100 is calculated, the higher the index the closer the correlation between the two curves. | | | | | |
| | See <u>Appendix F</u> for more details. | | | | | |
| BES | The curve is passed through a Bessel filter. The user is prompted for the cutoff frequency and | | | | | |

| | the order of the filter. | | | |
|------|--|--|--|--|
| CORA | T/HIS includes CORA (COR relation and A nalysis), an implementation of the methodology used by the Partnership for Dummy Technology and Biomechanics (<u>PDB</u>) software <u>CORA</u> . For more details, see <u>Appendix F – CORA implementation</u> . | | | |
| MADM | The minimum area discrepancy method (MADM) is ideal for correlation between Ansys LS-DYNA simulations and physical tests when force versus deflection is the relationship of interest, and offers benefits over other correlation methods that focus on parameters versus time. For more details, see <u>Appendix F – MADM Correlation tool</u> . | | | |
| OLC | The Occupant Load Criterion (OLC) is a parameter used to assess the MPDB-to-vehicle impact in the Euro NCAP Compatibility assessment. This operation requires two inputs: 1. The X-acceleration curve of the Barrier Model's Centre of gravity (CoG). 2. The Initial Velocity of the Barrier Model's CoG, which can be specified by either selecting the velocity curve or providing the initial velocity as an numerical input. There is also an option to auto-regularise and auto-filter the input curves, before calculating the OLC. The filter class can be chosen from the available Filter Curves using options. Apply Filter Curves using C180 K Accel Curve #1 X Velocity input #2 Output Curve % (highest+1) U Stock ways regularise curves 0 10000E-03 New X axis interval (dt) X Accel Curve #1 X Velocity Input #389.0000 U Stock Stoc | | | |

| | The OLC operation outputs five curves: | | | | |
|----|---|--|--|--|--|
| | Velocity Curve of the Virtual Occupant Model with OLC value and vertical lines to signify the end of the free flight phase and the end of the ideal restraint phase. Velocity Curve of the Barrier Centre of Gravity. Displacement Curve of the Barrier Centre of Gravity. Displacement Curve of the Virtual Occupant Model. Relative Displacement between the two Displacement curves. | | | | |
| | The display option for OLC value and vertical lines for the end of the free flight phase and the end of the ideal restraint phase can be toggled using the Show OLC value option in Tools \rightarrow Settings \rightarrow General . | | | | |
| | For more information on the calculation of OLC, refer to <u>Appendix E \rightarrow</u> <u>Occupant Load Criterion (OLC)</u> . | | | | |
| | Tibia Index (TI) is an injury criterion for the lower leg area used to predict the leg injuries. | | | | |
| | TI requires three input curves: Axial Curve, X Moment Curve and Y Moment Curve | | | | |
| | Additionally, two constant inputs: Critical Force \(F_{zc}\) and Critical Bending Moment \(M_{rc}\). | | | | |
| ті | These Critical constant values vary depending on the Occupant type . For the standard occupant types, \(F_{zc}\) and \(M_{rc}\) values are updated automatically. Otherwise, if the occupant type Other is selected then the Critical force and Critical Bending Moment values can be provided manually. | | | | |
| | The unit system of the selected input curves is also displayed in this panel. The values of critical constants for the standard occupant types are internally converted to the unit system shown. | | | | |
| | There is also an option to auto-regularise and auto-filter the input curves, before calculating the TI. The filter class can be chosen from the available Filter Curves using dropdown. | | | | |

| | Apply | | | | |

| | <u>Appendix E \rightarrow Tibia Index (TI)</u> . | | | | |
| | | | | | |
| | The DAMAGE criterion (or DMG for short) is a brain injury metric which is based on deformation output from a second-order system of equations. | | | | |
| | DMG requires three input curves: Head Rotation Velocity X, Head Rotation Velocity Y, Head Rotation Velocity Z. | | | | |
| DMG | The unit system of the selected input curves is also displayed in this panel. The scaling factor, stiffness and damping constants value are internally converted to the unit system shown. | | | | |
| | There is also an option to auto-regularise and auto-filter the input curves, before calculating the DMG. The filter class can be chosen from the available Filter Curves using options. | | | | |
| | There is also an option to choose the calculation method used to solve the second order differential equation: | | | | |
| | Runge Kutta 4 uses a fourth-order approximation to calculate the solution at each time step, providing good accuracy for most problems. | | | | |

| Runge Kutta Fehlberg 45 is an adaptive step size version of Runge Kutta 4. It automatically adjusts the step size based on the solution's behaviour, balancing accuracy and computational efficiency. Newmark Beta Method is a method to solve structural dynamics problems, particularly for second-order equations of motion. |

8.13. SEISMIC Options

SEISMIC Options

The **SEISMIC** menu is shown in the figure (right). T/HIS can be used to handle response spectra information. In particular, displacement, velocity or acceleration spectra can be read and converted to another format.

| | | Seismic | | ? × |
|-----|-----|---------|-----|------|
| DV | DA | VD | VA | AD |
| AV | DS | RS | FFT | IFFT |
| NCP | BLC | | | |

- **DV** Displacement spectrum is converted to a velocity spectrum
- **DA** Displacement spectrum is converted to an acceleration spectrum
- **VD** Velocity spectrum is converted to a displacement spectrum
- VA Velocity spectrum is converted to an acceleration spectrum
- **AD** Acceleration spectrum is converted to a displacement spectrum
- **AV** Acceleration spectrum is converted to a velocity spectrum.
- **DS** Produce a design spectrum from a response spectrum through the specification of a broadening factor..
- RS

Produce a response spectrum from input accelerations. This gives the response of a damped single degree of freedom system, given its damping factor and period, to the input acceleration time-history.

FFT

Perform a fast Fourier transform. Convert an input signal from the time to the frequency domain.

There are three options for output;

- magnitude only
- magnitude and phase
- real and imaginary components of the time signal.

The frequency is calculated in Hz NOT radians/s if the time axis is in seconds.

T/HIS automatically adds points with zero y-value to the end of the curve to pad the curve out so that the number of points is increased to the next power of 2.

There are two options for scaling the curves output:

• Scaling Option 1 - Consistent with other signal processing software giving a magnitude independent of any padding. This is the default and recommended for most purposes. Performing an inverse FFT on the resulting curves will NOT get back exactly to the original curve if it did not have a number of points equal to a power of 2.

• Scaling Option 2 - With this option, applying an inverse FFT to the resulting curves will generate a curve the same as the original even if the original curve did not have a number of points equal to a power of 2. This is useful if users wish to create their own filters, where the filter characteristic is defined in the frequency domain.

An option to regularise the curve before performing the function is on by default. The spacing between points on the frequency axis of the resulting curve is determined by the time duration of the padded input curve; dx = 1.0/(time).

The highest frequency in the output curve is determined by the time interval of the input curve; F (max). = (#points)/dt

IFFT

Performs an inverse fast Fourier transform. Converts two input signals from the frequency to the time domain. The two input signals can be the magnitude and phase or real and imaginary components of the time signal.

NOTE: If an FFT using scaling option 1 is performed on a curve that does not have a number of points equal to a power of 2 and then an IFFT is performed on the resulting curves you will NOT get back exactly to the original curve. This is because the FFT and IFFT both scale their output curves by the number of points in the curve, which in this case will be different. For the FFT the number of points used to scale the curves is the original number of points before padding. For the IFFT the number of points used is the original number of points plus the points needed to make it a power of 2.

If the number of points in the original curve is a power of 2 and no padding is required, the IFFT of the resulting curves will get back to the original curve.

NCP

By default beam element plastic rotations are always written out by Ansys LS-DYNA as being increasing +ve (i.e. cumulative). This option allows a noncumulative plastic rotation to be calculated by taking two input curves: the

moment/time and the cumulative rotation/time histories for the beam in question.

BLC

Baseline correction.

8.14. MACRO Options

MACRO Options

The **MACRO** menu can be used to play FAST-TCF based macro files on existing T/HIS curves.

T/HIS macro files can be stored in any directory. Each user can define up to three macro areas using the oa_pref option:

this*macro_directory :
C:\blah\macros

T/HIS will read any . thm files within the macro directories and generate the macro menu (shown right) using keywords within the macro scripts. T/HIS will search the macro directories in the following order.

this*macro_directory from SYSTEM
oa_pref file
this*macro_directory from users
oa_pref file
this*macro_directory from local
oa_pref file

The scripting for a macro in T/HIS is based upon FAST-TCF using variables within the script (see <u>FAST-TCF section</u> for more details). There are some extra command options to make T/HIS aware of input curves and constants within the macro. These macro keywords are as follows:

| Macro Functions | | | | | |
|-----------------|-----------------|--------------|-------|----|--|
| macro2 | macro3 | macro4 | macro | o5 | |
| macro6 | to_g | | | | |
| | | | | | |
| | | | | | |
| Apply | | nacro number | 0 | | |
| Apply | | Tacro number | 2 | | |
| Macro Curve | Inputs | | | | |
| | Curve input 1 | #1 | | | |
| | Curve input 2 | #3 | | | |
| | Curve input 3 | #2 | | | |
| | Curve input 4 | #5 | | | |
| | Curve input 5 | #4 | | | |
| Macro Constants | | | | | |
| C | onstant Input 1 | 1.0 | | | |
| C | onstant Input 2 | 2.2 | | | |
| C | onstant Input 3 | 1100E-5 | | | |
| | | | | | |

macro acr <name>
macro title <description>
macro curve <curve</pre>

variable> <curve description> acronym for the macro button in T/HIS a more descriptive title for the macro

FAST-TCF variable name for input curve followed by curve description

macro const <const
variable> <curve
description>

FAST-TCF variable name for input constant followed by constant description

If one or more macro files are found with duplicate acronyms then only the last file read will be displayed so users can override SYSTEM macros with their own definitions if they want to.

When the user selects one of the Macro functions the macro file associated with the function is read and T/HIS creates a selection menu for the user to define the relevant curve numbers and constant values to input into the macro script. These inputs will **replace** the variables used within the macro.

For example: If the user selects #1 for the macro curve variable macro_input, then any occurrence of \$macro_input in the macro script will be replaced by #1.

An example macro script follows. This macro asks the user for a filter option (e.g. c60, c600, c1000) and also an input curve number. The macro then filters the input curve and divides by 9810.

Macro to convert a file to g after filtering
#
macro acr to_g
macro title filter and convert curve to g
macro curve macro_input input curve
macro const macro_filter filter to use
#
model none
model 1
oper \$macro_filter \$macro_input tag filtered
oper div filtered 9810.0

8.15. FAST-TCF Options

FAST-TCF Options

The **FAST-TCF** menu can be used to capture and playback FAST-TCF scripts. FAST-TCF is a simple and intuitive scripting language for T/HIS. See <u>FAST-TCF</u> for more details and commands.

8.15.1. Create

Create

T/HIS 9.2 onwards has the ability to automatically generate FAST-TCF scripts using the CREATE menu.

The FAST-TCF script will contain all of the commands required to

- 1. Create and position multiple graphs on pages.
- 2. Extract the data from models or other files
- 3. Carry out any curve operations required to reproduce the chosen curves
- 4. Set any curve styles and labels
- 5. Set plot attributes such as titles, axis labels, colours, fonts and scaling
- 6. Generate the output image and/or curve file
- 7. Generate curve groups
- 8. Generate variable and tabular output requests

| | FAST-TCF Script | ? X | | | |
|--|--|-----|--|--|--|
| Create | Run | | | | |
| Apply | | | | | |
| Script Name : Generate for | rfacing\TestRun\jac_test.inp All Pages Current Page Only Page 1 All Graphs All Active Graphs Only Graph | | | | |
| | | | | | |
| FASTICE Scrip | ot : Image Output ✓ 24 bit PNG ✓ | | | | |
| Filename : | ULT_DIR%\script_output.png | | | | |
| FASTTCF Script : Curve Output | | | | | |
| EASTICE Scri | nt : Curve Output | | | | |
| FASTTCF Scri Filename : Unblanked Select Curv | ULT_DIR%\script_output.cur Curves | | | | |
| Filename : Unblanked Select Curv | ULT_DIR%\script_output.cur Curves /es pt : Curve Group Output roups | | | | |

Before generating the FAST-TCF script the following options can be set:

Generate For

| All Pages | The FAST-TCF script will contain all of the commands required to regenerate all of the pages that contain 1 or more graphs. |
|-------------------|---|
| | If the option to generate images is selected then the FAST-TCF script will contain the commands to generate multiple images with the page number appended to the filename specified. |
| Current Page | The FAST-TCF script will contain all of the commands required to regenerate the currently displayed page. |
| Only Page (n) | The FAST-TCF script will contain all of the commands required to regenerate the selected page. |
| All Graphs | The FAST-TCF script will contain all of the commands required to regenerate all the currently defined graphs. All of the graphs will be positioned on page 1 using the currently defined layout. |
| | This option will only be available if T/HIS only contains a single page (<u>see Page Layouts</u>). |
| All Active Graphs | The FAST-TCF script will contain all of the commands required to regenerate all of the active graphs. All of the graphs will be positioned on page 1 using the currently defined layout. |
| | This option will only be available if T/HIS only contains a single page (<u>see Page Layouts</u>). |
| Only Graph (n) | The FAST-TCF script will contain all of the commands required to regenerate the selected graph. The graph will be positioned on page 1. |

FAST-TCF Script : Image Output

If this option is selected then the FAST-TCF script will contain the commands required to generate an image of each of the pages/graphs selected for output. The **Image Format** can be set to any of the supported image types (<u>see IMAGE Options</u>).

If the FAST-TCF script generates multiple pages then the **Filename** specified will be used for the first image. Subsequent images will use the specified filename with "_2", "_3" ... appended.

FAST-TCF Script : Curve Output

By default the FAST-TCF script will only contain the command needed to reproduce the curves that are unblanked in 1 or more of the graphs selected for output. This option can be used to select additional curves for which the commands required to generate them are also added to the FAST-TCF script. If a curve is selected that is also unblanked in one of the graphs the command to regenerate it are only added to the FAST-TCF script once.

In addition to selecting additional curves this option can also be used to add commands to the FAST-TCF script to write the additional curves out to a T/HIS .cur curve file.

FAST-TCF Script : Curve Group Output

This option can be used to select additional curves for output to the FAST-TCF script by curve group. If a curve is selected that is also unblanked in one of the graphs the command to regenerate it are only added to the FAST-TCF script once. This option will also add the commands to regenerate the selected curve groups to the FAST-TCF script.

FAST-TCF Script : Variable Output

This option can be used to define variable and tabular output requests for output to the FAST-TCF script via the menu launched by pressing the button. Variable and tabular output requests defined in a FAST-TCF script that is read in will appear in the menu.

Variable Output or **Tabular Output** are selected at the top of the menu. Each output request is defined on a row of the table. The curve and variable type are selected using the drop down menu. A default variable name is generated and can be manually edited or a name can be selected from variable names that are present in . Additional value fields are populated with default values if required and these can be edited. The output description is also populated with default text that can be edited. The output type is selected using the drop down menu. Curve Lock prevents the curve that the variable refers to from being deleted. If a curve is not locked and is deleted, then any variables associated with that curve will also be deleted.

Pressing the heading buttons will sort the output request definitions.

8.15.2. Run

Run

This menu allows the user to run a FAST-TCF file from within T/HIS. After the user has selected the FAST-TCF file T/HIS scans the file for data requests and model requests to see what input the FAST-TCF file requires. Note that there must be a model read into T/HIS before a FAST-TCF file that contains data extraction can be run.

The next FAST-TCF command line is displayed in red in the upper text area, at this point the user can select to **Play** the FAST-TCF file or **Step** through it line by line. After every line of FAST-TCF the resulting command in T/HIS is shown in the lower text area. Select **End** during stepping through the lines to go to the end of the file. **Reread** will re read the file and start back at the beginning.

The **Model Mapping** option allows the user to define which model in T/HIS should be used for the equivalent model number in the FAST-TCF script. The model number **zero** is equivalent to the default model in FAST-TCF if no models are defined. The default model mapping will use the same model numbers as in the FAST-TCF script.

Auto confirm text boxes will force T/HIS to confirm any text boxes that should appear in the interactive playback of a FAST-TCF script (such as HIC results and so on).

The FAST-TCF script will ignore any existing T/HIS curves and their tags. This guarantees that the user can run a single FAST-TCF file many times and it will only use the new curves created by FAST-TCF.

| | FAST-T | CF Script | ? 🗙 |

8.16. TITLE/AXES/LEGEND Options

TITLE/AXES/LEGEND Options

The **TITLE/AXES** menu is shown in the figure (below).

This menu controls the contents of the title and axes labels and the axis scaling.

The individual axis, title and legend menus can also be accessed by clicking over the appropriately highlighted area on the graph.

Changes to the TITLE/AXES/LEGEND options are only applied to active graphs (<u>see Active</u> <u>Graphs</u>).

| Title / Axes | | | | |
|--------------|--------|--------|---------|--------|
| Title | X Axis | Y Axis | Y2 Axis | Legend |

8.16.1. TITLE

TITLE

The plot title may be set automatically or manually. When the **Automatic** option is selected the text box will display <automatic> and the plot title will be set to the title of the first curve that is currently being plotted. The plot title may be turned on and off by toggling the **Display Title** button.

Save Preferences to File

Launches a popup to quickly save preferences to the oa_pref file. See <u>Save Preferences</u> <u>Popup</u>.

8.16.2. X-AXIS

X-AXIS

AXIS LABELS

The x-axis label may be set automatically or a user defined label can be specified.. When the **Automatic** option is selected the text box will display <automatic> and the axis label will be set to the x axis label of the first curve that is currently being plotted. The axis label may be turned on and off by toggling the **Display Label** button.

In addition to displaying the axis labels an optional unit label can also be appended to the axis label. If the option to add a unit label is set to Automatic then the unit label displayed will depend on the current curves that are visible and the current unit system being used to display results (see <u>UNITS</u> for more information on Unit Systems). If the curves being displayed do not have the same axis unit then no unit label will be displayed. The unit label may be turned on and off by toggling the **Add Units** button.

AXIS LIMITS

The minimum and maximum x axis values can be controlled using a combination of the text box and the popup menu opposite.

Autoscale

The axis values will be set to the maximum and minimum values of all the curves that are currently being plotted.

Locked

The axis limit is set to the user defined value specified in the text box. If the curves are translated of scaled dynamically the limit will be reset.

Note : The global command **AUTOSCALE** (see <u>Autoscale</u>) will reset the minimum and maximum values to **AUTO** .

AXIS TYPE

The x-axis can be switched between a **Linear** or **Logarithmic** scale. If a logarithmic scale is selected, a warning will be generated if an attempt is made to plot points that have -ve or zero X values and the points will be skipped.

GRID SPACING

By default T/HIS will automatically set the grid line intervals for the x-axis when the grid is tuned on (see <u>GRID</u>). If the GRID option is changed from **Automatic** to **Manual** a grid **Interval** and **Offset** my be specified. If the **Interval** is set to 0.1 and the **Offset** to 0.02 then grid lines will be produced at 0.02, 0.12, 0.22

Add Exponent to Label UNITS Units. Format Automatic Ŧ Axis values can be displayed Decimal Places using 3 different formats: Font Default Ŧ Size Automatic Ŧ Colour Foreground v. G1 Plotting Display **Automatic** 10.000 Values are displayed using Plotting Display 9.000 exponential format, all values 1.000e+04 are displayed as values of E0, 8.000 Plotting G3 Dist E3, E6 etc. 9.000e+03 7.000 10000.000 8.000e+03 e.g 11.234E+03 6.000 9000.000 7.000e+03 5.000 8000.000 **Scientific** 6.000e+03 4.000 7000.000 5.000e+03 3.000 Values are displayed using 6000.000 exponential format. 4.000e+03 2.000 5000.000 3.000e+03 1.000 e.g 1.123E+04 4000.000 E3 2.000e+03 0.000 0.000 3000.000 1.000e+03 2000.000 0.000e+00 Automatic 0.000 1000.000 General 0.000 Scientific 0.000 0.10 Values are displayed as real numbers. General

In addition to specifying the format, the number of decimal places can also be set between 0 and 9 and the colour and font used to display the values can be set.

Save Preferences to File

e.g 11234.000

Launches a popup to quickly save preferences to the oa_pref file. See <u>Save</u> <u>Preferences Popup</u>.

8.16.3. Y-AXIS

Y-AXIS

The same options for LABELS, LIMITS, SCALE, GRID LINES and UNITS apply to the Y-AXIS as those available for the X_AXIS.

8.16.4. Second Y-AXIS

Second Y-AXIS

Curves can be plotted in T/HIS using 2 different y-axis scales. When **Add Second Y Axis** is selected using the tickbox in the Y2 Axis menu the Curve Manager changes

from

to

| ID | Y | 2 | Label |
|----|------|---------------------|--------------------|
| Δ | 1 > | | Disp x - Node 1343 |
| | 2 🕨 | J - 0- I | Disp x - Node 1344 |
| | 3 🕨 | 」 _← | Disp x - Node 1345 |
| | 4 ▶□ | <u>-</u> | |
| | 5 🕨 | | |

with an additional tick box for each curve that controls which curves are plotted against the second (right hand) y-axis.

If only one y-axis scale is used it is not possible to meaningfully plot curves with different units or very different values. A second scale allows more information to be displayed at once, as demonstrated below.

All of the options that are available to control the label, scale and type of the y-axis are also available for the second y-axis except for the Grid option.

NOTE : When the DOUBLE AXIS option is used with GRID lines a grid is only plotted for the left hand y-axis.

8.16.5. Legend

Legend

Curve Labels

Show Prefix

This option can be used to automatically add a prefix to each of the curve legends when a curve is plotted.

This option has 3 settings:

Automatic

If there is more that 1 model loaded in T/HIS then a prefix will automatically be added to any curves that have been read in from a model. Curves read in from other files will not be prefixed.

On

A prefix will automatically be added to any curves that have been read in from a model regardless of the number of models currently loaded in T/HIS. Curves read in from other files will not be prefixed.

Off

No prefixes will be added

Prefix Format

This option can be used to set the format used for the curve prefix. This option has 4 settings

| Model Number | The model number will be used as the prefix. e.g (M1) |
|-----------------|--|
| Directory | The directory name the model was read from will be used at the prefix. e.g. (/run1) |
| THF File | The root name of the THF file will be used as the prefix. e.g (sled_test) |
| User Defined | A user defined prefix will be used. The prefix can be defined on a model by model case using the <u>Model Menu</u> . |

The font, size and colour of the text used to display the legends can also be specified.

Layout

T/HIS has 4 different plotting formats as described below. The number of columns used to display the curve legends can also be set between 1 & 3. When multiple columns are used curve labels will automatically be truncated to fit the available space.

Column List (default)

This format fixes the size of the plotting area. The maximum

number of curve legends that can be displayed will depend on the font family and size selected by the user and the number of columns.

If any <u>USER LINES</u> have been defined then the area used to display the legend will be reduced so that the text does not cover the user lines.

Automatic

This format automatically adjusts the plot size to maximise the plotting area while still showing a maximum of 18 line labels. Any text entered using the <u>USER</u> <u>LINES</u> option will be ignored in this plotting mode.

Off

This format turns **OFF** the display of the graph legend and maximises the plotting area by not showing any line labels. Any text entered using the <u>USER LINES</u> option will be ignored in this plotting mode.

Floating

This format maximises the plotting area and positions the legend on top of the graph area.

The size of the legend can be modified by clicking with the left mouse button on the legend border/corner and dragging.

The legend can also be moved by clicking with the left mouse button inside the legend and dragging.

BACKGROUND

This option can be used to alter the default background colour of the floating legend. By default the colour will be the same as the background colour of the graph. As well as setting a different background colour for the floating legend a %age transparency can also be specified if the legend obscures any curves.

USER LINES

This option can be used to alter the default text that appears on the bottom righthand corner of each plot. Text can be typed into any of the panels or they can be left blank. The **Size** of the text may be altered. If no text is specified the area used by the curve legends will be increased.

The default values are read from the preferences file (see <u>Appendix H</u> for more details).

Save Preferences to File

Launches a popup to quickly save preferences to the oa_pref file. See Preferences.

8.17. DISPLAY Options

DISPLAY

The **DISPLAY** menu is shown in the below figure. This menu controls the overall appearance of plots.

As well as controlling basic things like the background colour and whether a grid is drawn, this menu also controls a number of default settings that are applied to all curves. These default settings may be overwritten for individual curves using the <u>Curve</u> <u>Manager</u>.

Changes to the Display options are only applied to <u>Active Graphs</u>. (With the exception that line anti-aliasing and scaling with DPI are both programme-wide.)

| | Displa | ? 🗙 | | | | |
|------------|----------------------------|--|--|--|--|--|
| Reset ALL | | | | | | |
| Legend | | | | | | |
| 🗸 Use Anti | alised Lines | Scale with DPI | | | | |
| Lines | | Default Line Width | | | | |

| | _ | ► Width FG ► Colour | | | | |
| Border | | ► Width FG ► Colour | | | | |
| Fix Styles | | | | | | |
| Background | • | | | | | |
| | Image | | | | | |
| Foreground | ŀ | | | | | |
| | Swap Foreground/Background | | | | | |
| | Save Prefe | erences to file | | | | |

8.17.1. LEGEND...

LEGEND...

This option will map the Legend settings panel (<u>see Legend</u>).

8.17.2. LINES

LINES

This is an **ON** / **OFF** switch for the lines between points to be drawn for all curves. The default is **ON** . The **Default Line Width** is used for all curves that have not had their widths explicitly set in the **Line Style** menu.

The default line width can be specified in the preferences file (see <u>Appendix H</u> for more details).

8.17.3. SYMBOLS

SYMBOLS

This is an **ON** / **OFF** switch which controls whether symbols are plotted on top of the curves to help identify them. This option affects all the curves that are currently being used. If you wish to turn the symbols on for only some of the curves then this switch should be set to **ON** and the **Line Style** menu should be used to turn the symbols off on the curves for which you do not want symbols drawn on. The default is **OFF**.

The **Symbols Frequency** is used for all curves that have not had a frequency explicitly set in the **Line Style** menu. This value controls how often a symbol is drawn on a curve.

8.17.4. GRID

GRID

This is an **ON** / **OFF** switch which determines whether or not grid lines are shown on the plot. The default is **OFF**. The **Grid Width** can be used to change the width of the grid and axis lines. The **COLOUR** button can be used to change the colour of the grid lines (see <u>COLOUR</u> for details on the available colours).

| /de | grid | on | turns grid lines on |
|-----|------|------|-------------------------------------|
| /de | grid | off | turns grid lines off |
| /de | grid | th 2 | sets the grid thickness to 2 pixels |

The default grid width and visibility can be specified in the preferences file (see <u>Appendix H</u> for more details).

8.17.5. AXIS

AXIS

| Axis | Vidth 🛛 FG 🖻 Colour |
|------|---------------------|
| | 🔽 Draw Top Axis |
| | 🗸 Draw Right Axis |

The **Axis Width** can be used to change the width of the axis lines. The **COLOUR** button can be used to change the colour of the axis lines (see Section <u>COLOUR</u> for details on the available colours).

The default axis width can be specified in the preferences file (see <u>Appendix H</u> for more details).

| Draw Top Axis | This option can be used to turn on and off the display of the graph's top axis |
|--------------------|---|
| Draw Right Axis | This option can be used to turn on and off the display of the graph's right hand axis |

The default settings for these 2 options can also be specified in the preferences file (see <u>Appendix H</u> for more details).

8.17.6. BORDER

BORDER

| Border | | Midth | FG ► Colour |
|--------|--|-------|-------------|
|--------|--|-------|-------------|

This is an **ON** / **OFF** switch which determines whether or not a border is drawn round the plot. The default is **ON**. The **Border Width** can be used to change the width of the border. The **COLOUR** button can be used to change the colour of the border (see Section <u>COLOUR</u> for details on the available colours).

8.17.7. FIX LINE STYLES

FIX LINE STYLES

| Fix Styles | |
|------------|--|
|------------|--|

This is an **ON** / **OFF** switch which resets the curve styles when they are plotted on the screen so that the curves cycle through the default T/HIS colours and styles as they are plotted. This will result in the first curve being plotted always being white, the second red, the third green .etc regardless of their curve numbers. The default is **OFF** .

8.17.8. Background

Background

| Background | Þ | |
|------------|-------|--|
| | Image | |

This option can be used to modify the background colour (see Section <u>COLOUR</u> for details on the available colours) or to set a background image. By default the background colour is set to BLACK.

Image

The IMAGE option can be used to display a background image behind a graph instead of a solid background colour.

If the image dimensions do not match the graph window dimensions then the image can be scaled to fit or it can be tiled.

| | Display Options - Ba | ckground | ? X |
|-----------|----------------------|----------|-------|
| Done | | | |
| Filename: | | | |
| Reread Fi | le | | |
| | Scaling | Positio | oning |

| | | | |
| West | Centre | | East |
| SW | South | | SE |

8.17.9. Foreground

Foreground

| Foreground | -4 |
|------------|----|
|------------|----|

This option can be used to modify the foreground colour (see Section <u>COLOUR</u> for details on the available colours). By default the background colour is set to BLACK and the foreground colour is set to WHITE.

Initially the grid, axes, border and labels are all set to the foreground colour.

8.17.10. Swap Foreground/Background

Swap Foreground/Background

Swap Foreground/Background

This option can be used to swap the currently defined foreground and background colours.

8.17.11. Display Max/Min

Display Max/Min

In versions of T/HIS prior to 9.4 the display of minimum and maximum curve values was controlled in the **DISPLAY** menu . In versions since 9.4 these options have been moved to the **PROPERTIES** menu (see section <u>PROPERTIES</u>).

8.17.12. Save Preference to File

Save Preference to file

Launches a popup to quickly save preferences to the oa_pref file. See <u>Save Preferences</u> <u>Popup</u>.

8.18. SETTINGS

8.18.1. Data Sources

Data Sources

This menu allows the user to specify their preferred order of data sources for the different data types. Upon reading in models T/HIS will read all files regardless of these preferences. When T/HIS extracts data for plotting the source is dependent on that currently set in this menu. If you select a data component or entity that is not available in the first data source T/HIS will automatically try the other data sources in order until the combination is found.

The **Model Manager** can be used to see what source has been used for each item for models already read into T/HIS.

| | | Se | ttings | | | |

8.18.2. Files

Files

File Names

By default the file filters in T/HIS are set to look for the file naming convention set for the Ansys LS-DYNA output files by the SHELL. This option can be used to swap the file filters back to the default Ansys LST naming convention. This option can be set in the <u>Preference File</u>.

| File type | ARUP | Ansys LST |
|--------------------|-----------|-----------|
| Time history | "job".thf | d3thdt |
| Extra Time history | "job".xtf | xtfile |

File Output

The <u>HIC</u>, <u>3ms Clip</u>, <u>ASI</u>, <u>THIV</u>, <u>TTI</u> Automotive injury criteria functions, <u>ERR</u> operator function and <u>COR1</u> and <u>COR2</u> correlation functions can all send their output to a file as well as to the screen. These options can be used to select which functions send output to a file and to specify a Root Filename that is used for all of the output files. The Root Filename can be set in the <u>Preference File</u>.

| | Set | ttings | | ? X |

| | Auto | | File famil | y size (MB) |

8.18.3. General

General

Curve Operations

All of the <u>AUTOMOTIVE</u> filters are designed to filter curves using seconds as the time unit. This option can be used to automatically convert the x-axis values of any curves from milliseconds to seconds before applying one of the filters. If a curve is automatically converted then the output curve is also automatically converted back into milliseconds. This option can be set in the <u>Preference File</u>.

All of the <u>AUTOMOTIVE</u> filters require curves with constant time intervals. This option can be used to specify a default time interval that will be used to automatically regularise a curve before it is filtered.

By default the <u>HIC</u> and <u>3ms Clip</u> functions calculate and report a value to the screen. These options can be used to make T/HIS display the peak values and the time widows they occur over. These options can be set in the <u>Preference File</u>.

At present 2 different methods are used to calculate the VC injury criteria for the ECER95 and IIHS regulations (see <u>Viscous Criteria</u> for more details). This option can be used to set the default value. This option can be set in the <u>Preference File</u>.

| Settings 🛛 🔁 🔀 | | | | |

| | | _ IIHS | | |
| Curve palett | е | De | fault 🔻 | |

By default T/HIS uses 6 colours (White, Red, Green, Blue, Cyan and Magenta) for any curves that have not had a colour explicitly defined for them. Curves 1,7,13... will be White, 2,8,14... will be Red.

This option can be used to change the default number of colours T/HIS uses.

| Default | Use the default 6 colours |
|----------|---|
| Extended | Use the first 13 colours |
| No Grey | Use all 30 predefined colours except the 3 grey ones |
| Full | Use all 30 predefined colours plus any user defined ones. |

The default value for the curve palette can also be specified in the preferences file (see <u>Appendix H</u> for more details).

8.18.4. Layout

Layout

Save Settings

This option can be used to save a T/HIS settings file which can be reloaded later. The settings file uses the same syntax as a FAST-TCF script except it only contains **layout** and **setup** commands.

The settings file can contain all of the commands required to reproduce the current page and graph layout or a subset of the commands.

Reload Settings

This option can be used to reload a previously saved settings file. In addition to reloading a file interactively a settings file can also be specified on the <u>command line</u>

-set=<filename>

or via the <u>Preference File</u>

this*settings_file: <filename>

| | Settings ? | | |

Label

This is the annotation that will be displayed on the graph.

Delete

This will delete the current annotation.

8.19.3. Format

Format

These options can be used to control the display of the measurements and annotations.

| 🖌 Show X Value | Show Y Value |
|-------------------|----------------------------------|
| Current | Foreground v |
| Other | 4 |
| Text Font | Default 🔻 |
| Text Size | automatic 🛛 🔻 |
| Text Colour | Foreground v |
| Background Colour | Background 🔻 |
| | 0 Transparency 100 ⊲ ■ ▷ 0 |
| Border | On/Off |
| Border Colour | Foreground 🔻 |
| Border Width | v |
| Symbol | ✔ On/Off |
| Symbol Size | 25 |
| Number Format | Scientific (1.2345E |
| Decimal Places | 3 📥 |

Values

Measurements can be displayed with both the X and Y values, just the X value, just the Y value or neither.

If only one of the values is shown the line between the two points will be drawn like so:

Text

The font, font size and colour of the values can be selected.

Background

To make it easier to read the values a background can also be specified. In addition to specifying the background colour a transparency value can be used to control the visibility of curves under the text.

Border and Border Colour

Specify a border and border colour to be added around the value.

Symbols

The symbols drawn on the measurement points can be turned on/off. The size of the symbol can also be specified.

Number Format

Specify the format of the values displayed on the graph.

8.20. Curve Groups

Curve Groups

This panel can be used to create and modify curve groups. T/HIS can contain an unlimited number of curve groups each of which can contain any curve.

Curve groups can be used as input to most T/HIS functions that require one or more input curves (see <u>Selecting Curves</u> for more details)

Each curve group should be given a unique name.

8.20.1. Create

Create

This option can be used to create a new curve group.

By default the group will be called "Curve_group_#" where "#" is the curve group number if an alternate name is not specified.

| Create Curve Group 🔹 🎗 | | | | |
|--|-----------------|----------------|---|--|

| #9 : (M1) Accel x - Node 1345 : (Chest) | | | | |

8.20.2. Modify

Modify

This option can be used to modify the contents of an existing curve group or its name.

When a curve group is selected any curves that are already defined in the group are highlighted in the curve list.

| Modify Curve Group 🔹 | | | | |
|--|-----------------|----------------|---|--|
| Curve Group : : | 2 | | | |
| Name : Dis | splacements | | | |
| | | | | |
| | Select Curve(s) | | ? | |
| Apply | | Cancel | | |
| All Listed | None | Visible (Page) | 1 | |

| #1 : (M1) | | | | |
| #2 : (M1) Disp x - Node 1344 | | | | |
| #3 : (M1) Disp x - Node 1345 : (Chest) | | | | |
| #4 : (M1) Vel x - Node 1343 : (Pelvis) | | | | |
| #5 : (M1) Vel x - Node 1344 | | | | |
| #6 : (M1) Vel x - Node 1345 : (Chest) | | | | |
| #7 : (M1) Accel x - Node 1343 : (Pelvis) | | | | |
| #8 : (M1) Accel x - Node 1344 | | | | |
| #9 : (M1) Accel x - Node 1345 : (Chest) | | | | |

The contents of <u>Automatic</u> curves groups can not be modified as T/HIS automatically adds and removes curves from automatic groups.

Curves that belong to an automatic curve group are highlighted in yellow.

The name of an automatic curve group can be changed.

| Modify Curve Group 🔹 🗙 | | | | |

| #9 : (M1) Accel x - Node 1345 : (Chest) | | | | |

8.20.3. Automatic

Automatic

By default T/HIS will automatically create a curve group for each model that is read in and will add any curves read in from that model into the curve group.

This option can be used to create other "automatic" curve groups.

| Automatic Curve Group Settings 🛛 🛙 🎽 |
|--|
| Done |
| Create groups automatically based on : |
| ✓ Model ID |
| Entity Type |
| Component Name using: |
| C component |
| component_entity_type |
| Curve File Index |
| Update Groups |

| Model ID | The default - one group is created for each model. |
|---------------------|---|
| Entity Type | This option will create one group for each Entity type (Modal, Node, Solid etc) that data is read from. If data is read from multiple models then a single group for each entity type will be created containing curves from multiple models. |
| Component Name | This option will create one group for each component (Node X displacement, Contact X Force etc), that data is read from. If data is read from multiple models then a single group for each component will be created containing curves from multiple models. |
| | The component groups can be named using either the component name (Disp X, Vel X) or the component name and the entity type (Disp X - Node, Vel X - Node) |
| Curve File Index | If curves are read in from curve files (.CUR or CSV) then this option will create one group for the 1st curves read form each file, a second group for the 2nd curve read from each file and so on. |

Multiple options can be selected at the same time.

| Update | This option will create and update the contents of automatic curve |
|--------|--|
| Groups | groups if the options are changed. |

The following preference options can be used to change the default options, (see <u>Format of the oa_pref File</u> for more details).

group_by_model
group_by_type
group_by_component
group_by_file_index
component_group_name

8.21. Graphs

GRAPHS

This panel can be used to create additional graphs within T/HIS.

In addition to creating graphs this menu can also be used to control the layout of the graphs and to set up pages of graphs within T/HIS.

See <u>Graphs and Pages</u> for more details.

8.21.1. Save Preferences to File

Save Preferences to File

Launches a popup to quickly save preferences to the oa_pref file. See <u>Save Preferences</u> <u>Popup</u>.

8.22. PROPERTIES

PROPERTIES

This menu can be used to display additional curves properties.

Minimum and maximum curve values can be highlighted for each curve and the value can also be displayed.

In addition to displaying the value on the curve the values can also be added automatically to the curve label in the graph legend.

8.22.1. Curves (Off)

Curves (Off)

This option will turn off the display of all minimum and maximum values.

| Curve Properties | | | | |
|--|--|--|--|--|
| Curves | Legend | | | |
| Off Summary All Curves | Maximum Value Display Maximum Value Minimum Value Display Minimum Value | | | |
| | Format Update | | | |

8.22.2. Curves (Summary)

Curves (Summary)

This option will display a single minimum/maximum value from all curves currently displayed..

The following properties can be displayed

Maximum valueMark the maximum value with a crossDisplay MaximumDisplay the maximum valueMinimum valueMark the minimum value with a cross

Display Minimum

| Display the minimum value |
|---------------------------|
|---------------------------|

| | Curve Properties |
|--|--|
| Curves | Legend |
| ☐ Off ☐ Summary ☐ All Curves | Maximum Value Display Maximum Value Minimum Value Display Minimum Value |
| | Format Update |

Curves (All curves)

This option can be used to select the properties that are displayed for each individual curve.

When this option is selected the display of injury criteria (HIC,HICd etc) for curves can also be selected.

8.22.3. Format

Format

This option can be used to control the display of the minimum/maximum values on the screen.

Text

The font, font size and colour of the values can be selected. Either a single colour can be used for all the values or the values for each curve can be coloured using the same colour as the curve.

Background

To make it easier to read the values a background can also be specified. In addition to specifying the background colour a transparency value can be used to control the visibility of curves under the text.

Border and Border Colour

Specify a border and border colour to be added around the value.

Connecting Line

This option will draw a line connecting the value with the point it relates to on the curve. The connecting line is drawn using the same colour as the border.

Value

The values can be displayed showing just the Y axis value or with both the X and Y axis values. If both values are displayed they can either be displayed separated by a comma or one above the other.

Number Format

The values can be displayed using 3 different formats

| Automatic | Values are displayed using exponential format, all values are displayed as values of E0, E3, E6 etc. e.g 11.234E+03 |
|------------|---|
| Scientific | Values are displayed using exponential format. e.g 1.123E+04 |
| General | Values are displayed as real numbers. e.g 11234.000 |

Decimal Places

In addition to specifying the format, the number of decimal places can also be set between 0 and 9.

8.22.4. Legend

Legend

This option can be used to automatically added curve properties to the curve labels in the legend area.

The following curve properties can be added to each curve label

Maximum value Minimum value Average value Injury Criteria (HIC, HICd etc)

Other options

- **Off** Turns off the display of curve properties in the legend
- **Append** Add the values to the same line as the curve labels in the legend

2nd Line Display the values using a second line for each curve in the legend

The format of the numbers added to the curve labels is the same as that used to display values on the curves.

| Curve Properties ? > | | | |
|--|----------|--------------|---------------------|
| Curves | | Legend | |
| Append | | | Update |
| ☐ 2nd line | | Select All | None |
| 🔲 Off | | Pick Visible | Show Curves 🔻 |
| Add Maximum Add Minimum Add Average Add HIC Add 3ms Clip | Add THIV | | |
| | | | nag - Node 1343 : (|
| | | | nag - Node 1344 |
| | | | nag - Node 1345 : (|
| | | | nag - Node 1346 : (|
| | | #5 Accel m | nag - Node 1347 : (|

8.22.5. Positioning Values

Positioning Values

By default T/HIS will automatically position minimum and maximum values to the right of the point they apply to.

If the default location of the text obscures other curves then the position can be changed by clicking on the value with the left mouse button and then dragging the value to a new position.

If dynamic viewing is used to either zoom in or translate the curves after a value has been moved to a new position then it will maintain it's new position relative to the minimum/maximum value location.

As well as moving the minimum/maximum values the values used to display injury criteria like HIC and HIC(d) can also be moved.

8.23. UNITS

UNITS

From version 9.4 onwards, T/HIS tries to keep track of the units for each curve's X and Y axis. For every data component that T/HIS can read from an Ansys LS-DYNA results file, one of the following basic units is stored for the curve's X and Y axis.

| Time | Rotation | Momentum | Energy Density |
|--------------|----------------------------|-------------------------|--------------------------|
| Energy | Rotational Velocity | Density | Mass Flow |
| Work | Rotational Acceleration | Stress | Frequency |
| Temperature | Length | Strain | Power |
| Displacement | Area | Force | Thermal Flux |
| Velocity | Volume | Moment | Force per unit width |
| Acceleration | Mass | Pressure | Moment per unit width |
| Viscosity | Thermal Diffusivity | Vorticity | Q Criterion |
| Current | Vector Potential | Magnetic Flux Vector | Electric Field Vector |
| Conductivity | | | |

When a curve operation is carried out on curve which has either the X or Y axis unit defined, the units for the output curve(s) are also calculated. If a curve operation is carried out using 2 or more input curves with different units and the result is a curve with inconsistent units, then the units are set to zero.

If one of the inputs is a constant then it assumed to be unitless.

| Input 1 | Input 2 | Operation | Output |
|----------------|------------------|---------------|----------------------|
| Velocity (m/s) | Velocity (m/s) | Add | Velocity (m/s) |
| Velocity (m/s) | Displacement (m) | Add | Unknown |
| Velocity (m/s) | Velocity (m/s) | Divide | Constant |
| Velocity (m/s) | Displacement (m) | Divide | Frequency (1/s) |
| Velocity (m/s) | Constant | Add | Velocity (m/s) |
| Velocity (m/s) | Constant | Divide | Velocity (m/s) |
| Velocity (m/s) | _ | Differentiate | Acceleration (m/s^2) |

8.23.1. Models

Models

By keeping track of the X and Y axis units for each curve T/HIS can now convert results from one unit system to another.

| Units | | | | | | |
|------------------------------|----------------------|--------|-----------|--|----------|--|
| Models | | Labels | | | Curves | |
| | Model Undefined v | | Display | | Factor | |
| | | | Unknown 🔻 | | | |
| Length: | Unknown | | Unknown | | 1.000000 | |
| Mass: | Unknown | | Unknown | | 1.000000 | |
| Time: | Unkn | iown | Unknown | | 1.000000 | |
| Display : Model Titles 🔻 | | | | | | |
| ✓ × | | | | | | |
| ✓ #1 : AI 6005-T6 Crush Tube | | | | | | |

For each model one of the following 6 unit systems can be defined.

| Name | Units |
|------|-----------------------------------|
| U1 | metre, kilogram, second (SI) |
| U2 | millimetre, tonne, second |
| U3 | millimetre, kilogram, millisecond |
| U4 | millimetre, gram, millisecond |
| U5 | foot, slug, second |
| U6 | metre, tonne, second |

In addition to specifying a unit system for each model a separate unit system can also be selected to use to display results.

If the model unit system and the display unit system are different then T/HIS will automatically calculate the correct factors to apply to the X and Y axis as the curve data is read from the file (All curves are stored inside T/HIS using the currently defined Display unit system).

| | Model | Display | Factor |
|---------|------------|------------|-----------|
| | mm, t, s 🔻 | m, kg, s 🔻 | |
| Length: | millimetre | metre | 0.001000 |
| Mass: | tonne | kilogram | 1000.0000 |
| Time: | second | second | 1.000000 |

8.23.2. Labels

Labels

This option will display the labels that will be used for each of the built-in units. Each Unit System has its own set of labels which can be modified if required.

| | | Units | | × |
|---|--------------|-----------------|-------------|------|
| | Models | Labels | Curves | |
| | Current | Display Units : | m,kg,s | Ŧ |
| Δ | | | Reset All | |
| | Time | | s | > |
| | Energy | | J | ► |
| | Work | | J | ► |
| | Temperatur | e | K | ► |
| | Displacmer | it | m | ► |

| Viscosity | kg/m s | T/mm s | kg/mm ms | gm/mm ms | slug/ft s | T/m s |
| Thermal Diffusivity | m^2/s | mm^2/s | mm^2/ms | mm^2/ms | ft^2/s | m^2/s |
| Vorticity | Radians/s | Radians/s | Radians/ms | Radians/ms | Radians/s | Radians/s |
| Q Criterion | 1/s | 1/s | 1/ms | 1/ms | 1/s | 1/s |
| Current | А | А | А | А | А | А |
| Vector Potential | kg m/A s^2 | T mm/A s^2 | kg mm/A ms^2 | gm mm/A ms^2 | slug ft/A s^2 | T m/A s^2 |
| Magnetic Flux Vector | kg/A s^2 | T/A s^2 | kg/A ms^2 | gm/A ms^2 | slug/A s^2 | T/A s^2 |
| Electric Field Vector | kg m/A s^3 | T mm/A s^3 | kg mm/A ms^3 | gm mm/A ms^3 | slug ft/A s^3 | T m/A s^3 |
| Conductivity | A^2 s^3/kg m^3 | A^2 s^3/T mm^3 | A^2 ms^3/kg mm^3 | A^2 ms^3/gm mm^3 | A^2 s^3/slug ft^3 | A^2 s^3/T m^3 |

If a curve has a user defined unit or if after a curve operation one of the curve axis units is not one of the basic units that T/HIS knows about then T/HIS will build a label from the currently defined length,mass,time,temperature and angle labels.

If for example a velocity/time curve is multiplied by another velocity time curve then the Y axis will have units of Velocity^2. If the current display unit system is U1 (m,kg,seconds) then the unit label for the curves y axis will be "m^2/s^2".

8.23.3. Curves

Curves

This option can be used to display the unit information for each curve.

温

The **Curve** dropdown displays the unit system of the selected curves. It can also be used to update curves that have an undefined unit system.

The **Display** dropdown shows the display unit system currently used in T/HIS. Display units can be modified from this dropdown or from the **Model** panel.

The **Factor** section indicates the mass, length, and time conversion factors between the selected unit system and the display unit system.

By default, the unit system for each curve is displayed, but this can be changed to show either the X or Y axis unit using the popup menu.

| Display Curve : | Unit System | ▼ |
|-----------------|-------------|---|
| | Unit System | |
| | X Axis Unit | |
| | Y Axis Unit | |

Setting the Unit System for a Curve

| | Undefined 🕨 | U1: m,kg,s (SI) |
|---|---------------|-----------------|
| | | U2: mm,T,s |
| If the unit system for a curve has not been defined then it will be displayed as "Undefined" and a | | U3: mm,kg,ms |
| popup menu will be available that can be used to | | U4: mm,gm,ms |
| select the correct unit system. If the selected unit | | U5: ft,slug,s |
| system is different to the unit system currently | | U6: m,T,s |
| being used to display results then the curve values | v unit system | |

will automatically be converted to the current display unit system.

If a curve is associated with a model, its units can only be modified from the Models panel and not from the Curves panel.

Multiple curves can be selected using the Ctrl or Shift keys. Once selected, the units can be changed via the Selected Curves dropdown or the Curves dropdown located at the top of the panel.

Note : Once the unit system for a curve has been defined it can not be changed.

Setting the Axis Units for a Curve

The X and Y axis units of a curve can be defined or changed at any time. The popup menu contains all of the basic Unit types that T/HIS knows about plus an option to setup a user defined unit.

To create a user defined unit for a curve, the unit should be defined in terms of its basic properties. The values for *mass, length,*

Moment per Unit Width Force per Unit Width

| User Defined | Þ | Unit Label : | s |
|--------------|---|--------------|------|
| | | Length : | 0.00 |
| | | Mass : | 0.00 |
| | | Time : | 1.00 |
| | | Angle : | 0.00 |
| | | Temp : | 0.00 |
| | | Apply | |

time, angle, tempetrature and *current* should be the powers that are used to describe the unit in terms of it's fundamental dimensions.

| Unit | Mass | Length | Time | Angle | Temperature | Current |
|--------------|------|--------|------|-------|-------------|---------|
| Time | 0.0 | 0.0 | 1.0 | 0.0 | 0.0 | 0.0 |
| Displacement | 0.0 | 1.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Velocity | 0.0 | 1.0 | -1.0 | 0.0 | 0.0 | 0.0 |
| Acceleration | 0.0 | 1.0 | -2.0 | 0.0 | 0.0 | 0.0 |
| Stress | 1.0 | -1.0 | -2.0 | 0.0 | 0.0 | 0.0 |

Some examples of common units defined using this method are shown below.

8.24. The JavaScript Interface

8.24.1. Introduction

Introduction

JavaScript is a freely available scripting language that is normally found performing the "work" behind interactive web pages, however its syntax and structure also make it an excellent tool for providing an externally programmable interface to programmes in general.

Within T/HIS it is implemented as an Application Programming Interface (API) which provides a range of functions that allow you to edit and create curves, open windows, generate plots, and so on. This is written in a very simple and non-intimidating way, with relatively few functions, that should be easy for non-programmers to use.

Anyone familiar with C or shell script programming will find existing JavaScripts are instantly readable, and can be given minor edits without further ado. For those who are more ambitious a good guide to the language is "**JavaScript, A definitive Guide** " by David Flanagan, published by O'Reilly, ISBN 0596101996.

In T/HIS 17.0 and earlier the implementation supported ECMAScript 5 features of JavaScript. In T/HIS 18.0 the implementation has been upgraded to support ECMAScript 6 (and newer) features of JavaScript.

The sections below describe how to run JavaScripts in T/HIS, and summarise its JavaScript API. For details of the API and its functions, and also some examples, see the JavaScript API Reference Manual

8.24.2. Using JavaScript in T/HIS

Using JavaScript in T/HIS.

Human-readable JavaScripts need to be **compiled**, meaning turned from something human-readable into a set of instructions that a computer can understand; and then **run** in their compiled form. They can be changed and rerun in their modified form at any time without having to exit and re-enter T/HIS, making the "write, test, modify, re-test" development cycle very quick and easy.

Compiling and Running a script

| Run | Will both compile and run the script unless it contains syntax errors, in which case it stops with an error message when compilation fails. |
|-------------|---|
| Debug | Starts the JavaScript debugger, <u>JaDe</u> to debug the script. |
| Check | Only compiles the script, reporting any errors found, and does not run it. |
| Encrypt | A script can be encrypted so that the source code is hidden but the script can still be run (when compiling and running the script T/HIS decrypts the file in memory). Once encrypted, the source code cannot be retrieved by an ordinary user, so make sure that you keep the original file somewhere safe. As a last resort contact Oasys Ltd Support, who can decrypt the script if required. If a script is split up into separate files by Use, the files are all combined together into the main file before encrypting. |
| Merge | If a script is split up into separate files by Use, the files are all combined together into a single file. This may be useful if you want to give the script to someone else and you do not want to have to give lots of different files. |
| GUI Builder | Opens the <u>GUI Builder to interactively build GUIs for your script.</u> |
| Running | Enables you to view (and kill) any scripts that are currently running |

Knowing which scripts are running

| JavaScrip | ot | ? 🔪 | 〈 Wher |
|-----------------|------|----------|---------------|
| | Kill | Kill all | show |
| | | Running | Use t |
| C:\work\test.js | | | the li |
| | | | and t |
| | | | To kil |
| | | | the so |
| | | | Alter |
| | | | |
| | | | curre |

When scripts are running in T/HIS, they are shown in the Running submenu.

Use the **Running** button to toggle between the list of scripts that are currently running, and the tree of available scripts.

To kill/terminate a running script, highlight the script(s) in the tree and press Kill.

Alternatively, to kill all the scripts that are currently running use Kill all.

File encodings for scripts

Version 10.0 of T/HIS introduced the ability for unicode text to be used on widgets created in a script. Previous versions of T/HIS only supported English text so the default ASCII encoding was used for script files (this is still the default encoding for script files).

If you want to use unicode text in widgets then you must use a file encoding that is capable to representing the unicode 'characters' you require. The **File encoding** popup allows you to change the file encoding used when reading the script file. T/HIS supports the following file encodings:

| Encoding | Description |
|---------------------|---|
| LATIN-1 | Default 'ASCII' encoding |

| UTF-16 | Should have a byte order mark (BOM). If not present assumes big endian |
| UTF-16LE | Little endian with or without byte order mark (BOM) |
| UTF-16BE | Big endian with or without byte order mark (BOM) |
| UTF-32 | Should have a byte order mark (BOM). If not present assumes big endian |
| UTF-32LE | Little endian with or without byte order mark (BOM) |
| UTF-32BE | Big endian with or without byte order mark (BOM) |

Please contact Oasys Ltd Support if you have problems or require another encoding to be supported.

To show the unicode text the appropriate font must be used. This can be set using the preferences this*cjk_unix_font and this*cjk_windows_font .

Dealing with errors in scripts

Script errors come in two forms:

Syntax

errors Are mistakes of JavaScript grammar or spelling, resulting in error messages during compilation.

These are easy to detect and correct since the line number and offending syntax are both described by the compiler. The script needs to be edited to correct the problem and then recompiled. Sometimes several iterations of the compile/edit cycle are required to eliminate all errors from a script.

Run-time Are errors of context or logic in scripts that are syntactically correct, and thus have compiled, but which fail at some stage when being run.

A typical example of a run-time error is an attempt to divide a value by zero, yielding the illegal result infinity. More subtle errors involve passing an invalid value to a function, accessing an array subscript that is out of range, and so

on.

The JavaScript API Reference Manual has been written in such a way that it handles "harmless" run-time errors by issuing a warning and continuing execution, but that more serious errors which could result in the wrong answers being generated issue an error message and terminate.

Garbage Collection memory size

Whenever a javascript creates an object, array or string variable, some memory needs to be allocated by the computer. When the variable goes out of scope (is no longer reachable) this memory needs to be returned. This is done automatically in JavaScript by a process called garbage collection.

The garbage collection process runs periodically when this memory use reaches a certain level. To be able to do this, the garbage collection process itself also requires a small amount of memory to keep track of all of the variables.

Prior to version 22.0, this garbage collection memory was a fixed size and had to be allocated before any scripts could run. The default size for this was 25Mb and there was a textbox on the script panel to change this to a larger value if required.

In T/HIS 22.0 the garbage collection memory is now expanded automatically as required to run the script(s). There is no longer any need to give the garbage collection memory size, so the textbox to specify the memory has been removed.

However, if you know in advance that your script has to retain a large number of objects, arrays, strings etc in memory then it might be beneficial to start the script with a larger memory, rather than letting T/HIS gradually increase the memory. This can be done using the this*javascript_memory_size preference or adding a special memory comment at the top of the script.

The maximum size of garbage collection memory that T/HIS can allocate is 4Gb. Note that this is the memory for the 'garbage collection' process, **NOT** the total memory for the script. The total memory for the script could be significantly higher than this value. If T/HIS is being run on a machine that is shared by several users and you want to limit the size of the memory for scripts, rather than expanding it automatically to 4Gb you can use the preference

oasys*javascript_maximum_memory_size

Assigning Scripts to Shortcut Keys

If a script is to be run repeatedly, it can be convenient to set up a shortcut to it. From within the JavaScript menu the script can be assigned to one of the 12 function keys. Alternatively, the JavaScript can be assigned to any key using the <u>Shortcut menu</u>.

| Assign script to function key: F1 | v |
|-----------------------------------|---|
| Assign Javascript to Function Key | |
| F1: E:\java\operate.js | |
| F2: <unused></unused> | |
| F3: <unused></unused> | |
| F4: <unused></unused> | |
| F5: <unused></unused> | |
| F6: <unused></unused> | |
| F7: <unused></unused> | |
| F8: <unused></unused> | |
| F9: <unused></unused> | |
| F10: <unused></unused> | |
| F11: <unused></unused> | |
| F12: <unused></unused> | |
| Explain this | |

Maintaining a library of JavaScripts

It is also convenient to have a library of scripts in a defined location.

By default T/HIS looks in **\$0A_INSTALL/this_library/scripts**, but you can define a different directory by setting the preference:

this*script_directory: some_different_directory_name

in your oa_pref file.

All scripts found in the relevant directory will be listed in the JavaScript panel, as shown in this example.

Using the "description:" comment at the top of a script to identify its purpose.

To help to identify scripts special comments are searched for in the top 10 lines of each script, and if description: is found, for example the comment line:

// description: Some description of the script's purpose

Then the description line is shown as hover text when the mouse is placed over that filename. For example the line:

// description: Colour curve by model number

Will result in the hover text " **Colour curve by model number** " appearing when the mouse hovers over the button to launch the script.

Using the "name:" comment at the top of a script to change its name

Normally the name shown for a script will be its filename, stripped of any leading pathname and trailing ".js" extension.

However if the string **name**: is found in the first ten lines of the script, then the following name will be used instead. For example the line:

// name: Colour By Model

Will result in the script appearing with the name "**colour By Model** " in tha JavaScript panel. This does not affect the actual name of the script, only the name on its library button.

Using the "memory:" comment at the top of a script to change the initial garbage collection memory

Very occasionally the **initial** <u>memory required for garbage collection</u> needs to be changed.

If the string **memory**: is found in the first ten lines of the script, then the size given will be used for the memory (unless the size in the memory textbox is larger than this value). For example the line:

// memory: 50

Will result in the script **initially** using 50Mb for garbage collection memory. T/HIS will automatically expand the memory required for garbage collection as necessary. See <u>Garbage Collection Memory Size</u> for more details.

Using the "encoding:" comment at the top of a script to change the encoding

By default the encoding used for scripts is LATIN1

If the string encoding: is found in a comment on the first twenty lines of the script, then the encoding will automatically be used for the script. The allowed values are UTF8 or UTF-8 for UTF-8 encoding and ShiftJIS, Shift-JIS or sjis for Shift-JIS encoding.

For example the line:

// encoding: UTF8

Will result in the UTF-8 encoding being used for the script.

Using the "module:" comment at the top of a script for ES6 modules

T/HIS has to compile scripts that use <u>ES6 modules</u> differently to 'normal' scripts. If a script has the extension .mjs then T/HIS will automatically compile the script to use <u>ES6</u> <u>modules</u>. Alternatively, if the file has a different extension, the module comment can be used to tell T/HIS that this file needs to be compiled to support <u>ES6 modules</u>.

If the string **module**: **TRUE** is found in a comment on the first twenty lines of the script, then the script will be compiled with <u>ES6 module support</u>.

For example the line:

// module: TRUE

Will result in the script being compiled with <u>ES6 module support</u>.

8.24.3. Running a JavaScript in "batch" mode

Running a JavaScript in "batch" mode.

All the above assumes that JavaScripts will be run interactively from the user interface, however it is also possible to run a script in "batch" mode using the command line interface. The relevant command-line commands are:

| /JAVASCRIPT - | +- | COMPILE | Compiles and checks the script, but does not run it. |
|---------------|----|-----------------------|--|
| | +- | EXECUTE | (Re)compiles and runs the script |
| | +- | MEMORY <nnn></nnn> | Resets the Garbage Collection threshold to <nnn> MBytes</nnn> |

To run a JavaScript from batch these commands need to be placed in a command file and run using the command line " -cf= command filename " option. For example the command file might be:

... some other commands
/JAVA EXEC my_script.js
...some further commands

And the command line required to run T/HIS might be something like:

\$OASYS/this10.exe -d=default -cf= command_file **-exit** analysis_name

Obviously multiple script invocations may be placed in a command file. For more information see:

| <u>Command and Session</u> <u>files</u> | Describes command files, and explains how to create and use them |
|--|---|
| <u>T/HIS command line</u> arguments | Describes the various command line arguments, and how to use them |

8.24.4. Running a JavaScript from within a FAST-TCF script

Running a JavaScript from within a FAST-TCF script

JavaScript scripts can also be run from within a FAST-TCF script using the "javascript" option

javascript "E:\javascripts\new_function.js"

Within a FAST-TCF script curves are usually accessed via curve tags. If a JavaScript is used within a FAST-TCF script it is recommended that the **Curve.GetFromTag()** function is used to access existing curves. If a new curve is created by a JavaScript within a FAST-TCF script then the new curve can be accessed within the FAST-TCF script using the "tag" parameter of the curve creation function

```
new_curve = new Curve(id,tag,label,x-axis label,y-axis label);
```

If a tag is not specified in the curve creation function

new_curve = new Curve(id);

then a curve tag will be generated automatically for the curve. The 1st curve created within the script will be tagged " **curve_js_1** ", the 2nd " **curve_js_2** " ...

8.24.5. ECMAScript 6 Modules

ECMAScript 6 modules

T/HIS 22.0 supports ES6 modules. For more information on ES6 modules, please refer to <u>https://developer.mozilla.org/en-US/docs/Web/JavaScript/Guide/Modules</u>.

Prior to support for ES6 modules, the only way to split up a script in T/HIS was to use the non-standard Use() functionality in the Oasys LS-DYNA Environment software. ES6 modules now give JavaScript built-in support for modular programming using the <code>import and export</code> keywords. T/HIS supports both static and dynamic imports for modules and this section gives a brief guide to how T/HIS locates modules.

To be able to support ES6 modules, T/HIS has to compile the script in a different way to a 'normal' script that does not use modules. So that T/HIS can tell how to compile the script we use a different extension .mjs for scripts that use modules. This follows the convention used by <u>V8</u> and <u>Node.js</u>. Alternatively, if you prefer, you can put a special <u>module</u> comment at the top of the script and continue to use the extension .js (or whatever other extension you prefer).

When importing modules using import then if the module filename is an absolute filename T/HIS can locate the file directly. However if a relative filename is used T/HIS will search for the file in the following order.

- 1. Relative to the directory that the main script is in.
- 2. Relative to any parent module directory.
- 3. Relative to any script_directory preference specified in a preference file given by a -pref=xxxx command line option.
- 4. Relative to any script_directory preference specified in a preference file in the current directory.
- 5. Relative to the script directory specified in the HOME directory. By default this will be \$HOME/primer_library/scripts but this can be changed with the script_directory preference in the HOME oa_pref file.
- 6. Relative to the script directory specified in the OA_INSTALL directory. By default this will be \$OA_INSTALL/primer_library/scripts but this can be changed with the script_directory preference in the OA_INSTALL oa_pref file.
- 7. Relative to the script directory specified in the OA_ADMIN directory. By default this will be \$OA_ADMIN/primer_library/scripts but this can be changed with the script_directory preference in the OA_ADMIN oa_pref file.
- 8. Relative to any module_directory preference specified in a preference file given by a -pref=xxxx command line option (unset by default).
- 9. Relative to any module_directory preference specified in a preference file in the current directory (unset by default).
- 10. Relative to any module_directory preference specified in the HOME oa_pref file (unset by default).

- 11. Relative to any module_directory preference specified in the OA_INSTALL oa_pref file (unset by default).
- 12. Relative to any module_directory preference specified in the OA_ADMIN oa_pref file (unset by default).

Note that the non-standard Use() functionality and ES6 modules cannot both be used when compiling a script. You must use one or the other. Where possible you should now use ES6 modules in preference as they are now part of core JavaScript.

Individual module files can be encrypted if required so if you want to protect only some parts of your code/process and leave the rest of it open/visible this can easily be done.

One difference between using the non-standard Use() method and ES6 modules is that with the Use() method T/HIS could merge all of the individual files back into a single file using the **Merge** command which could then be encrypted if required to only have to give out a single file instead of a 'package'. For ES6 modules an external tool such as <u>rollup.js</u> or <u>Webpack</u> is required to merge the files. Once combined into a single file, T/HIS can encrypt it.

8.24.6. Scripts using GUIs

Scripts using GUIs

Scripts that create a graphical user interface (GUI) have to keep running so that the windows for the user interface remain visible. The way that this is done has changed in version 21.

All programs that have a graphical user interface (GUI) use an "event loop" to process any mouse/keyboard events. T/HIS has a main "event loop" to process all of the program's events.

In version 20 and before, if a script created and showed a window, T/HIS would start a new "event loop" to manage and process that JavaScript window.

The script would not return from the window Show() call until the window was hidden/closed.

i.e. showing the window would "block" execution of the script until the window was closed.

When the window is closed, the script continues. When execution reaches the end of the script, the script is terminated

For example, in version 20 and earlier, in the following script, "Hello, world!" will not be printed until the window is closed because the call to w.Show() will not return until the window is closed.

```
// Create a window with a widget
var w = new Window("Test", 0.5, 0.6, 0.5, 0.6);
var l = new Widget(w, Widget.LABEL, 0, 50, 0, 6, "Press X to close
the window");
// Show the window and start event loop
w.Show();
// Print message
Message("Hello, world!")
```

When the window is closed the message is printed and the script will then terminate as execution has reached the end of the script.

In version 21 the behaviour has changed. If a script creates and shows a window, T/HIS will ***not*** start a new "event loop" to manage and process that JavaScript window. The window will now be processed from the main event loop in T/HIS.

The script now returns from the window Show() as soon as the window is shown, and execution of the script continues.

i.e. showing the window no longer "blocks" execution of the script until the window is closed.

When execution reaches the end of the script, the script is ***not*** terminated.

The script continues running "in the background" as the script has shown a window.

For example, in version 21, in the same script "Hello, world!" will be printed immediately after the window is shown, because the call to w.Show() returns after the window is shown.

When the message is printed, the script will ***not*** terminate when execution reaches the end of the script. The script will continue to run "in the background". You can use the <u>Running</u> button in the script menu to see which scripts are running at any time.

If a script that shows windows continues running "in the background", and does not terminate when execution reaches the end of the script, how/when does the script terminate?

A script that uses windows ***must*** now call **Exit** to terminate the script

```
// Create a window with a widget
var w = new Window("Test", 0.5, 0.6, 0.5, 0.6);
var l = new Widget(w, Widget.LABEL, 0, 50, 0, 6, "Press X to close
the window");
// Exit when window closed
w.onClose = Exit;
// Show the window
w.Show();
// Print message
Message("Hello, world!");
```

If the script does not call Exit then the script will continue to run in the background, even if no windows are being shown. If necessary the <u>Running</u> menu can be used to terminate the script.

This change was primarily required for running multiple scripts in PRIMER, but the behaviour in T/HIS is the same. See <u>Why the change has been made in version 21</u> in the PRIMER manual for details.

For simple scripts, the only change that should be required is to make sure that the script exits when the main window is closed by calling Exit(). The Window onClose event can be used to do this.

If you have specifically relied on script execution "blocking" when the Window Show method is used, then your script may need to be slightly modified. Please contact our support team if you have any questions or need assistance.

8.24.7. Examples

Examples

By far the easiest way to learn JavaScript is by example and, more specifically by modifing existing scripts to do what you want.

The software comes supplied with examples in the **\$oASYS**/ programme_ **library/examples** directory (for T/HIS **\$oASYS/this_library/examples**) and you are free to use and modify these files for your own purposes.

8.24.8. MADM Correlation Tool

MADM Correlation Tool

Included in T/HIS as a JavaScript is the MADM Correlation Tool. The minimum area discrepancy method (MADM) is ideal for correlation between Ansys LS-DYNA simulations and physical tests when force versus deflection is the relationship of interest, and offers benefits over other correlation methods that focus on parameters versus time. To run the tool, open the JavaScript panel, and select **MADM** \rightarrow **MADM Correlation Tool**. For more details, see <u>Appendix F – MADM Correlation tool</u>.

8.24.9. The T/HIS JavaScript API

The T/HIS JavaScript API

The API is documented in the JavaScript API Reference Manual

The global class section lists all the functions available in the global scope. To make them easier to locate, they are also presented in different categories in the tree on the left hand side.

8.24.10. CORA (CORrelation and Analysis) Tool

CORA (CORrelation and Analysis) Tool

Included in T/HIS as a JavaScript is the CORA (**COR** relation and **A** nalysis) tool, an implementation of the methodology used by the Partnership for Dummy Technology and Biomechanics (PDB) software <u>CORA</u>. To run the tool, open the JavaScript panel, and select **CORA** \rightarrow **CORA** (**COR** relation and **Analysis**). For more details, see <u>Appendix F – CORA</u> implementation.

8.25. Datum Lines

Datum Lines

Datum lines can be added to graphs to show limits and reference curves. Unlike normal curves DATUM lines are not used to calculate graph limits when auto scaling and are not shown in the curve legend. There is no hard-wired upper limit on the number of datum lines - machine specifications are the limiting factor.

| — Read | Write | Curves | Models |
|--------------|-------------|------------|---------|
| Edit | Style | Properties | Images |
| Operate | Maths | Automotive | Seismic |
| Macros | FAST-TCF | Title/Axes | Display |
| Settings | Preferences | Groups | Graphs |
| Command File | Units | JavaScript | Datum |

Each graph can contain multiple DATUM lines, all DATUM lines are drawn in the order they have been defined before any curves are plotted.

8.25.1. List

List

This option lists any datum line definitions that have been created.

This menu can also be used to select which datum lines appear on each graph. Each datum line can appear on more than one graph.

A range of datum lines can be added/removed from graphs by selecting the first line/graph combination and then holding down **Shift** while selecting the second line/graph.

Clicking on any of the datum line definitions will highlight it in blue and display a popup menu containing the following options.

| Edit | Edit the selected datum line definition. This option will |
|------------------------|---|
| | display the CREATE/EDIT menu. |
| Add to All Graphs | Add the selected datum line definition to all the currently |
| | defined graphs |
| Remove From All Graphs | Remove the selected datum line definition from all the currently defined graphs |
| Move Datum | Make a copy of the selected datum line, the original definition will be deleted when the copy in inserted. |
| Copy Datum | Make a copy of the selected datum line. |
| Insert Before | Insert the previously copied/moved datum line definition before the selected datum line; if nothing has previously been copied or moved, a blank datum line definition is inserted before the selected datum line and the new definition can subsequently be updated. |
| Insert After | Insert the previously copied/moved datum line definition after selected datum line; if nothing has previously been copied or moved, a blank datum line definition is inserted after the selected datum line and the new definition can subsequently be updated. |
| Delete | This will delete the selected datum line. |

8.25.2. Create/Edit

Create/Edit

Each datum line must be defined with a unique acronym that is used to identify it in FAST-TCF scripts. The acronym shouldn't contain any spaces.

An optional label that is displayed on the graph next to the datum line can also be defined. The font, size and colour for the label can be defined, as well as the orientation and position of the label relative to the datum line.

datum lines can be defined as

- Constant Y values
- Constant Y2 values
- Constant X values
- Curves of X,Y points

For constant X, Y or Y2 datums, the line will automatically extend to the edges of the graph and the areas either side of the line can be filled using any of the standard T/HIS colours.

For constant datums, an optional second value can be defined, along with a corresponding second label. A third fill colour can be used to fill in between the two datum lines, reducing the need for multiple datums which rely on being drawn in the correct order.

| – Datum Lines 2 – J | | | |
|---------------------|--------------|--|--|
| List | Edit | Read Save | |
| Update | | Quit | |
| Acronym : d | atum 1 | Value : 1000.0 Label : Upper Limit | |
| Type : | 🗆 Constant Y | Ind Value : 700.00 2nd Label : Lower Limit | |
| | Constant Y2 | | |
| | Constant X | | |
| L | ⊔ Points | | |
| Line Colour | Foreground⊧ | Fill Above | |
| Line Style | | 🖻 Fill Between 📂 | |
| Line Width | | Fill Below | |
| Label Font | Default 🖻 | Fill Left | |
| Label Size | automatic 🖻 | ► Fill Centre | |
| Label Colour | Foreground⊧ | ► Fill Right | |
| Label Position | default 🖻 | • | |
| Label Orient | Horizontal 🖻 | • | |
| | | | |
| 1 | | | |

As the datum lines are drawn in the order they are defined, care must be taken when applying fill colours. The following example shows the effect of defining the datums in a different order. Using the optional second value, the following example can actually be made into a single datum with two values, two labels and three fill colours, as in the above image.

In order to define a datum using X,Y points, either each point can be manually added or the points can be copied into the datum from a curve, using the **Copy points from curve...** button. This will open a list of curves and allow one to be selected or picked on the screen and the option to copy the curve label is also given. The areas between the curve and the axes can be filled, either above and below or left and right. Note that

datum curves are always plotted against the left-hand y-axis scale, even when copied from a curve currently plotted against the right-hand y-axis.

8.25.3. Read

Read

This option can be used to read in a file containing datum line definitions that has previously been saved.

All datum lines must have a unique acronym. When the file is read the user has the choice to:

- 1. Delete any existing datum line definitions before the file is read.
- 2. If a datum line in the file being read has the same acronym as an existing datum line then the existing definition will be overwritten.
- 3. If a datum line in the file being read has the same acronym as an existing datum line then the new definition in the file will be ignored.

The preference option

this*datum_file : C:\datum\this001.dtm

can also be used to define a default file containing datum line definitions that is read automatically when T/HIS starts (see <u>Appendix H</u> for more details)

8.25.4. Save

Save

This option can be used to save any datum line definitions to a file so that they can be reloaded and used in future T/HIS sessions.

| | D | atum Lines | ? - _ X |
|------------|---------------|------------|----------------|
| List | Create | Read | Save |
| Apply | Cancel | | |
| Filename : | .\this001.dtm | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | - |
| | | | |

8.26. T/HIS Session Save and Retrieve

T/HIS Session Save and Retrieve

T/HIS session save and retrieve saves the current T/HIS session as a session file of format (.tsf) onto the disk which can be read back later on to retrieve the saved T/HIS session. A T/HIS session file can also appended to or overlayed on top of an existing session.

8.26.1. Save Session

Save Session

A T/HIS session can be saved either through Save/Retrieve Session panel or on Exit.

Save Session - Save/Retrieve Session Panel

To save a T/HIS session, select **File** -> **Session File** -> **Save** to open the Save/Retrieve Session panel in the menu area. Enter a name for the session file in the **File Name** textbox and click **Apply**. A filename can also be entered using file selection browser.

It should be noted that T/HIS session file does not directly store either the Ansys LS-DYNA model results or any csv/cur files that have been used for generating the curves inside the session file by default. It will only contain the full address path to these files. As a result of this session file do not occupy much space on disk.

If users want they can embed extra information into the session file so that the saved T/HIS session can be retrieved even if Ansys LS-DYNA results/csv/cur files are deleted or lost.

Embed This option embeds the cur or csv files that are used for creating the cur/csv curves. The session file with embedded cur/csv files no longer depend on these files and the session can be retrieved even if these files are deleted or lost. If you want this option to be enabled always, you can set the preference this*session_embed_cur_csv_files: ON (see Format of the oa_pref File for more details).

Embed

curve
 data into
 session file. A session file with embedded curve data can be retrieved
 even if the model files are missing. However, a session retrieved using
 embedded curve data loses information such as curve ID and graph
 properties. If you want this option to be enabled always, you can set the

preference: this*session_embed_curve_data: ON (see Format of the oa_pref File for more details).

Save Session - On Exit

T/HIS session can be saved on exit from T/HIS by selecting **SAVE SESSION** button on the exit INFORMATION panel. The session file saved would have a name of the format **this_<DATE>_<TIME>.tsf**. The file would be by saved to the location defined in preference file (see <u>Format of the oa_pref File</u> for more details).

```
this*session_save_option:
```

```
this*session_save_dir:
```

The session file can also saved automatically every time T/HIS exits by defining in the preference file (see <u>Format of the oa_pref File</u> for more details).

```
this*session_auto_save:
```

| E | | | |
|---|--|--|--|
| Z | EXIT CP_EXIT (Keep CP File) SAVE SESSION CANCEL (Continue) | | |
| I | | | |
| I | | | |
| | Confirm EXIT: EXIT will tidy up and exit; | | |
| | CP_EXIT will save the current Checkpoint file | | |
| | and then exit. | | |
| | SAVE SESSION Saves the T/His session file with name | | |
| | this <date> <time>.tsf to HOME location.</time></date> | | |
| | CANCEL will return to the programme. | | |
| | | | |
| 1 | | | |
| | and then exit. SAVE SESSION Saves the T/His session file with name this_ <date>_<time>.tsf to HOME location.</time></date> | | |

8.26.2. Retrieve Session

Retrieve Session

A session file (.tsf) that has been saved onto the disk can be opened by simply doubleclicking on it.

To open a session file (.tsf) from inside T/HIS, select **File** -> **Session File** -> **Retrieve** to open the Save/Retrieve Session panel in the menu area. Enter the name of the session file which needs to be opened in the **File Name** textbox and click **Apply**. The session file can also be selected using file selection browser. The Retrieve Session panel can pop-up on the screen every time T/HIS is launched by setting the

preference this*show_session_retrieve_on_start: ON (see Format of the oa_pref File for more details).

A typical T/HIS session can be retrieved in two possible ways depending on the data saved in session file:

- 1. Using Ansys LS-DYNA model(s), cur and csv files
- 2. Using embedded curve xy data

Note: An option to select either of the above types is provided only if the session file contains embedded curve xy data. By default session is retrieved using Ansys LS-DYNA model(s), cur and csv files option.

| | | Save/F | Retrieve Ses | sion | | 2 X |

Using Ansys LS-DYNA model(s), cur and csv files

The session retrieved using Ansys LS-DYNA models, cur and csv files can restore all the curve information such as ID, blanking status, curve history, curve and graph properties such as color, curve symbol, line width, line style and captions. This option needs Ansys LS-DYNA model(s), cur and csv files that are not embedded in the session files to be present in the locations defined inside the session.

If the session files uses any Ansys LS-DYNA models then the path of models used by the session file can be found in **List of Ansys LS-DYNA models inside session file**. If the session file contains any model which is not found in the path defined inside the session file, the background color of the textbox turns red from blue.

The path of the models used by the session files can be modified either by modifying the path of the file in the textbox or by select the file using the file selection browser.

| List of LS-DYNA models inside session file | | | |
|--|-----|-----------------------------|--|
| Δ | M 1 | C:\Sample\sample_model1.thf | |
| | M 2 | C:\Sample\sample_model2.thf | |
| | М З | C:\Sample\sample_model3.thf | |
| | M 4 | | |
| | M 5 | | |
| | M 6 | | |
| | M 7 | | |
| | M 8 | | |
| | M 9 | | |
| ∇ | M10 | | |

A T/HIS session file can be opened even if some of the models are missing. The retrieved session will only contain the curves from the models that are present.

When trying to open a new session file with T/HIS already containing model(s) or curve(s), T/HIS session retrieve offers three different options:

Г

| | Retrieve Op | tions 🧧 🗖 🔄 | |
|---|--|--------------------------|--|
| - | Close | | |
| [| Delete existing session and open new one | | |
| [| Retains existing session and open on a new graph | | |
| [| Retains existing session and adds to the existing graphs | | |
| | Overlay properties: | | |
| _ | Curve options: | _ Graph options: | |
| [| Use default T/HIS | Use existing | |
| | Use .tsf file properties | Use .tsf file properties | |

| Delete existing session and open new one (New Session) | This option deletes the current existing session and opens the selected session file as a fresh new T/HIS session. It should noted that graphs and curves, once deleted, cannot be retrieved unless they are saved beforehand. | |
|---|--|--|
| Retains existing session and open on a new graph (Append session) | This option retains the current existing session as it is and the graphs from the session file will start from the highest available graph id. Total number graphs in the combined session is limited to 32. | |
| Retains existing session and adds to the existing graphs (Overlay session) | This option retains the current existing session as it is and the curves from session file will be added to their corresponding graph in the current session. | |

The above Retrieve Options can be set by clicking on the **Options** button in the Save/Retrieve Session panel. This button becomes available only if T/HIS already contains model(s) or curve(s). Clicking on this button will open up the Retrieve Options pop-up.

The Overlay Properties become available when **Retains existing session and adds to the existing graphs** option is selected. The Overlay Properties will help in defining the curve style for the curves/graphs properties such as curve line type, width, graph title, x-

axis and y-axis labels and font that are being overlaid on top of existing session the curve and graph.

| - 1 | Retrieve Options | | | | |
|-----|---|--|--|--|--|
| - 1 | | | | | |
| | Close | | | | |
| | | | | | |
| | | | | | |
| | Delete existing session and open new one | | | | |
| | Retains existing session and open on a new graph | | | | |
| | | | | | |
| | Retains existing session and adds to the existing graphs | | | | |
| | | | | | |
| | Overlay properties: | | | | |
| | · · · | | | | |
| | | | | | |
| | Use default T/HIS Use existing | | | | |
| | Use .tsf file properties | | | | |
| | | | | | |
| | | | | | |
| ay | Use default T/HIS This option automatically defines the cur | | | | |
| | for the curves that are being overlaid. | | | | |
| | | | | | |

| Overlay Curve | Use default T/HIS | This option automatically defines the curve style for the curves that are being overlaid. |
|-----------------------------|-----------------------------|--|
| Options | Use .tsf file properties | For the curves that are being overlaid, this option will apply the curve style defined inside the session file (.tsf). |
| Overlay Graph Options | Use existing | This option will retain the current existing graph properties such as x-axis and y-axis labels and font as it is. |
| | Use .tsf file properties | This option will apply the graph properties such as x-axis and y-axis labels and font as defined inside the session file (.tsf). |

Using embedded curve xy data

If the selected session file contains embedded curve xy data, the option to select Retrieve using embedded curve data becomes available. This option retrieves all the curves even when the Ansys LS-DYNA model files required for session are missing/lost. However, the session retrieved using embedded curve xy data loses certain curve and graph properties. Hence, session option such as append and overlay are not applicable for a session retrieved using embedded curve data.

8.27. Workflows

Workflows

The Oasys Suite contains powerful tools and capabilities that can be used to interrogate and debug your analysis results. However...

- 1. The tools are not always customised for your specific loadcases or tasks
- 2. You may need to manually perform a number of steps to process your results, which can be time-consuming and prone to error
- 3. The JavaScript API can be used to create tools to automate your post-processing workflow, but this requires time, resource and knowledge, which is not always available

To address these issues, the Workflows feature provides tools customised for specific loadcases and tasks, built upon the existing capabilities in the Oasys Suite, to make it easier to interrogate and post-process results.

The Workflows framework provides a simple structure to transfer data from PRIMER to the post-processing software. Browse the selection of already-available <u>Workflow Tools</u>, or read more about the <u>Workflows menu in T/HIS</u>.

| - Tools | | | R PR PRIMER |
|-------------|----------|------------|-------------|
| Read | Write | Curves | Models |
| Edit | Style | Properties | Workflows |
| Operate | Maths | Automotive | Seismic |
| Macros | FAST-TCF | Title/Axes | Display |
| Settings | Measure | Groups | Graphs |
| Command Fil | Units | JavaScript | Datum |

8.27.1. Workflows Updates

Workflows 22.0 (released with Oasys Suite 22.0)

Many pre- and post-processors offer a range of tools that can be used to configure and interrogate Ansys LS-DYNA models. However:

- 1. The basic tools are not always customised for Ansys LS-DYNA, or for specific loadcases
- 2. You may need to perform many manual steps to process your results, which can be time-consuming and prone to error
- 3. Scripting APIs can be used to create tools to automate tasks, but this requires time, resource and knowledge, which is not always available

To address these issues, we introduced Workflows. Workflows is a powerful framework that provides you with customised tools that work seamlessly from pre-processing through to post-processing, providing results quickly and reliably.

Workflow Tools

Learn how to use the latest Workflow tools here.

Learn about Workflow User Data.

In addition to the tools provided, you can create your own bespoke tools. Please <u>contact</u> <u>us</u> if you have an idea for a tool and would like some help creating it.

Releases

The Workflows tools are constantly being improved and enhanced. If you have any requests for new features or experience issues using Workflows, please <u>contact us</u> and we will aim to address your requests in future releases. This documentation is for 22.0 (released with Oasys Suite 22.0). A record of all releases is listed below.

8.27.2. Workflows menu in T/HIS

Workflows menu in T/HIS

$\textbf{Tools} \rightarrow \textbf{Workflows}$

The Workflows menu allows easy access to all the available workflows. In T/HIS, you can open the Workflows menu by selecting **Tools** \rightarrow **Workflows**. The **Defined Workflows** tab shows all the Workflows that can be selected. Selecting any of the Workflows will run the JavaScript defined in the Workflow Definition. Running a Workflow will minimise the Workflows menu and open the script's user-interface. The Workflows menu will maximise again after closing the script.

When the Workflows menu is initially opened, it shows all the available Workflows, but you can filter the Workflows by using the **Filters** tree. You can select multiple categories to filter the available Workflows displayed. Individual categories can be selected with single clicks; pressing the **Ctrl** and **Shift** keys while clicking on the tree will do a multi select.

Every Workflow can be tagged with Category and Value pairs, which populate the Filters tree. Selecting multiple Values within a Category will show all the Workflows tagged with any of the selected Values. However, selecting Values across Categories will show workflows which are tagged with all the selected Category/Value.

You can always refresh the Workflow user data and available Workflows shown in the menu by using the refresh C button in the top-right corner of the panel. This will reread the Workflow data from the files so that the updated data is available. This is useful if you update the Workflow data from a PRIMER session and you want to use the revised user data in your already-open T/HIS session.

In both D3PLOT and T/HIS, you have the option to automatically open the Workflow menu when reading a model that has associated workflow data, by selecting the **Open Menu Automatically** tick box at the top-right corner of the panel.

If there is more than one model in memory and multiple models have the same Workflow associated with them, the individual Workflow buttons in the **Defined Workflows** pane will have a drop-down option to select for which models you wish to run the Workflow (see example below). You can select a single model or multiple models. The maximum and minimum number of models you can use in a Workflow is defined by the Minimum Multiple Models and Maximum Multiple Models parameters in the Workflow Definition.

The **Undefined Workflows** tab shows all the workflows that can be run in T/HIS, but don't have the required user data to run them.

Selecting one of the workflows will open the model in PRIMER and start the workflow so you can select the required data.

In T/HIS a window will open telling you to press **REFRESH** when you have saved the data in PRIMER. This will update the workflow menu, moving the workflow to the **Defined Workflows** tab so it can be run in T/HIS.

| _ | |
|-----|--|
| | REFRESH |
| | |
| | PRIMER has been started to select and save workflow data |
| Ļ | When you have saved your workflow data in PRIMER, press REFRESH to update the menu in D3PLOT with the new data. |

9. Other Options

9.1. Tool Bar

Tool Bar

File Graphs Plotting Functions Display Images Options Blank

The tool bar is located across the top of the main T/HIS window and provides easy access to all of the main T/HIS menus from a series of drop down menus. In addition to the menus the drop down menus also allow a number of items to be changed dynamically and it provides a constant feedback of the cursor position within the graph area.

Each graph window contains its own tool bar that provides a subset of the functions in the main toolbar (see <u>Graph Tool Bar</u>).

9.1.1. File

File

The File drop down menu can be used to access the following menus.

| Read | see <u>READ Options</u> for more details. | |
|------------------|--|------------|
| Write | see <u>WRITE Options</u> for more details. | File |
| Curve | see <u>Curve Manager</u> for more details. | Read 🗠 🗠 |
| Manager | | Write |
| Model Manager | see <u>Select</u> for more details. | Curves |

| | menu. | Print |
| Print | This option is only available on PC's and can be used to access the standard Windows Print | Manual |
| | menu. | Exit |
| Manual | Displays this manual. | |

9.1.2. Graphs

Graphs

The Graphs drop down menu can be used to create new graphs and to change layout options.

| Create | Create a new graph, see <u>Creating</u> | Graphs |
|-----------------|--|--------------------------|
| | <u>Graphs</u> for more details. | Create |
| Options | Modify graph layout options, see | Options |
| | Creating Graphs for more details. | Auto-hide graph tool bar |
| Auto-hide graph | This option can be used to | |
| tool bar | automatically hide the tool bar, see | |
| | <u>Graph Tool Bar</u> , at the top of each | |
| | graph window. | |

9.1.3. Plotting

Plotting

The Plotting drop down menu can be used to access the following plotting commands.

| Plot | see <u>PLOT</u> for more details. | Plotting |
|-----------|--|-----------|
| Zoom | see <u>ZOOM</u> for more details. | Plot |
| Point | see <u>POINT</u> for more details. | Zoom |
| Autoscale | see <u>AUTOSCALE</u> for more details. | Point |
| Centre | see <u>CENTRE</u> for more details. | Autoscale |
| | | Centre |

9.1.4. Functions

Functions

The Functions drop down menu can be used to access all of the curve functions.

| Automotive | see <u>AUTOMOTIVE Options</u> for more details. | Functions | |
|------------|---|------------|---|
| Operate | see <u>OPERATE Options</u> for more details. | Automotive | ⊳ |
| Maths | see MATHS Options for more details. | Operate | ⊳ |
| Matris | | Maths | ⊳ |
| Seismic | see <u>SEISMIC Options</u> for more details. | Seismic | |

9.1.5. Images

Images

The Images drop down menu can be used to save the current displayed graphs as an image in a number of formats. In addition to saving an image this menu can also be used to read in an image that is used as the background for each graph.

| BMP, JPEG | | Images |
|------------|---|------------|
| | JPEG for more details. | BMP, JPEG |
| Postscript | Generate a Postscript or PDF image, see | Postscript |
| | Postscript for more details. | Background |
| Background | This option can be used to set an image as the background for each graph, see <u>Background</u> for more details. | |

9.1.6. Display

Display

The Display drop down menu can be used to access the Title/Axis and Display menus and to dynamically modify the appearance of graphs. This menu changes all of the currently active graphs (see <u>Active Graphs</u>).

| Title/Axis | see <u>TITLE/AXES/LEGEND Options</u> for more | Display | | |
|-------------------|---|-----------------|--|--|
| | details. | Title/Axis | | |
| Legend | see <u>Legend</u> for more details. | Legend | | |
| Display | see <u>DISPLAY Options</u> for more details. | Display | | |
| Grid | Turns the grid on/off, see <u>GRID</u> for more details. | Grid | | |
| Symbols | Turns graph symbols on/off, see <u>SYMBOLS</u> | Symbols | | |
| | for more details. | ✓Lines | | |
| Lines | Turns graph lines on/off, see <u>LINE STYLES</u> for more details. | ✓ Border | | |
| Border | | Foreground 📃 🖻 | | |
| border | Turns the plot border on/off, see <u>BORDER</u> for more details. | Background 📂 | | |
| Foreground | Sets the foreground colour, see | Swap Fore/Back | | |
| | FOREGROUND for more details. | Plot Format 🛛 🖻 | | |
| Background | Sets the background colour, see <u>BACKGROUND</u> for more details. | | | |
| Swap Fore/Back | Swaps the current foreground and background colours, see <u>Swap</u> <u>Foreground/Background</u> for more details. | | | |
| Plot Format | Set the current plot format, see <u>Layout</u> for more details. | | | |

9.1.7. Options

Options

The Options drop down menu can be used to access all the following functions.

| Command File | see <u>Command / Session Files</u> for more details. |
|-----------------------|---|
| Settings | Change data sources and other settings, see <u>SETTINGS</u> for more details. |
| FAST-TCF | Generate/playback FAST-TCF scripts, see <u>FAST-TCF Options</u> for more details. |
| Convert LSDA>ASCII | Convert a LSDA binout file to ASCII, see <u>Convert Binout</u> for more details. |
| Edit Preferences | Displays the preference editor, see <u>Preferences</u> for more details. |
| Menu Attributes | Modify menu fonts, size and colours, see <u>MENU Attributes</u> for more details. |
| Auto Update | Turn on/off automatic update. |
| Show Model Prefix | Turn the model prefix on/off or set it to automatic, see <u>Curve Labels</u> for more details. |
| Prefix Format | Select the prefix format displayed for each model. See <u>Prefix Format</u> <u>Options</u> for more details. |

- Drag with Turn on/off the display of curves when dragging axis borders and curves legends. On some slow machines the time taken to update the display when a large number of curves is displayed makes the dragging response too slow. This option will automatically turn off the display of curves while the dragging operation is active.
- Shortcuts Setup keyboard shortcuts for commonly used function, see section Keyboard Shortcuts for more details.

MENU Attributes

This panel allows you to tune the visual attributes of the screen menus within T/HIS and save them if you wish.

| — Menu Attributes ? 🗖 🗌 🗙 | | | |

| MENU_AU | JTO_CONFIRM (affec | cts this session only, | setting is not saved) |

Display Factor

Lies in the range 0.5 to 2.0, default 1.0. Values < 1.0 reduce the apparent size of the screen so that menus and text become larger. Values > 1.0 act in the opposite sense. This is the simplest way of taking into account the display size.

Font Size, Quality and Scaling

| | Font size: | ☐ Tiny | ☐ Plain | Explain fonts |
|------|------------|-----------|--------------|----------------|
| | | ☐ Small | ☐ Anti-alias | Permit scaling |
| 1 | | 🗆 Default | Proof | Permit scaling |
| | | Large | | Cached fonts |
| give | | ⊔ Huge | | |
| in | | | | |

On most displays the **Default** font size will give the best appearance in

menu interface panels, but occasionally **Small** or **Large** fonts may look better. It is recommended that you set the Display Factor first in order to get the best overall layout on your display, then adjust the font size if necessary.

Font quality improvements were made for T/HIS 17.0, and on most displays **Proof** quality will look best. However on low resolution displays it may look a little fuzzy due to the anti-aliasing process, and **Anti-alias** (coarser) or **Plain** (not anti-aliased) may give a crisper result.

Font scaling (**Permit scaling**) can be useful when your choice of font is a bit too large for the buttons in the user interface, since it allows the default font size to be reduced where text would overflow the space in a button. However it can result in a mixture of font sizes in a panel, which might improve legibility but looks untidy, so it is generally better to choose a Display Factor and Font Size that work well together on your display, and turn Scaling off.

Cached fonts is an obscure setting that will only apply on Linux systems where the "core" X11 font package has not been loaded, and the software reverts to cached bitmaps. If you have font problems on Linux please contact Oasys Ltd Support for advice and help.

Font selection

Historically T/HIS only provided Helvetica, Times and Courier fonts, but from T/HIS 17.0 a wider range of fonts has been made available.

The default for the User interface is still Helvetica for menu panels (the "Menus font") and Courier

for listings (the "Listing font"), but you can use the popup menus to select from any of the fonts on your computer. The range of fonts available will depend both on the operating system and what has been installed, but typically there can be many. To try to make the choice manageable these are separated into

Proportionally spaced fonts, where character width varies. This is preferred for GUI panels with buttons.

Monospaced fonts, where each character width is the same. This is preferred for text listings.

Within each category fonts are also sorted by weight, with "normal" being the most commonly used. "Light" options tend to be narrower, permitting more characters to fit in a button, "Heavy" options tend to use bold text, and can be useful when using very large fonts - perhaps on a projector or when setting up the user interface for someone who is visually impaired.

Brightness

Lies in the range 0.0 to 1.0, default 1.0. Controls the brightness of the menu interface only (it will not affect displayed graphics).

Saturation

Lies in the range 0.0 to 1.0, default 1.0. Controls the colour saturation of the menu interface. (Again it will not affect displayed graphics.)

Left Handed

The software uses mouse buttons and keyboard 'meta settings keys (<shift> & <control>) in a handed way that is set up by default for right-handed use. It is possible to configure either or both for left-handed use.

Save Settings

Once you have adjusted the above to your taste you can save these settings in your 'oa_pref' file for future use with the **Save_Settings** button. If you do not save settings they will be lost when this session exits.

9.1.8. Quick Pick

Quick Pick

The Quick Pick menu can be used to perform many common curve operations using just the mouse. The current "Quick Pick" mode is displayed on the tool bar and can be changed using the popup menu.

The current "Quick Pick" option can be applied to a single curve by selecting the curve using the left mouse button. Multiple curves can be selected by holding down the left mouse button and dragging out an area.

| Blank 🕨 | Functions | p- |

This option can be used to blank all curves except for the selected ones. The selection can be applied to just the graph they were selected in, all the currently active graphs or all graphs.

| Only 🕨 | This Graph |
|--------|-------------------|
| | All Active Graphs |
| | All Graphs |

This option can be applied to multiple curves and it can be undone using the middle mouse button.

Delete

This option can be used to delete curves. It can be applied to multiple curves but it can not be undone.

Properties...

This option will display the current properties for a curve (see <u>Properties...</u> for more details). If multiple curves are selected this option is only applied to the one with the lowest curve ID.

History...

This option can be used to view and edit the history of operations used to create a curve (see <u>Curve Histories</u> ... for more details).

Edit...

This option can be used to select a curve for editing (see <u>EDIT Options</u> for more details). If multiple curves are selected this option is only applied to the one with the lowest curve ID.

Edit Labels...

This option can be used to edit the label, title and axis labels for a curve (see <u>Edit</u> <u>Labels...</u> for more details). If multiple curves are selected this option is only applied to the one with the lowest curve ID.

Colours...

This option can be used to change the colour of curves. This option can be applied to multiple curves and it can be undone using the middle mouse button.

Line Width...

This option can be used to change the line width of curves. This option can be applied to multiple curves and it can be undone using the middle mouse button.

Line Style...

This option can be used to change the line style of curves. This option can be applied to multiple curves and it can be undone using the middle mouse button.

Symbols...

This option can be used to change the symbol style of curves. This option can be applied to multiple curves and it can be undone using the middle mouse button.

Edit Curve in PRIMER...

This option can be used to send the load curves in the linked session of PRIMER, see <u>PRIMER</u>: Synchronising with ... for more details.

Edit Entity in PRIMER...

This option can be used to send the curve entities in the linked session of PRIMER, see <u>PRIMER</u>: <u>Synchronising with ...</u> for more details.

9.2. Graph Tool Bar

Graph Tool Bar

| G1 🕨 | Plotting | Display | Auto_Blank | AB |
|------|----------|---------|------------|----|

9.2.1. Graph Selection

Graph Selection

G1

This option can be used to make a graph active or inactive, see <u>Active Graphs</u> for more details.

9.2.2. Plotting

Plotting

Plotting

This option provides the same functions as the <u>Plotting</u> menu in the main toolbar with the exception that the settings only apply to the graph in the window instead of all of the currently active graphs.

9.2.3. Display

Display

Display

This option provided the same functions as the <u>Display</u> menu in the main toolbar with the exception that the settings only apply to the graph in the window instead of all of the currently active graphs.

9.2.4. Auto_Blank

Auto_Blank

The **Auto_Blank** function can be used to blank and unblank curves in a graph using either the TAB key or SHIFT+TAB.

By default if you now press the TAB key in a graph T/HIS will automatically blank all the curves except for those belonging to model 1. If you press TAB a 2nd time you will just see the curve belonging to model 2, a third time model 3. When you reach the end of the models you have curves for pressing the TAB key loops back to model 1. If you press SHIFT+TAB then it goes the other way (model 3 > model 2 > model 1 > model 3)

Instead of blanking curves by model the behaviour of the TAB key can be changed.

| Models | Default. Blanks curves by model ID. |
|--------------------|--|
| Components | Blanks curves by component. e.g Node X Displacement > Node Y Displacement > Node Z Displacement > |
| Entity Types | Blanks curves by entity type e.g. Whole Model > Parts > Nodes > Solids > |
| Entity ID | Blanks curves by ID. e.g Node 1 and Solid 1 > Node 2 and Solid 2 > |
| Component Types | This is similar to Component except that it lumps all the displacement curves together then velocity so you get x,y,z and magnitudes. You will also get data for different entity types. So Energy would show things like Whole Model KE and Contact Energies. |
| Surface/Int Point | Blanks curves by surface or through thickness integration point. e.g Top > Middle > Bottom > Layer 1 > |
| Curves ID's | Blanks curves by ID |

The default **Auto_Blank** mode can be modified using the preference file (see <u>Appendix</u> <u>H</u> for more details)

this*auto_blank_mode:

9.2.5. Curve Locking

Curve Locking

Lock

The **Lock** option works in a similar way to locking in PRIMER and D3PLOT. When the **Lock** button is pressed at the top of a graph, all currently blanked curves in that graph are locked from becoming visible, until they are unlocked. This allows the remaining unlocked curves to be manipulated without unblanking any of the locked curves. This includes the use of the shortcut keys 'u', 'r' and ,'b'. Locking can also be set via the Curve Table using the graph buttons (see <u>Table</u> for more details).

Once the **Lock** button is pressed, a popup is attached, providing the option to either unlock the curves in that graph or **Unfreeze All**. 'Freezing' is the equivalent of locking for visible curves, so once a curve is frozen, it will stay visible until unfrozen. This can be set using Quick Pick, the Curve Manager or the Curve Table.

9.2.6. AB

AB

This option can be used to turn and off the Auto Blank option. The default setting for this option can be modified using the preference file (see <u>Appendix H</u> for more details)

this*auto_blank:

9.3. CURVE INFORMATION

CURVE INFORMATION

Pressing the right mouse button while in the graphics window will display a popup menu listing the ID, label and the data source of the nearest curve.

When data is read from either one of the Ansys LS-DYNA output files T/HIS will store the ID and type of the entity that the data applies to. If the curve label is modified this data will remain unchanged so that the curve source can still be identified.

If a curve has been read in from another source then T/HIS will report the data source as being UNKNOWN.

If a curve is created from another curve using one of the T/HIS curve operations then the data source for the new curve will be copied from the original curve. If the operation uses more than one curve as input then the data source information will only be copied to the new curve if all of the input curves had the same data source.

Edit Points... will open the Curve Editor for the selected curve, allowing points to be added, deleted or changed individually. If the curve is an equation curve (see Equation), then there will also be an **Edit Equation...** option present, allowing the equation to be updated and overwrite the original curve.

The Colour, Line Width, Line Style and Symbol pop-up menus

9.3.1. Properties...

Properties...

This option displays a number of properties for a curve including minimum and maximum values, average and RMS value.

| Xmin | 0.0000000 | |
|---------|-----------|-----------------|
| Xmax | 0.0998993 | |
| Ymin | 0.0000000 | @ X = 0.0000000 |
| Ymax | 1217170.8 | @ X = 0.0479982 |
| RMS | 343394.38 | |
| Average | 271682.56 | |

9.3.2. Edit Labels...

Edit Labels...

This option can be used to change the title, tag, line label and axis labels for a curve.

| Line Label | Accel mag - Node 1348 | |
|------------|---------------------------------|--|
| Title | LG09 : LARGE TEST 9: BELTED SLE | |
| X-Axis | Time | |
| Y-Axis | Acceleration | |
| Тад | | |
| Apply | | |

9.3.3. Functions...

Functions...

The Functions popup menu can be used to access any of the curve operations that take a single curve as the only input. As well as applying an operation to a curve this menu can also be used to select between:

- Overwriting the input curve with the output from each function
- Writing the output to the 1st unused curve

| Automotive | Þ |
|-------------------|----|
| Operate | Þ |
| Maths | Þ |
| Seismic | Þ |
| Output : 1st Free | ₽. |

9.4. Curve Histories...

Curve Histories...

Internally T/HIS knows about all of the operations used to create a curve and the order that the operations were applied. In addition to knowing the operations used to create each curve T/HIS also knows which curves were used as inputs to operations that created other curves.

9.4.1. Viewing

Viewing

When a curve is selected and the curve history is displayed, a floating window will be displayed that shows all of the operations used to create a curve.

In the example below, 3 items were read in and then combined using the **VEC** operation.

| | Curve History | ? - _ X |
|---------------|---|----------------|
| Curve: #4:Vec | stor (y1,y2,y3) | |
| Update Curve | Update Curve + Dependants List Dependants | Reset Curve |
| Read | | |
| Read | | |
| Read | T | |

More information on each part of the curve history can be obtained by moving the mouse across each operation.

If a curve operation has one or more inputs that are not curves then the hover text will display all of the inputs along with their values.

9.4.2. Modifying

Modifying

As well as viewing the operations used to create a curve the operations can also be modified by right clicking on them.

operation, the entity ID can be changed to any other ID of the same entity type. T/HIS will automatically check if results are available for the new ID and display a warning if they are not.

| Read | v | | | |
|-------------|---------|---|----------|----------|
| Read : | THF | | Disp x | RVel y |
| Type : | Node | | Disp y | RVel z |
| ID : | 1343 | | Disp z | RVel mag |
| Component : | Accel z | ⊳ | Disp mag | RAcc x |
| | | | Vel x | RAcc y |
| | | | Vel y | RAcc z |
| | | | 0-1- | |

As well as changing the entity ID the data component can also be modified by selecting a different component in the popup menu.

If a curve operation has one or more inputs that are not curves then right clicking on the operation will display a popup menu that will allow all of the values to be modified.

As well as changing the inputs to existing curve operations it is also possible to change a curve operation to any other curve operation that has the same number of input curves. 1

Right clicking on the popup symbol next to the name of the current curve operation will display a menu containing a list of all of the curve operations that are available which have the same number of input curves.

If for example the current curve operation is **CLIP**

| Function : CLIP 🖻 | INT | EXP | BUTP |
|-------------------------------|---------|----------|------------|
| X Minimum -1e+020 | DIF | ** N | UNITS |
| X Maximum <mark>1e+020</mark> | SMO | LOG10 | JavaScript |

| | LOG | VC2 | |

9.4.3. Inserting New Operations

Inserting New Operations

New operations can be inserted into the chain of curve operations by right-clicking on one of the + symbols between the existing operations.

The popup menu that is displayed will contain all of the curve operations that take a single curve as input and produce a single output curve.

| Read | | | |
|----------|-----------------|-----------|------------|
| + 7 | ADD (y) | SQR | BUT |
| _ | ADD (x) | SIN | FIR |
| Read v + | SUB (y) | cos | 3ms CLIP |

| | ORDER | RS | - |
| | ORDER WINDOW | RS C60 | |

9.4.4. Update Curve

Update Curve

Update Curve

If any of the operations used to create a curve are modified or if a new operation is inserted then this option can be used to automatically update the curve. T/HIS will automatically rebuild the curve using the updated set of curve operations and will replace the old curve with the new one.

9.4.5. Update Curve Dependants

Update Curve + Dependants

Update Curve + Dependants

This option will update the selected curve and any dependant curves. As T/HIS stores all of the operations used to create every curve, it knows if a curve has been used as an input to any other curves.

The selected curve will be automatically rebuilt and replaced with the new curve, and then any curves that use the selected curve as an input will also be rebuilt and replaced.

9.4.6. List Dependants

List Dependants

List Dependants

This option will display a list containing any curves that have been created which use the currently selected curve as an input somewhere in their chain of curve operations.

9.4.7. Reset Curve

Reset Curve

Reset Curve

This option can be used to reset all of the curve operations used to create a curve if any of them have been modified.

9.5. Keyboard Shortcuts

Keyboard Shortcuts

Some panels and actions can be accessed through pre-programmed shortcuts and from T/HIS 9.4 onwards the keys they are assigned to are customisable.

From T/HIS 9.4 onwards a number of new pre-programmed shortcuts have been added, including the top menu panels and window layout options. In addition to these pre-programmed shortcuts Macros and FAST-TCF scripts can also be assigned to a key.

A listing of the available shortcuts and the keys they are assigned to can be brought up by pressing the '?' key (by default) or accessing it through the Options top menu.

This will bring up a panel, from which you may assign the shortcuts, Macros and FAST-TCF scripts to the keys. Note that upper and lower case letters can be assigned different shortcuts.

A list of all the available pre-programmed shortcuts is given at the end of this section with their default key(s) if assigned.

| _ | | | | | | | |

9.6. Preferences

Preferences

The Preference menu provides an interactive editor for setting options for T/HIS in the oa_pref preference file (see <u>Appendix H</u> for more details on the oa_pref file/options).

The preferences editor reads an XML file that contains all possible preferences and their valid options, and allows you to change them at will. In this example the user is changing the background colour in T/HIS.

Note that changes made in the Preferences editor will not affect the current session of T/HIS, they will only take effect the next time it is run.

Preferences for T/HIS ? **-**_X File Edit Dismiss Help All programs Name: this*add_ascii_zero ₫-D3PLOT Type: <logical> +PRIMER Default: FALSE Automatically add point Description: H-SHELL Active: 🖌 🔒 ḋ-T/HIS Value: FALSE _add_ascii_ $\overline{\chi}$ -auto_regul -auto_upda -checkpoint -convert_ti -file_names legend_col line_width -datum_file -macro_dir Preferences

-

.

9.6.1. Save Preferences Popup

Save Preferences Popup

The Save Preferences menu allows a means to quickly save graph properties straight to the oa_pref file.

The popup works by reading the graph (defaults to Graph 1) properties to take preferences from. When a save button is pressed (**Title**, **X Axis**, **Y Axis**, etc..), the menu will look for changes to the relevant preferences and print those preferences to the oa_pref file.

For example, by pressing on **Display** will save (most of) the options setup in the Display menu from the specified graph into your oa_pref file.

9.7. PRIMER: Synchronising with PRIMER

PRIMER: Synchronising with PRIMER

| Page Number : | H4 H 1 | |
|---------------|--------|-------------|
| - Tools | | R PR PRIMER |
| Read Write | Curves | Models |

T/HIS can be synchronised with PRIMER using a shared memory link. This means that a post-processing model that is open in T/HIS can have its corresponding keyword file open in PRIMER, and information can be exchanged between the two programs.

By default, no link takes place, but it can be opened in any of the following ways:

- A running T/HIS session starts a new PRIMER session using the stipulated model.
- A running PRIMER session starts a new T/HIS session using the stipulated model. and
- Once a link is established, in either of the modes above, further models can be opened and linked at will.

The link is symmetrical and bi-directional, with no concept of parent or child, and it can be closed at any time leaving both programs running autonomously. What you **can't** do at present is to link an autonomous, already running, T/HIS or PRIMER session with another autonomous session.

9.7.1. The PRE panel

The PRE panel

When running linked with PRIMER the Pre panel (invoked by pressing the PRIMER button) shows the current status of the link. In this example we have four models open in T/HIS, and in this example:

- Models 1 and 2 are currently open in PRIMER
- Model 3 is not open in PRIMER, but a keyword file has been found automatically.
- Model 4 is also not open in PRIMER, and T/HIS has not found a keyword file automatically.

| Option | Status of model | Action performed |
|---------------|--------------------|--|
| Add to PRIMER | | T/HIS has found a keyword file automatically, add this model to PRIMER |
| Find KVV file | INOT linked | T/HIS cannot find a keyword file, browse for a filename manually |
| Disconnect | Linked | Model is linked with PRIMER session, disconnect it |

The file open/close options are

There is a corresponding Post panel in PRIMER, with the same layout and functionality.

Effects of linking and unlinking models

In all cases:

- Linking or disconnecting a model does not affect that model's status in either programme, both T/HIS and PRIMER will continue to run normally.
- Models may be disconnected and reconnected at will.
- When a model is deleted in T/HIS it is implicitly disconnected in PRIMER, but will not be deleted from PRIMER. Similarly, if a model is deleted in PRIMER is will be disconnected from T/HIS, but not deleted.
- The link logic attempts to keep model numbers the same in both PRIMER and T/HIS, however it is possible to defeat this by opening additional models in one programme but not the other. Doing so may cause the link to fail in some respects (so it is not recommended!).

The PRE panel can be opened or closed at will without affecting the status of linked models, it simply provides feedback about the current status and attributes of linked models.

| | Pre-Processor | ? X |
|------|---------------------------------|---------------|
| 4 mc | idel(s), 3 with keyword files f | ound, 2 open |
| M1 | Keyword file available | Disconnect |
| M2 | Keyword file available | Disconnect |
| MЗ | Keyword file available | Add to PRIMER |
| M4 | Keyword file not found | Find KW file |

9.7.2. Locating keyword deck in T/HIS

Locating keyword deck in T/HIS

T/HIS can automatically locate an associated Ansys LS-DYNA keyword file to load in a linked PRIMER session. Model name is written to the ztf file and if this model exists then it is auto-loaded in PRIMER. If the .ztf file is missing, the approach depends on filename convention:

If you use the Ansys / LST results filename convention (d3thdt, xtfile):

• T/HIS looks to see if there is a single Ansys LS-DYNA keyword file (.key/.k/.kby or a .gz/.zip variant thereof) in the working directory and auto-loads it in PRIMER.

If you use the ARUP results filename convention (.thf, .xtf):

- T/HIS looks to see if a [job].thf has been loaded. If yes, T/HIS looks for a matching [job].key/.k/.kby or a .gz/.zip variant thereof.
- If a [job].thf is not found, T/HIS tries a similar logic with a potential [job].xtf file.
- Failing all of that, T/HIS looks to see if there is a single Ansys LS-DYNA keyword file in the working directory.
- The final fall-back, as always, is for you to manually select an input deck to load in PRIMER.

9.7.3. Highlight output database cards in PRIMER

Highlight output database cards in PRIMER

Most of the entity buttons in the Read Data panel have a dropdown option. If you click on an entity with right mouse button , an **Edit in PRIMER** option will be displayed. This option will open PRIMER (if it is not linked already) and will highlight the database cards required for this specific entity. You can turn on the required database cards with relevant values and use them in your next Ansys LS-DYNA run to get results related to that specific entity in T/HIS. PRIMER will always highlight the database cards for entities in the same order as they are clicked in T/HIS. For more reference, see the images mentioned below.

9.7.4. Synchronising Operations

Synchronising Operations

Load curves and data can be exchanged across the link using the following methods. Like other <u>Quick Pick</u> commands this may be set as the current operations, or selected from a menu of choices (as shown here) in response to a right-click.

| Edit | |
|-----------------------|------|
| Edit Labels | • |
| Colour | Þ |
| Line Width | • |
| Line Style | - Þ- |
| Symbol | Þ |
| Edit Curve in PRIMER | PR |
| Edit Entity in PRIMER | PR |
| Dismiss | |

Edit Load Curve in PRIMER

Select one or more curve to send to PRIMER. The DEFINE_CURVE Edit panel is launched in the linked PRIMER session.

Edit Curve Entity in PRIMER

Select one or more curves to call up the corresponding Edit panel in PRIMER, so if for example you clicked on a curve that was an acceleration for a node you would get the NODE Editor in PRIMER or if you clicked on a contact force curve you would get the CONTACT Editor in PRIMER.

T/HIS 17.0 onwards can be linked to REPORTER with a shared memory link, allowing reports to be interactively created and edited. For more information on this, see <u>REPORTER Integration</u>.

10. FAST-TCF

10.1. FAST-TCF Overview

FAST-TCF OVERVIEW

FAST-TCF is a scripting language for T/HIS. It is designed to be editable and backwardcompatible with previous versions of T/HIS. From T/HIS 9.2, FAST-TCF scripts can be recorded and played back. The FAST-TCF scripts are plain text files, and are therefore easy to edit and manipulate.

10.1.1. New Features

NEW FEATURES

New Features for FAST-TCF version 11.0

Version 11 of T/HIS contains the following new FAST-TCF commands

- Support for DISBOUT data component
- Support for PLLYOUT data components
- <u>"style_m" command for setting curve styles by model</u>

New Features for FAST-TCF version 10.0

Version 10 of T/HIS contains the following new FAST-TCF commands

- Support for TRHIST data components
- <u>Support for CPM_SENSOR data components</u>
- <u>New wildcard options for specifying curve tags</u>
- <u>Ouputting a range of curves to curve file</u>

New Features for FAST-TCF version 9.4

Version 9.4 of T/HIS contains the following new FAST-TCF commands

- Support for DBFSI data components
- Support for TPRINT data components
- <u>New "plot setup" commands</u>
- <u>New curve style options</u>

New Features for FAST-TCF version 9.3

Because of the multiple graphs and pages available in T/HIS 9.3 additional commands have been added to FAST-TCF 93 to define and position graphs and to generate multiple images containing one or more graphs. Because of these new commands version 9.3 FAST-TCF scripts generated by T/HIS can not be used in previous releases.

- <u>New commands have been added for generating and positioning multiple</u> graphs and pages.
- New commands for generating images containing multiple graphs and pages.
- <u>New variables have been added for accessing the output values of the ERR</u> <u>command.</u>
- <u>New built in variables "\$run_nameN", "\$run_titleN" and "\$run_dirN" for multiple</u> models.
- <u>New built in variable"\$FTCF_PATH</u>

New Features for FAST-TCF version 9.2

FAST-TCF has been extensively revised to include almost all of the T/HIS commands. The improved functionality does mean that old scripts may have to be changed to meet the new standards.

NOTE: FAST-TCF is not 100% compatible with pre-version 9.1 input scripts:

- Variables have changed to allow more flexibility, but the old rule for filenames (word1 + word2) has now been discontinued, filenames must all be one word
- <u>Rigidwall command must now have "n" for the xtf file output (rather than</u> <u>nothing at all)</u>
- Shell and Solid effective strain must have the fourth word "eff" to distinguish them from other types of strain that have been added
- No FAST-TCF defaults for plot setup defaults are now the T/HIS standard ones

New features since version 9.1:

- <u>Reading of keyword, csv, csv2, and bulk data files, keyboard entry</u>
- <u>Operation commands "order", "cat", "r_ave", "stress", "logx", "logx10", "translate",</u> <u>"vector2D", "window"</u>
- Variables are processed on a line by line basis
- <u>Variables can be defined using curve properties for example a variable could be</u> <u>set to equal max of a curve, and then used to divide another curve</u>
- Continuation lines added defined using a "\" at the very end of a line
- <u>Tabulation commands "yatmax" and "yatmin" added for Y values at maximum</u> <u>and minimum X</u>
- <u>All extraction commands are supported: Boundary, Geo contacts, FSI, Joints, SPH,</u> <u>Thick shells and so on</u>
- All the missing components for previous data types are now supported
- Multiple data extraction on one line e.g. "node 100:last acc X"
- Multiple generic tagging and labeling of output curves using wildcard "*"
- Multiple curves can be operated upon in one line e.g. "oper ADD acc_* 10.0"
- Multiple curves can be plotted using wildcards "*" in tag names
- Integration point output can be changed
- <u>Multiple models supported</u>
- Extended plotting syntax for setting up plot defaults (grid colours, offsets, fonts and so on)
- <u>"Tabc" command for writing out tabulation data to a csv file</u>
- "plot" and "auto" commands added for use in interactive playback mode
- macro support for running FAST-TCF files on specific curves

10.2. FAST-TCF Introduction

10.2.1. General Rules

General Rules

- 1. **Each line** in the input file defines **one** data extraction or plot request
- 2. Long lines can be split into shorter ones using a continuation character "\" at the end of each line
- 3. Space characters are used to divide the line into 'words'
- 4. The input script is NOT case-sensitive.
- 5. Unless detailed elsewhere in this manual, the first few (usually three) characters of the first word on the line discriminate the request of a particular entity, and the syntax which applies to reading in the remaining words on the line
- 6. If the first word on the line is not recognised, the program ignores it it is treated as a comment
- 7. The last words on the data extraction request lines allow <u>options</u> for filtering, Yaxis scaling, HIC, average and a short reference tag (The tags may be used for operation and plotting requests)
- 8. The last words on the plotting request line allow <u>options</u> for title, line style and axis changes
- 9. A successful data extraction always has a curve outputted, if there is no output (e.g. HIC, ERR) then a duplicate curve is outputted. This helps with tagging output curves

10.2.2. Running FAST-TCF

Running FAST-TCF

Automatic running

FAST-TCF is integrated into the T/HIS executable and can be accessed from the command line or SHELL.

Command line syntax:

```
<this executable> -tcf=<FAST-TCF input file> -start_in=<start
directory> -exit-batch <thf file name>
```

```
e.g. this93.exe -tcf=side_impact.tcf -start_in=e:\side_impact\run1 -
exit run1.thf
```

The <thf file file>, -start_in, -exit and -batch syntax are all optional.

NOTES:

- If no THF file is specified then T/HIS will search the directory for the latest one (*.thf).
- If no THF file exists, then T/HIS will look for a d3thdt file (xtf file = xtfile).
- If this does not exist then no thf or xtf input filename is passed to FAST-TCF, and the input file is defaulted to ASCII
- The program runs in any directory you like (via the <code>-start_in</code> command line option). The FAST-TCF output files are created in that directory, and files written out are relative to that directory.

Instead of opening a single model multiple models can be read using the command line option

```
<this executable> -tcf=<FAST-TCF input file> -start_in=<start
directory> -exit-batch -model_list=<file name>
```

The -model_list expects a text file with a list of filenames (1 per line) to read into model slots within T/HIS.

- e.g e:\side_imnpact\run1\run1.thf
 - e:\side_imnpact\run2\run2.thf
 - e:\side_imnpact\run3\run3.thf
 - e:\side imnpact\run4\run4.thf

SHELL operation:

In SHELL, click the **Options...** button below the T/HIS icon. Select the input data file, FAST-TCF input script and any other required options as necessary. Press **Run** at the bottom of the panel to launch T/HIS and automatically run the FAST-TCF script.

Interactive running

In the Tools menu within T/HIS, select the FAST-TCF option, then click on the **Run** tab in the sub-menu that appears. This brings up the following menu:

The user can select the script file then with play the whole file through, or step through each command one by one.

The FAST-TCF line appears in the top dialogue box, and the translated T/HIS line appears in the bottom box. The line about to be sent to T/HIS appears in red text.

To end the script prematurely, hit the **End** button.

10.2.3. Input Files Needed, and Output and Intermediate Files Created

Input Files Needed, and Output and Intermediate Files Created

- 1. *input_script* is **required** at the start.
- 2. *input_script* .output is a file that contains the concatenated output from FAST-TCF.
- 3. *input_script* .tmp is a temporary file that FAST-TCF creates for translation. This is merged after completion into *input_script* .output so if you see this file then FAST-TCF didn't finish cleanly.
- 4. *input_script* .rep is a temporary report file of the FAST-TCF run. This is merged after completion into *input_script* .output so if you see this file then FAST-TCF didn't finish cleanly.
- 5. *input_script* .tcf are the commands passed to T/HIS from FAST-TCF. This is merged after completion into *input_script* .output so if you see this file then FAST-TCF didn't finish cleanly. The command lines contain special characters such as \r, \m and \l. These are used internally in T/HIS and should be ignored by the user.
- 6. *input_script* .sngval contains summaries of every curve outputted.

Other files will be made, such as postscript or bitmap plots, but these will have names specified by the user.

10.2.4. Debugging FAST-TCF Files

Debugging FAST-TCF files

Complicated FAST-TCF files will inevitably go wrong. There are a number of things the user can do to help identify where it is going wrong. Assuming the command line syntax is correct and the correct files are in the run directory, these typical procedures are as follows:

Identifying errors using the interactive playback option in T/HIS:

- Read the model(s) into T/HIS.
- Read the FAST-TCF script into T/HIS under the "FAST-TCF > Run" sub menu.
- Step through the FAST-TCF script manually, keeping an eye on how FAST-TCF is translating the lines, and the output T/HIS is producing.

Identifying if FAST-TCF has found an error:

- If FAST-TCF finds an error, then it is stored and T/HIS then resets the command line and continues to translate the input file. If 10 errors are found then T/HIS will stop at this line. You can set this error amount internally within FAST-TCF.
- Once T/HIS has stopped, the errors are summarised in the command line box and the terminal that T/HIS was run from. The number of warnings found is also printed.
- It should be obvious what is wrong, FAST-TCF checks numerous things, including:
 - Whether T/HIS created the curve from the previous line.
 - That the syntax is correct for all the data input lines (the data extraction requests have additional checking to check the combinations of words inputted is right).
 - If the syntax is correct, whether it applies to the file being requested for output.
 - The output file exists in the directory for the data extraction.
- Correct the input line error utilising the reference tables in this document if applicable.

Identifying what errors T/HIS is giving:

- Identify how many curves were outputted into T/HIS before things went wrong (run T/HIS in graphical mode).
- Place an exit keyword **after the next** input line. This should stop T/HIS just after the line which is causing the file to fail.
- Check what errors T/HIS is giving out. If it's not obvious what went wrong then try another procedure.

Identifying if there are warnings or errors from FAST-TCF:

- The errors are summarised once T/HIS has finished. They are printed in the command line box and the terminal which T/HIS was run from.
- There will be a *input_file* .rep or *input_file* .output file in the directory which contains any warnings or errors that FAST-TCF has detected. Make sure nothing is obviously wrong with the input file using this report file.
- The *input_file*. tmp or *input_file* .output file contains the actual file inputted into FAST-TCF after includes have been found and special characters removed. Check this is correct and all the include files have been accounted for.

Identifying if FAST-TCF is processing the line correctly:

- It's possible that FAST-TCF has processed the line incorrectly. If so, open the *input_file* .tcf or *input_file* .output file to investigate what FAST-TCF is asking T/HIS to do.
- Identify which line is going wrong using the above procedure, and then find this section in the .tcf file. Input the entire tcf request for the line into the T/HIS command box to step through what is being asked from T/HIS. This may highlight where things are going wrong. The command lines contain special characters such as \r, \m and \l. These are used internally in T/HIS and should be ignored by the user.

Using PRIMER to check a FAST-TCF file:

- PRIMER has a FAST-TCF Check menu under the main Check menu. This can be used to check the FAST-TCF file data requests against a certain keyword deck.
- Read the deck into PRIMER, and select Model > Check > FAST-TCF. Select the FAST-TCF file and press Apply. Details can be found in <u>the PRIMER manual</u>.
- PRIMER will highlight any errors that have occurred with the input file with regards to the keyword deck.
- The main PRIMER checks are if the line syntax is valid, whether the correct file is being outputted, whether the relevant DATABASE_HISTORY is present and whether the id. actually exists.
- Any errors will have to be corrected manually in PRIMER.

NOTE: If FAST-TCF has completed, then it may be necessary to open the *input_file* .output file which has the all the output files concatenated together in different sections.

10.2.5. Creating FAST-TCF Files

Creating FAST-TCF files

The most obvious option is to generate a FAST-TCF script using a text editor such as vim or wordpad. However, an easier option is to use T/HIS as normal, then generate a FAST-TCF script to recreate the curves currently displayed on the screen from within T/HIS.

It involves a single button click to produce a FAST-TCF script that can recreate the plot on the screen.

T/HIS internally stores the history behind each curve; noting which curves, operations and data requests were used to create each curve. This means that the user **does not** have to start recording a command file, and carefully record a script. Instead the user can work for as long as they like as normal, then choose to generate a FAST-TCF script to recreate the plot on the screen by using the FAST-TCF Create menu.

By default the FAST-TCF script that is generated will contain commands to reproduce all of the graphs that are currently defined in T/HIS. Instead of reproducing all of the graphs the FAST-TCF script can also contain the commands to

generate a subset of pages or graphs.

FAST-TCF Script : Image Output

This option can be used to add the commands to the FAST-TCF script to generate an image of each graph/page that is selected for output. In addition to selecting the image format a filename can also be specified that is used in the FAST-TCF script as the output filename for images.

FAST-TCF Script : Curve Output

This option can be used to add commands to the FAST-TCF script to write curves out to a T/HIS curve file. By default this option will add commands to the FAST-TCF script write any curves that are unblanked in a graph to a curve file. Instead of writing all of the unblanked curves out to a file the **Select Curves** option can be used to select a subset of curves.

FAST-TCF Script : Curve Group Output

This option can be used to select additional curves for output to the FAST-TCF script by curve group. If a curve is selected that is also unblanked in one of the graphs the command to regenerate it are only added to the FAST-TCF script once. This option will also add the commands to regenerate the selected curve groups to the FAST-TCF script.

10.3. Page/Graph Layout and Selection

PAGE / GRAPH LAYOUT AND SELECTION

FAST-TCF scripts can contain commands to create and position multiple graphs. T/HIS Pages can also be created and graphs moved between pages. By default T/HIS will automatically create a single graph on the 1st 'Page' when it starts. If a single graph is required then the script does not need to contain any of the commands in this section. If additional graphs are required then by default they will be created on the 1st Page unless multiple pages have been selected.

| Keywor d | 2nd word | 3rd word | 4th word | 5th word | 6th word | 7th wor d | 8th wor d | 9th word | notes |

|---------|----|-----------|---|---|---|---|---|
| n / all | y2 | precision | m | - | - | - | Set the number of decimal places displayed for the second y axis values to (m) in graph (n) or all graphs |

10.4. Input Syntax to Load Other Files

INPUT SYNTAX TO LOAD OTHER FILES

FAST-TCF has the option of reading in curve files and other FAST-TCF files nested within the input file. T/HIS now writes out and reads in curve styles and internal tags. FAST-TCF recognizes these tags if the user wishes to refer to them later on in the input file. If they are relative then the include files must be relative to where T/HIS is running from.

Filenames can contain spaces, but if they do then they **must** be enclosed in quotes

| Description | keyword | second word | third word onwards | notes |
|---------------------|----------|-------------------|--|--|
| Bulk data | readb | bulk data file | - | curves will be read in at this point in the file, and will be numbered accordingly |
| CSV 1 (X,Y,X,Y) | readcsv | | Ir <row number<br="">containing line labels> ar <row number<br="">containing axis labels></row></row> | Subsequent words can be any of these 2 options. If no options then assumes reading x from column 1 and no labels. |
| CSV 2 (X,Y,Y,Y) | readcsv2 | csv file | xg <x start="" value=""> <x interval> xc <x column<br="" values="">number> Ir <row number<br="">containing line labels> ar <row number<br="">containing axis labels></row></row></x></x </x> | Subsequent words can be any of the 3rd word options. O nly one of the options XG and XC can be used. If no options then assumes reading x from column 1 and no labels. |
| T/HIS Curve file | rea | curve name | - | curves will be read in at this point in the file, and will be numbered accordingly curve tags and styles are stored automatically through the \$TAG and \$STYLE lines NOTE: If the tag in the curve file conflicts with an existing tag, the tag is NOT read in |

e.g. read "c:\my documents\filename.cur".

| Keyword | readk | keyword filename | - | | e read in at this file, and will be ccordingly |
|----------------------------|-------------|------------------------|---|---|---|
| FAST-TCF Include | inc | include filename | - | FAST-TCF will search for includes within includes etc FAST-TCF pastes the include files into the final input file as soon as they are detected | |
| LS-PrePost Curve file | readlspost | filename | - | Reads in cur PREPOST cu | ves from an LS- rve file |
| LS-PrePost XY data file | readlsp_xy | filename | - | Reads in cur PREPOST XY | ves from an LS- data file |
| DIAdem | read_diadem | tile | <channel number="" to<br="">read> OR "<channel name to read>" (must use quotes)</channel </channel> | either of the xg <x start<br="">value> <x< th=""><th>words can be se 2 options Only one of these 2 options can be used</th></x<></x> | words can be se 2 options Only one of these 2 options can be used |
| JavaScript | | JavaScript filename | - | following co FAST-TCF scr JavaScript sh curves tags f | ed by the re referenced by mmand in the ript then the rould generate for the curves then be used in |

Keyboard entry can also be added into the FAST-TCF file, allowing for simple curves to be created in T/HIS. The keyword for this is **keyboard**. The order of the following words is important, and must be adhered to (see below). The continuation line character is useful here "\".

| IKevword | following word | following word | notes |
|----------|-------------------|-------------------|----------------------------|
| | xaxis | x axis name | specifies the x axis label |
| Keyboard | yaxis | y axis name | specifies the y axis label |
| | label | curve label | specifies the curve label |

| data xval,y data xval2, xval3, etc | yval2 no space between the x and y values, only a |
|---|---|
|---|---|

for example, to create an acceleration curve with a straight line at value 1.0:

keyboard title straight line \ xaxis time \ yaxis accn \ label straight line at 1.0 \ data 0.000000,1.000000 \ 1.000000,1.000000

10.5. Input for Data Extraction Requests

INPUT FOR DATA EXTRACTION REQUESTS

Each data extraction request occupies one line, with the 'words' on the line separated by space characters.

The line starts with a keyword and the required arguments follow, then any optional requests can occur after the arguments (see later on in the manual).

ID can be a number **or a name** (enclosed in quotes ""), depending on whether the Ansys LS-DYNA version supports it in the relevant output file.

When writing out FAST-TCF scripts from T/HIS, there is an option in the 'Create' panel to write entity names (when they exist) in place of numeric IDs into any generated script.

Multiple data requests

T/HIS 9.2 onwards supports multiple data output syntax. T/HIS will read the data in one file pass, making it much quicker for larger runs. To use this in FAST-TCF you need to specify the range using a colon (:) and it must be in a single word. As well as the standard numbers you can use, there are some special words namely "all", "first" and "last" (see example).

| e.g. | whole_model | te | lsda | |
|------|----------------------|----------------------|------------------|---------|
| | (whole model) | (total energy) | (force lsda file |) |
| | node | 42 | force | y_dir |
| | (node extraction) | (i.d. 42) | (force in y-dire | ection) |
| | node | "end of roof" | accel | z |
| | (node extraction) | (i.d. "end of roof") | (z acceleration | 1) |
| | node | 100:last | force | y_dir |
| | (node extraction) | all nodes from 100 | (force in y-dire | ection) |
| | node | all | force | y_dir |
| | (node extraction) | all nodes | (force in y-dire | ection) |

Potential Speedup for data extraction

In some situations, it may be possible to speedup the data extraction routines for FAST-TCF. A simple but effective change can be made to the FAST-TCF script such that it improves the efficiency of data extraction by an order of N items.

An example can be seen below trying to extract various nodes, tag them and then label it.

node 6600000 b y tag by6600000 label by6600000
node 6600001 b y tag by6600001 label by6600001
node 6600002 b y tag by6600002 label by6600002
node 6600003 b y tag by6600003 label by6600003
node 6600004 b y tag by6600004 label by6600004

While these are perfectly valid FAST-TCF lines and will parse correctly, these can be rewritten into:

node 6600000 b y tag by6600000 node 6600001 b y tag by6600001 node 6600002 b y tag by6600002 node 6600003 b y tag by6600003 node 6600004 b y tag by6600004 label by6600000 by6600000 label by6600002 by6600002 label by6600003 by6600003 label by6600004 by6600004

Externally, to a real person, these lines can be seen as equivalent to the first example. However, internally, it's another matter. In the first example, T/HIS would instead have to process the first line, come out of the reading loop and then back into it again to parse the second line and so on until completion. The change effectively allows T/HIS to bundle all of the "node" commands together, allowing them to be read in a singular, much more efficient pass and then apply the labels after this data extraction has been completed.

In this example, "label" is the additional option that has been given to the read line, however this would be the case for any other additional option. Unfortunately it's important to note that this means that the speedup will only work if the read line does not contain any additional options on it and the read commands are placed together like in the example. Any additional options that you may have must be separated from the read commands like the example above to work.

The speedup gained is directly linked with the number of items that are being read in so while you would see some gain for a small number of items, the speedup is much more noticeable when handling a large number of items.

10.5.1. Selecting Models

Selecting Models

If T/HIS contains more than one model the data extraction commands will attempt to read data from all the model that are currently selected. To specify which model to read data from the following commands can be used

| Keyword | second word | notes |
|---------|-------------|---|
| | n | Select model "n" for reading data from |
| model | all | Select all models for reading data from |
| | none | Unselect all models |

10.5.2. Data Extraction Options

Data Extraction options

Specifying Files for data extraction

For some Ansys LS-DYNA data types results can be extracted from multiple files. By default FAST-TCF scripts will extract data from the default T/HIS file type for each entity type (see <u>Data Sources</u>). These defaults can be changed via the <u>preference file</u>.

Instead of using the default file any of the valid files types can be specified by using either the <u>define file</u> keyword (e.g. define file LSDA) or by adding an <u>extra line option</u>. When this occurs, FAST-TCF will take the extraction request from the specified type of file - **but only if T/HIS allows it.**

| Keyword | second word | third word | notes | | |
|---------|-----------------------------------|--|---|--|--|
| | | lsda will alwa | | | |
| | file xtf chosen (see data extract | will always check that T/HIS can get the output from | | | |
| define | | | this file, if not then the original default file will be chosen (see data extraction table). This file can still | | |
| | | tht | be overwritten on the actual input line | | |
| | | default | be overwritten on the actual input line | | |

e.g. node 42 displacement x

(read data from default file)
define file LSDA
node 42 displacement x
(read data from LSDA file)
node 42 displacement x ASCII
(read data from ASCII file)

Specifying components for Steady State Dynamics (SSD) analysis

For a SSD analysis Ansys LS-DYNA generates 2 data values, an amplitude and an angle, for each component in the NODOUT and ELOUT parts of the LSDA (binout) file. By default FAST-TCF will extract the amplitude for each data component but this can be changed if required to extract the angle value.

| Keyword | second word | third word | notes |
|---------|----------------|------------|---|
| define | ssd_comp | amplitude | selects the amplitude value for all following data requests |
| | | langle | selects the angle value for all following data requests |

e.g. define ssd_comp angle

(read angle value for all SSD analysis data components)
define ssd_comp amplitude
(read amplitude value for all SSD analysis data components)

10.5.3. Defining Groups of Parts

Defining Groups of Parts

| Description | keyword | | following words |
|-----------------------|---------|----------|--------------------|
| Group definition | gdef | group id | part ids |
| Add parts to group | gadd | group id | part ids |

- 1. The line starts with 'gdef' or 'gadd' and is followed by an integer for the group i.d, and then part i.d. numbers separated by spaces, or for a range of parts separated by a ':'.
- 2. No options should be applied to this card, because all the words on the line are written out as integers.
- 3. The input is on one line (which may result in a long line ...). If the line is too long (currently ~1000 characters) T/HIS will truncate the command and issue an error message. The 'gadd' command is useful if the 'gdef' command is too long to create a group on a single line.

| e.g. | gdef 1 | 1 2 3 4 | 10:20 30:40 | |
|------|--------------------------|---------------------|-------------------------------|--|
| | (group define i.d. 1) | (parts 1 2 3 and 4) | (parts 10 to 20 and 30 to 40) | |
| | gadd 1 | 5 6 7 8 | 50:60 | |
| | (group add i.d. | (parts 5 6 7 and 8) | (parts 50 to 60) | |

10.5.4. Specifying Surfaces, Integration Points and Nodal Locations for Data Extraction

Specifying Surfaces, Integration Points and Nodal Locations for data extraction

Specifying Surfaces and Integration Points

From T/HIS 12.0 onwards, the syntax for specifying which surface or integration point to read data from for Shells, Thick Shells and Beams has changed. These options are now appended to data extraction as follows.

Shells and Thick Shells

| extra word #1 | extra word #2 | notes |
|------------------|---------------|---|
| | top | |
| surface | middle | If no surface option is specified then the default (middle) |
| Surface | bottom | surface will be used. |
| | n | |

e.g. shell 99 stress xx tag curve_1

(read x stress for shell 99 middle surface)
shell 99 stress xx surface top tag curve_1
(read x stress for shell 99 top surface)
shell 99 stress xx surface 3 tag curve_1
(read x stress for shell 99 layer 3)

Beams

| extra word #1 | extra word #2 | notes |
|------------------|---------------|--|
| ipoint | n | Specifies the beam integration point to read data from |

e.g. beam 99 stress x ipoint 1 tag curve_1

(read axial stress for beam 99 integration point 1)

Specifying in-plane integration points for Shells and Thick Shells

In recent versions of Ansys LS-DYNA it is possible to write out data at multiple in-plane integration points for fully integrated Shells and Thick Shells for each through thickness layer.

For fully integrated solid elements data can also be written out for all 8 integration points.

By default T/HIS will automatically read the average value for each element. If the element isn't fully integrated then the data for the 1st point will be used, if it is fully integrated and has multiple integration points then the average value will be calculated.

| extra word #1 | extra word #2 | notes |
|------------------|---------------|---|
| ipoint | n | Specifies the in-plane integration point to read data from. If this option isn't specified then the surface centre value will be selected. If the element is fully integrated then the average value will be calculated from all 4 in-plane values |

e.g. shell 99 stress xx tag curve_1

(read x stress for shell 99 middle surface, centre value)
shell 99 stress xx ipoint 1 tag curve_1
(read x stress for shell 99 middle surface in-plane integration point 1)
shell 99 stress xx surface middle ipoint 1 tag curve_1
(read x stress for shell 99 middle surface in-plane integration point 1)
shell 99 stress xx surface 5 ipoint 2 tag curve_1
(read x stress for shell 99 layer 5 in-plane integration point 2)

Specifying integration points for Solids

In recent versions of Ansys LS-DYNA it is possible to write out data at all 8 integration points or fully integrated solid elements.

By default T/HIS will automatically read the average value for each element. If the element isn't fully integrated then the data for the 1st point will be used, if it is fully integrated and has multiple integration points then the average value will be calculated.

| extra word #1 | extra word #2 | notes |
|------------------|---------------|---|
| ipoint | n | Specifies the solid integration point to read data from. If this option isn't specified then the centre value will be selected. If the element is fully integrated then the average value will be calculated from all 8 values |

e.g. solid 99 stress xx tag curve_1

(read x stress for solid 99 centre value)

solid 99 stress xx ipoint 1 tag curve_1

(read x stress for solid 99 integration point 1)

Selecting data at element nodal positions

In recent versions of Ansys LS-DYNA it is possible to write out data for Solid, Shells and Thick Shells that has been extrapolated from the integration points to the elements nodes.

For Shells the values at all through thickness layers can be extrapolated to the nodes. For Thick Shells the bottom surface values are extrapolated to nodes 1-4 and the top surface values are extrapolated to nodes 5-8.

| extra w #1 | ord extra word #2 | notes | | | | |
|---------------|--|--|--|--|--|--|
| node | n | Specifies the element node number to read data for | | | | |
| e.g. sł | nell 99 stress xx : | node 3 | | | | |
| (r | (read x stress for shell 99 middle surface extrapolated to node 3) | | | | | |
| sł | nell 99 stress xx : | surface 5 node 1 tag curve_1 | | | | |

(read x stress for shell 99 layer 5 extrapolated to node 1)

tshell 99 stress xx node 7 tag curve_1

(read x stress for thick shell 99 top surface extrapolated to node 7)

solid 99 stress xx node 4 tag curve_1

(read x stress for solid 99 extrapolated to node4)

10.5.5. Data Extraction Reference Table

Data extraction reference table

| Data type | Keyword | Second word | Third word | Fourth word | Description |

7.4.5.1 Defining Surfaces / Integration points for data extraction

Some data components can be written out at multiple locations.

In recent versions of Ansys LS-DYNA it is possible for each element to write out multiple values for some data components.

For fully integrated Shells and Thick Shells values can be written out for all 4 in-plane integration points in each through thickness location. In addition to the integration point values it is also possible to write out data that has been extrapolated from the integration points out to the shells nodes.

For fully integrated solid elements data can also be written out for all 8 integration points and values can also be extrapolated to the elements nodes.

To select these additional values the entity ID's specified in a FAST-TCF scripts can be modified as follows.

| | n | Average value for solid (default) | | | |
|--------|------|---|--|--|--|
| Solids | n@X | Value at integration point X (0 < X < 8) | | | |
| | n@-X | Value at node X (0 < X < 8) | | | |
| | n | Average value for shell (default) | | | |
| Shells | n@X | /alue at integration point X (0 < X < 4) | | | |
| | n@-X | Value at node X (0 < X < 4) | | | |
| | | | | | |
| Shells | n | Average value for thick shell (default) | | | |
| Snells | n@X | Value at integration point X (0 < X < 4) | | | |
| | n@-X | Value at node X (0 < X < 8) | | | |

e.g. solid 10

(solid 10 - average value)
solid 20@5
(solid 20 - data from 5th integration point)
shell 20@-3
(shell 20 - data extrapolated to shells 3rd node)

10.6. Units

UNITS

T/HIS 9.4 onwards can automatically add unit information to graph labels and it can convert results from one unit system to another.

Each model in T/HIS can have a Unit System defined for it and a separate Unit System can be defined for displaying results. T/HIS will automatically convert results from the model Unit System to the display Unit System. T/HIS has 6 built in unit systems.

| Unit System name | Units |
|---------------------|---------------|
| U1 | m, kg, s |
| U2 | mm, t, s |
| U3 | mm, kg, ms |
| U4 | mm, g, ms |
| U5 | ft, slug, s |
| U6 | m, t, s |

Setting the unit system for a model

To set the unit system for a model

| Keyword | second word | third word | fourth word | notes |
|---------|----------------|------------|----------------|---|
| units | | n | U1 | Set the unit system for model 'n' to U1 |
| | model | | U2 | Set the unit system for model 'n' to U2 |
| | | | U3 | Set the unit system for model 'n' to U3 |
| | | | U4 | Set the unit system for model 'n' to U4 |
| | | | U5 | Set the unit system for model 'n' to U5 |
| | | | U6 | Set the unit system for model 'n' to U6 |
| | | all | as above | Set the unit system for all models |

Setting the DISPLAY unit system

To set the display unit system

| ikevword | second word | third word | notes |
|----------|----------------|------------|-----------------------------------|
| | | U1 | Set the display unit system to U1 |
| | display | U2 | Set the display unit system to U2 |
| units | | U3 | Set the display unit system to U3 |
| units | | U4 | Set the display unit system to U4 |
| | | U5 | Set the display unit system to U5 |
| | | U6 | Set the display unit system to U6 |

Curve Axis units

By default T/HIS will automatically set the Unit System for any curves read from a model to those of the model. In addition to setting the curve Unit System, T/HIS will automatically set a unit type for the X and Y axis of the curve. These unit types are maintained through curve operations so that the correct units can be displayed for each curve.

| Keyword | second word | third word | additional words | | vords | notes |
|---------|----------------|---------------|----------------------------|----|-------------|--|
| | | curve #1 | curve #2 to curve #n | ## | I Init name | ## ends the curve list Set the X axis unit for curves |
| unit | | * | ## | | I Init name | ## ends the curve list Set the X axis unit for all curves |
| | су | curve #1 | curve #2 to curve #n | ## | I Init name | ## ends the curve list Set the Y axis unit for curves |
| | | * | ## | | i init name | ## ends the curve list Set the Y axis unit for all curves |

The X and Y Axis units for a curve can be manually set if required.

The Unit name can be any of the following

| Time | Rotation | Momentum | Energy Den |
|--------------|-----------|----------|--------------|
| Energy | Rot Vel | Density | Mass Flow |
| Work | Rot Accel | Stress | Frequency |
| Temperature | Length | Strain | Power |
| Displacement | Area | Force | Thermal Flux |
| Velocity | Volume | Moment | Force width |

| Accel | Mass | Pressure | Moment width |
|--------------|---------------------|-------------------|----------------|
| Viscosity | Thermal Diffusivity | Vorticity | Q Criterion |
| Current | Vec Potential | Magnetic Flux Vec | Elec Field Vec |
| Conductivity | | | |

Curve Unit Systems

If a curve has been read in from any source other than a model then the Unit System can also be set.

| Keyword | second word | third word | additional words | | | notes |
|---------|----------------|---------------|------------------------------|-------------------------|------------------------|--|
| unite | | curve #1 | curve #2 to curve # #n | Unit #System name | 7 | ## ends the curve list Set the Unit System for curves |
| units | | cu | * | ## | Unit System name | 2 |

Other UNIT options

If a CSV file is written out from within a FAST-TCF script (see <u>FAST-TCF CURVE OUTPUT</u>) then by default it will contain rows containing UNIT information for the curves if UNITS have been defined.

Some third party applications and scripts can not read T/HIS CSV files containing this additional UNIT information correctly. The following option can be added to FAST-TCF scripts to turn on and off the output of this additional information.

| Keyword | | third word | notes |
|---------|-----|---------------|---|
| unit | | on | Turns on the output of UNIT information to CSV files |
| unit | CSV | off | Turns off the output of UNIT information to CSV files |

10.7. Curve Tags

CURVE TAGS

In FAST-TCF any operation that uses one or more curves as an input can reference the curve using either the curve number or a curve tag. **The use of curve Tags is strongly recommended as it enables scripts to be easily modified and sections added / deleted without having to renumber all the curve references within the script.**

Curve tags are defined for a curve by adding the keyword TAG to the data extraction command followed by the tag.

| e.g. | node | 42 | force y_dir | tag curve_1 |
|------|--------|----------------------|----------------------------|---------------------------------|
| | (node) | (i.d. 42) | (force in y- direction) | (tag the curve as "curve_1") |
| | node | "end of roof" | accel z | tag point_2 |
| | (node) | (i.d. "end of roof") | (z acceleration) | (tag the curve as "point_2") |

Tags cannot begin with a numeric character, e.g. tag 1_curve is not allowed.

If a tag is not specified for a curve then FAST-TCF will automatically generate a tag for the curve using the T/HIS curve number.

The tag for a curve can be redefined at anytime within a script using the "tag" command (see <u>Setting curve Labels, Titles and tags</u>) for more details. Once a curve tag has been redefined the original definition should not be used in any following commands - a curve can only have 1 tag defined at any time.

Tagging curves from a T/HIS curve file

Curves read in from a T/HIS curve file can be tagged by refering to each curve in the file using a negative number:

| e.g. | tag | -1 | curve_1 |
|------|-----|----------------------------------|--------------------|
| | | (1st curve in the curve file) | (tag as "curve_1") |
| | tag | -2 | curve_2 |
| | | (2nd curve in the curve file) | (tag as "curve_2") |

If curves are read in from a T/HIS curve file then then the FAST-TCF tag will be generated using the following rules.

- 1. If the data extraction command contains a tag option then that tag will be used (as above).
- 2. If the curve file contains curve tags then they will be used if the data extraction command DOES NOT contain a tag option.
- 3. If no tags are specified in the file or in the data extraction command then T/HIS will automatically tag each curve as '#' where # is the internal T/HIS curve number.

In the third case, if for example there are three curves already in T/HIS, the curves read in from the curve file will be tagged as '4', '5', '6', '7', etc. This limits how you can refer to these curves since would not be able to multiply two curves together. For example the command op mul 4 5 tag new_curve would multiply the curve tagged as '4' by the number 5, not by the curve tagged as '5'.

To avoid this limitation you will need to tag your curves using either the syntax explained above or by specifying a tag in the curve file.

Tagging multiple curve outputs

From T/HIS 9.2 onwards, multiple curve outputs can be generated from one FAST-TCF input line. Curve tags and labels can be specified for multiple curves using the following special syntax (note this only works on multiple curves):

- If the user specifies a wildcard in the tag or label (a "*"), then FAST-TCF will substitute the wildcard for the number of the curve outputted (starting from 1).
- If the user specifies a "##" then the entity ID is substituted in its place which is useful if the user knows what entities are expected on output.

| e.g. | node 5:last | accel mag | tag node_* | lab Head Accn * |
|------|----------------|-----------|-----------------|---------------------------------|
| | (node IDs. 5 | (accel | tags = node_1, | labels = Head Accn 1, Head Accn |
| | to last) | mag) | node_2, etc | 2, etc |
| | node 10:20 | accel mag | tag node_## | lab Head Accn ## |
| | (nodes 10 to | (accel | tags = node_10, | labels = Head Accn 10, Head |
| | 20) | mag) | node_11, etc | Accn 11, etc |

Using Wildcards

A number of T/HIS functions and operations can be applied to multiple curves in a single command by specifying multiple curve tags using wildcards.

From T/HIS 10.0 onwards the following wildcards are supported

| Wildcard | Matches |
|----------|----------------------|
| * | 1 or more characters |

| ? | a single character | | | | | | |
|-------------|---|--|--|--|--|--|--|
| [a-e] | matches a single character against a range of characters , 'a','b','c','d' or 'e' | | | | | | |
| [abc] | [abc] matches a single character against a list of characters, 'a', 'b' or 'c' | | | | | | |
| e.g. operat | te multiple x_disp_* 10 tag x_mul_* | | | | | | |

(Multiple all curves with a tag starting with "x_disp_" by 10 and tag the outputs as x_mul_1, x_mul_2 ... - see <u>PERFORMING FAST-TCF CURVE OPERATIONS</u> for more details)

```
display x_disp_*
```

(Display all curves with a tag starting with "x_disp_" - see <u>Curve Display</u> for more details)

copy curve_file.cur x_disp_*

(Write all curves with a tag starting with "x_disp_" to a file called "curve_file.cur"-see <u>FAST-TCF CURVE OUTPUT</u> for more details)

csv curve_file.csv curve_1? curve_3[0 -3]

Write curves with tags curve_10, curve_11, curve_12 and curves with tags curve_30, curve_31, curve_32, curve_33 to a CSV file called "curve_file.csv"- see <u>FAST-TCF CURVE OUTPUT</u> for more details)

Using Curve Numbers

Although it is not recommended curves can be referenced using the internal curve number instead of the curve tag. If for example the 1st curve generated by a script has the tag "curve_1" then the following 2 commands are identical.

| e.g. | operate | multiple | curve_1 | 10 | tag | x_mul_* |
|------|---------|----------|---------|----|-----|---------|
| | operate | multiple | #1 | 10 | tag | x_mul_* |

If curve numbers are used within a script then T/HIS will automatically offset the curve numbers in the script by the number of curves T/HIS already has defined before the script is executed.

| ρσ | operate | multiple | #1 | 10 | tag | x mul * |
|------|---------|----------|----|----|-----|---------|
| C.g. | - | - | | | - | |

would multiply internal curve number 1 by 10 if T/HIS didn't contain any curve definitions when the script was run.

If T/HIS already contained 100 curves then the same command would multiple internal curve 101 by 10.

This means it is possible to play a script containing curve numbers multiple times within a session without having to either delete all the existing curves or modify the script each time.

Tagging the most recently created or highest ID curve

The most recently created/edited curve or the curve with the highest ID can be tagged with the specific commands "recent" and "highest".

| e.g. | tag | recent | curve_tag_1 |
|------|-----|---------|-------------|
| | tag | highest | curve_tag_2 |

These commands won't be written out automatically into a FAST-TCF script, so will need to be added manually. It is worth noting that if a curve tag starts with "recent" or "highest", then any command intended to change the tag would instead be interpreted as setting the tag of the most recent or highest ID curve, as in the above example. It is therefore recommended that curve tags should not start with "recent" or "highest".

10.8. Curve Groups

CURVE GROUPS

Curve groups can be defined within FAST-TCF scripts using the **cgroup** keyword. After a curve group has been defined in a FAST-TCF script it can then be used as an input to some FAST-TCF commands. Each curve group should be given a unique name within the FAST-TCF script.

| Keyword | Second word | Third word | following word | notes |
|---------|----------------|------------|-------------------|--|
| cgroup | create | name | - | Create a curve group called "name". If the name contains any spaces then it should be enclosed in quotes ("name with space") |
| | add | name | curve list | Adds a list of curves to the curve group called "name". If the name contains any spaces then it should be enclosed in quotes ("name with space"). The curve list should be a list of curve tags. |
| | remove | name | curve list | Removes a list of curves from the curve group called "name". If the name contains any spaces then it should be enclosed in quotes ("name with space"). The curve list should be a list of curve tags. |

e.g. cgroup create group_1

(Create a curve group called "group_1")

cgroup add group_1 curve_1 curve_2

(Add curves with tags "curve_1" and "curve_2" to group "group_1")

cgroup create "Group 2"

(Create a curve group called "Group 2")

cgroup add "Group 2" curve_1*

(Add all curves with a curve tag containing "curve_1" to group "Group 2")

cgroup remove "Group 2" curve_11

(Remove curve with tag "curve_11" from group "Group 2")

To use a curve group as the input to another FAST-TCF command the curve group name is preceeded by an &. If a curve group name contains spaces then the name should be enclosed in double quotes and the & should be before the first ".

| e.g. | operate | multiple | &group_1 | 10 | tag | output_* |
|------|---------|-----------------------------|---------------|------------------------|--------------|----------------|
| | • | l curves in cur utput_2) | ve group "gro | oup_1" by [·] | 10 and tag t | he outputs as |
| | operate | multiple | &"Group 2" | 10 | tag | output_* |
| | • | l curves in cur utput_2) | ve group "Gr | oup 2 " by | 10 and tag | the outputs as |

Curve Groups can currently be used

- As the first curve input in all of the **operate** commands
- Within the list of curves specified as input to <u>curve range</u> functions.
- To select a group of curves for the **display** command.
- When outputting curves to T/HIS curve files and CSV files.

10.9. Performing FAST-TCF Curve Operations

PERFORMING FAST-TCF CURVE OPERATIONS

| Description | keyword | following words |
|-------------|---------|---|
| Curve | opor | oper command + necessary words (depending |
| operation | oper | on operation) |

Many curve processing operations and functions are available. The syntax is common for all types of curve operation:

- 1. The first word is oper and is followed by:
- 2. The operation/function name e.g. ADD, INT.
- 3. The required number of arguments for the operation, e.g. ADD requires two arguments, a curve and either a curve or a value.
- 4. The remainder of the line may contain optional requests.
- 5. Any optional requests can occur after the arguments.
- 6. Curve numbers must be in the format: #<curve number>
- 7. An output curve is always needed for operation commands such as hic, hicd, tti, 3ms, err, the curve will be copied and the operation is executed on the copied curve.
- 8. A curve tag containing a wildcard or a curve group can be specified as the first curve input for any curve operation. If a curve tag contains a wildcard or if a curve group is specified then the curve operation will be repeated for each curve that either the tag matches or is in the curve group.

| e.g. | oper hic | node_acc | 1.0 | 15E-3 | label Hic-ed node accn |
|------|----------|-------------|-------------|------------------|---------------------------|
| | (hic) | (curve tag) | (scale=1.0) | (15ms period) | (label) |

In T/HIS 9.2 onwards, the user can operate on multiple input curves (only the first curve can be multiple at the moment) using the wildcard "*". For example, to multiply all curves starting with the tag **acc** :

e.g. oper mul acc* 9810.0

(multiply) (on all curves with tag acc*)

10.9.1. Standard Operation Commands

Standard operation commands

| Description | keyword | operation command | • | following word #2 | additional words | notes |
|----------------------|---------|----------------------|----------|-------------------------|----------------------------|---|
| Absolute value | oper | abs | curve #1 | - | - | |
| Add Y | oper | add | curve #1 | curve #2 or constant | - | |
| Add X | oper | adx | curve #1 | curve #2 or constant | - | |
| | | | | | auto | Input requires all 4 values, |
| Clip curve | oper | cli | curve #1 | x min value / "auto" | y min value / "auto" | "auto" sets the value |
| | | | | | y max value / "auto" | automatically |
| Combine | oper | com | curve #1 | curve #2 | - | |
| Concatenate | oper | cat | curve #1 | curve #2 | - | |
| Derivative | oper | dif | curve #1 | - | - | |
| db | oper | db | curve #1 | reference value | | Convert a curve to dB |
| db(A) | oper | dba | curve #1 | narrow | | Apply narrow band A weighting |
| | oper | | | octave | | Apply octave band A weighting |
| Div Y | oper | div | curve #1 | curve #2 or constant | - | |
| Div X | oper | dix | curve #1 | curve #2 or constant | - | |
| Error calculation | oper | err | curve #1 | curve #2 | - | Value is stored with the output curve |
| Integral | oper | int | curve #1 | - | - | |
| Least squares | oper | lsq | curve #1 | - | - | |
| Мар | oper | map | curve #1 | curve #2 | - | |

| | | | | "2 | | | |
|--------------------|------|------|---------------------|-------------------------|------|--------------|--|
| Mul Y | oper | mul | curve #1 | curve #2 or constant | - | | |
| Mul X | oper | mux | curve #1 | curve #2 or constant | - | | |
| Normalise | oper | nor | curve #1 | - | _ | | |
| | | | | octave | rms | db | Octave or 1/3rd |
| Octava | opor | oct | aunyo #1 | | rms | linear db | Octave bands. Value for each band can be |
| Octave | oper | oct | curve #1 tl | third | mean | | calculated using either mean or RMS values, and the input can either be linear or in dB. |
| Order | oper | ord | curve #1 | - | _ | | |
| Reciprocal | oper | rec | curve #1 | - | _ | | |
| Reverse | oper | rev | curve #1 | - | - | | |
| Rolling average | oper | r-av | $r_{1}r_{1}e_{\pm}$ | averaging window | - | | If the averaging window is undefined or set to 0.0 then the y-values at each point are calculated by averaging all of the proceeding curve points. If the averaging window is set to T then the y- values at each point are calculated by averaging between -T/2 and +T/2. |

| Smooth | oper | smo | CUIVE #1 | smoothing factor | - | Factor must be an integer |
|-------------------------|------|--------|----------|----------------------------|--|--|
| Stress | oper | str | curve #1 | "true" or "engineering" | - | |
| Sub Y | oper | sub | curve #1 | curve #2 or constant | - | |
| Sub X | oper | sux | curve #1 | curve #2 or constant | - | |
| Translate | oper | tra | curve #1 | X value | Y value | |
| Vector 2D | oper | v2d | curve #1 | curve #2 | - | |
| Vector mag | oper | vec | curve #1 | curve #2 | curve #3 | |
| Window | oper | win | curve #1 | "han", "cos", "exp" | lead in (only for "cos" option) | Writes out 2 curves |
| Zero curve (X and Y) | oper | zer | curve #1 | - | - | Shifts curve to 0,0 (X and Y values) |
| Zero curve (X only) | oper | zero_x | curve #1 | - | - | Shift curve to 0,Y (X only) |
| Zero curve (Y only) | oper | zero_y | curve #1 | - | - | Shift curve to X,0 (Y only) |

10.9.2. Maths Operation Commands

Maths operation commands

| Description | keyword | operation command | - | following word #2 | additional words | notes |
|--------------------|---------|----------------------|----------|----------------------|---------------------|-------|
| Arc cosine | oper | acos | curve #1 | - | - | |
| Arc sine | oper | asin | curve #1 | - | - | |
| Arc tangent | oper | atan | curve #1 | - | - | |
| Cosine | oper | cos | curve #1 | - | - | |
| Log base 10 | oper | log10 | curve #1 | - | - | |
| Log base 10 (X) | oper | log10x | curve #1 | - | - | |
| Natural Exp | oper | exp | curve #1 | - | - | |
| Natural log | oper | log | curve #1 | - | - | |
| Natural log (X) | oper | logx | curve #1 | - | - | |
| Power | oper | pow | curve #1 | nth power | - | |
| Sine | oper | sin | curve #1 | - | - | |
| Square root | oper | sqr | curve #1 | - | - | |
| Tangent | oper | tan | curve #1 | - | - | |

10.9.3. Automotive Operation Commands

Automotive operation commands

| Description | Keyword | Operation command | - | - | Additional words | Notes |
|-----------------------------------|---------|----------------------|------------------|-----------------------------|--|--|
| Delta V | oper | acu | curve #1 | offset | time period | |
| Acceleration severity index | oper | asi | | , | Accn z curve # | word6 = acceleration conversion factor word7 = x limit word8 = y limit word9 = z limit |
| Butterworth filter | oper | but | curve #1 | cut off frequency | order | |
| C60 filter | oper | c60 | curve #1 | - | - | |
| C180 filter | oper | c180 | curve #1 | - | - | |
| C600 filter | oper | c600 | curve #1 | - | - | |
| C1000 filter | oper | c1000 | curve #1 | - | - | |
| Clip value | oper | cva | curve #1 | window | Label displayed on screen <i>(optional)</i> | Value is stored with the output curve |
| Exceedence | oper | exc | curve #1 | auto / pos / neg | - | |
| Fir filter | oper | fir | curve #1 | - | - | |
| Hic | oper | hic | curve #1 | division scale factor | time period | Value is stored with the output curve |
| Hicd | oper | hicd | curve #1 | division scale factor | time period | Value is stored with the output curve |
| Neck injury criteria | oper | nu | Shear curve # | | Moment curve # | word6 = Fzc tension word7 = Fzc compression word8 = Myc flexion word9 = Myc extension |

| | | | | | | word10 = |
|--|------|------|------------------------------|---|------------------------|--|
| | | | | | | Word I 0 = Distance from |
| | | | | | | ioint |
| | | | | new dt | | joint |
| Regularise | oper | reg | curve #1 | value | - | |
| тніу | opor | thi | Accn x | Accn y | Yaw rate | word6 = Horizontal distance word7 = Lateral |
| | oper | un | curve # | curve # | curve # | distance word8 = Head to vehicle distance |
| тті | oper | tti | Upper rib curve # | | Lower spine curve # | Value is stored with the output curve |
| Viscous criteria ECER95 | oper | vc | curve #1 | constant A | constant B | ECER95 method |
| Viscous criteria IIHS | oper | vc2 | curve #1 | constant A | constant B | IIHS method |
| Curve Correlation (strict) | oper | corr | strict | curve #1 | curve #2 | Value is stored with the output curves |
| Curve Correlation (loose) | oper | corr | loose | curve #1 | curve #2 | Value is stored with the output curves |
| Weighted Integrated Factor Curve Correlation (WIFAC) | oper | wif | curve #1z | curve #2 | - | Value is stored with the output curve |
| Occupant Load Criterion (OLC) | oper | olc | X Acceleration curve # | X Velocity curve # or lnitial velocity as constant | - | - |
| Tibia Index (Tl) | oper | ti | Axial curve # | Moment | Y Moment Curve # | word6 = Fzc Critical Force word7 = Mrc Critical Bending Moment |

| DAMAGE (DMG) | oper | dmg | | Y Rot. Vel Curve# | Z Rot. Vel Curve# | Calculation method word6 = rk4 / rkf45 / nbm |
|-----------------|------|-----|--|----------------------|----------------------|---|
|-----------------|------|-----|--|----------------------|----------------------|---|

10.9.4. Seismic Operation Commands

Seismic operation commands

| Description | VOVMORA | operation command | - | following word #2 | additional words | notes |
|---------------------------|---------|----------------------|----------|----------------------|---------------------|---|
| Accn to disp spectra | oper | ad | curve #1 | - | - | |
| Accn to vel spectra | oper | av | curve #1 | - | - | |
| Disp to vel spectra | oper | d∨ | curve #1 | - | - | |
| Disp to accn spectra | oper | da | curve #1 | - | - | |
| Vel to disp spectra | oper | vd | curve #1 | - | - | |
| Vel to accn spectra | oper | va | curve #1 | - | - | |
| Baseline correction | oper | blc | curve #1 | - | - | |
| Design spectrum | oper | ds | curve #1 | broadening factor | - | |
| FFT | oper | fft | curve #1 | - | - | |
| Non cumulative P.R. | oper | ncp | curve #1 | curve #2 | - | |
| Response spectrum | oper | rs | curve #1 | damping factor | sampling factor | Sampling must be either 30 or 70 |

10.9.5. Range of Curve Operation Commands

Range of curve operation commands

| Description | Kewword | operation command | _ | following word #2 | additional words | notes |
|-------------|----------------|----------------------|----------|-------------------------|---------------------|--------------------------------|
| Average | oper | ave | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Envelope | oper | env | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Minimum | oper | min | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Maximum | oper | max | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Resultant | oper | res | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Sum | oper | sum | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |
| Sum | oper | sum | curve #1 | curve #2 to curve #n | ## | "##" ends the curve list |

10.10. Applying Extra Options to Data Requests

APPLYING EXTRA OPTIONS TO DATA REQUESTS

Extra options can be used after a data component extraction, or a curve operation. After the basic request for a particuar component and particular entity have been made, the following extra data on the line is recognised to manipulate the curve further. This includes options to label a curve, scale it, write it out and so on.

Each request is executed in the order on the line, **if the curve label is used, it must be the last input on the line.**

| e.g. | no 54 | accel mag | xsc 1000 ysc 0.0001 | hic | lab Head Accn |
|------|-------------------|-------------|------------------------|-----------------------|------------------|
| | (node i.d. 54) | (accel mag) | (scale x and y) | (obtain hic value) | (curve label) |
| | no 1 | accel mag | filter c60 | append output. | cur |
| | (node i.d. 1) | (accel mag) | (filter with C60) | (append the curv | ve to a file) |
| | no 1 | accel mag | tag node_1_acc | | |
| | | | (tag the curve "pode" | 1 acc" for asso of | use later in the |

(node i.d. 1) (accel mag)

(tag the curve "node_1_acc" for ease of use later in the script)

| Description | IONTION | following word #1 | following word #2 | notes |
|-----------------------|------------------------|----------------------|----------------------|--|
| 3ms clip | 3ms | - | - | Curve is squared and then square rooted to remove -ve values Curve is truncated around 3ms values - only 3ms part is left |
| Append into file | арр | filename | - | Appends into curve file, if it doesn't exist - create it |
| Combine | com | curve #2 | - | Y-value curve #1 vs X- value curve #2 |
| Copy into file | сор | filename | - | Copy will overwrite any previous instance of the file |
| Error function | err | curve #2 | - | |
| ніс | hic, hic15, hicd | - | - | Curve is squared and then square rooted to remove -ve values, an identical curve is outputted |

| Filtering | fil | fir c60 c180 | | |
|-----------------------|-----|--------------------|---------------------------|---|
| riiteinig | | c600 | - | |
| | | c1000 | | |
| X scale factor | xsc | scale factor | - | |
| Y scale factor | ysc | scale factor | - | |
| Label | lab | label word #1 | ± 12 MORA ± 7 ATC | Keyword and label must be at the end of the line |
| Reference tag | tag | tag word | | lnvalid words: "style", "xax", "yax", "title" |
| ASCII file request | ASC | - | - | |
| LSDA file request | LSD | - | - | |
| THF file request | THF | - | - | |
| XTF file request | XTF | - | - | |

Using extra options on multiple curve outputs

From T/HIS 9.2 onwards, multiple curve outputs can be generated from one FAST-TCF input line. Unfortunately most of the extra options displayed below will NOT work on these multiple outputs. However, support has been added to allow tagging and labeling of all the multiple curves outputted in one go (see <u>Tagging multiple curve outputs</u>).

10.11. Setting Properties for Curves

Setting properties for curves

The folowing options can be used to set up properties for curves.

Setting curve Labels, Titles and tags

| Description | kevword | second word | third word | fourth word | notes |
|------------------------------------|---------|-------------------|---------------------|---------------------|---------------------------------------|
| Curve Label | lab | curve # or tag | label word 1 | label word 2 etc | Specifies a new curve label |
| Curve Tag | tag | curve # or tag | tag | - | Specifies a new curve tag |
| Curve Title | tit | curve # or tag | label word 1 | label word 2 etc | Specifies a new curve title |
| Curve X axis label | xla | curve # or tag | label word 1 | | Specifies a new x -axis label |
| Curve Y axis label | yla | curve # or tag | label word 1 | | Specifies a new y-axis label |
| 1st Y axis | y1 | curve # or tag | - | - | puts the curve on the 1st y axis |
| 2nd Y axis | у2 | curve # or tag | - | - | puts the curve on the 2nd y axis |
| User defined model prefix | prefix | model | model # or 'all' | "prefix string" | sets the user defined model prefix |

From T/HIS 9.4 onwards, curve properties such as the minimum and maximum values can be displayed in the legend area as well as within the graph area.

The following commands use a new **properties** keyword and can be used to specify the font, colour and background used to display values as well as selecting which values are displayed on each curve.

| Keyword | 2nd word | 3rd word | 4th word | 5th word | 6th word | 7th word | notes |
|----------------|-------------|----------|----------------------------|-------------|--------------------|-------------|---|
| propertie s | forma t | font | hm hb cm cb tm | | standard colour | - | sets up font used to display curve properties fonts available: hm - helvetica |

| | | | tb | defaul | | | medium |
|----------------|------------|------------------|---------------------|--------|---|---|--|
| | | | default | t | | | cb - courier bold tm - times new |
| | | | | | | | roman medium etc |
| | | | | | | | font sizes in pt: 8, 10, 12 etc |
| | | background | standard colour | - | - | - | Set a background colour for the text |
| | | transparenc y | integer (0- 100) | | - | - | Set the background transparency |
| | | border | standard colour | on/off | - | - | Set a border colour round the text and turn it on/off |
| | | arrow | on/off | - | - | - | Turn on/off a line connecting the text to the min/max value location |
| | | num | y_only | - | - | - | Only display the y value |
| | | num | x_y | - | - | - | Display both the x and y values on a single line |
| | | num | ху | - | - | - | Display both the x and y values on separate lines |
| | | value | <type></type> | - | - | - | Set the unit format to one of <i>automatic, general, scientific</i> for graph (n) |
| | | precision | m | - | - | - | Set the number of decimal places displayed for the y axis values to (m) in graph (n) |
| | | | off | - | - | - | Turn off the display of curve values in the legend area |
| propertie s | legen d | format | append | - | - | - | Append curve values (min,max,average) to the curve labels in the legend. |

| | | | | | | | Add a 2nd line to the legned for each |
|-----------|--------|----------|----------|-------|---------|---------------------|--|
| | | | 2nd | - | - | - | curve containing the curve values |
| | | | | | | | (min,max,average |
| | | | | | | |). |
| | | | | | maximum | | Turn on/off the |
| | | | | | minimum | | display of one of |
| | | | | | average | | the following curve properties in the |
| | | | | | | | legend. Input one |
| | | | | | | | or more curves and |
| | | | | | | | terminate the list |
| | | | | | | | with ## |
| | | curve #1 | curve #2 | ## | | on/o | maximum - display |
| | | | | | | ff | curve maximum |
| | | | | | other | | value |
| | | | | | | | minimum - display |
| | | | | | | | curve minimum value |
| | | | | | | | average - display |
| | | | | | | | curve average value |
| | | | | | | | other - display |
| | | | | | | | other curve values |
| | | | off | | | | Turn off the display of cuvre values in |
| | | | 011 | - | - | - | the graph area |
| | | | | | | | Display the |
| | | | summary | - | | | minimum/maximu |
| | | | | | - | - | m value for all of |
| | | format | | | | | the curves currently visible |
| | | | | | | | Display |
| propertie | curves | | | | | | minimum/maximu |
| s | | all | - | - | - | m values for each | |
| | | | | | | | curve that is currently visible |
| | | | smaximu | | | | Turns on/off the |
| | | m | | | | display of one of | |
| | | sminimum | | | | the following curve | |
| | | summary | lmaximum | on/of | - | - | summary |
| | | | inaximum | - | | | properties |
| | | | lminimum | | | | smaximum - |

| | | | | | | highlight the maximum value for all the curves displayed sminimum - highlight the minimum value for all the curves displayed Imaximum - label the maximum vlaue for all the curves displayed Iminimum - label the minimum vlaue for all the curves displayed |
|--|----------|----------|----|---|------------|--|
| | curve #1 | curve #2 | ## | smaximu m sminimum lmaximum lminimum other | on/o ff | Turns on/off the display of one of the following curve summary properties. Input one or more curves |

10.12. Defining Datums

10.12.1. Creating Datum Definitions

Creating Datum Definitions

The following options can be used to setup DATUM definitions

| keyword | second word | notes |
|----------------|--|---|
| start datum | | Starts a Datum definition |
| acronym | acronym | Specifies the datum acronym |
| label | label | Specifies the datum label |
| label | 2nd label | Specifies the label for the optional second constant datum line |
| | constant_x | Defines the datum as a constant x value |
| tu 10 0 | constant_y | Defines the datum as a constant y value |
| type | constant_y2 | Defines the datum as a constant y2 value |
| | Points | Defined the datum as a set of x,y points |
| value | value | Specifies the value for a constant x, y or y2 datum |
| 2nd value | 2nd value | Specifies the optional second value for a constant x, y or y2 datum |
| num_points | #points x1,y1 y2,y2 | Specifies the number of points used to define a datum, followed by pairs of x,y values. |
| line_colour | colour (see <u>Line</u> <u>Colours</u>) | Specify the line colour used to display the datum line (or none) |
| line_style | style (see <u>Setting</u> <u>Curve Styles</u> | Specifies the line style used to display the datum line (or none) |
| line_width | width (see <u>Line</u> <u>Width</u> | Specifies the line width used to display the datum line (or none) |
| fill_colour1 | colour (see <u>Line</u> <u>Colours</u>) | Defines the colour used to fill above/right of the datum line |
| fill_colour2 | colour (see <u>Line</u> <u>Colours</u>) | Defines the colour used to fill below/left of the datum line |
| fill_colour3 | colour (see <u>Line</u> <u>Colours</u>) | Defines the colour used to fill between the two constant datum lines if a second value is present |
| label_font | | Define the font used to display the label |
| label_size | 8,10,12,14,18,24 | Define the font point size used to display the label |
| label_colour | colour (see <u>Line</u> <u>Colours</u>) | Define the colour used to display the label |
| label position | Above Centre | Position label at centre above line |
| label_position | Above Left | Position label on left above line |

| | Above Right | Position label on right above line |
|-------------------|---------------------------|-------------------------------------|
| | Below Centre | Position label at centre below line |
| | Below Left | Position label on left below line |
| | Below Right | Position label on right below line |
| | None | Turn off label display |
| | Middle Left | Position label on left in middle |
| | Top Left | Position label on left at top |
| | Bottom Left | Position label on left at bottom |
| | Middle Right | Position label on right in middle |
| | Top Right | Position label on right at top |
| | Bottom Right | Position label on right in middle |
| label_orientation | Horizontal or Vertical | Orientation of the datum label(s) |
| label_point | point number | Position label at datum point |
| end_datum | | Ends a Datum definition. |

Each DATUM definition must start with a "start_datum" keyword and end with a "end_datum" keyword. Any lines between a "start_datum" and "end_datum" keyword that do not form part of a datum definition are ignored. From T/HIS 17.0 onwards, FAST-TCF variables defined by "define var *name value* " can be used inside DATUM defitions.

The following creates a DATUM definition at Y=1000.0 with a label "Hic Limit", the area below the line is filled in GREEN and the area above is filled in RED.

| START DATUM | |
|-------------------|-------------|
| ACRONYM | datum_1 |
| LABEL | Hic Limit |
| TYPE | constant_y |
| VALUE | 1000.000000 |
| LINE_COLOUR | green |
| LINE_STYLE | solid |
| LINE_WIDTH | normal |
| FILL_COLOUR_1 | red |
| FILL_COLOUR_2 | green |
| LABEL_FONT | default |
| LABEL_SIZE | automatic |
| LABEL_COLOUR | foreground |
| LABEL_POSITION | default |
| LABEL_ORIENTATION | Horizontal |
| END_DATUM | |

Alternatively a <u>*.dtm file</u> can be read in using the 'inc' keyword, e.g.

inc C:\my_datum_file.dtm

10.12.2. Adding Datum Lines to Graphs

Adding Datum Lines to Graphs

Multiple DATUM definitions can be added to each graph using the datum acronym

| Keyword | 2nd word | 3rd word | notes |
|---------|----------|----------|--|
| datum | add | acronym | Adds the datum with the acronym to the currently selected graphs |

datum add maximum: Add datum with the acronym "maximum" to all selected graphs

layout graph select none: Deselect all graphs (see <u>PAGE / GRAPH LAYOUT AND</u> <u>SELECTION</u>)

layout graph select 1: Select graph 1 (see PAGE / GRAPH LAYOUT AND SELECTION)

datum add maximum: Add datum with the acronym "maximum" to graph 1 (currently selected)

datum add minimum: Add datum with the acronym "minimum" to graph 1 (currently selected)

10.12.3. Removing Datum Lines from Graphs

Removing Datum Lines from Graphs

Multiple DATUM definitions can be added to each graph using the datum acronym

| Keyword | 2nd word | nd word 3rd word <mark>notes</mark> | | | | |
|--|--|-------------------------------------|---|--|--|--|
| datum | remove | acronym | Removes the datum with the acronym from the currently selected graphs | | | |
| datum remove maximum Remove datum with the acronym "maximum" from all selected graphs | | | | | | |
| layout grap select none | ^h Deselect all ք | raphs (see <u>PAC</u> | GE / GRAPH LAYOUT AND SELECTION) | | | |
| layout grap select 1 | ^h Select graph | 1 (see <u>PAGE / C</u> | GRAPH LAYOUT AND SELECTION) | | | |
| datum remov maximum | datum remove Remove datum with the acronym "maximum" from graph 1 (currently selected) | | | | | |
| datum remov minimum | datum remove Remove datum with the acronym "minimum" from graph 1 (curren | | | | | |

10.13. FAST-TCF Image Output Options

FAST-TCF IMAGE OUTPUT OPTIONS

The options to generate images can be split into 5 sections:

Setting Curve Style Setting Curve Styles by Model Plot setup Curve Display Image Generation

10.13.1. Setting Curve Styles

Setting Curve Styles

| Description | keyword | second word | following words |
|------------------------|---------|---------------------|-----------------|
| Plot style setup | style | style name | style options |
| Individual curve style | stylec | curve number or tag | style options |

This section explains how to set up the styles for the curves in a plot. The two types of syntax available in the table above effect when and how the curves are styled.

The "plot style setup" (keyword **style**) allows the user to define a plot-specific styling that applies the styles to the curves only when they are requested for a plot. It is independent of the curve id, but dependent on the order the curves are requested in the plot command. The style is given its own "tag" which the user can request on the image FAST-TCF line.

This is useful for producing plots from FAST-TCF that all have the same curve appearance. For the following words, each space represents a new curve style definition. The styles for each curve are defined by the type keywords below, separated by commas.

| e.g. | style ENERGIES | <pre>solid,green,norm</pre> | dash,blue,heavy | sol,W5,yel,500 |
|------|----------------|-----------------------------|-----------------|----------------|
| | (style name) | (curve #1) | (curve #2) | (curve #3) |

When a plot is requested, FAST-TCF will apply the curve styles to the list of curves (in order) in the plot. So in the example above, the first curve would appear green, the second curve blue and the third yellow.

The "individual curve style" (keyword stylec) is the more traditional way of styling a curve that a T/HIS user would be more familiar with - FAST-TCF styles the single curve id instantly. The user can only define one style at a time.

e.g. stylec #12 solid,green,W9

(style curve number 12) style to apply

Line Styles

| Style options | word options | default |
|---------------|--------------|---------|
| | solid | |
| Line style | dash | solid |
| | none | |

Line Colours

| Style options | word options | default | |
|---------------|--|----------------------|--|
| Style options | word options white red green blue cyan magenta yellow | default | |
| Line colour | orange turquoise indigo lime sky pink | dependent on curve # | |
| | black foreground background | | |

Line Width

| Style options | word options | default |
|---------------|--------------|---------|
| | fine | normal |
| Line width | normal | |
| | bold | |
| | heavy | |

Line Symbols

| Style options | word options | default | |
|---------------|--------------|-------------------------|--|
| | triangle | | |
| | square | | |
| | diamond | | |
| | hourglass | dependent on curve # | |
| Line symbols | cross | | |
| | circle | | |
| | star | | |
| | dot | | |
| | null | | |
| Symbol | frequency | - | |

10.13.2. Setting Curve Styles by Model

Setting Curve Styles by Model

From T/HIS 11.0 onwards, a new option can be used to colour all of the curves belonging to a model in a single operation.

| Description | keyword | second word | following words |
|------------------------|---------|--------------|-----------------|
| Colour curves by model | style_m | model number | style options |

The available style options are exactly the same as for the stylec command (see Setting Curve Styles)

| e.g. | style_m 2 | <pre>solid,green,norm</pre> |
|------|----------------|-----------------------------|
| | model number 2 | style to apply |

would set all the curves belonging to model 2 to solid, green lines using the default line thickness.

10.13.3. Plot Setup

Plot setup

| Description | keyword | following words | |
|-------------|---------|------------------|--|
| Plot setup | setup | plot setup words | |

These options set the appearance of any plots that are created afterwards. They are to do with the general appearance of the plot rather than the curve itself. The curve appearances can be set up with the <u>style definition line</u> and on the <u>image plotting line</u>. All following words must be on the same line. If the "on" or "off" is missed out from the following word (where applicable) then FAST-TCF will take the **opposite** to the default (this helps with backwards compatibility issues but can also make a script more compact).

| e.g. | setup | ax bold | grid on | line bold | reverse |
|------|-------|------------------------|----------------|-----------------|-------------------------------------|
| | | (bold axes) | (grid on) | (bold lines) | (reverse foreground and background) |
| | setup | double on | border off | show 3ms | size 250 |
| | | (double axes on) | (no border) | (3ms window on) | (size = 1000 x 750 pixels) |
| | setup | fonts t | itle hb 24 red | | |

(title: helvetica bold 24pt, in red)

| Plot setup description | plot setup word | following word(s) | notes | |
|---------------------------|-------------------------------|-------------------|--|--|
| | | fine | | |
| | | normal | for colours - see standard list | |
| Axis thickness | | bold | below | |
| | | heavy | below | |
| | | standard colour | | |
| Background | ckground back standard colour | | for colours - see standard list below | |
| | bo | fine | | |
| | | normal | for colours, coo stondard list | |
| Border | | bold | for colours - see standard list below | |
| | | heavy | | |
| | | standard colour | | |

| | | on or off | | | | |
|-----------------------------|--------|--|----------------------|----------|---|---|
| Double yaxis | do | on or off | | | | |
| Fix line styles | fix | on or off | | | this overwrites any style definitions | |
| Fonts | fon | [yu]nits [y2u]nits | hb cm cb tm | 10 12 | Colou | sets up fonts for the image: fonts available: hm - helvetica medium cb - courier bold rtm - times new roman medium etc font sizes in pt: 8, 10, 12 etcfor colours - see standard list below |

| | | numerical value | Set the x axis minimum value | | |
| | | auto | Set the x axis unit label to be defined automatically | | |
| | x_unit | manual | Set the x axis unit label to a user defined label | | |
| | | "unit string" | Set the user defined x axis label | | |
| | | on | Turn on the display of the x axis unit label | | |
| | | off | Turn off the display of the x axis unit label | | |
| | y_lab | auto | Set the y axis label to be defined | | |
| | | | automatically | | |
| | | manual | Set the y axis label to a user defined label | | |
| | | "label string" | Set the user defined y axis label | | |
| | | on | Turn on the display of the y axis label | | |
| | | off | Turn off the display of the y axis label | | |
| | y_min | auto | Set the y axis minimum value to automatic | | |
| | | auto_visible | Set the y axis minimum to the automatic value based on the visible part of the x-axis. | | |
| Y Axis | | numerical value | Set the y axis minimum value | | |
| Properties | | auto | Set the y axis maximum value to automatic | | |
| | y_max | auto_visible | Set the y axis maximum to the automatic value based on the visible part of the x-axis. | | |
| | | numerical value | Set the y axis maximum value | | |
| | | auto | Set the y and y2 axis minimum and maximum values to automatic | | |
| | y_ranges | auto_visible | Set the y and y2 axis minimum and maximum to the automatic values based on the visible part of the x-axis. | | |
| | | y_auto | Set the y axis minimum and maximum values to automatic | | |

| | | | Set the y axis minimum and maximum to | | |
|--------------------------|----------|-----------------|--|--|--|
| | | y_auto_visible | the automatic values based on the visible part of the x-axis. | | |
| | | auto | Set the y axis unit label to be defined automatically | | |
| | y_unit | manual | Set the y axis unit label to a user defined label | | |
| | | "unit string" | Set the user defined y axis label | | |
| | | on | Turn on the display of the y axis unit label | | |
| | | off | Turn off the display of the y axis unit label | | |
| | | auto | Set the second y axis label to be defined automatically | | |
| | | manual | Set the second y axis label to a user defined label | | |
| | y2_lab | "label string" | Set the user defined second y axis label | | |
| | y2_min | on | Turn on the display of the second y axis label | | |
| | | off | Turn off the display of th seconde y axis label | | |
| | | auto | Set the second y axis minimum value to automatic | | |
| | | auto_visible | Set the second y axis minimum to the automatic value based on the visible part of the x-axis. | | |
| | | numerical value | Set the second y axis minimum value | | |
| 2nd Y Axis Properties | y2_max | auto | Set the second y axis maximum value to automatic | | |
| rioperties | | auto_visible | Set the second y axis maximum to the automatic value based on the visible part of the x-axis. | | |
| | | numerical value | Set the second y axis maximum value | | |
| | | auto | Set the y and y2 axis minimum and maximum values to automatic | | |
| | y_ranges | auto_visible | Set the y and y2 axis minimum and maximum to the automatic values based on the visible part of the x-axis. | | |
| | | y2_auto | Set the second y axis minimum and maximum values to automatic | | |
| | | y2_auto_visible | Set the second y axis minimum and maximum to the automatic values based on the visible part of the x-axis. | | |
| | y2_unit | auto | Set the second y axis unit label to be defined automatically | | |

| manual | Set the second y axis unit label to a user defined label |
|---------------|--|
| "unit string" | Set the user defined second y axis label |
| on | Turn on the display of the second y axis unit label |
| off | Turn off the display of the second y axis unit label |

Deprecated Plot Setup Options

The following setup commands have been deprecated since T/HIS 9.4 and may be removed entirely in the future. They are superseded by the "properties" keyword (see <u>Setting properties for curves</u>).

| - | plot setup word | following w | ord(s) | notes | | |
|-----------------------------------|--------------------|-----------------|-----------|---|--|--|
| Set colour of min/max value | min_max | standard colour | | for colours - see standard list below | | |
| Show max value | show | max | | Turn on/off the highlight of the Maximum Value | | |
| Show max value | show | min | | Turn on/off the highlight of the Maximum Value | | |
| Display X value at max | show | xmax | | Display x value at Maximum | | |
| Display X value at min | show | xmin | on off | Display x value at Maximum | | |
| Display Y value at max | show | ymax | | Display y value at Maximum | | |
| Display Y value at min | show | ymin | | Display y value at Maximum | | |
| Show 3ms Clip Widow | show | 3ms | | | | |
| Show HIC | show | hic | | | | |

10.13.4. Curve Display

Curve Display

The list of curves displayed in each graph is controlled by the **display** keyword. The list of curves can contain a mixture of curve tags, curve numbers (prefixed with #) or curve groups. If curve tags are specified in the curve list then they can contain wildcards.

| keyword | second word | notes |
|---------|-------------|---|
| | | The curve list can contain a mixture of |
| display | curve list | curve tags, curve numbers (prefixed with #) or curve groups. If curve tags are specified |
| | | in the curve list then they can contain wildcards. |

The following option can be appended to the **display** keyword after the curve list.

| - | _ | following word #1 | following word #2 | notes |
|----------------------|-----|----------------------|-------------------|---|
| Style application | sty | style name | - | Curves have styles applied in the order they were defined |

The following additional options that can be appended to the **display** keyword after the curve list were deprecated in T/HIS 9.4 and may be removed entirely in the future, so their use is not recommended. Equivalent commands have been added to the <u>Plot</u> <u>Setup</u> commands along with a number of new options.

| | | following word #1 | following word #2 | notes |
|-----------------------|-----|--|------------------------------|---|
| Title | tit | title word #1 | | Takes following words as a title until another keyword is found |
| X axis options | хах | if numeric #1 - xaxis min otherwise xaxis label | xaxis max otherwise vavis | Takes following words as a label until another keyword is found |
| Y axis options | vax | if numeric #1 - yaxis min otherwise yaxis label | yaxis max otherwise yayis | Takes following words as a label until another keyword is found |
| 2nd Y axis options | 2ya | if numeric #1 - yaxis min | if numeric #2 - yaxis max | |

| | otherwise label | - | therwise yaxis Ibel | Takes following words as a label until another keyword is found |
|--------------|--------------------|----------------|------------------------|---|
| e.g. display | curve_1 | curve_2 | | |
| (display "cu | irve_1" and "cu | irve_2") | | |
| display | curve_2 | &"Curve | group 3" | title SLED TEST \ xax Time \ yax Displacement |
| (dicalay/lay | المامصد الأحسر | the currice in | |)" Cot the plot title and y and y |

(display "curve_2" and all the curves in "Curve group 3". Set the plot title and x and y axis labels.)

10.13.5. Image Generation

Image Generation

Many different types of image format can be outputted from FAST-TCF.

From T/HIS 17.0 onwards, the FAST-TCF image output options have been revised to allow multiple graphs and pages to be selected for output. The old pre-T/HIS 9.3 syntax (see <u>Pre 9.3 Image Output</u>) is still supported for existing scripts but is officially deprecated and users are strongly advised to move to the new command format where all options are prefixed with either the "display" or "image" keyword.

| Description | keyword | following words |
|--------------|---------|-----------------|
| Image output | image | image options |

The available image output options are

| Option | kevword | | | third word | fourth word | notes |
|----------------|----------|---------|----------|---------------|----------------|--|
| Bitman (8 hit) | image | bit / | filename | graph | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| Bitmap (8 bit) | intage | bmp | | page | | Generate an image for each page / the current page / page number 'n' |
| Bitmap (8 bit | image | bit_u / | filename | graph | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| uncompressed) | intage | bmp_u | | | current | Generate an image for each page / the current page / page number 'n' |
| Cif (9 hit) | imago | aif | | graph | | Generate an image containing all graphs / all active graphs / graph number 'n' |
| Gif (8 bit) | image gi | gif | filename | | current | Generate an image for each page / the current page / page number 'n' |
| Png (8 bit) | image p | png | filename | graph | | Generate an image containing all graphs / all active graphs / graph number 'n' |
| | | | | | | Generate an image for each page / the current page / page number 'n' |

| Bitmap (24 bit) | image bit24 | | filename | | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
|-----------------|-------------|---------------|----------|-------|-----------------|--|
| | intage | bmp24 | | page | | Generate an image for each page / the current page / page number 'n' |
| Pixel map (24 | image | ppm / | filename | graph | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| bit) | intage | pix | | | current | Generate an image for each page / the current page / page number 'n' |
| Jpeg (24 bit) | image i | jpg / jpeg | filename | | active / 'n' | Generate an image containing all graphs / all active graphs / graph number 'n' |
| JboB (14 mic) | | | | page | current | Generate an image for each page / the current page / page number 'n' |
| Dog (24 bit) | image | png24 | filename | graph | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| Png (24 bit) | | | | page | current | Generate an image for each page / the current page / page number 'n' |
| Destervint | | | £:1 | | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| Postscript | image ps | μs | filename | page | current | Generate an image for each page / the current page / page number 'n' |
| PDE | imaga | ndf | | graph | active / | Generate an image containing all graphs / all active graphs / graph number 'n' |
| PDF | image pdf | μαι | filename | page | current | Generate an image for each page / the current page / page number 'n' |

In addition to the image formats the following image output options can also be specified

| Description keyword second word notes |
|---------------------------------------|
|---------------------------------------|

| | _ | | | | | | |
|-------------------------------|--|-------------------------|---------------------|---|--|--|--|
| Image resolution | | i res | screen / 2x / 4x | Set the resolution to either the same as the screen or 2 or 4 times the screen resolution for image ouptut | | | |
| Postscript /PDF resolution | | n res | screen / 2x / 4x | Set the resolution to either the same as the screen or 2 or 4 times the screen resolution for Postscript and PDF ouptut | | | |
| Plot title | | ti | title string | Specify the plot title (postscript / PDF output only) | | | |
| Figure Numb | ber | fi | figure number | Specify the figure number (postscript / PDF output only) | | | |
| Orientation | | ori | lland / nort | Specify the paper orientation (postscript / PDF output only) | | | |
| image bmp | out | tput1.bmp | graph all | | | | |
| | (ge | enerate a k | oitmap called | output1.bmp containing all the current graphs) | | | |
| image jpeg | .0 | tput2.jpg | • | | | | |
| 5 51 5 | | | | alled output2.jpg containing page 3) | | | |
| image | (ge 2x | inclate a j | i Lu image ca | aned outputz.jpg containing page 5) | | | |
| i res | 28 | | | | | | |
| _ | • | t the reso solution) | lution used fo | or all following images to 2 x the screen | | | |
| image ti | Rui | n number | 2 | | | | |
| | (set the plot title to "Run number 2" for any following postscript or PDF images) | | | | | | |
| image ori | lar | ndscape | | | | | |
| | (set the page layout to landscape for any following postscript or PDF images) | | | | | | |

10.13.6. Pre 9.3 Image Output

Pre 9.3 Image Output

The following pre-T/HIS 9.3 image output commands are still supported but has been officially deprecated and users are recommended to use the new format described above. **Support for the below commands may be removed entirely in the future.**

Curve styles that have been previously defined can be applied to the curves in the plot, and various other settings can be made with regards to the axes and titles.

Images that require a second yaxis need to determine which curves go on which axis. To do this, use a "##" in the curve listing to switch to the second axis. The options are described in the tables below.

Curve files can be included within the curves to plot. FAST-TCF detects a curve file to read in using the pattern string ".cur" at the end of the name. The curves are read in, styles are applied, and the image is plotted. The curves are then deleted.

The user can use wildcards ("*") in the tag names to select multiple curves for plotting.

| bit d.bmp | #1 #3 CRV2 ## #2 #4 head_accn | | | Title 2nd axis example | | |
|-----------------|-------------------------------|---------------------|------------------------|---------------------------|------------|--|
| | (2 curves or | 1st yaxis and | 3 on 2nd yaxis) | (Title) | | |
| bit h.bmp | #1 #3 CRV2 | style ONE | xax 0 5E-3 | Time | Title Head | |
| | (curves) | (style to apply) | (xaxis min and max) | (XLabel) | (Title) | |
| bit l.bmp | #1 #100 re | ference.cur] | line.cur #1000 | style reference | | |
| | (curves and | curve files to p | olot) | (style to a | apply) | |
| bmp test.bmp | accn* | | | | | |

(all curves with tags beginning with "accn")

| Description | keyword | | following words | following words |
|-------------|------------------|----------|--------------------|--------------------------|
| Bitmap | bit / bmp | filename | curve(s) | additional formatting |
| | bit_u / bmp_u | filename | curve(s) | additional formatting |
| Jpeg | jpg / jpeg | filename | curve(s) | additional formatting |

| Pixel map | ppm | filename | CUIVVA(S) | additional formatting |
|-------------------|-------|----------|-----------|--------------------------|

| Colour postscript | cpost | filename | curve(s) | additional formatting |

| | format word | following word #1 | following word #2 | notes |
|-----------------------|----------------|---|---|---|
| Style application | sty | style name | - | Curves have styles applied in the order they were defined |
| Title | tit | title word #1 | title word #2 etc | Takes following words as a title until another keyword is found |
| X axis options | xax | if numeric #1 - xaxis min otherwise xaxis label | if numeric #2 - xaxis max otherwise xaxis label | Takes following words as a label until another keyword is found |
| Y axis options | уах | if numeric #1 - yaxis min otherwise yaxis | if numeric #2 - yaxis max otherwise yaxis | Takes following words as a label until another keyword is found |
| 2nd Y axis options | 2ya | label if numeric #1 - yaxis min otherwise yaxis label | label if numeric #2 - yaxis max otherwise yaxis label | Takes following words as a label until another keyword is found |

10.14. Outputting Curve Properties to Text Files, Variables and REPORTER

Outputting curve properties to text files, variables and REPORTER

These requests output a curve property (eg its maximum Y value) into a specified tabulation file, to a REPORTER variable in a text file, or into a variable within FAST-TCF.

| Output type | keywo rd | 2nd word | 3rd wor d | 4th word | word | · • | le | variab le name | descripti on words | Notes |
|-------------------------------|-------------|--------------|-----------------|---------------------------|------|-----|------|----------------------|-----------------------|---|
| Tabulati on file | tab | filena me | curv e # | proper ty to output | S | | varf | variabl e name | descriptio n | |
| Tabulati on file append | taba | filena me | curv e # | proper ty to output | s | | varf | variabl e name | descriptio n | |
| Tabulati on file (csv) | tabc | filena me | curv e # | proper ty to output | s | | varf | variabl e name | descriptio n | Each output is append ed to the current line in the file. |
| Tabulati on file (csv) | tabcr | filena me | curv | proper ty to output | s | | varf | variabl e name | | Each output is append ed to the current line in the file, followe d by a carrage |

| | | | | | | | | | | return so that the next output starts a new line. |
|--------------------------|------|----------------------|-------------|---------------------------|----|--------|------|----------------------|-----------------|---|
| FAST-TCF variable | varf | variabl e name | curv o # | proper ty to output | S | format | - | - | descriptio n | |
| REPORTE R variable | var | | р # | proper ty to output | 2 | | varf | variabl e name | descriptio n | |
| REPORTE | vara | variabl | curv | proper | if | format | varf | variabl | descriptio | |

10.14.1. Available Curve Properties

Available Curve Properties

Various advanced requests can be performed (e.g. first non-zero Y, maximum in a window) and the table below describes them in more detail. Requests which require inputs (e.g. t1 and t2 of a window) take the default values in the table if the following words do not appear to be numbers, or if no following words exist.

| Property to output | property word | value words | notes |
|---------------------------------------|------------------|------------------------|---------------------------------------|
| Minimum x | minx | - | - |
| Maximum x | maxx | - | - |
| Minimum y | min | - | - |
| X at minimum y | xatmin | - | - |
| Y at minimum x | yatmin | - | - |
| Minimum y in window t1 t2 | minw | t1 and t2 | default t1=-1E19 and t2=+1E19 |
| X at minimum y in window t1 t2 | xminw | t1 and t2 | default t1=-1E19 and t2=+1E19 |
| Maximum y | max | - | - |
| X at maximum y | xatmax | - | - |
| Y at maximum x | yatmax | - | - |
| Maximum y in window t1 t2 | maxw | t1 and t2 | default t1=-1E19 and t2=+1E19 |
| X at maximum y in window t1 t2 | xmaxw | t1 and t2 | default t1=-1E19 and t2=+1E19 |
| Average in window t1 t2 | ave | t1 and t2 | default t1=-1E19 and t2=+1E19 |
| Hic | hic | - | - |
| t1 of Hic window | hict1 | - | - |
| t2 of Hic window | hict2 | - | - |
| Hicd | hicd | - | - |
| t1 of Hicd window | hicdt1 | - | - |
| t2 of Hicd window | hicdt2 | - | - |
| 3ms | 3ms | - | - |
| t1 of 3ms window | 3mst1 | - | - |
| t2 of 3ms window | 3mst2 | - | - |
| Y at X | yatx | x value | default xvalue=-1E19 |
| X when Y is passed after gate time | xvgate | y value & gate time | default yvalue=-1E19, gate=+1E19 |
| X at first non-zero Y | xnonz | - | nonzero = 1/1000000th of curve max |

| X at last non-zero Y | xfail | - | nonzero = 1/1000000th of curve max |
|---|------------|---|---------------------------------------|
| Y value at last non-zero Y | yfail | - | nonzero = 1/1000000th of curve max |
| ТТІ | tti | - | - |
| Error Function - Max difference & time | max_err | - | - |
| Error Function - Difference as a %age of reference | pc_err | - | - |
| Error Function - Difference as a %age of peak reference | pc_max_err | - | - |
| Error Function - Average Difference | av_err | - | - |
| Error Function - Average Difference as a %age of peak reference | av_max_err | - | - |
| Error Function - Area weighted difference | area_err | - | - |
| Error Function - Max difference & time | err | - | - |
| Curve Correlation Function | correlate | | Returns curve correlation value |

The are also variables which relate to properties of all curves rather than specific curves. In this case the 3rd word "curve #" should be replaced by "all".

| Property to output | property word | value words | notes |
|--|------------------|-------------|-------|
| Minimum x over all curves | all_minx | - | - |
| Maximum x over all curves | all_maxx | - | - |
| Minimum y over all curves | all_miny | - | - |
| X at minimum y over all curves | all_xatmin | - | - |
| Maximum y over all curves | all_maxy | - | - |
| X at maximum y over all curves | all_xatmax | - | - |
| Curve number of curve containing minimum y over all curves | all_catmin | - | - |
| Curve number of curve | all_catmax | - | - |

10.14.2. Writing Out Curve Properties to a Text "Tabulation" File

Writing out curve properties to a text "tabulation" file

This is achieved using the "tabulation" command. This automatically overwrites any existing file in the output directory, but only on the **first occurrence** in the input script. If this is not desired then use the "taba" command which will append an existing file on the first tab call.

The command "tabc" is available from T/HIS 9.2 onwards. This command appends the data into CSV format on the last line in the file. The first call to this command writes a **new line** to the file, and the subsequent calls append the end of this line. This enables the user to compare runs on a line by line basis in software such as Microsoft Excel.

Some examples of writing out curve properties to a text file are below:

| e.g. | tab output.txt | #1 | max | max y of c | urve #1 |
|------|-------------------------------------|----------------------------------|--------------------------------|--------------------------|---------------|
| | (file output.txt) tab output.txt | (curve number) node_head_accn | (maximum Y) ^{maxw} | (description 1.00E-03 |) 30.00E-3 |
| | (file output.txt) | (curve tag) | (max Y in window) | (window t1) | (window t2) |
| | taba output.txt | node_head_accn | min | | |
| | (append output.txt) | (curve tag) | (minimum Y) | | |

Properties for multiple curves can be output by specifying either multiple "tab" commands or by using a curve tag containing wildcards or a curve group.

| e.g. | tab output.txt | node_* | max | maximum y value |
|------|-------------------|---|----------------|-----------------|
| | (file output.txt) | (all curves with a tag starting with node_) | (maximum Y) | (description) |
| | tab output.txt | &group_1 | max | maximum y value |
| | (file output.txt) | (all curves in group | (maximum | (description) |

10.14.3. Writing Out REPORTER Variables

Writing out REPORTER variables

REPORTER can write curve properties to its reports, so FAST-TCF needs to output a text file that REPORTER can interrogate to find out the curve properties it needs. To tell FAST-TCF to output a REPORTER variable, the keyword "varr" is used (for backwards compatibility "var" is sufficient). Use "vara" to append to an existing file.

| e.g. | varr head_hic | #1 | hic | hic result for head node |
|------|-----------------------------------|---------------------|---------------------|-----------------------------|
| | (REPORTER variable %head_hic%) | (curve number 1) | (output request) | (description) |
| e.g. | vara max_y | #1 | max | maximum y value |
| | (REPORTER variable | (curve | (output | (description) |

10.14.4. Setting Up New FAST-TCF Variables to Contain Curve Properties

Setting up new FAST-TCF variables to contain curve properties

If you wish to use a curve property as a new variable within FAST-TCF - there are two ways you can achieve this.

- 1. Use the keyword "varf ". This should be used when the user doesn't also require the value to be outputted into a text file or a REPORTER file.
- Within a "tab", "taba", "tabc" Or "varr" line, use the word "varf" just before the description words. The variable name is defined as the word after "varf".

The variable value is equal to the return value of the request. The variable can then be used in any subsequent lines of FAST-TCF.

For instance, the simplest way to set the variable **MAX_ACCN** to the max of curve #1 is:

varf MAX_ACCN #1 max

However, if the user wishes to combine writing a property to a text file and defining a variable in FAST-TCF, this syntax could be used:

tab output.txt #1 max varf MAX_ACCN

10.14.5. Format

Format

From T/HIS 9.3 onwards, the format used to display the value can be controlled by adding an optional "format" keyword after the property to be output and any additional inputs that property requires. The format should be specified directly after the "format" keyword and should use standard "C" programming syntax to specify a floating point format using either f,e,E,g or G format specifiers.

| e.g. | tab output.txt | head | max | max y of curve #1 | |
|------|-------------------|-------------|----------------|----------------------|----------------------|
| | (file output.txt) | (curve tag) | (maximum Y) | (description) | |
| | tab output.txt | head | max | format %6.3f | max y of curve #1 |
| | (file output.txt) | (curve tag) | (maximum Y) | (format) | (description) |
| | tab output.txt | head | max | format %.3f | max y of curve #1 |
| | (file output.txt) | (curve tag) | (maximum Y) | (format) | (description) |

Example formats

| Number | Format | Output |
|--------------|--------|------------|
| 12.3456 | %5.2f | 12.35 |
| 12.3456 | %7.3e | 1.2345e+01 |
| 12.3456 | %7.3E | 1.2345E+01 |
| 2345678.9 | %.0f | 2345678 |
| 2345678.9 | %6.5g | 2.3457e+06 |
| 2345678.9 | %6.5G | 2.3457E+06 |
| -0.000013583 | 84.3e | -1.358E-05 |

10.14.6. Description

Description

From T/HIS 9.3 onwards, the description specified as part of the output for a curve property can contain the following keywords that will automatically be replaced with the corresponding curve property.

| keyword Cur | | Curve Pro | urve Property | | | | |
|-------------|---------------------|--------------|---|-----------------------------------|-----|--|--|
| {tag} | | FAST-TCF c | FAST-TCF curve tag | | | | |
| {label} | | Curve labe | I | | | | |
| {id} | | Entity ID th | Entity ID that the curve was created from | | | | |
| {moo | del} | Model ID c | urve was cre | eated from | | | |
| e.g. | tab output.tr | head | max | Max accl of node {id} | | | |
| | (file output.txt | - | (maximum Y) | (description) | | | |
| | tab output.t | t head | max | Model {model} max accl of node {i | ld} | | |
| | (file | (curve | (maximum | (description) | | | |

10.15. FAST-TCF Curve Output

FAST-TCF CURVE OUTPUT

Curves can be written out to either T/HIS curve files or CSV files from within a FAST-TCF script by using either the "app", "cop", "csv" or "csv2" keyword.

| Description | kevword | second word | third word | | notes |
|---------------------|-----------|----------------|------------|------------------|--|
| Copy into file | сор | filename | curve list | - | will overwrite any previous file |
| Append into file | арр | filename | curve list | - | will append any previous file |
| CSV file TYPE 1 | CSV | filename | curve list | - | will overwrite any previous csv file. CSV has the format X1,Y1,X2,Y2,X3,Y3 |
| CSV file | csv2 file | ilename | curve list | last word = auto | will overwrite any previous csv file. CSV has the format X1,Y1,Y2,Y3 x axis interval is taken from curve #1 if all curves are chosen |
| TYPE 2 | | | | x start time | will overwrite any previous csv file. CSV has the format X1,Y1,Y2,Y3 start time and interval are defined in the line |

The curve list for all of these commands can contain either curve tags (with or without wildcards), curve numbers (prefixed with #), curve groups or '*' to select all curves.

e.g. copy output_file.cur curve_1 &"group 1"

(Write "curve_1" and all the curves in curve group "group 1" to a new file "output_file.cur")

```
append output_file.cur curve_1 &"group 1"
```

(Append "curve_1" and all the curves in curve group "group 1" to the file "output_file.cur")

```
csv output.csv curve_1* curve_2*
```

(Write all curves with tags that start with "curve_1" or "curve_2" to a CSV called "output.csv")

NOTE : There is no limit to the number of curves that can be output to a file but there is a limit to the number of items that can be specified in the curve list (currently 100). If more than 100 curves are to be output to a file then a <u>curve group</u> containing all of the curves should be created and used within the curve list. Alternatively if the curves are being written to a T/HIS curve file then the first 100 curves can be output using the "**cop**" keyword and then additional curves can be appended to the file using the "**app**" keyword.

Specifying curves using Curve Numbers

When outputting curves to a file a range of explicit curve numbers can be specified using the syntax **#start:#end**. This option only applies to curve numbers because curve tags can be defined in an arbitrary order.

CSV files

If a CSV/CSV2 file is written out from within a FAST-TCF script then by default it will contain rows containing UNIT information for the curves if UNITS have been defined. This additional information can be turned off if it isn't required (see <u>Curve Unit</u> <u>Systems</u>).

10.16. FAST-TCF ADDITIONAL

10.16.1. T/HIS Preferences and Additional Commands

T/HIS preferences and additional commands

There are a number of additional commands that improve the functionality of FAST-TCF such as labeling, resetting values, tagging curves and defining variables. All following words must be on the same line. The variables section is explained in more detail <u>below</u>

| e.g. | report | 3ms | | err | | hic |
|----------------------|---------|-----------|----------------|-----------------------|----------------|--|
| | 1.6 | to) | CF.clp written | (FAST-TCF.e to) | err written | (FAST-TCF.hic written to) |
| | define | file | | lsda (define de de | | (I -) |
| | | | | · · | a as default f | lle) |
| | сору | output. | | #1 | 11.4 · · C1 | , |
| | | (file nan | ne) | | e #1 into file | |
| | define | | | date | | 30_Nov_2005 |
| | | (define v | /ariable) | (variable na | , | (variable value) |
| Descr | ription | keyword | second word | third word | fourth word | notes |
| Autos plot | scale | ac | - | - | - | for use in interactive playback |
| Auto upda plot | te | auto | on or off | - | - | whether to auto update the plot on data read / font updates and so on. Please note this is reset to ON after any font definition. |
| Plot g | graphs | plot | - | - | - | for use in interactive playback |
| Appe into f | | арр | filename | curve name | - | will append any previous file |
| Cond | ense | condense | - | - | - | Condense the curve numbers |
| Conv | ert | convert | on or off | | | Automatically convert curves from ms units to s(econds) before applying any filters and then convert back again. |

| Define FAST-TCF variable | def | var | name (without "\$") | value | see FAST-TCF variables section |
|----------------------------------|------|-------------------------|--|------------------------|---|

| | reset3 | - | - | _ | Variable names and default title removed |
| User- defined | col | numner (1-6) | RRGGBB (6- digit hexadecimal) | - | 6-digit hexadecimal format for rgb colour values. |
| colours | col_rgb | colour number (1-6) | r g b (3 integers in | - | Seperate integer format for rgb colour values. |

10.16.2. Limits

Limits

| Description | limit | |
|---------------------|----------------|--|
| word limit per line | 80 words | |
| include file name | 150 characters | |
| tag length | 60 characters | |

10.16.3. Variables

Variables

Variable names can only have "a-z", "0-9" and "_" in them. Variables can be inserted anywhere in the script, FAST-TCF will replace any variables with their corresponding values before processing the line, for example:

define var output displacement define var nod_id 12345678 define var xscale 0.001

node \$nod id \$output x xscale \$xscale

converts into:

node 12345678 displacement x xscale 0.001

Variable definitions can contain several words or other varaibles, and these will be joined together to form the final variable value, for example:

define var day 31st define var month january define var year 2099 define var date \$day _ \$month _ \$year

creates the variable date with value 31st_january_2099

Because variables cannot have anything other than "a-z", "0-9" and "_" in them, it is possible to use variables within strings:

define var analysis run01 vers2

read january \$analysis.cur

converts into

read january_run01_vers2.cur

However, sometimes the user may want to insert a variable within other alphanumeric words, in these circumstances use a "**\$\$**" terminator to designate the end of the variable name:

```
define var analysis xyz_run01
read $analysis$$_x.cur
```

converts into

read xyz_run01_x.cur

There are several built in variables, and these depend on the system and command line used to run FAST-TCF, they can be checked on the dialogue T/HIS prints before starting:

| \$run_name | This is the basename of the key file in for the 1st model directory (should there be one). If a script refers to multiple models then \$run_name <i>N</i> (where <i>N</i> is the model number) can be used for each model. |
|-------------------------------|---|
| \$run_dir | This is the full pathname of the directory containing the output files for a model. If a script refers to multiple models then \$run_dir n (where n is the model number) can be used for each model. |
| <pre>\$run_title</pre> | This is the title of the analysis found in the output files. If a script refers to multiple models then \$run_title <i>N</i> (where <i>N</i> is the model number) can be used for each model. |
| <pre>\$ftcf_script</pre> | This is the name of the FAST-TCF that is being run |
| <pre>\$ftcf_script_dir</pre> | This is the name of the directory containing the FAST-TCF that is being run |
| \$ftcf_dir | This is the name of the current working directory. |
| <pre>\$ftcf_path</pre> | This is the full pathname of the current working directory. |
| <pre>\$ftcf_startin_dir</pre> | This is the full pathname of the directory that T/HIS was started in. |

FASTTCF called

Fasttcf script: C:\example\test.inp
tmp file: C:\example\other_folder\test.tmp
tcf file: C:\example\other_folder\test.tcf
report file: C:\example\other_folder\test.rep
\$FTCF_SCRIPT_variable: test.inp
\$FTCF_SCRIPT_DIR variable: C:\example\
\$FTCF_DIR variable: other_folder
\$FTCF_DIR variable: C:\example\other_folder
\$FTCF_PATH variable: C:\example\other_folder
\$FTCF_PATH variable: C:\example\other_folder
\$RUN_TITLE var: lg09 : Large Test 9: Belted sled test
\$RUN_DIR var: E:\test\sled
\$RUN_TITLE1 var: new_lg09
\$RUN_DIR1 var: E:\test\sled

10.16.4. Notes and Presumptions

Notes and Presumptions

- Curves must be in the format: #<curve number> to differentiate between curves and constants
- Any image will be overwritten if it already exists in the run area
- Curves are always labeled and then written to files, any other options are done in the order of input on the line
- If your line is getting too long, use a "\" to designate a continuation line FAST-TCF will then join the lines together before processing

11. Search (Quick Find)

11.1. Introduction

Introduction

Quick Find can be used to search for and quickly:

- Go to menus / functionality
- Open tutorials

It can be accessed by clicking in the Search box in the top bar or by pressing the '#' key.

Typing in the textbox brings up a list of found items that match the entered text. Items in the list can be selected by clicking on them or by using the up and down arrow keys and pressing enter. The selected item will then perform the task, e.g. open a menu.

11.2. Fuzzy Matching

Fuzzy Matching

A 'fuzzy' matching method is used to match the entered text with the searchable items. It judges that something has matched when the characters of the entered text appear in the same order as the item that can be searched for.

For example if you type 'c60' then 'Tools->Automotive-> **C60** ' would be a match, but 'Tools->Automotive-> **C1000** ' wouldn't because the '6' doesn't match. (Note that the search is case insensitive).

Additionally, if the entered search pattern contains spaces and the characters do not all match in the same order then T/HIS will look to see if the words can be swapped to find a match.

For example 'back image' would find 'Image->Background' even though the words do not appear in that order.

This hopefully makes it easier to find items as you do not need to know the precise search term.

The found items are listed in order of how closely they match the entered text so items that more closely match appear nearer the top of the list. It determines this by assigning a score to each match, with higher scores given to items that contain consecutively matched characters and if the characters appear at the start of words.

11.3. Search Terms

Search Terms

The default search term associated with a menu item is the trail of menus/buttons you would need to manually open/press, e.g. to get to the C60 filter you would need to go to **Tools**, then **Automotive** then **C60**, hence the search term 'Tools->Automotive->C60'.

In addition, some menus have alternative search terms associated with them. For example C60 can also be found from the alternative text 'SAE class 60 filter':

| Q, | SAEclass |
|----|--------------------------|
| | Tools->Automotive->C60 |
| | (SAE class 60 filter) |
| | Tools->Automotive->C180 |
| | (SAE class 180 filter) |
| | Tools->Automotive->C600 |
| | (SAE class 600 filter) |
| | Tools->Automotive->C1000 |
| | (SAE class 1000 filter) |

This can be useful for cases where you don't know or can't remember under which menu some functionality lives.

Note that the alternative text appears in brackets under the default search term so you can see how you would get to the menu manually.

If you can't find menus that you know exist in T/HIS it is likely that you are using different terminology to what we expect. If so, please contact Oasys Ltd Support and we can add alternative text based on what you are entering as your search text.

Alternative text associated with a menu may also describe some of the features on a menu. For example the text colour is set in the Display menu, but if you didn't know this it would be hard to find.

In this case the alternative text 'Text Colour' is associated with this menu:

| Q, | tex |
|----|----------------|
| | Tools->Display |
| | (Text Colour) |

11.4. Tutorials

Tutorials

The full installation of the Oasys LS-DYNA Environment software contains some pdf tutorials for various features within the software. They are installed in the \$OA_INSTALL/manuals/tutorials/this directory and can be found and opened using Quick Find.

11.5. Options

Options

There are a few options that can be set to alter how Quick Find works. These can be accessed by pressing the **Options** -> **Settings** button and choosing the **Search** tab.

- Save settings to the oa_pref file
- Set the text colours for matched and unmatched characters
- Recently selected items are saved by T/HIS and appear higher in the list of available options. By default the last ten selected items are saved, but this can be changed here. To turn it off set it to zero.
- Set the maximum number of found items to display in the list
- The size of the Search box on the top bar

12. REPORTER Integration

REPORTER INTEGRATION

This section describes how to work with D3PLOT, T/HIS and REPORTER to quickly and easily create reports from results.

12.1. Linking the Programs

Linking the Programs

REPORTER can be opened from D3PLOT and T/HIS using the REPORTER button in the top-right. This opens a linked session of REPORTER, allowing reports to be interactively created and edited. Both D3PLOT and T/HIS can be opened from inside REPORTER too, using the program buttons in the top bar of REPORTER. REPORTER can be connected to both D3PLOT and T/HIS at the same time and the D3PLOT->T/HIS link is also supported. Graphs in T/HIS are treated the same as graphs in a D3PLOT->T/HIS linked session.

12.2. Item Tree

Item Tree

Once a template is opened in REPORTER, all items in the template will appear in the Item Tree in the REPORTER panel in D3PLOT or T/HIS. Selecting an item in the Item Tree will select the corresponding item in REPORTER and vice-versa.

The Item Tree can include items of all types in REPORTER, such as textboxes and images, as well as D3PLOT, T/HIS and PRIMER items. Only placeholders, D3PLOT items and T/HIS items can be overwritten with new D3PLOT or T/HIS items. Placeholder items exist to allow a layout to be created for the report before populating it and can be converted into any other item type.

12.3. Capture

Capture

Windows and graphs can be captured into REPORTER, saving an image together with additional information to allow the capture to be reloaded later. For D3PLOT windows, this is a properties and settings file. For T/HIS graphs, this is a FAST-TCF script. Graphs captured in the D3PLOT->T/HIS link are treated exactly the same as graphs in T/HIS, so the resulting items will be identical. <u>Variables</u> containing useful values related to the models or curves in the captured window can be added to the item before capturing (see <u>Variables</u>).

Note that in the version 17.0 method, only single windows and graphs can be captured. The intention being that the windows and graphs are easily captured individually and laid out in REPORTER with greater flexibility.

In order to capture a window, first select the target item in REPORTER, either selecting it directly in REPORTER or using the item tree. You can capture into a new item by selecting 'I+ Add Item' in the item tree. Once the item is selected, the 'Resize' button on the top bar of the window can be used to resize the window to match whatever image size is specified on the selected REPORTER item, such as 'Fit object box'. Finally, either press 'Capture' on the top bar of the target window or select the window in the 'Active window' list in the REPORTER panel and press 'Capture' at the top of the panel.

| PR IP DP Vel Vec REC AC Zoom CN AI Manual Tidy IP SXY SYZ SSO A R Views Rev Stop 7 SXY SYZ SSO A R Views Rev File A Anim Draw A | |

This will send the information to REPORTER and the image will appear on the item.

12.4. Reload

Reload

Existing REPORTER items can be reloaded back into D3PLOT or T/HIS. Items captured from graphs in the D3PLOT->T/HIS link are treated the same as items captured from standalone T/HIS. As such, they can each be reloaded either into D3PLOT or T/HIS.

First select the item in REPORTER that you want to reload.

Then either press reload at the top of the target window, or select 'New Window' in the Active window list.

This will clear the target window, open the relevant models, not opening them again if they are already open in the session, then load the stored item information, reproducing the capture.

12.4.1. Reload Models

Reload Models

The models used in an existing item are listed in the Reload models list. The models will be listed as Item Mn, where n is the index of the model in the item, not of the model in the session. If the model is also open in the current session, then the model ID in the current session will be displayed in brackets.

Each entry in the list has a popup attached, allowing the model to replaced either by a model in the current session or by browsing for a model. This will not change the models stored in the item, but instead when the item is reloaded into the current session the replacement models will be used. The resulting window will then need to be captured, either into a new item or to overwrite the original.

12.5. Variables

Variables

Variables can be added to both D3PLOT and T/HIS items, allowing data related to the capture to be made available in REPORTER. The REPORTER panel can be undocked and expanded to display the variables list by selecting Show Variables.

For T/HIS items, variables can be added containing properties of any of the curves in the selected graph or all the curves combined using the All Curves option. By default, T/HIS items will have variables for the MAX and MIN values taken over all curves in the selected graph. When selecting the curve for a newly created variable using the curve popup, curves are referred to as ICn, meaning Item Curve n, where n is the index of the curve in the selected graph. The curve label and number in the current session are also displayed in the popup.

For D3PLOT items, variables can be added for the MAX and MIN values of any of the plotted data components on any of the models. By default, D3PLOT items will have variables for the MAX and MIN values of all plotted data components for each model in the selected window.

Variables can be added using the + button and deleted using the X button next to the row.

Initially, variables will appear under New Variables until the item is captured, when they will move to Existing Variables. Variables will be given default names based on their item name in REPORTER (e.g. d3plot6_1, this4), variable type and model/curve that they relate to. However, these names and descriptions can be manually edited.

For D3PLOT items, the Entity ID and Entity Type tickboxes can be used to create additional variables to contain this information. These will have the same name as the original variable with either _ENT_ID or _ENT_TYPE appended.

For T/HIS items, the Add variables containing curve label tickbox will create an additional variable containing the curve label of the relevant curve, with LABEL appended to the name.

Example of a D3PLOT item with two existing variables, referring to models in Window 1.

| I+ Add Item | | | | |

12.6. Generate

Generate

Once a complete template has been created, it can be generated using File >> Generate in REPORTER. This will generate in an existing session if there is one, otherwise a new session will be started. T/HIS items will be generated in standalone T/HIS, unless the T/HIS link is already open in D3PLOT, in which case they will generate in the link. It is faster to generate in standalone T/HIS.

12.7. Exceptions to the Version 17.0 Method and Existing Templates from Version 16.0 and Earlier

Exceptions to the Version 17.0 Method and Existing Templates from Version 16.0 and Earlier

There are some item types that are not supported in the new Version 17.0 method. In this case, the Version 16.0 method will be used and nothing will have changed. These are:

- T/HIS JavaScript items
- Items containing multiple graphs/windows

Any item can be captured and generated using the Version 16.0 method by selecting the Capture and generate this item using the old method option in the object information in REPORTER.

Existing Version 16.0 and earlier templates should work exactly as they used to. All items will use the Version 17.0 method unless they meet one of the specified exceptions above. This gives some additional benefits:

- When generating the report, all supported items will be generated in the same session, without opening the same models multiple times. This will make the process faster.
- The report can be edited interactively using all the perks of the Version 17.0 method.

13. JaDe: The JavaScript debugger

JaDe: The JavaScript debugger

JaDe is included in D3PLOT, PRIMER and T/HIS to help debug and develop JavaScripts. It is started by selecting a script and pressing the **Debug** button in the JavaScript menu in any of the programs. The initial screen is shown below.

It is fairly basic but hopefully has enough functionality for people to be able to find and fix problems in scripts.

13.1. Viewing the Script Files and Functions

Viewing the script files and functions

The main part of the window shows the script file. If your script is broken up into separate file (by using Use) then you can get a list of the different files and view them by using the **Source** popup. To go to a particular line in the file use the **goto line** textbox.

A list of the functions in the script is shown in the **Functions** menu on the top left. If you want to look at a particular function then click on the function name and the main text window will jump to the correct file and line.

13.2. Adding/Removing Breakpoints

Adding/removing breakpoints

A breakpoint is a line in the script where execution will pause in JaDe. To add a breakpoint either left click on the line you want the breakpoint on or right click on the line and select **Create breakpoint** from the popup. A red circle is then drawn on the line to show that there is an active breakpoint.

Additionally the breakpoint will also be added to the list in the breakpoint window (bottom left of JaDe). You can click on this at any time and the main text window will jump to the correct file and line.

Active breakpoints are shown with a red circle. Breakpoints can be activated/deactivated by clicking on the line again. Unactive breakpoints are shown as a grey circle instead of a red one. They are also shown in grey text in the breakpoint window.

To delete a breakpoint right click on the line and select **Delete breakpoint**. The breakpoint will be deleted.

Conditional breakpoints

Sometimes it is useful to only stop at a breakpoint if a certain condition is met. For example in the above example we may only want to stop at line 114 if mines is 10. You can do this by right clicking on the the breakpoint and selecting **Add condition**.

| - | Add breakpoint condition | | | | | |
|-----------|---------------------------|--------|--|--|--|--|
| Enter cor | Enter condition to add to | | | | | |
| breakpoi | breakpoint (e.g. n == 1) | | | | | |
| mines== | 10 | | | | | |
| | ОК | Cancel | | | | |
| | | | | | | |

A window is mapped allowing you type in the condition you want to try to meet. The condition should be a JavaScript expression which evaluates to true if you want the breakpoint to stop execution, or false if you want the breakpoint to be skipped. In this example the condition is n = 10.

If a breakpoint has a condition associated with it a C is drawn on the circle and in the breakpoint window. The condition can be edited again or removed by right clicking on the breakpoint and selecting either **Edit condition** or **Remove condition** from the popup.

13.3. Running the Script

Running the script

Running the script is controlled by the buttons at the top of the debugger window. By default the script will be run in the debugger in 'strict mode'. This tries to pick up things which you might not have intended by running the script in a stricter environment doing more checking. You can toggle this on/off by using the **strict mode** checkbox.

Starting and stopping

To start the script press the **Run** button. Execution of the script will start. If you have not defined any breakpoints then the script will run until it finishes (unless there are some script errors or <u>exceptions</u>). If there is a breakpoint then the debugger will stop execution of the script when it reaches it. If the script is running and you want to pause execution of the script at any time you can press **Interrupt**.

| | JaDe (JavaScript Debugger) | | | | | | | | | | |
|-----------------------------------|--|---|--|--|--|--|--|--|--|--|--|
| <main></main> | Run Continue Next Step Source V goto line: | × | | | | | | | | | |
| allocate_mines | Interrupt Kill Finish strict mode: 🗸 memory: | | | | | | | | | | |
| cell_clicked | Print | | | | | | | | | | |
| changed | | | | | | | | | | | |
| check_cell | 106 | | | | | | | | | | |
| confirm_exit | <pre>107 // Check for end of game 108 if (marked+cleared == rows*cols) end_game();</pre> | | | | | | | | | | |
| draw_frown | | | | | | | | | | | |
| Functions Quickwatch | 109 | | | | | | | | | | |
| | 110 } | | | | | | | | | | |
| allocate_mines (minesweeper.js:11 | 111 | | | | | | | | | | |
| start_game (minesweeper.js:160) | 112 function allocate_mines() | | | | | | | | | | |
| <main> (minesweeper.js:65)</main> | 113 { | | | | | | | | | | |
| | 114 var n = mines; | | | | | | | | | | |
| | 115 115 | | | | | | | | | | |
| | 116 while (n) | | | | | | | | | | |
| | 117 { | | | | | | | | | | |
| minesweeper.js:114 | 118 var pos = Math.round(Math.floor(rows*cols*Math. | | | | | | | | | | |
| | 119 if (pos >= 0 && pos < rows*cols) | | | | | | | | | | |
| | 120 { | | | | | | | | | | |
| | 121 if (cells[pos].mine == false) | | | | | | | | | | |
| | 122 { | | | | | | | | | | |
| | | | | | | | | | | | |
| | C:\work\test\javascript\include_test\minesweeper.js | | | | | | | | | | |

The line that the debugger has paused the script on is shown by a green triangle. In the above example it is paused at line 114. The middle panel on the left shows the <u>call</u> <u>stack</u>. See the <u>call stack section</u> for more details.

Stepping and continuing

Once the script is paused in the debugger you can step through the source code by using the **Continue**, **Next**, **Step** and **Finish** buttons.

Continue will resume execution of the script again.

Next continues to the next line in the current function. i.e. it will step *over* a function call.

Step continues execution to the next source line (which may be in a different function. i.e. it will step *into* a function call).

Finish will finish executing the current function and stop at the next line in the calling function (the function above this in the <u>call stack</u>).

Alternatively, if you want to continue until a particular line you can right click on the line you want to continue until and select **Continue to here** from the popup.

13.4. Printing the Value of a Variable

Printing the value of a variable

If you want to see the value of a variable you can type the name of the variable you want to see in the textbox at the top of the debugger and press **Print**. JaDe will evaluate the variable and output the result in the statusbar at the bottom of the debugger.

Using Quickwatch

If you want to look at the values for lots of variables it is annoying to have to type the variable name in and press **Print** for each one. A better way is to use **Quickwatch** at the top left of JaDe

Type the name of the variable that you want to watch in the **Click to add** textbox. A line will be added for the variable showing its name and value. e.g. in the following image the variable mines is being displayed and its current value is 10. If the value is very long hover over the value to get the whole string.

| mines | 10 |
|--------------|------------|
| | |
| | |
| | |
| | |
| Click to add |] |
| Functions | Quickwatch |

You can add any number of variables to watch. To remove one right click on the variable and select **Remove quickwatch** from the popup.

If a variable exists and has been assigned to then the value is displayed. e.g. mines in the following example.

If the variable exists but it has not yet had a value assigned its value is the undefined value. e.g. pos in the following example.

If the variable does not exist the value is shown as ! invalid !.e.g. fred in the following example.

| mines | 10 | | | | | | | |
|--------------|-------------|--|--|--|--|--|--|--|
| n | undefined | | | | | | | |
| pos | undefined | | | | | | | |
| fred | ! invalid ! | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| Click to add | | | | | | | | |
| Functions | Quickwatch | | | | | | | |

13.5. The Call Stack

The call stack

The call stack shows which functions have been called in the script to get to the current point. It is the middle left window in JaDe.

The top line shows the function that the script is currently paused at. The other lines show the calling functions in order. The above example can be read as:

- 1. The script starts
- 2. On line 65 in script file minesweeper.js in the 'main' program the function start_game is called.
- 3. On line 160 in script file minesweeper.js in function <code>start_game</code> the function <code>allocate_mines</code> is called
- 4. On line 114 in script file minesweeper.js in function allocate_mines the script is paused.

This information is sometimes very useful in more complicated scripts to find out the order things are done in.

The function that the user is currently looking at is highlighted in blue. You can move up or down the call stack by clicking on a line. The main text window will jump to the correct file and line. The line will be shown with a blue triangle instead of a green triangle.

13.6. Exceptions

Exceptions

Sometimes when developing a script you get errors that you need to try to investigate and fix. e.g. an object is null when it should be defined or you try to call a method that does not exist for an object. In these cases an exception is thrown by JavaScript and the script would terminate is run normally. JaDe will trap the exception and stop at the line where the exception occured. e.g. If for example you has the following code:

```
Copy Code
JavaScript
var w = new Window('Example', 0.5, 1.0, 0.5, 1.0);
w.BadMethod();
w.Show()
```

There is no method called BadMethod for a Window. JaDe will stop at this point and allow you to look at the script.

13.7. Memory Usage

Memory usage

When a script creates arrays, objects or strings it has to allocate some memory to be able to do so (for example an array storing 1,000,000 items will use considerably more memory than an array to store 100 items). To manage this memory JavaScript uses a process called 'garbage collection'. When the array, object or string goes out of scope (can no longer be reached by the script) it can be garbage collected and the memory freed. For the JavaScript engine to be able to do this it must keep track of what memory has been allocated. It does this by keeping a list of the live memory. This list also uses a small amount of memory and this memory is the garbage collection memory. The maximum size for the garbage collection memory is set when running a script.

JaDe allows you do see how much garbage collection memory has been used with a usage bar.

If you hover over the usage bar you can see exactly how much garbage collection memory is being used. As the JavaScript engine allocates memory for objects, arrays etc this will increase. When the engine performs garbage collection to free memory the usage will go down. Note that the engine will normally only perform garbage collection when it thinks it is necessary so if you run a script multiple times in JaDe the memory could continue to increase until the engine decides to do garbage collection, then the memory will reduce.

Note also that JaDe also requires some garbage collection memory to function so the bar also includes some memory for JaDe.

14. The JavaScript GUI Builder

The JavaScript GUI Builder

The JavaScript GUI Builder is an interactive GUI Builder, available in D3PLOT, PRIMER and T/HIS, making it easier to create JavaScript GUIs, removing the need to write code to create windows and widgets.

It can be started by pressing the **GUI Builder** button in the JavaScript menu in any of the programs.

| - GUI Builder Properties - | | | - GUI Builder ? | | | | | | | | | | · 🗆 🗙 |
|----------------------------|-----------------------------|------|-----------------|---------|---------|---|---|----------------|---|----------|-------|-----------------|-------|
| Alphabetical | Categorised | File | ۳ | Window: | Window1 | ٣ | V | Vindow Options | ۳ | Add Widg | ets 🔻 | General Options | . 1 |
| escription | | | | | | | | | | | | | |
| ame | Window1 | | | | | | | | | | | | |
| tie | |] | | | | | | | | | | | |
| imensions | | | | | | | | | | | | | |
| ottom | 0.400000 | 1 | | | | | | | | | | | |
| p . | 0.500000 | | | | | | | | | | | | |
| ft | 0.400000 | | | | | | | | | | | | |
| ght | 0.500000 | | | | | | | | | | | | |
| eight | 0.000000 | 1 | | | | | | | | | | | |
| ridth | 0.000000 |] | | | | | | | | | | | |
| esize | LEFT RIGHT TOP BOTTOM | | | | | | | | | | | | |
| ppearance | | | | | | | | | | | | | |
| ctive | true | | | | | | | | | | | | |
| ackground | DEFAULT | | | | | | | | | | | | |
| howClose | true | | | | | | | | | | | | |
| ehaviour | | | | | | | | | | | | | |
| nAfterShow | | 1 | | | | | | | | | | | |
| nBeforeShow | | 1 | | | | | | | | | | | |
| nClose | | 1 | | | | | | | | | | | |

You can then design and save your GUI to a file:

| ss me! | Window Options V | Add Widgets V | General Options |
|--------|------------------|---------------|-----------------|
| ss me! | | | |
| ss me! | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

Then read the file in your script to automatically generate the window and widgets:

| - | | - 🗆 🗙 |
|--------------------|-----------|-------|
| Write some text: | | |
| Press this button: | Press me! | |
| Option 1 🔹 | | |
| | | |

14.1. How to Build a GUI

How to build a GUI

The builder is split into two windows. The properties window for setting the properties of the widgets and windows and a design window for adding, positioning and resizing widgets.

| - GU | Builder Properties - | | | | GL | ll Builder | | ? = 🗆 |
|--------------|-----------------------------|------|-----------------|---|----------------|---------------------------------|---|-----------------|
| Alphabetical | Categorised | File | Window: Window1 | Ŧ | Window Options | Add Widgets | • | General Options |
| Description | | | | | | | | |

14.1.2. Move a Widget

Move a widget

Widgets can be moved by left-clicking on them and dragging, or by using arrow keys.

14.1.3. Resize a Widget

Resize a widget

Widgets can be resized by left-clicking on their border and dragging.

14.1.4. Selecting Widgets

Selecting widgets

Multiple widgets can be selected by holding the Ctrl or Shift keys and left-clicking.

Alternatively a box can be dragged around the widgets you want to select.

14.1.5. Aligning Widgets

Aligning widgets

When multiple widgets are selected the borders can be aligned by right-clicking on the widget you want to align the other widgets to, and then selecting how you want them to be aligned.

14.1.6. Setting the Properties of Widgets

Setting the properties of widgets

The properties of a widget can be modified in the properties window, e.g. change the category to CATEGORY_APPLY.

| Propertie | IS . | - |
|--|---|--------------------------|
| abetical | Categorized | |
| | | |
| B1 | | |
| | | |
| 12 | | |
| 6 | | |
| 9 | | |
| 29 | | |
| | | |
| true | | |
| CATEGORY_G | ENERIC | |
| NO_CATEGOR | RY | |
| | | |
| CATEGORY_A | | |
| CATEGORY_C | CANCEL | |
| CATEGORY_C | CANCEL DATA_ENTRY_HEADER | |
| CATEGORY_C CATEGORY_E CATEGORY_E | CANCEL DATA_ENTRY_HEADER DISMISS | |
| CATEGORY_C | CANCEL DATA_ENTRY_HEADER DISMISS ENTITY | |
| CATEGORY_C CATEGORY_C CATEGORY_C CATEGORY_E | CANCEL DATA_ENTRY_HEADER DISMISS ENTITY GENERIC | |
| | abetical B1 12 6 9 29 true CATEGORY_G | B1 12 6 9 29 |

The appearance of the widget will update in the design window. If multiple widgets are selected the property will be applied to all the selected widgets.

14.1.7. Copying and Pasting Widgets

Copying and pasting widgets

You can copy and paste widgets by right-clicking on them and selecting **Copy** and then right-clicking on the window and selecting **Paste**. The new widget will have all the same properties as the copied widget.

Alternatively you can use the shortcuts Ctrl-C and Ctrl-V.

14.1.8. Deleting Widgets

Deleting widgets

To delete a widget, right-click on it and select **Delete**. Alternatively you can press the Delete shortcut key.

14.1.9. Lock the Position of Widgets

Lock the position of widgets

To lock the position of a widget so it can't be repositioned or resized, right-click on it and select **Lock**. To unlock it again, right-click on it and select **Unlock**

14.1.10. Adding Widgetitems to Comboboxes and Listboxes

Adding widgetitems to comboboxes, listboxes and radiobuttons

To add WidgetItems to a Combobox, Listbox or Radiobutton, right-click on it and select **Edit WidgetItems**. This will update the design window where you can add WidgetItems by pressing the **Add New WidgetItem** button.

The appearance of the current WidgetItem can be modified in the same way as Widgets by clicking on the WidgetItem and updating its properties. To delete a WidgetItem, click on the - on the right hand side. Once you have finished, press **Apply** to return to the normal design window.

| GUI Bu | ilder Properti | es | |
|--------------|----------------|-------------|---|
| Alphabetical | | Categorised | |
| Description | | | |
| name | WI3 | | |
| Appearance | | | |
| background | WHITE | | • |

| | Dimensions | | |
| | Max X | 200 | |
| | Max Y | 110 | 1 |
| | Delete Curren | t Window | |

The name of the current window is displayed in the Window selection dropdown menu.

| File V | Window: Window2 🔹 | Window Options 🔻 | Add Widgets 🔻 |
|--------|-------------------|------------------|---------------|
| | | | |

To change to a different window, select it from the dropdown menu.

| File V | Window: Window2 | | • | Window | Options | s ▼ |
|--------|-----------------|--|---|--------|---------|-----|
| | Main Windows | | | | | |
| | Window1 | | | | | |
| | Window2 | | | | | |

14.1.12. PopupWindows

PopupWindows

PopupWindows can be linked to widgets by setting the popupWindow property.

| Dimensions | | |
|--|--|----------|
| bottom | 14 | |
| top | 8 | Button |
| eft | 8 | |
| right | 28 | |
| | | |
| Popups | | |

| bottom top left right PopupS popupDirection popupSymbol popupWindow Timer timerDelay timerRepeat Misc | 8 8 28 BOTTOM true PopupWindow1 | |

To remove a PopupWindow linked to a widget, set the popupWindow to <no popup>.

14.1.13. Saving and Loading a GUI

Saving and loading a GUI

The GUI can be saved to file by pressing the **Save** button and then selecting a file. The saved file is a JavaScript file containing the window and widget definitions in a JSON string, and a call to Window.BuildGUIFromString() which builds the GUI when the script is run. Further details are given in the next section.

| File | Window: Window2 |
|----------|-------------------|
| Load | |
| Save | |
| Write ra | w JavaScript file |
| Dismiss | • |

It can be reloaded by pressing the **Load** button and selecting the file to load.

| File | Vindow: Window2 |
|----------|-------------------|
| Load | - |
| Save | 2 |
| Write ra | w JavaScript file |
| Dismiss | |

The GUI can also be saved as a raw JavaScript file, with the calls to create and position the windows and widgets, explicitly defined, rather than using Window.BuildGUIFromString(). This cannot be loaded back into the GUI Builder, however it may be useful for creating GUIs to run in versions prior to v18 that don't have the Window.BuildGUIFromString() function.

| File Vindow: Window: W | dow2 |
|--|------|
| Load | |
| Save | |
| Write raw JavaScript file | |
| Dismiss | |

14.2. How to Use the GUI in a Script

How to use the GUI in a script

The GUI is saved to a JavaScript file, containing the GUI definition in a JSON string and a call to Window.BuildGUIFromString(). It is saved with the extension .jsi to indicate that it should be included from another file. You should not need to edit this file.

When saving the GUI a *.js file is also written to demonstrate how to include the *.jsi file and display the GUI. This can be used as a template to follow and modify.

It is written to the same folder as the *.jsi file and named

<jsi_filename>_TEMPLATE.js, e.g. if the *.jsi file is called demo.jsi, the *.js file will be saved as demo_TEMPLATE.js

The following sections explain how you can reference the Windows, Widgets and WidgetItem objects within your script.

14.2.1. Read the GUI Into a Script

Read the GUI Into a Script

To read the GUI in a script you need to include the *.jsi file with the Use() function.

This will create a global variable (gui by default) containing all the GUI objects. The name of the variable can be changed in the GUI builder menu under General Options.

For example, to include the GUI saved in C:\my_gui.jsi:

Use("C:\\my_gui.jsi");

14.2.2. Accessing the Window Objects

Accessing the Window objects

The GUI Window objects are stored as properties on the global GUI object. The name of the property is whatever was defined in the properties window in the GUI builder.

| - Properties | | | | | |
|--------------|-----------|-------------|--|--|--|
| Alpha | betical | Categorized | | | |
| Description | | | | | |
| name | my_window | | | | |
| title | | | | | |

To display the Window called **my_window** use the Show() method:

if (gui) gui.my_window.Show();

14.2.3. Accessing the Widget Objects

Accessing the Widget objects

Similarly, each Widget object is a property of the Window object. The name of the Widget property is whatever was defined in the properties window in the GUI builder.

| GUI Builder Properties | | | - | - | | |
|------------------------|------------|-------------|---|-------------|-------|------|
| Alphabetical | | Categorised | | Dismiss | Load | Save |
| Description | | | | Window: Wir | ndow1 | • |
| name | btnExample | | | | | |
| Dimensions | | | | | _ | |
| bottom | 10 | | | Button |] | |
| top | 4 | | | | | |

For example if the window is called **my_window** and the widget is called **btnExample**, the Widget object can be accessed and modified with.

var btn = gui.my_window.btnExample;

btn.text = Test;

14.2.4. Accessing the Widgetitem Objects

Accessing the WidgetItem objects

WidgetItem objects are a property of the Widget.

| - | GUI Builder Pro | perties | - | | |
|-------------|-----------------|-------------|----------------|-------|------|
| Alphabe | tical | Categorised | Dismiss | Load | Save |
| Description | | | Window: Wi | ndow1 | • |
| name | btnExan | nple | | | |
| Dimensions | | | | | |
| bottom | 10 | | Button | | |
| top | 4 | | | | |

For, example if the Window is called **my_window**, the Widget the WidgetItem is on is called **cbxExample** and the widget item is called **wi1**, it can be accessed and modified with.

var wi = gui.my_window.cbxExample.wi1;

14.2.5. Defining Callback Functions

Defining callback functions

Callback functions (onClick, onChange, etc.) can be assigned to the window and widgets in the properties window, by adding the name of a function to call.

For example to set the onClick property of a widget so it calls a function called **pressed**:

| Functions | |
|-----------|---------|
| onClick | pressed |
| onPopup | |
| onTimer | |

This function then needs to be defined in your script:

Use("C:\\test.jsi");

```
if (gui) gui.my_window.Show();
```

```
function pressed()
```

{

Message("You clicked me!");

}

15. Fonts on Linux

Fonts on Linux

Prior to version 17.0, the software used "legacy" X11 fixed fonts on Linux, from version 17.0 onwards, it uses Freetype fonts, which give improved appearance and a wider range of typefaces.

The recommended proportional font for menu panels is "DejaVu Sans Condensed" which is widely available on Linux, but you can change this using **Options, Menu attributes** where a different font can be selected from those available on your system. For example on the author's CentOS 7 system the choice of fonts is:

15.1. The Range of Fonts Available

The range of fonts available

The range of fonts you see on your system will depend on the version of Linux you are using and what fonts you have installed; the image above was captured from a CentOS 7 machine.

Oasys LS-DYNA Environment software interrogates the font server to extract all available fonts, then sorts them for presentation purposes by spacing (proportional or monospaced) and weight (normal, light, bold). The "recommended" fonts, as shown in the right hand popup menu above, are simply those which have been found by trial and error to give the best appearance. However this is a very subjective matter, and you may prefer something different: choose something that you like then use **Save Settings** to save it. If you change your mind later you can always come back to this panel to select something else.

Helvetica is provided as an option for backwards compatibility with the older user interface; it is not natively available on Linux so a different font is substituted, which tends not to look very good in Freetype.

Monospaced font selection problems

We have observed that while proportional font selection works correctly on Linux, the selection of monospaced fonts seems to have some bugs:

- The default "courier" font works, but tends to produce a font that is too small in some situations and probably is not exactly courier, although it looks very similar.
- The "recommended" monospaced font on some systems comes out as "Courier 10 Pt Regular", which is a genuine courier font, however if you select that it will produce something completely different. Experiment shows that if you ask for "Courier 10 Pt" then you get what you expect, but appending "Regular" breaks the font selection somehow

This appears to be a "fontconfig" problem: the system's font server simply gets it wrong. This can be demonstrated by the command

fc-match "font of your choice"

for example fc-match "courier" on a RHEL 7 machine produces the result "Nimbus Mono PS" "Regular"

If you are happy with the monospaced font used for help texts and the like you don't need to take any action, however if you want to change it you may need to experiment a bit to find something that looks good on your system by typing different variations of

names into the "Listing font: [.....]" text entry box. You can use the "fc-match" command in conjunction with this to see what the font server will map your request onto. Once you have found something satisfactory use **Save Settings** to save it in your oa_pref file and it will be remembered for future use.

15.2. Plain Versus Anti-aliased Fonts

Plain versus Anti-aliased fonts

On some monitors, especially relatively low resolution ones, the anti-aliasing of fonts can result in quite fuzzy text. The quality of this will depend on the version of Freetype installed, and more recent Linuxes will tend to look better since they are more likely to use sub-pixel sampling.

Some users may prefer the cruder but sharper appearance of the original "core X11" legacy fonts, and these can be used by changing to **Plain** so long as you actually have these fonts loaded on your machine. On the CentOS 7 machine being used to create this manual page the equivalent "plain" font image of the above is:

If you try this on your machine and it doesn't work then it means that you need to load the legacy font package(s), see below.

Loading legacy Core X11 fonts

You don't need to load these, it is only necessary if you want the old-style "plain" appearance described in the section above.

You will need root privileges to install these, so unless you are familiar with working as root and using commands such as "rpm", "yum" or "yast" please seek help from your IT department, or alternatively contact Oasys Ltd for help.

The best fonts to install are the 75 dots per inch (dpi) ones, which can be obtained online for a range of common Linux operating systems from <u>https://pkgs.org/download/xorg-x11-fonts-75dpi</u>

If that fails you may already have the relevant packages in your installation files, you should look for (in order)

RedHat/CentOS

```
xorg-x11-fonts-75dpi
xorg-x11-fonts-IS08859-1-75dpi
xorg-x11-fonts-Type1
xorg-x11-fonts-misc
xorg-x11-fonts-100dpi
xorg-x11-fonts-IS08859-1-100dpi
```

You don't have to install all of these.

The 75dpi and 100dpi font packages are the same typefaces at different resolutions. You should choose the one which gives the best looking results on your display, but in the author's experience the 75dpi one looks fine but the 100dpi one looks as if a spider was let loose with a leaky pen! Always try the 75dpi one first.

To manage fonts on RHEL/CentOS do the following:

- Log in as root
- To see the X11 fonts currently installed type "yum list installed | grep xorg | grep font"
- To see X11 fonts available but not installed "yum list available | grep xorg | grep font"
- To install something "yum install package", for example "yum install xorg-x11-fonts-75dpi"

You can list the range of "yum" commands available with "man yum".

16. Appendices

16.1. APPENDIX A - Ansys LS-DYNA Data Components

16.1.1. Model Data Components

Model Data Components

The following global data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|----------------------------|-----------------|-----------------|------------------|-------|
| DT | Time Step | yes | | yes | yes |
| KE | Kinetic energy | yes | | yes | yes |
| IE | Internal energy | yes | | yes | yes |
| SWE | Stonewall energy | | | yes | yes |
| SPE | Spring and damper energy | | | yes | yes |
| HG | Hourglass energy | | | yes | yes |
| SDE | System damping energy | | | yes | yes |
| JE | Joint internal energy | | | yes | yes |
| SIE | Sliding interface energy | | | yes | yes |
| EW | External work | | yes | yes | yes |
| RBE | Rigid Body stopper energy | | | yes | |
| TE | Total energy | yes | | yes | yes |
| TER | Total/initial energy ratio | | | yes | yes |
| VX | Average X velocity | yes | | yes | yes |
| VY | Average Y velocity | yes | | yes | yes |
| VZ | Average Z velocity | yes | | yes | yes |
| TZC | Time per zone cycle | | | yes | yes |
| AM | Added mass | | | yes | yes |
| PM | %age Mass increase | | | yes | yes |
| EKE | Eroded Kinetic energy | | | yes | yes |
| EIE | Eroded Internal energy | | | yes | yes |
| EHG | Eroded Hourglass energy | | | yes | yes |

| ER | Energy Ratio w/o Eroded | | yes | yes |
|------|--|--|-----|-----|
| DRCE | Current Distortional Kinetic Energy | | | yes |
| DRMX | Maximum Distortional Kinetic Energy | | | yes |
| DRCO | Convergence Factor | | | yes |
| DRKE | Total Kinetic Energy | | | yes |
| MPE | Mat Plastic Energy | | yes | yes |
| MEE | Mat Elastic Energy | | yes | yes |
| MDE | Mat Damage Energy | | yes | yes |
| DIE | Dissipated Internal Energy | | yes | yes |
| DKE | Disssipated Kinetic Energy | | yes | yes |
| DE | Drilling Energy | | yes | yes |

16.1.2. Part Data Components

Part Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|-------------------------|-----------------|-----------------|------------------|-------|
| KE | Kinetic energy | yes | | yes | yes |
| IE | Internal energy | yes | | yes | yes |
| HG | Hourglass energy | | | yes | yes |
| TE | Total energy | yes | | yes | yes |
| ХМ | X momentum | | | yes | yes |
| YM | Y momentum | | | yes | yes |
| ZM | Z momentum | | | yes | yes |
| VX | Average X velocity | yes | | yes | yes |
| VY | Average Y velocity | yes | | yes | yes |
| VZ | Average Z velocity | yes | | yes | yes |
| MA | Mass | yes | | yes | yes |
| EIE | Eroded Internal energy | | | yes | yes |
| ER | Energy Ratio w/o Eroded | | | yes | yes |
| MPE | Mat Plastic Energy | | | yes | |
| MEE | Mat Elastic Energy | | | yes | |
| MDE | Mat Damage Energy | | | yes | |

For Parts the following data components are available.

16.1.3. Part Group Data Components

Part Group Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|------------------|-----------------|-----------------|------------------|-------|
| KE | Kinetic energy | yes | | yes | yes |
| IE | Internal energy | yes | | yes | yes |
| HG | Hourglass energy | yes | | yes | yes |
| TE | Total energy | yes | | yes | yes |
| MA | Mass | yes | | yes | yes |

For Part Groups the following data components are available.

16.1.4. Nodal Data Components

Nodal Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|----------------------------------|-----------------|-----------------|------------------|-------|
| TE | Temperature | yes | | yes | yes |
| DX | X Displacement | yes | | yes | yes |
| DY | Y Displacement | yes | | yes | yes |
| DZ | Z Displacement | yes | | yes | yes |
| DM | Displacement Magnitude | yes | | yes | yes |
| VX | X Velocity | yes | | yes | yes |
| VY | Y Velocity | yes | | yes | yes |
| VZ | Z Velocity | yes | | yes | yes |
| VM | Velocity Magnitude | yes | | yes | yes |
| AX | X Acceleration | yes | | yes | yes |
| AY | Y Acceleration | yes | | yes | yes |
| AZ | Z Acceleration | yes | | yes | yes |
| AM | Acceleration Magnitude | yes | | yes | yes |
| СХ | X Co-ordinate | | | yes | yes |
| CY | Y Co-ordinate | | | yes | yes |
| CZ | Z Co-ordinate | | | yes | yes |
| RX | X Rotation | | | yes | yes |
| RY | Y Rotation | | | yes | yes |
| RZ | Z Rotation | | | yes | yes |
| RM | Rotation Magnitude | | | yes | yes |
| RVX | X Rotational Velocity | | | yes | yes |
| RVY | Y Rotational Velocity | | | yes | yes |
| RVZ | Z Rotational Velocity | | | yes | yes |
| RVM | Rotational Velocity Magnitude | | | yes | yes |

For nodes the following data components are available.

| RAX | X Rotational Acceleration | | yes | yes |
|-----|--------------------------------------|--|-----|-----|
| RAY | Y Rotational Acceleration | | yes | yes |
| RAZ | Z Rotational Acceleration | | yes | yes |
| RAM | Rotational Acceleration Magnitude | | yes | yes |
| FLX | X Thermal Flux | | yes | yes |
| FLY | Y Thermal Flux | | yes | yes |
| FLZ | Z Thermal Flux | | yes | yes |
| FLM | Thermal Flux Magnitude | | yes | yes |

Frequency Domain Analysis

For a steady state dynamic analysis (SSD) the following nodal data components are available. For each data component both amplitude and phase angle data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|----------------|-----------------|-----------------|------------------|-------|
| DX | X Displacement | | | yes | |
| DY | Y Displacement | | | yes | |
| DZ | Z Displacement | | | yes | |
| VX | X Velocity | | | yes | |
| VY | Y Velocity | | | yes | |
| VZ | Z Velocity | | | yes | |
| AX | X Acceleration | | | yes | |
| AY | Y Acceleration | | | yes | |
| AZ | Z Acceleration | | | yes | |

For a random vibration analysis (PSD) the following nodal data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|------------------------|-----------------|-----------------|------------------|-------|
| DX | X Displacement | yes | | yes | yes |
| DY | Y Displacement | yes | | yes | yes |
| DZ | Z Displacement | yes | | yes | yes |
| DM | Displacement Magnitude | yes | | yes | yes |

| VX | X Velocity | yes | yes | yes |
|----|------------------------|-----|-----|-----|
| VY | Y Velocity | yes | yes | yes |
| VZ | Z Velocity | yes | yes | yes |
| VM | Velocity Magnitude | yes | yes | yes |
| AX | X Acceleration | yes | yes | yes |
| AY | Y Acceleration | yes | yes | yes |
| AZ | Z Acceleration | yes | yes | yes |
| AM | Acceleration Magnitude | yes | yes | yes |

Only nodes that have been declared in "nodal time-history blocks" will be available for processing. To get a list of available node numbers in command line mode use the \mathbf{M} (enu) command.

Coordinate system of results

All nodal results are in the global cartesian coordinate system **except** at nodes which have been defined as accelerometers: these report accelerations in the local coordinate system of the accelerometer subject to any rotations its "parent" rigid body has undergone.

16.1.5. Solid Data Components

Solid Data Components

THF XTF LSDA Component ASCII (d3thdt) (xtfile) (binout) **Stress components** Stress in XX SXX yes yes SYY Stress in YY yes yes SZZ Stress in ZZ yes yes SXY Stress in XY yes yes SYZ Stress in YZ yes yes Stress in ZX SZX yes yes SMX Maximum Principal Stress yes yes SMN Minimum Principal Stress yes yes SMS Maximum Shear Stress yes yes SVM Von Mises Stress yes yes SAV Average Stress (Pressure) yes yes STR Stress Triaxiality Factor yes yes Strain components EFF **Effective Plastic Strain** yes yes EXX Strain in XX yes yes EYY Strain in YY yes yes EZZ Strain in ZZ yes yes EXY Strain in XY yes yes EYZ Strain in YZ yes yes EZX Strain in ZX yes yes EMX Maximum Principal Strain yes yes EMN Minimum Principal Strain yes yes EMS Maximum Shear Strain yes yes EVM Von Mises Strain yes yes

For solids the following data components are available.

| EAV | Average Strain | yes | | yes | | |
|--------------------|----------------------|-----|--|-----|--|--|
| "Extra" components | | | | | | |
| SOEn | Extra Data Component | yes | | yes | | |

Frequency Domain Analysis

For a steady state dynamic analysis (SSD) the following nodal data components are available. For each data component both amplitude and phase angle data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | |
|--------------|-------------------|-----------------|-----------------|------------------|-------|--|--|
| Stress compo | Stress components | | | | | | |

|-------------|-------------------|--|--|-----|--|--|--|
| SYZ | Stress in YZ | | | yes | | | |
| SZX | Stress in ZX | | | yes | | | |
| SVM | Von Mises Stress | | | yes | | | |
| Strain comp | Strain components | | | | | | |
| EXX | Strain in XX | | | yes | | | |
| EYY | Strain in YY | | | yes | | | |
| EZZ | Strain in ZZ | | | yes | | | |
| EXY | Strain in XY | | | yes | | | |
| EYZ | Strain in YZ | | | yes | | | |
| EZX | Strain in ZX | | | yes | | | |

Coordinate systems of results

The stress and strain tensors are reported in the global cartesian system unless the option to output results in the part coordinate system has been used. Writing the directional strain tensor is optional in Ansys LS-DYNA: it will only appear in the menu if it is present.

"Extra" data components

The "extra" data components (**soEn**) are also optional and only appear if present in the database. They are material dependent results, and are treated as scalar data of unknown type by T/HIS.

16.1.6. Beam Data Components

Beam Data Components

For beams the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|--------------|-----------------------------------|-----------------|-----------------|------------------|-------|
| Basic data d | components | | | | |
| NX | Axial force | yes | | yes | |
| NY | Shear force in Y | yes | | yes | |
| NZ | Shear force in Z | yes | | yes | |

| MZ | Moment in Z | | | yes | |
| MX | Torsional moment | | | yes | |
| Integration point data | | | | | |
| SXX | Axial stress | | | yes | |
| SXY | XY shear stress | | | yes | |
| SZX | ZX shear stress | | | yes | |
| EFF | Effective plastic strain | | | yes | |

| ΓVV | Avial strain | | 1405 | |
|-----|--------------|--|------|--|
| EXX | Axial strain | | yes | |

16.1.6.1. Additional Beam Results: Written if Requested from Ansys LS-DYNA

Additional Beam Results: written if requested from Ansys LS-DYNA

In addition to the basic data components additional beam results may be output to the .**THF** file for both Belytschko-Schwer and Hughes-Lui beam elements. As no indication of the element type is written to the .**THF** file it is impossible for T/HIS to work out whether a specific element is a Belytschko-Schwer or a Hughes-Lui beam. As the element type is unknown the user must know which element type a beam is in order to extract the correct results.

Belytschko-Schwer Beams

If you have used Belytschko-Schwer beams with a resultant plastic material model the following "plastic" results will also be written out to .**THF** file: (Note that these data are written even if the ***DATABASE_EXTENT_BINARY** card field **< beamip >** is not set - the presence of a resultant beam material triggers their output automatically. This is not the case for Hughes-Liu data components, for which output must be requested explicitly, see below.)

Coordinate systems of results

Beam results are always output in the element local coordinate system. Only beams declared in "beam element time-history blocks" will be available.

"Extra" data components

Where "extra" results are written, and T/HIS cannot resolve unambiguously whether they are Belytschko-Schwer plastic data, or Hughes-Liu stress/strain data, **it is your responsibility to interpret the results correctly**.

Notes on beam data

1. Hughes-Liu (integrated) beams locate their integration point(s) at mid-span, and have a constant shear force and moment along their length.

The location and number of integration points through the thickness at mid span depends on the beam shape. See the *SECTION_BEAM keyword in the Ansys LS-DYNA manual for more information.

 Belytschko-Schwer (resultant) beams calculate the moment variation along the beam, so may have different Myy and Mzz terms at ends one and two. This presents a problem when only the basic force and moment vector is written since only one Myy and one Mzz term are output. These are in fact the values at end 1. So if you have a cantilever fixed at end 2, with a point load at end 1,

you will not see any moment in it if you only plot the basic Myy or Mzz data components (although the moment will be there and it will behave correctly). Furthermore, the sign of the end 1 Myy and Mzz moments written to the extra data slots is opposite to the sign of the basic moment vector Myy and Mzz moments so care must be taken in interpreting the direction of moments when switching between basic and extra data component moments.

16.1.7. Shell Data Components

Shell Data Components

For shells the following data components are available. These combine with directions for the data component, and in some cases a location through the shell thickness.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | |
|-----------|---------------------------|-----------------|-----------------|------------------|-------|--|
| Stress co | Stress components | | | | | |
| SXX | Stress in XX | yes | | yes | | |
| SYY | Stress in YY | yes | | yes | | |
| SZZ | Stress in ZZ | yes | | yes | | |
| SXY | Stress in XY | yes | | yes | | |
| SYZ | Stress in YZ | yes | | yes | | |
| SZX | Stress in ZX | yes | | yes | | |
| SMX | Maximum Principal Stress | yes | | yes | | |
| SMN | Minimum Principal Stress | yes | | yes | | |
| SMS | Maximum Shear Stress | yes | | yes | | |
| SVM | Von Mises Stress | yes | | yes | | |
| SAV | Average Stress (Pressure) | yes | | yes | | |
| STR | Stress Triaxiality Factor | yes | | yes | | |
| Strain co | mponents | | | | | |
| EFF | Effective Plastic Strain | yes | | yes | | |
| EXX | Strain in XX | yes | | yes | | |
| EYY | Strain in YY | yes | | yes | | |
| EZZ | Strain in ZZ | yes | | yes | | |
| EXY | Strain in XY | yes | | yes | | |
| EYZ | Strain in YZ | yes | | yes | | |
| EZX | Strain in ZX | yes | | yes | | |
| EMX | Maximum Principal Strain | yes | | yes | | |
| EMN | Minimum Principal Strain | yes | | yes | | |
| EMS | Maximum Shear Strain | yes | | yes | | |

| EVM | Von Mises Strain | yes | | yes | |

| EXX | Strain in XX | | | yes | |
| EYY | Strain in YY | | | yes | |
| EZZ | Strain in ZZ | | | yes | |
| EXY | Strain in XY | | | yes | |
| EYZ | Strain in YZ | | | yes | |
| EZX | Strain in ZX | | | yes | |

16.1.7.1. THF (d3thdt) File

THF (d3thdt) File

| Stress | Stress tensors are in the global cartesian system unless the option to use material axes has been invoked for orthotropic materials (CMPFLG on *DATABASE_EXTENT_BINARY). By default results are available at top and bottom integration points and mid-surface but values can be output for all through thickness integration points by using MAXINT on *DATABASE_EXTENT_BINARY |
|---------------------|--|
| Strain | The Strain tensors output is optional. Values are in the global cartesian system unless the option to use material axes has been invoked for orthotropic materials (CMPFLG on *DATABASE_EXTENT_BINARY). Only values at the top and bottom integration points are output. T/HIS will average these values for the mid surface. |
| Forces & Moments | Force and moment resultants are <data> per unit width, and are written in the element local axis system. Refer to "Theory of Plates and Shells", Timoshenko, for a precise definition of these values.</data> |
| Extra | The "Extra History" data components will only appear in the menu if they have been selected for output (NEIPS on *DATABASE_EXTENT_BINARY). These are output for the same surfaces / integration points as the stress tensor values. |

Through Thickness Integration Points

NOTE: The top and bottom "surfaces" are **not** the outer fibres if the default Gaussian integration rules are used, but rather the outer and inner integration points. The relationship between integration point location and shell thickness depends on the number of integration points used.

The following diagram shows locations of integration points with respect to shell half-thickness (t/2) assuming the default Gaussian integration rules have been used:

No of Points Distance of outer fibres from neutral axis as a proportion of t/2

- 1 0.0 (membrane)
- 2 0.577 t/2
- 3 0.775
- 4 0.861 t/2
- 5 0.906

The "top" (or outer) point is on the positive local Z side of the element neutral axis. The output of shell data from Ansys LS-DYNA will fall into one of two categories, and the "surface" options available in T/HIS depend on this.

NOTE: It is possible to use non-default integration schemes in Ansys LS-DYNA which may locate the integration points at different places. This is an advanced topic: contact Oasys Ltd Support for advice.

Default output case: 3 "surfaces"

In this case, regardless of how many integration points the shell elements may actually have through their thickness, Ansys LS-DYNA writes out:

| Top surface : | Top integration point |
|---------------------|-----------------------------|
| Centre surface : | Computed neutral axis value |
| Bottom surface : | Bottom integration point |

Note that the "centre" surface here is the neutral axis value. For membrane elements all three sets of values will be the same.

Optional output case: user-defined number of integration points

The number of through thickness integration points written to the THF file can be modified using the value of MAXINT on the *DATABASE_EXTENT_BINARY card. If this parameter is changed then all thin and thick shell output written to the THF file will have MAXINT data slots for integration points in the file, regardless of how many integration points a given element may have through its thickness.

If MAXINT is not 3 then the order in which data is written to the THF file is controlled by the actual number of integration points of integration points in a shells formulation. The following table illustrates output for the case of MAXINT not equal to 3

| Data slot in file | Shell with 3 Integration points | Shell with 5 Integration points | Shell with any other nunber of integration points |
|-------------------------|---------------------------------|---------------------------------|---|
| #1 | Middle | Middle | Bottom |
| #2 | Bottom | Bottom | I |
| #3 | Тор | Bottom + 1 | |

| #4 | zero | Тор - 1 | |
|----|------|---------|-----|
| #5 | zero | Тор | Тор |
| #6 | zero | zero | |

NOTE: The THF file does NOT contain any information on the number of integration points each shell was defined with.

No explicit neutral axis value is calculated or output.

The outcome of writing more integration points than have been used in a shell formulation is undefined.

There is no guarantee that the "centre" surface in this context is the neutral axis value: this will depend upon the element integration scheme. In addition where the "centre" value has been averaged from a pair of points, when the number of layers is an even number, it will definitely not be the neutral axis value: consider plastic strain in a section in pure bending!

The ZTF file generated by PRIMER can help to resolve some of these problems.

THF File + ZTF File

If a ZTF file had been generated using PRIMER then T/HIS can use additional information from the ZTF to correctly work out the number of integration points each shell element was defined with. If an attempt is made to output data for a surface that does not exist in the THF file then T/HIS will generate a warning message and a NULL curve will be generated.

In addition to working out the correct number of through thickness integration points for each element T/HIS can also use the information in the ZTF to identify models where MAXINT has been set to a -ve number in order to generate data for multiple in-plane integration points.

| | MAXINT = 6, no ZTF file | MAXINT = 6, ZTF file present | MAXINT = 9, no ZTF file | MAXINT = 9, ZTF file present |
|--|--------------------------------|---------------------------------|--------------------------------|---------------------------------|

|--|---|--|---------------------------|---------------------------|
|--|---|--|---------------------------|---------------------------|

In-plane Integration Points

In some versions of Ansys LS-DYNA it is now possible to write out data for all 4 in-plane integration points for fully integrated shells by setting MAXINT on the *DATABASE_EXTENT_BINARY card to a -ve number. For example specifying a value of -8 will generate data for 8 layers each with 4 in-plane integration points. If this option is used then all the elements will be written out using this option regardless of whether they are fully integrated or not.

As there is no information in the THF to indicate that data for 4 in-plane integration points has been written to the file then the file format will be exactly the same as for an analysis with a +ve value of MAXINT 4 times larger. For example MAXINT = -8 and MAXINT = 32 will both produce THF files with 32 integration points worth of data and there is no way for T/HIS to know which value of MAXINT was used to generate the data. The ZTF file generated by PRIMER can help to resolve this problem.

If multiple in-plane integration points are written to the THF file then they are written in the following order.

Layer 1 - in-plane int point #1 Layer 2 - in-plane int point #1 Layer n - in-plane int point #1 Layer 1 - in-plane int point #2 Layer 2 - in-plane int point #2 Layer n - in-plane int point #2 Layer 1 - in-plane int point #3

••••

NOTE: If non fully integrated shells are included in the list of elements written to the THF file then in some versions of Ansys LS-DYNA the 2nd, 3rrd and 4th inplane values will all be zero. Care should therefore be taken if the 4 in-plane values are averaged.

In some versions of Ansys LS-DYNA the 1st in-plane integration point is correctly written out using the global axis system while the 2nd, 3rd and 4th in-plane values are written using the elements local coordinate system. Care should therefore be taken if the 4 in-plane values are averaged.

16.1.7.2. LSDA (binout) File

LSDA (binout) File

| Stress | By default stress tensors are in the local element coordinate system. Values are written out for all the through thickness and in-plane integration points. |
|---------------------|--|
| Strain | The Strain tensors output is optional. By defaul the values are in the local element coordinate systems and only values at the top and bottom integration points are output. T/HIS will average these values for the mid surface. |
| Forces & Moments | These are not written to the LSDA file. |
| Extra | By default "Extra" data components are not written to the LSDA file. Some recent versions of Ansys LS-DYNA can now write the"Extra" data components to the LSDA file if the parameters OPTION1, OPTION2, OPTION3 and OPTION4 are set on the *DATABASE_ELOUT card. |

Global v Local coordinate system results

The LSDA file can contain both ELOUT and ELOUTDET data components. By default T/HIS uses the data from ELOUTDET as ELOUT only contains a subset of the data in ELOUDET.

In some versions of Ansys LS-DYNA it is possible to change the Shell and ThickShell data components written to the ELOUT so that they are defined using the Global coordinate system (see EOCS on *CONTROL_OUTPUT) instead of the default local element coordinate system If this option is used then only the ELOUT file is modified, the ELOUDET file is still written using the local element coordinate system.

If T/HIS detects that the LSDA file contains both ELOUT and ELOUDET and that they are using different coordinate systems then T/HIS will display an additional option can be used to force T/HIS to use the ELOUT file data instead of the ELOUTDET data.

Through Thickness Integration Points (surfaces/layers)

Unlike the THF file the LSDA file can contain different numbers of integration points for each element. This means that if "Top" surface is selected T/HIS can correctly identify which integration point it needs to read data from.

By default strain tensors are only written out for the top and bottom surfaces and T/HIS averages these for the mid surface values. In recent versions of Ansys LS-DYNA the

parameter INTOUT on the *DATABASE_EXTENT_BINARY card can change this so that strain tensor values are written out for all the through thickness integration points. T/HIS does not currently support these additional values.

In-plane Integration Points

By default the LSDA file will contain data for all 4 in-plane integration points for any fully integrated shells. As with the THF file by default there is no information in the LSDA file to tell the difference between a shell with 32 through thickness integration points and a shell with 8 through thickness layers and 4 in-plane points per layer. If a ZTF file written by PRIMER is present then T/HIS can use the extra information on the ZTF to work out which elements have multiple in-plane points.

If the parameter INTOUT on the *DATABASE_EXTENT_BINARY card is set then the format of the LSDA file is changed and the LSDA file then contains enough information for T/HIS to identify the shells with multiple in-plane integration points without the ZTF file.

In addition to changing the format of the LSDA file setting INTOUT on the *DATABASE_EXTENT_BINARY card also outputs strain tensor values at each in-plane integration point as well as all the through thickness layers. T/HIS does not currently support strain values from multiple in-plane integration points.

Extrapolated Stress / Strain Values

The parameter NODOUT on the *DATABASE_EXTENT_BINARY card "gaa" can be used to generate stress and strain values that have been extrapolated to the nodal positions instead of values at the elements integration points. T/HIS does not currently support these extrapolated values.

16.1.8. Thick Shell Data Components

Thick Shell Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-------------|---------------------------|-----------------|-----------------|------------------|-------|
| Stress comp | onents | | | | |
| SXX | Stress in XX | yes | | yes | |
| SYY | Stress in YY | yes | | yes | |
| SZZ | Stress in ZZ | yes | | yes | |
| SXY | Stress in XY | yes | | yes | |
| SYZ | Stress in YZ | yes | | yes | |
| SZX | Stress in ZX | yes | | yes | |
| SMX | Maximum Principal Stress | yes | | yes | |
| SMN | Minimum Principal Stress | yes | | yes | |
| SMS | Maximum Shear Stress | yes | | yes | |
| SVM | Von Mises Stress | yes | | yes | |
| SAV | Average Stress (Pressure) | yes | | yes | |
| STR | Stress Triaxiality Factor | yes | | yes | |
| Strain comp | onents | | | | |
| EFF | Effective Plastic Strain | yes | | yes | |
| EXX | Strain in XX | yes | | yes | |
| EYY | Strain in YY | yes | | yes | |
| EZZ | Strain in ZZ | yes | | yes | |
| EXY | Strain in XY | yes | | yes | |
| EYZ | Strain in YZ | yes | | yes | |
| EZX | Strain in ZX | yes | | yes | |
| EMX | Maximum Principal Strain | yes | | yes | |
| EMN | Minimum Principal Strain | yes | | yes | |
| EMS | Maximum Shear Strain | yes | | yes | |
| EVM | Von Mises Strain | yes | | yes | |

For thick shells the following data components are available.

| EAV | Average Strain | yes | yes | |
|--------------------|----------------------|-----|-----|--|
| "Extra" components | | | | |
| An | Extra Data Component | yes | yes | |

Frequency Domain Analysis

For a steady state dynamic analysis (SSD) the following nodal data components are available. For each data component both amplitude and phase angle data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-------------|--------------|-----------------|-----------------|------------------|-------|
| Stress comp | onents | | | | |
| SXX | Stress in XX | | | yes | |
| SYY | Stress in YY | | | yes | |
| SZZ | Stress in ZZ | | | yes | |
| SXY | Stress in XY | | | yes | |
| SYZ | Stress in YZ | | | yes | |
| SZX | Stress in ZX | | | yes | |
| Strain comp | onents | | | | |
| EXX | Strain in XX | | | yes | |
| EYY | Strain in YY | | | yes | |
| EZZ | Strain in ZZ | | | yes | |
| EXY | Strain in XY | | | yes | |
| EYZ | Strain in YZ | | | yes | |
| EZX | Strain in ZX | | | yes | |

For a random vibration analysis (PSD) the following nodal data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|--------------|--------------|-----------------|-----------------|------------------|-------|
| Stress compo | onents | | | | |
| SXX | Stress in XX | | | yes | |
| SYY | Stress in YY | | | yes | |
| SZZ | Stress in ZZ | | | yes | |

| SXY | Stress in XY | | yes | |
|------------|------------------|--|-----|--|
| SYZ | Stress in YZ | | yes | |
| SZX | Stress in ZX | | yes | |
| SVM | Von Mises Stress | | yes | |
| Strain com | oonents | | | |
| EXX | Strain in XX | | yes | |
| EYY | Strain in YY | | yes | |
| EZZ | Strain in ZZ | | yes | |
| EXY | Strain in XY | | yes | |
| EYZ | Strain in YZ | | yes | |
| EZX | Strain in ZX | | yes | |

16.1.8.1. THF (d3thdt) File

THF (d3thdt) File

| Stress | Stress tensors are in the global cartesian system unless the option to use material axes has been invoked for orthotropic materials (CMPFLG on *DATABASE_EXTENT_BINARY). By default results are available at top and bottom integration points and mid-surface but values can be output for all through thickness integration points by using MAXINT on *DATABASE_EXTENT_BINARY |
|--------|--|
| Strain | The Strain tensors output is optional. Values are in the global cartesian system unless the option to use material axes has been invoked for orthotropic materials (CMPFLG on *DATABASE_EXTENT_BINARY). Only values at the top and bottom integration points are output. T/HIS will average these values for the mid surface. |
| Extra | The "Extra Historyl" data components will only appear in the menu if they have been selected for output (NEIPS on *DATABASE_EXTENT_BINARY). These are output for the same surfaces / integration points as the stress tensor values. |

Through Thickness Integration Points

NOTE: The top and bottom "surfaces" are **not** the outer fibres if the default Gaussian integration rules are used, but rather the outer and inner integration points. The relationship between integration point location and shell thickness depends on the number of integration points used.

The following diagram shows locations of integration points with respect to shell half-thickness (±/2) assuming the default Gaussian integration rules have been used:

No of Points Distance of outer fibres from neutral axis as a proportion of t/2

- 1 0.0 (membrane)
- 2 0.577 t/2
- 3 0.775
- 4 0.861 t/2
- 5 0.906

The "top" (or outer) point is on the positive local Z side of the element neutral axis. The output of shell data from Ansys LS-DYNA will fall into one of two categories, and the "surface" options available in T/HIS depend on this.

NOTE: It is possible to use non-default integration schemes in Ansys LS-DYNA which may locate the integration points at different places. This is an advanced topic: contact Oasys Ltd Support for advice.

Default output case: 3 "surfaces"

In this case, regardless of how many integration points the shell elements may actually have through their thickness, Ansys LS-DYNA writes out:

| Top surface : | Top integration point |
|---------------------|-----------------------------|
| Centre surface : | Computed neutral axis value |
| Bottom surface : | Bottom integration point |

Note that the "centre" surface here is the neutral axis value. For membrane elements all three sets of values will be the same.

Optional output case: user-defined number of integration points

The number of through thickness integration points written to the THF file can be modified using the value of MAXINT on the *DATABASE_EXTENT_BINARY card. If this parameter is changed then all thin and thick shell output written to the THF file will have MAXINT data slots for integration points in the file, regardless of how many integration points a given element may have through its thickness.

If MAXINT is not 3 then the order in which data is written to the THF file is controlled by the actual number of integration points of integration points in a shells formulation. The following table illustrates output for the case of MAXINT not equal to 3

| Data slot in file | Thick Shell with 3 Integration points | Thick Shell with any other nunber of integration points |
|----------------------|---------------------------------------|--|
| #1 | Middle | Bottom |
| #2 | Bottom | |
| #3 | Тор | |

| #4 | zero | |
|----|------|-----|
| #5 | zero | Тор |
| #6 | zero | |

NOTE: The THF file does NOT contain any information on the number of integration points each shell was defined with.

No explicit neutral axis value is calculated or output.

The outcome of writing more integration points than have been used in a shell formulation is undefined.

There is no guarantee that the "centre" surface in this context is the neutral axis value: this will depend upon the element integration scheme. In addition where the "centre" value has been averaged from a pair of points, when the number of layers is an even number, it will definitely not be the neutral axis value: consider plastic strain in a section in pure bending!

The ZTF file generated by PRIMER can help to resolve some of these problems.

THF File + ZTF File

If a ZTF file had been generated using PRIMER then T/HIS can use additional information from the ZTF to correctly work out the number of integration points each shell element was defined with. If an attempt is made to output data for a surface that does not exist in the THF file then T/HIS will generate a warning message and a NULL curve will be generated.

In addition to working out the correct number of through thickness integration points for each element T/HIS can also use the information in the ZTF to identify models where MAXINT has been set to a -ve number in order to generate data for multiple in-plane integration points.

| | MAXINT = 6, no ZTF file | MAXINT = 6, ZTF file present | MAXINT = 9, no ZTF file | MAXINT = 9, ZTF file present |
|--|--------------------------------|---------------------------------|--------------------------------|---------------------------------|
| Thick Shell 1 has 4 integration points | Undefined (#int points < 6) | Correct (int point #4) | Undefined (#int points < 9) | Correct (int point #4) |
| Thick Shell 2 has 6 integration points | Correct (int point #6) | Correct (int point #6) | Undefined (#int points < 9) | Correct (int point #6) |

Effect of plotting "Top" surface on models with MAXINT = 6 and MAXINT = 9 whit and without a ZTF file.

| Thick Shell 3 has | • | Warning | Correct (int | Correct (int |
|-------------------|-------------|-----------------|--------------|--------------|
| 9 integration | integration | message as #int | point #9) | point #9) |
| points | point) | points < 6 | point #9) | point #9) |

In-plane Integration Points

In some versions of Ansys LS-DYNA it is now possible to write out data for all 4 in-plane integration points for fully integrated shells by setting MAXINT on the *DATABASE_EXTENT_BINARY card to a -ve number. For example specifying a value of -8 will generate data for 8 layers each with 4 in-plane integration points. If this option is used then all the elements will be written out using this option regardless of whether they are fully integrated or not.

As there is no information in the THF to indicate that data for 4 in-plane integration points has been written to the file then the file format will be exactly the same as for an analysis with a +ve value of MAXINT 4 times larger. For example MAXINT = -8 and MAXINT = 32 will both produce THF files with 32 integration points worth of data and there is no way for T/HIS to know which value of MAXINT was used to generate the data. The ZTF file generated by PRIMER can help to resolve this problem.

If multiple in-plane integration points are written to the THF file then they are written in the following order.

Layer 1 - in-plane int point #1 Layer 2 - in-plane int point #1 Layer n - in-plane int point #1 Layer 1 - in-plane int point #2 Layer 2 - in-plane int point #2 Layer n - in-plane int point #2 Layer 1 - in-plane int point #3

••••

NOTE: If non fully integrated shells are included in the list of elements written to the THF file then in some versions of Ansys LS-DYNA the 2nd, 3rrd and 4th inplane values will all be zero. Care should therefore be taken if the 4 in-plane values are averaged.

In some versions of Ansys LS-DYNA the 1st in-plane integration point is correctly written out using the global axis system while the 2nd, 3rd and 4th in-plane values are written using the elements local coordinate system. Care should therefore be taken if the 4 in-plane values are averaged.

16.1.8.2. LSDA (binout) File

LSDA (binout) File

| Stress | By default stress tensors are in the local element coordinate system. Values are written out for all the through thickness and in-plane integration points. |
|--------|--|
| Strain | The Strain tensors output is optional. By default values are in the local element coordinate systems and only values at the top and bottom integration points are output. T/HIS will average these values for the mid surface. |
| Extra | By default "Extra" data components are not written to the LSDA file. Some recent versions of Ansys LS-DYNA can now write the"Extra" data components to the LSDA file if the parameters OPTION1, OPTION2, OPTION3 and OPTION4 are set on the *DATABASE_ELOUT card. |

Global v Local coordinate system results

The LSDA file can contain both ELOUT and ELOUTDET data components. By default T/HIS uses the data from ELOUTDET as ELOUT only contains a subset of the data in ELOUDET.

In some versions of Ansys LS-DYNA it is possible to change the Shell and ThickShell data components written to the ELOUT so that they are defined using the Global coordinate system (see EOCS on *CONTROL_OUTPUT) instead of the default local element coordinate system If this option is used then only the ELOUT file is modified, the ELOUDET file is still written using the local element coordinate system.

If T/HIS detects that the LSDA file contains both ELOUT and ELOUDET and that they are using different coordinate systems then T/HIS will display an additional option can be used to force T/HIS to use the ELOUT file data instead of the ELOUTDET data.

Through Thickness Integration Points (surfaces/layers)

Unlike the THF file the LSDA file can contain different numbers of integration points for each element. This means that if "Top" surface is selected T/HIS can correctly identify which integration point it needs to read data from.

By default strain tensors are only written out for the top and bottom surfaces and T/HIS averages these for the mid surface values. In recent versions of Ansys LS-DYNA the parameter INTOUT on the *DATABASE_EXTENT_BINARY card can change this so that strain tensor values are written out for all the through thickness integration points. T/HIS does not currently support these additional values.

In-plane Integration Points

By default the LSDA file will contain data for all 4 in-plane integration points for any fully integrated shells. As with the THF file by default there is no information in the LSDA file to tell the difference between a shell with 32 through thickness integration points and a shell with 8 through thickness layers and 4 in-plane points per layer. If a ZTF file written by PRIMER is present then T/HIS can use the extra information on the ZTF to work out which elements have multiple in-plane points.

If the parameter INTOUT on the *DATABASE_EXTENT_BINARY card is set then the format of the LSDA file is changed and the LSDA file then contains enough information for T/HIS to identify the shells with multiple in-plane integration points without the ZTF file.

In addition to changing the format of the LSDA file setting INTOUT on the *DATABASE_EXTENT_BINARY card also outputs strain tensor values at each in-plane integration point as well as all the through thickness layers. T/HIS does not currently support strain values from multiple in-plane integration points.

Extrapolated Stress / Strain Values

The parameter NODOUT on the *DATABASE_EXTENT_BINARY card can be used to generate stress and strain values that have been extrapolated to the nodal positions instead of values at the elements integration points. T/HIS does not currently support these extrapolated values.

16.1.9. Rigid Wall Data Components

Rigid Wall Data Components

For rigid walls the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|----------------|-----------------|-----------------|------------------|-------|
| FN | Normal force | | yes | yes | yes |
| FX | Global X force | | | yes | yes |
| FY | Global Y force | | | yes | yes |
| FZ | Global Z force | | | yes | yes |

16.1.10. Discrete Element (Spring/Damper) Data Components

Discrete Element (Spring/Damper) Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |

16.1.18. Cross Section Data Components

Cross Section Data Components

For cross sections the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|-----------------------|-----------------|-----------------|------------------|-------|
| FX | X Force | | | yes | yes |
| FY | Y Force | | | yes | yes |
| FZ | Z Force | | | yes | yes |
| RM | Force Magnitude | | | yes | yes |
| MX | Moment in X | | | yes | yes |
| MY | Moment in Y | | | yes | yes |
| MZ | Moment in Z | | | yes | yes |
| MM | Moment Magnitude | | | yes | yes |
| СХ | X centroid coordinate | | | yes | yes |
| CY | Y centroid coordinate | | | yes | yes |
| CZ | Z centroid coordinate | | | yes | yes |
| AR | Area of Cross Section | | | yes | yes |

16.1.19. Subsystem Data Components

Subsystem Data Components

For subsystems the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | | | |
|--------------|-----------------------|-----------------|-----------------|------------------|-------|--|--|--|--|
| Energy | Energy | | | | | | | | |
| KE | Kinetic energy | | | yes | yes | | | | |
| IE | Internal energy | | | yes | yes | | | | |
| HG | Hourglass energy | | | yes | yes | | | | |
| KR | Kinetic energy ratio | | | yes | yes | | | | |
| IM | Internal energy ratio | | | yes | yes | | | | |
| Momentum | | | | | | | | | |
| ХМ | X momentum | | | yes | yes | | | | |
| YM | Y momentum | | | yes | yes | | | | |
| ZM | Z momentum | | | yes | yes | | | | |
| Mass | | | | | | | | | |
| ТМ | Total Mass | | | yes | yes | | | | |
| СМ | Center of Mass | | | yes | | | | | |
| ХСМ | X Center of Mass | | | yes | yes | | | | |
| YCM | Y Center of Mass | | | yes | yes | | | | |
| ZCM | Z Center of Mass | | | yes | yes | | | | |
| Inertia Tens | ors | | | | | | | | |

| P33 | Principal Directions Row13 | | | yes | yes | | | |

16.1.20. Geometric Contact Data Components

Geometric Contact Data Components

For geometric contact entities the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|------------------|-----------------|-----------------|------------------|-------|
| FX | X Force | | | yes | yes |
| FY | Y Force | | | yes | yes |
| FZ | Z Force | | | yes | yes |
| RM | Force Magnitude | | | yes | yes |
| MX | Moment in X | | | yes | yes |
| MY | Moment in Y | | | yes | yes |
| MZ | Moment in Z | | | yes | yes |
| MM | Moment Magnitude | | | yes | yes |

16.1.21. Nodal Rigid Body Data Components

Nodal Rigid Body Data Components

For nodal rigid bodies the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|----------------------------------|-----------------|-----------------|------------------|-------|
| DX | X Displacement | | | yes | yes |
| DY | Y Displacement | | | yes | yes |
| DZ | Z Displacement | | | yes | yes |
| DM | Displacement Magnitude | | | yes | yes |
| VX | X Velocity | | | yes | yes |
| VY | Y Velocity | | | yes | yes |
| VZ | Z Velocity | | | yes | yes |
| VM | Velocity Magnitude | | | yes | yes |
| AX | X Acceleration | | | yes | yes |
| AY | Y Acceleration | | | yes | yes |
| AZ | Z Acceleration | | | yes | yes |
| AM | Acceleration Magnitude | | | yes | yes |
| СХ | X Co-ordinate | | | yes | yes |
| CY | Y Co-ordinate | | | yes | yes |
| CZ | Z Co-ordinate | | | yes | yes |
| RX | X Rotation | | | yes | yes |
| RY | Y Rotation | | | yes | yes |
| RZ | Z Rotation | | | yes | yes |
| RM | Rotation Magnitude | | | yes | yes |
| RVX | X Rotational Velocity | | | yes | yes |
| RVY | Y Rotational Velocity | | | yes | yes |
| RVZ | Z Rotational Velocity | | | yes | yes |
| RVM | Rotational Velocity Magnitude | | | yes | yes |
| RAX | X Rotational Acceleration | | | yes | yes |
| RAY | Y Rotational Acceleration | | | yes | yes |

| RAZ | Z Rotational Acceleration | | yes | yes |
|------|--------------------------------------|--|-----|-----|
| RAM | Rotational Acceleration Magnitude | | yes | yes |
| D11 | Direction Cosine 11 | | yes | |
| D12 | Direction Cosine 12 | | yes | |
| D13 | Direction Cosine 13 | | yes | |
| D21 | Direction Cosine 21 | | yes | |
| D22 | Direction Cosine 22 | | yes | |
| D23 | Direction Cosine 23 | | yes | |
| D31 | Direction Cosine 31 | | yes | |
| D32 | Direction Cosine 32 | | yes | |
| D33 | Direction Cosine 33 | | yes | |
| LDX | Local X Displacement | | yes | yes |
| LDY | Local Y Displacement | | yes | yes |
| LDZ | Local Z Displacement | | yes | yes |
| LVX | Local X Velocity | | yes | yes |
| LVY | Local Y Velocity | | yes | yes |
| LVZ | Local Z Velocity | | yes | yes |
| LAX | Local X Acceleration | | yes | yes |
| LAY | Local Y Acceleration | | yes | yes |
| LAZ | Local Z Acceleration | | yes | yes |
| LRX | Local X Rotation | | yes | yes |
| LRY | Local Y Rotation | | yes | yes |
| LRZ | Local Z Rotation | | yes | yes |
| LRVX | Local X Rotational Velocity | | yes | yes |
| LRVY | Local Y Rotational Velocity | | yes | yes |
| LRVZ | Local Z Rotational Velocity | | yes | yes |
| LRAX | Local X Rotational Acceleration | | yes | yes |
| LRAY | Local Y Rotational Acceleration | | yes | yes |
| LRAZ | Local Z Rotational | | yes | yes |

16.1.22. Spotweld Data Components

Spotweld Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|--|-----------------|-----------------|------------------|----------|
| AX | Axial force | | | yes | yes |
| SH | Shear force | | | yes | yes |
| LE | Length | | | yes | yes |
| FT | Failure Time | | | yes | yes |
| FA | Failure | | | yes | yes |
| MM | Moment Magnitude | | | yes | yes |
| ТО | Torsion | | | yes | yes |
| - | additional data components a emblies if the DCFAIL file is writ | | ilable for S | Solid Spotw | elds and |
| FF | DC Failure Function | | | yes | yes |
| NF | Normal Failure Term | | | yes | yes |
| SF | Shear Failure Term | | | yes | yes |
| BF | Bending Failure Term | | | yes | yes |
| AR | Spotweld Area | | | yes | yes |

For spotwelds the following data components are available.

The DCFAIL file contains additional data for spotweld solids and clusters models using the _DAIMLERCHRYSLER version of *MAT_SPOTWELD (this version of the material does not support beam elements). The file contains additional failure data showing how close to failure the spotweld is in tension, shear, bending and torsion, in addition it contains another copy the normal spotweld forces written to the SWFORC file.

The new data components appear under the SOLID and ASSEMBLY sub types within the SPOTWELD menu. If the SWFORC file is also present then the normal forces and read from the SWFORC file, if the SWFORC file doesn't exist but the DCFAIL file does then the data components (Normal, shear forces etc) that are mirrored in the DCFAIL file are read from there instead.

As the DCFAIL file only contains the ID's and not the types or each connection then it is not possible to tell from the DCFAIL file alone which items are solids and which ones are spotweld clusters. If the SWFORC file is present then T/HIS used the information in this file to match up the ID's and work out the type of each item in the DCFAIL file. If the

SWFORC file isn't present then it attempts to use the data in the ZTF file to work out the types.

16.1.23. SPC Data Components

SPC Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|------------------|-----------------|-----------------|------------------|-------|
| FX | X Force | | | yes | yes |
| FY | Y Force | | | yes | yes |
| FZ | Z Force | | | yes | yes |
| FM | Force Magnitude | | | yes | yes |
| MX | Moment in X | | | yes | yes |
| MY | Moment in Y | | | yes | yes |
| MZ | Moment in Z | | | yes | yes |
| MM | Moment Magnitude | | | yes | yes |

For SPC's the following data components are available.

16.1.24. Boundary Condition Data Components

Boundary Condition Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | | | |
|---------------|--|-----------------|-----------------|------------------|--------------|--|--|--|--|
| For Pressure | For Pressure and Force Boundary conditions the following components are available. | | | | | | | | |
| FX | Applied X Force | | | yes | yes | | | | |
| FY | Applied Y Force | | | yes | yes | | | | |
| FZ | Applied Z Force | | | yes | yes | | | | |
| FR | Applied Resultant force | | | yes | yes | | | | |
| EN | Energy from applied force | | | yes | yes | | | | |
| For Nodal Ve | locity Boundary conditions th | ne following | g compone | ents are ava | ailable. | | | | |
| FX | Boundary condition motion X Force | | | yes | yes | | | | |
| FY | Boundary condition motion Y Force | | | yes | yes | | | | |
| FZ | Boundary condition motion Z Force | | | yes | yes | | | | |
| FR | Resultant Boundary condition motion force | | | yes | yes | | | | |
| EN | Energy from Boundary condition motion | | | yes | yes | | | | |
| For Rigid Boo | ly Velocity Boundary conditio | ns the follo | wing com | ponents ar | e available. | | | | |
| FX | Boundary condition motion X Force | | | yes | yes | | | | |
| FY | Boundary condition motion Y Force | | | yes | yes | | | | |
| FZ | Boundary condition motion Z Force | | | yes | yes | | | | |
| FR | Resultant Boundary condition motion force | | | yes | yes | | | | |
| EN | Energy from Boundary condition motion | | | yes | yes | | | | |

For SPC's the following data components are available.

| IVI X | Boundary condition motion X Moment | | yes | yes |
|-------|---------------------------------------|--|-----|-----|
| MY | Boundary condition motion Y Moment | | yes | yes |
| MZ | Boundary condition motion Z Moment | | yes | yes |
| ММ | Boundary condition | | yes | yes |

16.1.25. FSI Data Components

FSI Data Components

For Fluid structural interactions the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|-------------------------|-----------------|-----------------|------------------|-------|
| PR | Pressure | | | | yes |
| FX | X Force | | | | yes |
| FY | Y Force | | | | yes |
| FZ | Z Force | | | | yes |
| FM | Force Magnitude | | | | yes |
| PL | Porous Leakage | | | | yes |
| MF | Mass Flux | | | | yes |
| LFX | Leakage X Force | | | | yes |
| LFY | Leakage X Force | | | | yes |
| LFZ | Leakage X Force | | | | yes |
| LFM | Leakage Force Magnitude | | | | yes |
| TE | Part Temperature | | | | yes |
| Х | X Co-ordinate of Sensor | | | | yes |
| Y | Y Co-ordinate of Sensor | | | | yes |
| Z | Z Co-ordinate of Sensor | | | | yes |
| PR | Pressure | | | | yes |
| SO | Cpld Solid ID | | | | yes |
| TE | Temperature at Sensor | | | | yes |

16.1.26. SPH Data Components

SPH Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|------------------|-----------------|-----------------|------------------|-------|
| DE | Density | | | yes | yes |
| EXX | Strain in XX | | | yes | yes |
| EYY | Strain in YY | | | yes | yes |
| EZZ | Strain in ZZ | | | yes | yes |
| EXY | Strain in XY | | | yes | yes |
| EYZ | Strain in YZ | | | yes | yes |
| EZX | Strain in ZX | | | yes | yes |
| EFS | Effective Stress | | | yes | yes |
| SXX | Stress in XX | | | yes | yes |
| SYY | Stress in YY | | | yes | yes |
| SZZ | Stress in ZZ | | | yes | yes |
| SXY | Stress in XY | | | yes | yes |
| SYZ | Stress in YZ | | | yes | yes |
| SZX | Stress in ZX | | | yes | yes |
| SM | Smoothing Length | | | yes | yes |

For SPH's the following data components are available.

16.1.27. Tracer Data Components

Tracer Data Components

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|-----|--------------------------|-----------------|-----------------|------------------|-------|
| СХ | X Co-ordinate | | | yes | yes |
| CY | Y Co-ordinate | | | yes | yes |
| CZ | Z Co-ordinate | | | yes | yes |
| CV | Current vector | | | yes | yes |
| VX | X Velocity | | | yes | yes |
| VY | Y Velocity | | | yes | yes |
| VZ | Z Velocity | | | yes | yes |
| VM | Velocity Magnitude | | | yes | yes |
| SXX | Stress in XX | | | yes | yes |
| SYY | Stress in YY | | | yes | yes |
| SZZ | Stress in ZZ | | | yes | yes |
| SXY | Stress in XY | | | yes | yes |
| SYZ | Stress in YZ | | | yes | yes |
| SZX | Stress in ZX | | | yes | yes |
| EFP | Effective Plastic Strain | | | yes | yes |
| DE | Density | | | yes | yes |
| RV | Relative volume | | | yes | yes |
| AC | Active | | | yes | yes |

For tracers the following data components are available.

16.1.28. Pulley Data Components

Pulley Data Components

For pulleys the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|----|------------|-----------------|-----------------|------------------|-------|
| FT | Force | | | yes | yes |
| SL | Slip | | | yes | yes |
| SR | Slip Rate | | | yes | yes |
| AN | Warp Angle | | | yes | yes |

16.1.29. ICFD Data Components

ICFD Data Components

For ICFD results the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | | |
|--------------|----------------------------|-----------------|-----------------|------------------|-------|--|--|--|
| ICFD Nodes a | ICFD Nodes and ICFD Points | | | | | | | |
| СХ | X Co-ordinate | | | | yes | | | |
| CY | Y Co-ordinate | | | | yes | | | |
| CZ | Z Co-ordinate | | | | yes | | | |
| CV | Current vector | | | | yes | | | |
| VX | X Velocity | | | | yes | | | |
| VY | Y Velocity | | | | yes | | | |
| VZ | Z Velocity | | | | yes | | | |
| VM | Velocity Magnitude | | | | yes | | | |
| AVX | X AVelocity | | | | yes | | | |
| AVY | Y AVelocity | | | | yes | | | |
| AVZ | Z AVelocity | | | | yes | | | |
| AVM | AVelocity Magnitude | | | | yes | | | |
| PR | Pressure | | | | yes | | | |
| DE | Density | | | | yes | | | |
| VC | Viscosity | | | | yes | | | |
| VTX | X Vorticity | | | | yes | | | |
| VTY | Y Vorticity | | | | yes | | | |
| VTZ | Z Vorticity | | | | yes | | | |
| VTM | Vorticity Magnitude | | | | yes | | | |
| QC | Q Critical | | | | yes | | | |
| VT | Viscous Turbulence | | | | yes | | | |
| PA | P Average | | | | yes | | | |
| LS | LSet | | | | yes | | | |
| A | Alpha | | | | yes | | | |
| TE | Temperature | | | | yes | | | |

| ICFD Drag | 5 | | | |
|-----------|-----------------------------------|--|----------|-----|
| FPX | X Pressure Drag | | | yes |
| FPY | Y Pressure Drag | | | yes |
| FPZ | Z Pressure Drag | | | yes |
| FPM | Pressure Drag Magnitude | | | yes |
| FVX | X Viscous Drag | | | yes |
| FVY | Y Viscous Drag | | | yes |
| FVZ | Z Viscous Drag | | | yes |
| FVM | Viscous Drag Magnitude | | | yes |
| MPX | MX Pressure Drag | | | yes |
| MPY | MY Pressure Drag | | | yes |
| MPZ | MZ Pressure Drag | | | yes |
| MPM | Pressure Drag Moment Magnitude | | | yes |
| MVX | MX Viscous Drag | | | yes |
| MVY | MY Viscous Drag | | | yes |
| MVZ | MZ Viscous Drag | | | yes |
| MVM | Viscous Drag Moment Magnitude | | | yes |
| ICFD Tem | perature | | <u>.</u> | |
| ΤΑΑ | Temperature Area Average | | | yes |
| TSA | Temperature Sum Average | | | yes |
| TEH | Average Heat Flux | | | yes |
| AR | Total Area | | | yes |
| НТС | Heat Transfer Coefficient | | | yes |
| ICFD ICV | | | | |
| PR | Pressure | | yes | yes |
| VO | Volume | | yes | yes |
| ICFD ICVI | | | | |
| AR | Area | | yes | yes |
| FR | Flow Rate | | yes | yes |

16.1.30. CESE Data Components

CESE Data Components

For CESE results the following data components are available.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | | |
|------------------------------|--------------------------|-----------------|-----------------|------------------|-------|--|--|--|
| CESE Element and CESE Points | | | | | | | | |
| СХ | X Co-ordinate | | | | yes | | | |
| СҮ | Y Co-ordinate | | | | yes | | | |
| CZ | Z Co-ordinate | | | | yes | | | |
| CV | Current vector | | | | yes | | | |
| VX | X Velocity | | | | yes | | | |
| VY | Y Velocity | | | | yes | | | |
| VZ | Z Velocity | | | | yes | | | |
| VM | Velocity Magnitude | | | | yes | | | |
| VTX | X Vorticity | | | | yes | | | |
| VTY | Y Vorticity | | | | yes | | | |
| VTZ | Z Vorticity | | | | yes | | | |
| VTM | Vorticity Magnitude | | | | yes | | | |
| DE | Density | | | | yes | | | |
| PR | Pressure | | | | yes | | | |
| TE | Temperature | | | | yes | | | |
| CESE FSI Dra | ag | | | | | | | |
| FPX | X Pressure Force | | | | yes | | | |
| FPY | Y Pressure Force | | | | yes | | | |
| FPZ | Z Pressure Force | | | | yes | | | |
| FPM | Pressure Force Magnitude | | | | yes | | | |
| CESE Segme | nt Set Drag | | | | | | | |
| FPX | X Pressure Force | | | | yes | | | |
| FPY | Y Pressure Force | | | | yes | | | |
| FPZ | Z Pressure Force | | | | yes | | | |
| FPM | Pressure Force Magnitude | | | | yes | | | |

| FVX | X Viscous Force | | yes |
|-----|-------------------------|--|-----|
| FVY | Y Viscous Force | | yes |
| FVZ | Z Viscous Force | | yes |
| FVM | Viscous Force Magnitude | | yes |
| AR | Total Area | | yes |

16.1.31. EM Data Components

EM Data Components

For EM results the following da

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII | | | |
|-------------|-----------------------------------|-----------------|-----------------|------------------|-------|--|--|--|
| EM Element, | EM Element, EM Node and EM Points | | | | | | | |
| CX | X Co-ordinate | | | | yes | | | |
| CY | Y Co-ordinate | | | | yes | | | |
| CZ | Z Co-ordinate | | | | yes | | | |
| CV | Current vector | | | | yes | | | |
| ECX | X Current | | | | yes | | | |
| ECY | Y Current | | | | yes | | | |
| ECZ | Z Current | | | | yes | | | |
| ECM | Current Magnitude | | | | yes | | | |
| BFX | X BField | | | | yes | | | |
| BFY | Y BField | | | | yes | | | |
| BFZ | Z BField | | | | yes | | | |
| BFM | BField Magnitude | | | | yes | | | |
| AFX | X AField | | | | yes | | | |
| AFY | Y AField | | | | yes | | | |
| AFZ | Z AField | | | | yes | | | |
| AFM | AField Magnitude | | | | yes | | | |
| S | Sigma | | | | yes | | | |
| MUR | Mu-R | | | | yes | | | |
| JHR | JHRate | | | | yes | | | |

| LDZ | Local Z Displacement | | | | yes |
| LAX | Local X Angle | | | | yes |
| LAY | Local Y Angle | | | | yes |
| LAZ | Local Z Angle | | | | yes |

For bearings the following data components are available.

16.1.35. DE to Surface Coupling Contact Data Components

DE to Surface Coupling Contact Data Components

For non-tied coupling interfaces between discrete element spheres (DES) and surfaces defined by shell part(s) or solid part(s) contacts, the following data components are available. This component is also known as DEMRCF in T/HIS.

| | Component | THF (d3thdt) | XTF (xtfile) | LSDA (binout) | ASCII |
|------|------------------|-----------------|-----------------|------------------|-------|
| FX | X Force | | | yes | yes |
| FY | Y Force | | | yes | yes |
| FZ | Z Force | | | yes | yes |
| FM | Force Magnitude | | | yes | yes |
| MX | X Moment | | | yes | yes |
| MY | Y Moment | | | yes | yes |
| MZ | Z Moment | | | yes | yes |
| MM | Moment Magnitude | | | yes | yes |
| Mass | Mass | | | yes | yes |

16.2. APPENDIX B - T/HIS Curve File Format

APPENDIX B - T/HIS CURVE FILE FORMAT

A curve file is a file of x, y values which can be read into T/HIS for plotting. It can be written by T/HIS or by another program, or created using a text editor.

The format is as flexible as possible to allow many types of data to be handled.

| Line 1 | : | Title |
|----------|---|--------------|
| Line 2 | : | X axis label |
| Line 3 | : | Y axis label |
| Line 4 | : | Curve label |
| Line 5 | : | X, Y point 1 |
| Line 6 | : | X, Y point 2 |
| : | | : |
| Line n+4 | : | X, Y point n |

The X and Y values can be in any format as long as the two values are separated by either a space or comma. Up to 500000 points can be input.

Several curves can be put in one file sequentially, separated by the word CONTINUE. The title and three label lines must be present for each curve.

A comment line may be included anywhere in the file by starting the line with a '\$'.

Comment lines above the curve's title can contain styles and curve tags associated with the corresponding curve.

16.2.1. Curve STYLE Information

Curve STYLE Information

From version 9.1 onwards T/HIS will recognise a line starting **\$ STYLE** as a style request for the following curve and the curve will be displayed with the corresponding style

A **\$ STYLE** line will take the format

\$ STYLE : LINE STYLE, LINE COLOUR, LINE WIDTH, LINE SYMBOLS, SYMBOL FREQUENCY

The following **\$ STYLE** options are available:

| Style options | Available styles | Default |
|------------------|---|------------------------|
| LINE STYLE | solid dash none | solid |
| LINE COLOUR | white red green blue cyan magenta yellow orange turquoise indigo lime | dependent on curve# |
| LINE WIDTH | fine normal bold heavy | normal |
| LINE SYMBOLS | triangle square diamond hourglass cross circle start dot null | dependent on curve# |
| SYMBOL FREQUENCY | frequency number (integer) | |

16.2.2. Curve TAGs

Curve TAGs

T/HIS will recognise a line starting with **\$ TAG** as a tag for the following curve and the tag can be used in T/HIS to reference the corresponding curve

a **\$ TAG** line will take the format

\$ TAG : tag name

16.2.3. Curve UNITs

Curve UNITs

From version 9.4 onwards a T/HIS curve file can also contain information on the Unit system and the X and Y axis units.

A unit system is defined by a line starting with **\$ UNIT SYSTEM** and will take the format

\$ UNIT SYSTEM : system name

The following unit systems names can be specified by using either the full name or just " **Un** ."

U1: m, kg, s (SI) U2: mm, t, s U3: mm, kg, ms U4: mm, g, ms U5: ft, slug, s U6: m, t, s

The X and Y axis units are defined by a line starting with either **\$ X AXIS UNIT** or **\$ Y AXIS UNIT** and take one of the 2 following formats

\$ X AXIS UNIT : unit name \$ X AXIS UNIT : mass,length,time,angle,temperature,current

For the 1st format thefollowing predefined unit names are available.

| Time | Rotation | Momentum | Energy Den |
|--------------|-----------|----------|--------------|
| Energy | Rot Vel | Density | Mass Flow |
| Work | Rot Accel | Stress | Frequency |
| Temperature | Length | Strain | Power |
| Displacement | Area | Force | Thermal Flux |
| Velocity | Volume | Moment | Force width |
| Accel Mass | | Pressure | Moment width |

If the axis units are NOT one of these predefined units then the second input format can be used to define the unit in terms of it's basic properties. The values for **mass**, **length, time, angle, temperature** and **current** should be the powers that are used to describe the unit in terms of it's fundamental dimensions.

Some examples of common units defined using this method are shown below.

| Unit | Mass | Length | Time | Angle | Temperature | Current |
|--------------|------|--------|------|-------|-------------|---------|
| Time | 0.0 | 0.0 | 1.0 | 0.0 | 0.0 | 0.0 |
| Displacement | 0.0 | 1.0 | 0.0 | 0.0 | 0.0 | 0.0 |

| Velocity | 0.0 | 1.0 | -1.0 | 0.0 | 0.0 | 0.0 |
|--------------|------|-----|------|-----|-----|-----|
| Acceleration | 0.0 | 1.0 | -2.0 | 0.0 | 0.0 | 0.0 |
| Stress | -1.0 | 1.0 | -2.0 | 0.0 | 0.0 | 0.0 |

16.2.4. Example

Example

The following example shows a curve file containing 2 curves.

The first curve will be plotted with a bold, solid, green line with triangular symbols every other data point. The curve contains 5 data points and is given a reference tag CURVE_1

The second curve will be plotted with a dashed, white, normal line. No symbols will be displayed. The curve contains 2 data points and has no reference tag.

Notes:

The abscissa (x axis) values are assumed to be in the correct order. The free format allowed for the data points. The style line must contain 5 comma separated words in the order LINE STYLE, LINE COLOUR, LINE WIDTH, LINE SYMBOLS, SYMBOL FREQUENCY to be successfully understood by T/HIS.

If any words are unspecified in the style line, as in curve 2, T/HIS will take the default option.

16.3. APPENDIX C - T/HIS Bulk Data File Format

APPENDIX C - T/HIS BULK DATA FILE FORMAT

Format of a T/HIS Bulk Data File.

A bulk data file contains a number of curves that share the same X values.

The format of the file is as follows:

| Line 1 | : | Title |
|-------------|---|--|
| Line 2 | : | Number of curves (maximum 12) |
| Line 3 | : | Format, see <u>Note 1</u> below |
| Line 4 | : | Multipliers on values, see <u>Note 2</u> below |
| Line 5 | : | Axis labels, see <u>Note 3</u> below |
| Line 6 | : | Line labels, see <u>Note 4</u> below |
| Line 7 | : | X, Y1, Y2, Y3 point 1 |
| Line 8 | : | X, Y1, Y2, Y3 point 2 |
| Line n+6 | : | X, Y1, Y2, Y3 point n |

Up to 500000 points can be read in for each curve.

- Note 1 The format for the point data must be given as a standard Fortran format statement, for example (F10.3, 4F10.2). The external brackets around the format must be included. If the data can be read in as a free format then type **FREE** or leave this line blank. Note however, free data is read in more slowly than formatted data.
- Note 2 The multipliers are the amount by which the values read in are to be multiplied. For example you may wish to correct from ms to s or units of **G** (gravity) to mm/s². On this line give the multipliers in the order X-value, Y1-value, Y2-value, etc. Separate each multiplier by a space or comma. A zero value is assumed to be 1. If all curves are to be read in as defined leave this line blank.
- Note 3 The axis labels are character strings, separated by commas given in the following order. X-axis label, Y1-axis label, Y2-axis label, etc.
- Note 4 The line labels are character strings separated by commas given in the following order. Line label 1, Line label 2, Line label 3, etc.

A comment line may be included any where in the file by starting the line with a \$.

The following shows a bulk data file with three curves and seven points on each curve.

\$ Comment line Title of the curves 3 FREE \$ A multiplier of 10 on X values and 5 on Y2 values 10,,5, x-axis,y1-axis,y2-axis,y3-axis curve 1,curve 2,curve 3 \$ Now for the data 0.0 0.0 1.0 2.0 1.0 1.0 3.0 4.0 2.0 2.0 4.0 5.0 2.4 4.4 5.5 7.4 3.3 7.8 5.8 9.2 4.4 10.0 12.0 13.0

16.4. APPENDIX D - Filtering

APPENDIX D - FILTERING

This Appendix describes the filtering options within T/HIS.

Curves can be filtered to remove high frequency noise. The technique is typically applied to acceleration and force traces. Options available include standard filters (Channel Frequency Classes 60, 180, 600 and 1000 as per British Standard BS AU 228: Part 1: 1989, and the USA's National Highway Traffic Safety Administration (NHTSA) FIR filter). The standard filters (except the FIR filter) are all special cases of the Butterworth filter.

16.4.1. Curve Regulation

Curve Regulation

All filtering options require the curves to have a constant time increment between points. This will generally be the case if the curves are Ansys LS-DYNA time history results. If not, the REGULARISE option will convert the curve to constant time increment.

Typically the time increment should be at least 10 times the cut-off frequency; 10kHz (a 0.0001 second interval time base) is a good choice for automotive crash applications.

16.4.2. Use of the Butterworth Filter Option

Use of the Butterworth Filter Option

The Butterworth filter is a low pass filter with two input variables; order and cut-off frequency.

The cut-off frequency is the frequency at which the gain of the filter is -3dB (i.e. the magnitude of signals at this frequency is halved by the filter). The lower the frequency the less noise passes through; but any peaks in the signal tend to get reduced in magnitude and delayed in time.

Unfiltered Signal

Filtered at 60Hz

Filtered at 180Hz

Filtered at 600Hz

Filtered at 1000Hz

The above figures show examples of filtering frequency using the four standard SAE filters (60, 180, 600 and 1000 Hz cut-off frequencies: see below). These show clearly how the original signal is smoothed.

16.4.3. Butterworth Filter Implementation

Butterworth Filter Implementation

Two refinements have been incorporated:

- Reflection of beginning and end of curves to minimise end-effects of filtering (see the figure below).
- The curve is first passed forwards through the filter, then the resulting signal is passed through backwards. This procedure minimises phase change errors. The poles and zeros of the filter are calculated such that the desired cut-off frequency is achieved after two passes.

16.4.4. Standard SAE Filter Options

Standard SAE Filter Options

Channel Filter Classes 60, 180, 600 and 1000 are Butterworth filters with the following parameters:

| Filter Class | Cut-off Frequency | Order |
|--------------|-------------------|-------|
| 60 | 100Hz | 2 |
| 180 | 300Hz | 2 |
| 600 | 1000Hz | 2 |
| 1000 | 1650Hz | 2 |

The gain characteristics are compared with the limits given in BS AU228 in the following four figures:

16.4.5. Standard FIR Filter Option

Standard FIR filter option

The FIR filter (Finite Impulse Response) is specified by NHTSA. It is used for filtering thoracic accelerations from side impact dummies; the filtered accelerations are then used in calculation of TTI (Thoracic Trauma Index). Its characteristics are:

- A passband frequency of 100Hz.
- A stopband frequency of 189Hz.
- A stopband gain of -50dB.
- A passband ripple of 0.0225dB.

It is based on a standard Fortran programme available from NHTSA.

16.4.6. Use of the Bessel Filter Option

Use of the Bessel Filter Option

The Bessel filter is a low pass filter with two input variables; order and cut-off frequency.

The order of the filter controls the roll-off rate, as shown here in the figure (right)

This is a 300Hz filter. It can be seen that higher orders attenuate the results more quickly: they have a higher roll-off rate.

This filter works in similar way to how the Butterworth filter works. The implementaion is the same with reflection and passing the curve through the filter forwards and backwards to minimise end-effects and phase change effects.

16.5. APPENDIX E - Injury Criteria

APPENDIX E - INJURY CRITERIA

T/HIS has the option to calculate two of the injury criteria that are used currently in occupant protection. These are the head impact criteria or HIC value and 3ms clip value. These criteria are defined as follows:

16.5.1. HIC Value

HIC Value

The HIC value is calculated from the resultant acceleration time history of the head centre of gravity filtered through a class 1000 filter. The HIC value is then calculated from;

HIC =
$$\left[\frac{1}{(t_2 - t_1)} \int_{t_1}^{t_2} a \, dt\right]^{2.5} (t_2 - t_1)$$

Where a is the acceleration expressed in g, and t $_1$ and t $_2$ are any two points in time. It is now usual for an upper limit on the range t $_2$ -t $_1$ of 36ms to be applied.

16.5.2. 3ms Clip

3ms Clip

The 3ms clip value is the maximum value of acceleration that is exceeded for a period of not less than 3 ms. This is not an easily comprehended definition: the following may be of more use:

- (1) At each time point T, take the interval (T to T+3ms);
- (2) In this interval find the **lowest** acceleration value;
- (3) The "3ms Clip" value is the interval (T to T+3ms) which has the **largest** "lowest" value as calculated in (2) above.

So, perhaps, a better definition might be: "the 3ms interval with the highest lowest acceleration value".

16.5.3. Viscous Criteria

Viscous Criteria

The VC value is calculated from a compression time history using the following formula (the values of the constants A and B assume the compression is in metres);

$$VC = A[V_{(t)}C_{(t)}]$$
where $C_{(t)} = \frac{D_{(t)}}{B}$
 $V_{(t)} = \frac{8[D_{(t+1)} - D_{(t+1)}] - [D_{(t+2)} - D_{(t-2)}]}{12dt}$ (ECER95 regulations)
 $V_{(t)} = \frac{dD}{dt}$ (IIHS regulations)
 $D_{(t)} = \text{Rib Compression}$
 $A = \text{Constant (1.3 frontal, 1.0 side)}$
 $B = \text{Constant (0.229 frontal, 0.140 side)}$

16.5.4. Acceleration Severity Index

Acceleration Severity Index

The ASI value is calculated from 3 acceleration time histories using the following fomula;

$$ASI_{(t)} = \left[\left(\frac{ax}{xl} \right)^2 + \left(\frac{ay}{yl} \right)^2 + \left(\frac{az}{zl} \right)^2 \right]^{0.5}$$

are the X,Y,Z accelerations of the vehicle:

- for the 1998 calculation (BS EN 1317-1:1998) they are averaged over a 50ms moving interval.
- for the 2010 calculation (BS EN 1317-1:2010) they are passed through a four-pole phaseless Butterworth filter with a 13Hz cutoff frequency.

xl,yl,zl are acceleration limits xl = 12g yl = 9g zl = 10g.

The acceleration input curves should be in units of g. If the input curves are in any other unit a conversion factor can be input to convert back to g.

When selecting input curves it is assumed that the X curve is numerically the first curve (the one with the lowest id) of the ones selected and the Z curve is the last. If they are in a different order then the acceleration limits can be modified to reflect the different order. For more information on ASI see BS EN 1317-1.

NOTE: For the BS EN 1317-1:2010 calculation T/His assumes the curves have been filtered through a Class 180 filter and padded with +/-0.5seconds of data as per the specification.

16.5.5. Theoretical Head Impact Velocity & Post Impact Head Deceleration

Theoretical Head Impact Velocity & Post Impact Head Deceleration

The theoretical head impact velocity concept has been developed for assessing occupant impact severity for vehicles involved in collisions with road vehicle restraint systems. The occupant inside the vehicle is considered to be a freely moving object that, as the vehicle changes its speed due to the contact with the restraint system, continues moving until it strikes the vehicle interior. The velocity magnitude at the time of impact with the vehicle interior is considered to be a measure of the vehicle to vehicle restraint system impact severity.

After impact the head is assumed to continue moving with the vehicle during the rest of the impact event. The post impact head deceleration (PHD) is calculated as the peak value using a 10ms moving average of the resultant vehicle acceleration after the THIV impact.

The THIV calculation requires the following inputs

- Horizontal Vehicle Acceleration Time History (Ax)
- Lateral Vehicle Acceleration Time History (Ay)
- Yaw Rate Time History
- Horizontal Distance from the occupants head to vehicle (Dx)
- Lateral Distance from the occupants head to vehicle (Dy)
- Initial X coordinate relative to CofG (X0)

The units for these fields should be consistent with the units that the model is in. For example, If the accelerations are in m/s² then values for Dx, Dy and X0 should be in metres. The Yaw Rate Time History curve is expected to be in radians/s

For more information on THIV and PHD see BS EN 1317-1.

16.5.6. Biomechanical neck injury predictor (NIJ)

Biomechanical neck injury predictor (NIJ)

The biomechanical neck injury predictor is a measure of the injury due to the load transferred through the occipital condyles. Its calculation combines the neck axial force and the flexion/extension moment about the occipital condyles.

It is used in association with the USSID dummy for standard American frontal impact tests.

The shear force (Fx), axial force (Fz) and bending moment (My) are measured by the dummy upper neck load cell for the duration of the crash, using force and moment definitions consistent with SAE J221/1. T/HIS will calculate the bending moment using the equation:

My = My' - e Fx

Where e is the e distance specified in the input window, Fx is the shear force.

Shear force, axial force and bending moment must be filtered using an SAE Channel Frequency Class 600 filter (C600) for the purposes of calculation.

During the collision, the Axial Force (Fz) can be in either tension or compression whilst the occipital condyle bending moment (Mocy) can be in either flexion or extension. This results in 4 possible loading conditions corresponding to the 4 curves output by T/HIS; tension-extension (Nte), tension-flexion (Ntf), compression-extension (Nce), and compression-flexion (Ncf). At each point in time only one of these 4 conditions can be met, hence the NIJ value is calculated for that condition and the value for the other 3 conditions is considered a value of zero..

The expression for calculating each NIJ loading condition is given by:

NIJ = (Fz/Fzc) + (Mocy/Myc)

where Fz and Mocy are as defined above, Fzc and Myc refer to the axial force and Bending moment critical values, given below:

The values of Fzc and Myc vary depending on the occupant, the occupants position and the sign of **Fz** and **Mocy**

For the dummy to pass the test, the following conditions must be met:

(i) None of the 4 NIJ values may exceed 1.0 at any time during the event

(ii) Peak Tension Force (Fz), measured at the upper neck load cell, may not exceed the specific dummy's limit (e.g. 2070N for the Hybrid III small female) at any time

(iii) Peak Compression Force (Fz), measured at the upper neck load cell, may not exceed the specific dummy's limit (e.g. 2520N for the Hybrid III small female) at any time

For more information on the use and calculation of NIJ, refer to the FMVSS 208 document

16.5.7. The Thoracic Trauma Index (TTI)

The Thoracic Trauma Index (TTI)

The Thoracic Trauma Index is used as a predictor of thoracic injury severity in the USSID dummy in standard American Side Impact tests.

The Index considers both rib and thorax acceleration in an impact.

The expression for calculating TTI is given by:

TTI = (G(R) + G(LS))/2

Where G(R) is the greater of the peak accelerations of either the upper or lower rib, expressed in g, and G(LS) is the peak acceleration in the lower spine (T12), expressed in g.

For the dummy to pass the test, the following conditions must be met:

(i) The TTI value must not exceed;

(a) 85g for a passenger car with 4 side doors, and for any multipurpose vehicle, truck or bus

(b) 90g for a passenger car with 2 side doors

(ii) The peak lateral acceleration of the pelvis shall not exceed 130g

(iii) Any side door, struck by the moving deformable barrier, shall not seperate totally from the car.

(iv) Any door not struck by the moving deformable barrier must meet the following requirements;

- (a) The door chall not disengage from the latched position
- (b) The latch shall not seperate from the striker

(c) The hinge components shall not separate from each other or from their attachment to the vehicle

(d) Neither the latch nor the hinge systems of the door shall pull out of their anchorage

For more information on the use and calculation of TTI, refer to the FMVSS 214 document

16.5.8. Occupant Load Criterion (OLC)

The calculation follows the method specified in the Euro NCAP Technical Bulletin (TB027) v1.1.1, which is intended for use with the Adult Occupant Protection Assessment Protocol v9.1.1. According to the TB 027, the Measured X-Acceleration of the Barrier COG of MPDB must be filtered using CFC 180.

Firstly, the acceleration curve is filtered using the trapezoidal rule to derive the velocity course of the barrier and (V_0) which is the initial velocity is added to the integrated curve.

$$V_t = \int A_X(t) \, dt + V_0$$

The end time (t_1) is the end of free flight phase of the virtual dummy of the barrier along a displacement of 0.065 m. This is calculated by using the equation:

$$\int_{t=0}^{t=t_1} V_0 \, dt - \int_{t=0}^{t=t_1} V(t) \, dt = 0.065$$

Here, the displacement of the virtual occupant in its free flight phase is \(V_0t\) and the displacement of the Barrier model is calculated by integrating the velocity curve. The difference of the two displacements should be equal to 0.065 m.

The end time (t_2) , corresponds to the ideal restraint phase, which is determined by solving the equation:

$$\int_{t=t_1}^{t=t_2} \left(V_0 - OLC_{SI-unit} \times (t-t_1) \right) dt - \int_{t=t_1}^{t=t_2} V(t) \, dt = 0.235$$

The area under the velocity curve of the barrier is calculated by subtracting the displacement (u_t) of the barrier model at point (t) from the displacement (u_{t1}) at point (t_1) :

Area of Velocity Curve ((t_1) to (t) = $(u_{t1} - u_t)$

The area under the virtual occupant curve is calculated by determining the area of the trapezoid from point (t_1) to (t_1) :

Area of Velocity of Virtual Occupant (\(t_1) to \(t)) = \($0.5*(V_{t1} + V_t)*(t - t_1)$)

The difference between these two areas should be 0.0235 m, which allows us to calculate the (t_2) value.

The OLC Value is finally calculated by using the following equation:

$$\int_{t=t_1}^{t=t_2} \left(V_0 - OLC_{SI-unit} \times (t-t_1) \right) dt - \int_{t=t_1}^{t=t_2} V(t) dt = 0.235$$

16.5.9. Tibia Index (TI)

Tibia Index (TI) is commonly used to predict lower leg injury. T/HIS calculates the Tibia Index based on the following interaction formula specified in <u>Euro NCAP Technical</u> <u>Bulletin (TB021) v4.1</u>.

$$TI(t) = \left|\frac{M_R(t)}{(M_R)_C}\right| + \left|\frac{F_z(t)}{(F_z)_C}\right|$$

with:

$$M_R(t) = \sqrt{M_x(t)^2 + M_y(t)^2}$$

where:

\(M_R(t)\) = Filtered resultant Tibia Moment \(M_x(t)\) = Filtered lateral Tibia Moment \(M_y(t)\) = Filtered Fore Tibia Moment \(F_z(t)\) = Filtered Axial Tibia Force \((M_R)_C\) = Moment critical value \((F_z)_C\) = Force critical value

According to <u>Euro NCAP Technical Bulletin (TB021) v4.1</u>, the Axial and Moment curves must be filtered using CFC 600 filter. If you provide unfiltered input curves, you can use the auto-filtering option available in the <u>Tibia Index menu</u>. When auto-filtering is turned ON, T/HIS will first filter the input curves using the selected filter class and then perform the Tibia Index calculation with the filtered curves.

The TI critical values for different standard types of Occupants are:

| Occupant type | \((M_R)_C\) [Nm] | \((F_z)_C\) [kN] |
|---------------|------------------|------------------|
| HIII-95M | 307 | 44.2 |
| HIII-50M | 225 | 35.9 |
| HIII-05F | 115 | 22.9 |
| THOR | 225 | 35.9 |

16.5.10. DAMAGE Criterion (DMG)

The DAMAGE value is determined by creating a second-order system that mimics the behavior of a physical mass-spring-damper setup. This model is used to capture the maximum strain exprienced by the brain when the head rotates around each axis.

The equation of motion for this damped, three-degree-of-freedom mechanical system, which is influenced by external forces acting on the masses, can be represented in matrix form:

Here,

 $\ \ (m = \text\{mass\}, \quad c_{ij} = \text\{damping coefficient\}, \quad k_{ij} = \text{stiffness coefficient} \) \\ \ \ (\delta, \dot{\delta}, \dot{\delta} = \text{displacement, velocity, acceleration} \) \\ \ \ (\dot{u} = \text{applied angular acceleration} \) \\ \ \ (\dot{u} = \text{kg}, \quad m_y = 1 \, \text{kg}, \quad m_z = 1 \, \text{kg} \) \\ \ \ (\m_x = 1 \, \text{kg}, \quad m_y = 1 \, \text{kg}, \quad m_z = 1 \, \text{kg} \) \\ \ \ (\m_x = 32142 \, \text{N/m}, \quad \k_{yy} = 23493 \, \text{N/m}, \quad \k_{zz} = 16935 \, \text{N/m} \) \\ \ \ (\m_x = 0 \, \text{N/m}, \quad \k_{yz} = 0 \, \text{N/m}, \quad \k_{zz} = 1636.3 \, \text{N/m} \) \\ \ \ (\m_a = 5.9148 \, \text{ms})$

\([c] = a_1 \times [k] \)

The solution to this equation , \(\vec{\delta}(t) = \begin{bmatrix} \delta_x(t) & \delta_y(t) & \delta_z(t) \end{bmatrix}^T \), is a vector containing the displacement time (t) histories of the three coupled masses. These displacements are assumed to be analogous to some measure of brain deformation under rotational motion about each axis of the head. The maximum magnitude of the system displacement is then fitted to the maximum brain strain (MPS), and is referred to as the **DAMAGE** metric.[E1]

The scale factor relates the maximum resultant displacement of the system to the MPS value from the FE brain model.

The equations of motion can be solved using various numerical methods, each with its advantages and specific applications. The calculation methods used by T/HIS are:

- 1. Runge-Kutta 4th Order (RK4)
- 2. Runge-Kutta Fehlberg (RKF45)
- 3. Newmark Beta method

16.6. APPENDIX F - Curve Correlation

APPENDIX F – Curve Correlation

T/HIS provides a number of ways to determine a measure for the degree to which two curves match i.e. correlation. Typically one curve is a reference curve that might come from physical testing, the other is the comparison curve that may be the result of a simulation of the scenario that generated the reference curve.

The following sections describe each of the tools and functions available in T/HIS:

- <u>CORA</u> An implementation of the methodology used by the Partnership for Dummy Technology and Biomechanics (<u>PDB</u>) software <u>CORA</u> (**COR**ellation and **A**nalysis) [F1], [F2]
- ISO 18571 An implementation of the calculations described in ISO 18571 [F3]
- <u>MADM</u> An implementation of the Minimum Area Discrepancy Method (MADM) [F4], [F5]
- <u>COR1 and COR2</u> The T/HIS correlation functions COR1 and COR2
- <u>COR3</u> The T/HIS correlation function COR3
- <u>WIF</u> The T/HIS correlation function that implements the weighted integrated factor method

CORA implementation

T/HIS implements the part of the PDB CORA method in which four measures of correlation are calculated and combined to give a total signal rating. One of these measures is made by examining how the curve fits within a defined corridor around the reference curve. The result is the **corridor metric**, with a value between zero and one. The remaining three measures are determined from properties related to a phase shift applied to the reference curve in order to achieve maximum cross-correlation. These three measures are each given a weighting and summed to give a **cross-correlation metric**, with a value between zero and one. The total signal rating is then determined from the weighted sum of the corridor and cross-correlation metrics.

Pre-requisites

- In order to achieve a meaningful correlation rating, the input curves should have a minimal amount of noise. This can be achieved using the filtering capabilities of T/HIS. It is assumed that any signal filtering required has been carried out prior to the use of CORA
- The curves should have x-values that increase monotonically
- The T/HIS CORA tool currently assumes the curves for analysis are available for selection within T/HIS

User interface

The T/HIS implementation of CORA is powered by JavaScript and can be accessed via **Tools** \rightarrow **Automotive** \rightarrow **CORA**. The options and parameters that are available for selection and modification are described in the hover text that appears when your mouse is positioned over the item of interest.

|---------------------------------|---|--|
| Rating method | Allows the choice of CORAplus 4.0.4, ISO 18571:2014 or ISO 18571:2024. | |
| Defaults | The default values as specified in [F1] (or [F3] for the ISO 18571 rating method) | |
| Output calculation curves | Curves illustrating the details of the correlation calculation are created if this option is selected | |
| Plot correlation graphs | Graph objects with respective curves for Corridor and Cross Correlation ratings. Scores and method can be automatically added to graph title or legend. | |
| File output | A record of the calculation input and results is produced if this option is selected. The full path to the output file is required and a file dialogue can be used to select the location by using the Save as button. If you wish to record multiple correlation analyses in the same file, the Append option should be selected otherwise the output file will be overwritten. | |
| Signal | Parameters and options related to the input signals and how they are pre-processed prior to the correlation rating being calculated | |
| Evaluation interval | The parameters in this section allow you to specify the most relevant region of the signals for correlation analysis | |
| Corridor | Parameters used in the calculation of the corridor metric | |
| Cross correlation | Parameters used in the calculation of the cross-correlation metric | |
| Signal rating weighting | The weighting factors applied to the corridor and cross-correlation metrics to obtain the overall signal rating | |
| Save configuration | Save the current input configuration to a file (in json format) for retrieval using the Load configuration option. | |
| Load configuration | To recreate a previous configuration a configuration file (in json format) can be loaded. The configuration file can be generated by using the Save configuration option. | |

The features of the CORA menu control the correlation assessment as follows:

Rating Methods

Three rating methods are available, described in the following sections:

- 1. <u>CORAplus 4.0.4</u>
- 2. <u>ISO/TS 18571:2014</u>
- 3. <u>ISO/TS 18571:2024</u>

CORAplus 4.0.4

The T/HIS CORA tool was benchmarked against the <u>PDB CORA software</u> CORAplus 4.0.4. The benchmarks indicated that the results will not always be consistent, because of differences in the cross correlation shifted and truncated curve used to perform the rating. In March 2022, <u>PDB</u> acknowledged some issues with its implementation, and intends to make corrections once ISO 18571 is next updated.

ISO/TS 18571:2014

The rating methods described in ISO/TS 18751:2014 [F3] have been implemented in T/HIS and are available by selecting the ISO/TS 18571:2014 rating method. This method in the T/HIS tool was also benchmarked against <u>PDB CORA software</u> CORAplus 4.0.4. The benchmarks indicated that the results will not always be consistent, because of differences in the dynamic time warping algorithms used. In March 2022, <u>PDB</u> acknowledged these differences, which relate to issues in ISO 18571 itself.

ISO/TS 18571:2024

The new ISO/TS 18571:2024 method is based on the latest ISO/TS 18571:2024 standard [F6] and supersedes the previously existing "ISO 18571 Euro NCAP v1.0" rating method in T/HIS. The ISO/TS 18571:2024 method is largely based on the existing ISO/TS 18571:2014 revision, with the following differences:

1. Dynamic Time Warping Constraint

In the Phase score calculation, the Dynamic Time Warping (DTW) algorithm is implemented with a Sakoe-Chiba window constraint with relative window size 0.1, as opposed to the unconstrained DTW algorithm described in the 2014 revision.

Additionally, a descent priority is enforced in the DTW algorithm warp path. When choosing the next step, if no clear minimum cost path is available—meaning that the options are equivalent or indistinguishable in terms of cost—the algorithm enforces a priority order for selecting the direction:

- 1. Move **downward** (to the cell directly below).
- 2. Move **leftward** (to the cell directly to the left).
- 3. Move **diagonally down-left** (to the cell diagonally below and to the left).

This priority ensures a consistent approach to path selection even in cases where the cost differences between potential paths are negligible.

2. Alternative Slope Method

In the Slope score calculation, an alternative slope method is used. In the 2014 revision, the gradient is calculated by dividing the signal into intervals (10 data points in length) and computing the average slope within each interval.

In the 2024 revision, the gradient of the original 10 kHz signal is computed using:

- forward difference for the first point (1st order accurate)
- backward difference for the last point (1st order accurate)
- central difference for all the other points (2nd order accurate)

such that the gradient curve is the same size as the input curve. The algorithm then applies a smoothing function to the gradient curve. For each point on the curve, the smoothing function takes the average of the point and the four neighbouring points on either side (reducing to zero points either side as one approaches the ends of the curve).

CORA scripting interface

A CORA or ISO 18571 assessment can be automated by importing the CORA module into your own T/HIS JavaScript. For instructions and a worked example, follow the CORA and ISO-18571 tutorial (Help \rightarrow Tutorials \rightarrow CORA and ISO-18571).

MADM Correlation tool

The MADM Correlation Tool in T/HIS is powered by JavaScript. The Minimum Area Discrepancy Method (MADM) is ideal for correlation between Ansys LS-DYNA simulations and physical tests when force versus deflection is the relationship of interest, and offers benefits over other correlation methods that focus on parameters versus time. The tool can be accessed by selecting **Tools** \rightarrow **Automotive** \rightarrow **MADM**.

Three input methods are available for providing average, lower, and upper curves for the MADM rating calculation:

1. Specify average/lower/upper curves

- The user can directly specify average, lower, and upper curves.
- These can be provided in the form of a CSV file, or by picking/selecting from T/HIS curves.
- 2. Generate offset from average curve
 - An average curve can be provided, and a corridor of uniform width generated around it. This width can be adjusted. Once a corridor is generated, it can be provided as the lower and upper curves.
 - The average curve can be provided in the form of a CSV file, or by picking/selecting from T/HIS curves.
- 3. Generate average + corridor from dataset

- From provided force-time and deflection-time datasets (which should each consist of more than one curve), a mean average curve can be generated. A corridor can then be generated which varies in width (the variation depends on each point's standard deviation). The width can be controlled via the number of standard deviations used in the calculation. These curves can then be provided as the average, lower, and upper curves.
- The datasets can be provided in the form of multiple separate CSV files, or by selecting multiple T/HIS curves. Note that the dataset should have a uniform number of points, with regular time intervals throughout.

Note that all data provided should have the deflection along the x-axis, and the force along the y-axis. In addition, a corridor cannot be generated from data which self-intersects – in this case, the corridor should be generated separately by the user. Finally, a corridor cannot be generated from data with non-adjacent duplicate points.

Previously generated curves are deleted when the curves are re-generated, or when the input method is changed.

A MADM assessment can be automated by importing the MADM module into your own T/HIS JavaScript. For instructions and a worked example, follow the MADM tutorial (**Help** \rightarrow **Tutorials** \rightarrow **MADM Worked Example**).

For information on the Minimum Area Discrepancy Method itself, further help and references can be found in the tool menu:

MADM input configuration can be saved or loaded via the **Save configuration** and **Load configuration** buttons. The configuration is saved as a JSON file. The following table documents the configuration file properties:

| Property Description | | Required? | Valid format |
|----------------------|--|--|--|
| method | Method used for input curve generation. Will change what inputs are required. | Required for all methods. | 'Can be "specifyCurves", "generateOffset", or "generateAverage". |
| curve_inputs.avg | Input average curve. | Required for methods "specifyCurves" and "generateOffset". | File path to a .cur or .csv file, or a valid curve ID. |
| curve_inputs.lower | Input lower curve. | Required for method "specifyCurves". | File path to a .cur or .csv file, or a valid curve ID. |

| | 1 | | |
|--------------------|---|--|--|
| curve_inputs.upper | Input upper curve. | Required for method "specifyCurves". | File path to a .cur or .csv file, or a valid curve ID. |
| curve_inputs.sim | Input simulation curve. | Required for all methods. | File path to a .cur or .csv file, or a valid curve ID. |
| curve_inputs.dt | Input deflection- time curves. | Required for method "generateAverage". | File path to a .cur or .csv files containing multiple curves, or an array of valid curve IDs. |
| curve_inputs.ft | Input force-time curves | Required for method "generateAverage". | File path to a .cur or .csv files containing multiple curves, or an array of valid curve IDs. |
| n | Input n value. Required for all methods. Defaults to 1. | Required for all methods. | A number or string of a number. Recommended to be between 0.5 and 3. |
| m | Input m value. Required for all methods. Defaults to 2. | Required for all methods. | A number or string of a number. Recommended to be between 1 and 2. |
| offset | Offset value of generated corridor. | Required for method "generateOffset". | A number or string of a number. Must be a real postive number. |
| half_width | Number of standard deviations of generated corridor half- width. | Required for method "generateAverage". | A number or string of a number. Must be a real postive number. |
| output_curves | File path that an output curve file will be written to. | Optional | File path to a .cur/.csv file. |
| output_image | File path that an output graph image will be written to. | Optional | File path to a .png file. |
| output_json | File path that an output results .json file will be written to. | Optional | File path to a .json file. |

The MADM Correlation Tool was developed in collaboration with the University of Coventry [F4], [F5].

COR1 and COR2

The Correlation functions COR1 and COR2 provide a measure of the degree to which two curves match. When comparing curves by eye, the quality of correlation may be judged on the basis of how well matched are the patterns of peaks, the overall shapes of the curves, etc, and can allow for differences of timing as well as magnitude. Thus a simple function based on the difference of Y-values (such as T/HIS ERR function) does not measure correlation in the same way as the human eye. The T/HIS correlation function attempts to include and quantify the more subtle ways in which the correlation of two curves may be judged.

The correlation function may be applied to any two curves whose x-values increase monotonically (e.g. responses versus time). The results are independent of the units used, e.g. milliseconds or seconds are both acceptable. The sign of the y-values is not important.

Only the overlap time period is considered (i.e. the range of x-values for which both curves have a y-value). The time period (range of X-values) and maximum absolute Y-value are used to non-dimensionalise the curves such that x-values run from 0 to 1, and the maximum absolute y-value is 1.

Five measures of correlation are calculated. Each is given equal weighting. The final correlation score is given as a percentage - two identical curves would score 100%.

The first two measures require identification of peaks in the curves. An unlimited number of peaks in each curve will be considered. A peak is defined as a local maximum (or in the case of negative y-values a minimum), satisfying the following criteria:

- Absolute y-value at least 0.5
- Separated from any larger peak by a trough (local minimum) at least 0.2 deep.

Peaks of positive or negative signs are considered. Peaks are matched only against peaks of the same sign in the other curve.

Measure 1 – Peak values

For each identified peak in Curve A, find the maximum value in Curve B within the same time range for which the value in Curve A is within a tolerance of the peak value. Points are lost according to the error in y-values compared to a tolerance limit. Repeat for peaks in curve B against values in Curve A.

This measure allows for the situation where curves are similar but the peaks are more strongly delineated in one of the curves, such that the program does not recognise the other curve as having a peak in that location.

Measure 2 – Peak matching

For each identified peak in Curve A, find the closest identified peak in Curve B. Points are lost according to the largest error (timing or y-value) compared to tolerance limits; points are also lost if there is no corresponding peak in Curve B. Repeat for Curve A peaks matched against those of Curve B.

This measure picks up matching of primary and secondary peaks in the curves, which may correspond to physical events.

Measure 3 – Area matching

The integral of each curve is calculated by summing the area of the curve above y=0 and the absolute area of the curve below y=0. Points are lost according to the difference compared to a tolerance limit.

Measure 4 – Curve shape (low frequency excursion)

The curves are filtered. A band is drawn around filtered curve A (using positive and negative offsets in x and y). The area of excursions of filtered Curve B outside the band is calculated. Points are lost according to the excursion area compared to a tolerance limit. The process is repeated for filtered Curve A excursions from a band drawn around filtered curve B.

Measure 5 – Curve shape (full curve)

The same as Measure 4 except that the curves are not filtered and different tolerance limits and band sizes may be used.

Output

T/HIS prints the overall correlation percentage and the marks from each measure to the screen or to a text file. A new curve is created from each input curve showing the identified peaks (used in measures 1 and 2). As the same curve could be used as input to multiple correlations the correlation percentage is stored internally in T/HIS with the 2 output curves NOT the input curves.

The correlation percentage can be accessed from within FAST-TCF scripts by requesting the "correlate" property for either of the 2 ouptut curves.

operation curve 1 tag curve_3 curve_4 e.g. correlate strict curve 2 Calculate correlation between "curve_1" and "curve_2". Tag the curves containing the peaks as "curve_3" and "curve_4" tab output.txt curve 3 correlate Output the curve correlation value from "curve_3" to the file "output.txt" taba output.txt curve 4 correlate Append the curve correlation value from "curve_4" to the file "output.txt"

Selection of Parameters

The Correlation algorithm has many tolerance limits and other inputs. Two sets of these parameters have been pre-selected, to offer strict or less strict judgement of correlation (buttons COR1 and COR2 in the Automotive menu). The parameters selected are:

| Criterion | Decription | COR1 Value | COR2 Value |
|--|--|---------------|---------------|
| Peak matching | Fraction difference in timing that scores zero points for this peak | 0.2 | 0.4 |
| Peak matching and peak values | Fraction difference in value that scores zero points for this peak | 0.25 | 0.5 |
| Area matching | Fraction difference in integral that | 0.3 | 0.5 |

| | scores zero points | | |
|--------------------------------|---|-------|------|
| | Size of tolerance band in X and Y, as fractions of the curve extent in X and Y | 0.025 | 0.05 |
| shape (low frequency | Excursion area fraction scoring zero points | 0.1 | 0.2 |
| Curve shape (full curve) | Size of tolerance band in X and Y, as fractions of the curve extent in X and Y | 0.025 | 0.05 |
| Curve shape (full curve) | Excursion area fraction scoring zero points | 0.2 | 0.4 |

It is expected that, if COR1 rates Curves A and B as better correlated than C and D, then COR2 would also rate the pairs of curves in the same order. The percentage correlation would be greater in each case from COR2 than from COR1. COR1 will provide a greater difference (discrimination) between well-correlated and very well-correlated pairs of curves; while COR2 will provide greater discrimination between averagely-correlated and poorly-correlated pairs of curves. The purpose of offering both versions of the correlation function is to allow the user to select a calibration of the function appropriate to the typical input curves used.

| Examples | COR1 | COR2 |
|----------|------|------|
|----------|------|------|

COR3

The Correlation function COR3 provides another measure of the degree to which two curves match based on the distance between the two curves.

This function first normalises the curves using two factors, specified either by the user or defaults calculated by the program (the maximum absolute X and Y values of both graphs).

For each point on the first normalised curve, the shortest distance to the second normalised curve is calculated (the thick black lines on the image above). The root mean square value of all these distances is subtracted from 1 and then multiplied by 100 to get an index between 0 and 100.

The process is repeated along the second curve (the thick red lines show the distances) and the two indices are averaged to get a final index. The higher the index the closer the correlation between the two curves.

Note that the choice of normalising factors is important. Incorrect factors may lead to a correlation index outside the range of 0 to 100.

WIF

The Correlation function WIF provides another measure of the degree to which two curves match. It uses the Weighted Integrated Factor method:

 $crit = 1 - \sqrt{\frac{\sum \max(f[n]^2, g[n]^2) \cdot \left(1 - \frac{\max(0, f[n] \cdot g[n])}{\max(f[n]^2, g[n]^2)}\right)^2}{\sum \max(f[n]^2, g[n]^2)}}$

16.7. APPENDIX G - The ERROR Calculation

APPENDIX G - The ERROR Calculation

The ERROR function outputs a number of values to indicate the degree of correlation between 2 curves. The function requires two input curves

- A reference curve to compare against (the first curve selected)
- The curve to compare against the reference

Once 2 curves have been selected the a check is carries out to see if the two curves contain the same number of points and if the range of x-axis values the same for the two curves. If any inconsistencies are found then a warning message is generated.

The following values are then calculated

Maximum difference and time of variation

Maximum difference as a %age of the reference value at the same time

Maximum difference as a %age of the peak reference value

Average difference

Average difference as a %age of the peak reference value

Area weighted difference =
$$\begin{pmatrix} \int |y_r - y_c| dx \\ \frac{1}{2} (\int y_r dx + \int y_c dx) \end{pmatrix}$$

where y_r = Reference Curve
 y_c = Data Curve

T/HIS Regression coefficient.

$$R^{2} = \begin{bmatrix} 1 - \frac{\sum (y_{c} - y_{a})^{2}}{\sum y_{a}^{2} - \frac{\sum y_{a}^{2}}{n}} \end{bmatrix}$$

y_c = Data Curve
y_a = Average of Data and Reference Curve = ½ (y_{c} + y_{r})
n = Number of Data Points

This is a value between 0 and 1 where 1 means 100% correlation

16.8. APPENDIX H - The "oa_pref" Preference File

APPENDIX H - The "oa_pref" preference file

This file contains code-specific preferences that can be used to modify the behaviour of T/HIS. It is optional and, where entries (or the whole file) are omitted T/HIS will revert to its default settings.

"oa_pref" naming convention and locations

The file is called "oa_pref. It is looked for in the following places in the order given:

- The optional administration directory defined by the environmental variable (**\$0A_ADMIN** or **\$0A_ADMIN_XX** where XX is the release number).
- The site-wide installation directory defined by the environment variable (**\$0A_INSTALL**)
- The user's home directory: \$HOME (Unix/Linux) or \$USERPROFILE\$ (Windows)
- The current working directory

See <u>Installation organisation</u> for an explanation of the directory structure.

All four files are read (if they exist) and the last preference read will be the one used, so the file can be customised for a particular job or user at will.

Files do not have to exist in any of these locations, and if none exists the programme defaults will be used.

On Unix and Linux:

\$HOME on Unix and Linux is usually the home directory specified for each user in the system password file.

The shell command "printenv " (or on some systems " setenv ") will show the value of this variable if set.

If not set then it is defined as the " ~ " directory for the user. The command " cd; pwd " will show this.

On Windows:

```
USERPROFILE \  On Windows is usually C: Documents and Settings <math display="inline">\langle user \ id > \  (
```

Issuing the "set " command from an MS-DOS prompt will show the value of this and other variables.

Generally speaking you should put

- Organisation-wide options in the version in \$OA_ADMIN_xx and/or \$OA_INSTALL,
- User-specific options in \$HOME / %USERPROFILE%
- Project-specific options in the current working directory.

The file contains preferences for the SHELL (lines commencing shell*), THIS (lines commencing this*), D3PLOT (lines commencing d3plot*), PRIMER (lines commencing primer*)and REPORTER (lines commencing reporter*). All lines take the format <preference name> <preference value>.

The general copy of the preference file should be present in the <u>\$OA_ADMIN_xx</u> and/or <u>\$OA_INSTALL</u> directory. This should contain the preferences most suitable for all software users on the system.

An individual's specific preferences file can be stored in the individual's home area. This can be used to personally customise the software to the individual's needs.

Whenever one of the programs whose preferences can be stored in the oa_pref file is fired up, the program will take preferences first from the general preference file in the <u>\$OA_ADMIN_xx</u> directory (if it exists) then the <u>\$OA_INSTALL</u> directory, then from the file in the user's home area, then from the current working directory.

Preferences defined in the general oa_pref file can be modified in the user's personal file but they can't be removed by it.

From version 9.4 onwards preferences can be locked. If a preference is locked it cannot be changed in an oa_pref file in a more junior directory. To lock a preference use the syntax **'this#'** rather than **'this*'**.

16.8.1. The Interactive Preferences Editor

The interactive Preferences Editor

You are free to edit oa_pref files by hand, but there is an interactive "Preferences Editor" that may be called from within T/HIS that makes the job much easier.

It is started by **Options, Edit Preferences** or through the Preferences Button in the Tool menu

The preferences editor reads an XML file that contains all possible preferences and their valid options, and allows you to change them at will. In this example the user is changing the background colour in D3PLOT.

Note that changes made in the Preferences editor will not affect the current session of D3PLOT, they will only take effect the next time it is run.

If you have write permission on the oa_pref file in the \$OASYS directory you will be asked if you want to update that file, otherwise you will only be given the option of updating your own file in your \$HOME / \$USERPROFILE directory.

In this example the user is changing the background colour.

The option is "active" (ie present in the oa_pref file) and currently is set to WHITE.

Usage is:

- Select an option in the Tree on the left hand side
- Make it active / inactive
- If active select a value from the popup, or type in a value if necessary

The colour of the highlighting in the left hand side tree is significant:

Green Means that the option has been read from your \$HOME/\$USERPROFILE file.

Red Means that the option has been read from the \$OA_INSTALL file.

Magenta Means that the option had been read from the \$OA_ADMIN file.

In either event, regardless of the data source, the updated option will be written to the file chosen when you started the preferences editor.

Because of the order of file reading (<u>see above</u>), and option read from the master \$OASYS file, amended, and written to your local \$HOME file will take precedence when you next run T/HIS.

16.8.2. Locking Preferences

Locking Preferences

From version 9.4 onwards preferences can be locked. Beside each option in the preference editor is a padlock symbol. If the symbol is green then the option is unlocked, if it is red then it is locked. If a preference option has been locked in a file that the user can not modify then an error message will be generated if the user tries to edit that option.

| Active: | |
|---------|---------------------|
| Active: | |

If a user manually edits the "oa_pref" file to try and set an option that has been locked in another preference file then the option will be ignored in the users preference file.

16.8.3. Format of the oa_pref File

Format of the oa_pref File

Entries are formatted in the following way:

<programme>*<option>: <setting>

For example: this*laser_paper_size: A4

The rules for formatting are:

- The <programme>*<option>: string must start at column 1;
- This string must be in lower case, and must not have any spaces in it.
- The **<setting>** must be separated from the string by at least one space.
- Lines starting with a " # " are treated as comments and are ignored.

(Users accustomed to setting the attributes of their window manager with the **.Xdefaults** file will recognise this format and syntax.)

| "oa | _pref" | arguments | valid | for | T/HIS |
|-----|--------|-----------|-------|-----|-------|
|-----|--------|-----------|-------|-----|-------|

| Preference | Туре | Description | Valid arguments | Default |
|-----------------------|---------------------|--|--|---------------|
| auto_blank | <string></string> | Turn ON/OFF AutoBlank | ON, OFF | ON |
| auto_blank_mode | <string></string> | Set the default AutoBlank mode | MODEL, COMPONENT_ID, ENTITY_TYPE, ENTITY_ID, COMPONENT_TYPE, SURFACE, CURVE | MODEL |
| auto_update | <logical></logical> | Automatically replot graph after changing axis/title options | TRUE, FALSE | TRUE |
| csv_separator | <string></string> | CSV file field separator | COMMA, TAB, SPACE | СОММА |
| datum_file | <string></string> | File containing DATUM line definitons | | <none></none> |
| edit_output_in_primer | <string></string> | Edit/Create DATABASE cards related to T/HIS entities in PRIMER | | ON |
| error_handler | <string></string> | | no_action, mini_dump, trap_continue, trace_exit | mini_dump |

| file_buffer_size | <integer></integer> | File buffer size used for read THF (d3thdt) files | 512 - 1048576 | 4096 |
|-----------------------|---------------------|---|---------------|---------------|
| master_group_file | <string></string> | Filename for default group information | | <none></none> |
| null_value | <real></real> | Value to assign to curves when data doesn't exist | | 1.0E+18 |
| pemag_calculation_v12 | <logical></logical> | Whether the PEMAG calculation uses the v12 logic. | TRUE, FALSE | FALSE |
| show_license_warning | | Display Window containing License System messages | TRUE, FALSE | TRUE |
| splash_screen_seen | <real></real> | Most recent version (as major.minor, eg 17.1) for which a splash screen has been seen | | 0.0 |

The following control automotive setup

| Preference | Туре | Description | Valid arguments | Default |
|--------------------|-------------------|---|--|------------|
| hic_time_window | <real></real> | Length of time window for HIC automotive operation. | 1e-10 - 1e37 | 0.036 |
| hic_scale_factor | <real></real> | Scale factor for acceleration used in HIC automotive operation. | 1e-10 - 1e37 | 9.81 |
| injury_text_colour | <string></string> | Colour used to display injury criteria values (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, | FOREGROUND |

| | | | MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|--------------------|-------------------|--|--|------------|
| injury_line_colour | <string></string> | Colour used to display injury criteria lines (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | FOREGROUND |

The following strings and values control formatting of values for graphs

| Preference | Туре | Description | Valid arguments | Default |
|-----------------------|---------------------|-----------------------|-----------------|---------|
| add_exponent_to_label | <logical></logical> | label | TRUE, FALSE | TRUE |
| second_y_axis | <logical></logical> | Display 2nd y axis | TRUE, FALSE | FALSE |

| x_axis | | - | | |
|-----------------------|---------------------|---|--|--------------------|
| x_axis_type | <string></string> | Linear or Logarithmic X Axis type | LOGARITHMIC, LINEAR | LINEAR |
| x_grid_spacing_off | <real></real> | X-Axis Grid Spacing value | | 0.0 |
| x_grid_spacing_int | <real></real> | X-Axis Grid Interval value | | 0.0 |
| x_grid_spacing_auto | <string></string> | X-Axis Grid Spacing | AUTOMATIC, LOCKED | AUTOMATIC |
| x_axis_decimal_places | <string></string> | Number of decimal places displayed for X axis values | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, Default(3) | Default(3) |
| x_axis_format | <string></string> | Format used to display X axis values | Automatic, General, Scientific, Default(Automatic) | Default(Automatic) |
| y_axis | | | | |
| y_axis_type | <string></string> | Linear or Logarithmic X Axis type | LOGARITHMIC, LINEAR | LINEAR |
| y_grid_spacing_off | <real></real> | Y-Axis Grid Spacing value | | 0.0 |
| y_grid_spacing_int | <real></real> | Y-Axis Grid Interval value | | 0.0 |
| y_grid_spacing_auto | <string></string> | Y-Axis Grid Spacing | AUTOMATIC, LOCKED | AUTOMATIC |
| y_axis_decimal_places | <string></string> | Number of decimal places displayed for Y axis values | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, Default(3) | Default(3) |
| y_axis_format | <string></string> | Format used to display Y axis values | Automatic, General, Scientific, Default(Automatic) | Default(Automatic) |
| y2_axis | | | | |
| y2_axis_type | <string></string> | Linear or Logarithmic X Axis type | LOGARITHMIC, LINEAR | LINEAR |
| y2_align_zero | <logical></logical> | Y2-Axis align with Y=0 | TRUE, FALSE | FALSE |
| | | | | |

| y2_axis_decimal_places | <string></string> | Number of decimal places displayed for second Y axis values | 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, Default(3) | Default(3) |
|------------------------|-------------------|---|---|--------------------|
| y2_axis_format | <string></string> | | - | Default(Automatic) |

The following strings and values control checkpoint

| Preference | Туре | Description | Valid arguments | Default |
|------------------------|---------------------|---|--------------------|---------------|
| write_checkpoint_files | ミークリンション | Record checkpoint files for the T/His session. | TRUE, FALSE | FALSE |
| . – | <string></string> | Directory for checkpoint files, or "none" to suppress them altogether | | <none></none> |
| show_checkpoint_files | <logical></logical> | Show checkpoint playback panel upon T/His startup. | TRUE, FALSE | FALSE |

The following control colours

| Preference | Туре | Description | Valid arguments | Default |
|-------------|-------------------|---|---|------------|
| axis_colour | <string></string> | Axis colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, | FOREGROUND |

| ctable_show_phd | <logical></logical> | Display PHD value | TRUE, FALSE | TRUE |
| ctable_show_corr | <logical></logical> | Display CORR value | TRUE, FALSE | TRUE |
| ctable_show_olc | <logical></logical> | Display OLC value | TRUE, FALSE | TRUE |
| ctable_properties_on | <logical></logical> | Display the properties columns | TRUE, FALSE | false |
| ctable_injuryvals_on | <logical></logical> | Display the injury values columns | TRUE, FALSE | false |

The following options control the preferred order of <u>data sources</u> for various entities

| Preference | Туре | Description | Valid arguments | Default |
|------------|---------------------|-----------------------------|---------------------------|---------------|
| use_elout | | LSDA file | | |
| global | <ordered></ordered> | Data source for global data | LSDA, ASCII, THF, none | <none></none> |

| | | - | | - |
|-------------|---------------------|---|---------------------------|---------------|
| part | <ordered></ordered> | Data source for part data | LSDA, ASCII, THF, none | <none></none> |
| node | <ordered></ordered> | Data source for node data | THF, LSDA, ASCII, none | <none></none> |
| elements | | | | |
| solid | <ordered></ordered> | Data source for solid data | THF, LSDA, none | <none></none> |
| beam | <ordered></ordered> | Data source for beam data | THF, LSDA, none | <none></none> |
| shell | <ordered></ordered> | Data source for shell data | THF, LSDA, none | <none></none> |
| tshell | <ordered></ordered> | Data source for thick shell data | THF, LSDA, none | <none></none> |
| spring | <ordered></ordered> | Data source for spring data | LSDA, ASCII, XTF, none | <none></none> |
| seatbelt | <ordered></ordered> | Data source for seatbelt data | LSDA, ASCII, XTF, none | <none></none> |
| retractor | <ordered></ordered> | Data source for retractor data | LSDA, ASCII, XTF, none | <none></none> |
| slipring | <ordered></ordered> | Data source for slipring data | LSDA, ASCII, XTF, none | <none></none> |
| wall | <ordered></ordered> | Data source for rigid wall data | LSDA, ASCII, XTF, none | <none></none> |
| contact | <ordered></ordered> | Data source for contact data | LSDA, ASCII, XTF, none | <none></none> |
| reaction | <ordered></ordered> | Data source for nodal reaction data | LSDA, ASCII, XTF, none | <none></none> |
| airbag | <ordered></ordered> | Data source for airbag data | LSDA, ASCII, XTF, none | <none></none> |
| joint | <ordered></ordered> | Data source for joint data | LSDA, ASCII, none | <none></none> |
| section | <ordered></ordered> | Data source for section data | LSDA, ASCII, none | <none></none> |
| subsystem | <ordered></ordered> | Data source for subsystems data | LSDA, ASCII, none | <none></none> |
| geo_contact | <ordered></ordered> | Data source for geometric contact data | LSDA, ASCII, none | <none></none> |
| nodal_rb | <ordered></ordered> | Data source for nodal rigid body data | LSDA, ASCII, none | <none></none> |
| weld | <ordered></ordered> | Data source for spotweld data | LSDA, ASCII, none | <none></none> |

| spc | <ordered></ordered> | Data source for spc data | LSDA, ASCII, none | <none></none> |
|----------|---------------------|---|----------------------|---------------|
| boundary | | | LSDA, ASCII, none | <none></none> |
| fsi | <ordered></ordered> | Data source for fluid structural interaction data | LSDA, ASCII, none | <none></none> |
| sph | <ordered></ordered> | Data source for SPH data | LSDA, ASCII, none | <none></none> |
| tracer | <ordered></ordered> | Data source for TRACER data | LSDA, ASCII, none | <none></none> |
| pulley | <ordered></ordered> | Data source for PULLEY data | LSDA, ASCII, none | <none></none> |
| prtube | <ordered></ordered> | Data source for PRTUBE data | LSDA, ASCII, none | <none></none> |
| pblast | <ordered></ordered> | Data source for Particle Blast data | LSDA, ASCII, none | <none></none> |
| bearing | <ordered></ordered> | Data source for BEARING data | LSDA, ASCII, none | <none></none> |

The following strings and values control display options

| Preference | Туре | Description | Valid arguments | Default |
|-------------|-------------------|---|---|---------|
| axis_width | <real></real> | Default line width for axis (pixels) | 1.0, 2.0, 4.0, 8.0 | 2.0 |
| axis_colour | <string></string> | Axis colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, | |

| axis_top | <string></string> | Turn ON/OFF drawing of | MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY ON, OFF | ON |
|-------------------|---------------------|--|--|------------|
| axis_right | <string></string> | graph top axis Turn ON/OFF drawing of graph right axis | ON, OFF | ON |
| background_colour | <string></string> | Background colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, RED/MAGENTA, GREEN/CYAN, INDIGO, YELLOW/GREEN, LIGHT_BLUE, DARK_ORANGE, PALE_YELLOW, GOLD, OLIVE, DARK_ORANGE, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, CYAN/BLUE, HOT_PINK, RED/ORANGE, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, LIGHT_GREY, AUTO | BLACK |
| border_on | <logical></logical> | Display border | TRUE, FALSE | TRUE |
| border_width | <real></real> | Default line width for border (pixels) | 1.0, 2.0, 4.0, 8.0 | 1.0 |
| border_colour | <string></string> | Border colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, | FOREGROUND |

| | | I | 1 | ī |
|-------------------|---------------------|---|--|-------|
| | | | YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
| display_lines | | | | |
| lines_on | <logical></logical> | Display lines | TRUE, FALSE | TRUE |
| line_width | <real></real> | Default line width for curves (pixels) | 1.0, 2.0, 4.0, 8.0 | 2.0 |
| fix_styles | | Fix curve styles to cycle through the default colours/styles regardless of the curve number | TRUE, FALSE | FALSE |
| foreground_colour | <string></string> | Foreground colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | TUROUOISE | WHITE |

| grid | | | LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|------------------|-------------------|--|--|------------|
| grid_on | | Display grid Default line width for | TRUE, FALSE | TRUE |
| grid_width | <real></real> | grid (pixels) | 1.0, 2.0, 4.0, 8.0 | 1.0 |
| grid_colour | <string></string> | Grid colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | FOREGROUND |
| legend | | | | |
| legend_bg_colour | <string></string> | Legends background colour (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, | BLACK |

| | | | YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|-----------------|---------------------|--|---|---------|
| legend_bg_trans | <integer></integer> | Legend background transparency | 0 - 100 | 0 |
| legend_layout | <string></string> | Layout of legend | COL_LIST, AUTO, OFF, FLOAT | AUTO |
| legend_columns | <string></string> | Number of columns to display in legend | 1, 2, 3 | 2 |
| prefix_format | <string></string> | Select the prefix formatting for Legend curve labels. | MODEL, DIRECTORY, ROOTNAME, USER | MODEL |
| show_prefix | <string></string> | Allows you to toggle the Legend curve label prefix On/Off | AUTO, ON, OFF | AUTO |
| plot_format | <string></string> | Default format of plot | COLUMN, DEFAULT, AUTO, OFF, FULL, FLOATING | DEFAULT |
| symbols_on | <logical></logical> | Display symbols (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | TRUE, FALSE | FALSE |
| symbol_freq | <integer></integer> | Symbol Frequency | 1 - 2147483646 | 1 |

The drive mappings allow T/HIS to convert equivalent folder names from Windows to

Unix and visa versa. This is currently only in use for the JavaScript function DriveMapFilename.

| Preference | Туре | Description | Valid arguments | Default |
|------------|-------------------|---|--------------------|---------------|
| drive_a | <string></string> | Mapping from Windows drive A: to unix path | | <none></none> |
| drive_b | <string></string> | Mapping from Windows drive B: to unix path | | <none></none> |
| drive_c | <string></string> | Mapping from Windows drive C: to unix path | | <none></none> |
| drive_d | <string></string> | Mapping from Windows drive D: to unix path | | <none></none> |
| drive_e | <string></string> | Mapping from Windows drive E: to unix path | | <none></none> |
| drive_f | <string></string> | Mapping from Windows drive F: to unix path | | <none></none> |
| drive_g | <string></string> | Mapping from Windows drive G: to unix path | | <none></none> |
| drive_h | <string></string> | Mapping from Windows drive H: to unix path | | <none></none> |
| drive_i | <string></string> | Mapping from Windows drive I: to unix path | | <none></none> |
| drive_j | <string></string> | Mapping from Windows drive J: to unix path | | <none></none> |
| drive_k | <string></string> | Mapping from Windows drive K: to unix path | | <none></none> |
| drive_l | <string></string> | Mapping from Windows drive L: to unix path | | <none></none> |
| drive_m | <string></string> | Mapping from Windows drive M: to unix path | | <none></none> |
| drive_n | <string></string> | Mapping from Windows drive N: to unix path | | <none></none> |
| drive_o | <string></string> | Mapping from Windows drive O: to unix path | | <none></none> |
| drive_p | <string></string> | Mapping from Windows drive P: to unix path | | <none></none> |
| drive_q | <string></string> | Mapping from Windows drive Q: to unix path | | <none></none> |
| drive_r | <string></string> | Mapping from Windows drive R: to unix path | | <none></none> |
| drive_s | <string></string> | Mapping from Windows drive S: to unix path | | <none></none> |

| drive_t | < | Mapping from Windows drive T: to unix path | <none></none> |
|---------|-------------------|---|---------------|
| drive_u | <string></string> | Mapping from Windows drive U: to unix path | <none></none> |
| drive_v | <string></string> | Mapping from Windows drive V: to unix path | <none></none> |
| drive_w | | Mapping from Windows drive W: to unix path | <none></none> |
| drive_x | <string></string> | Mapping from Windows drive X: to unix path | <none></none> |
| drive_y | <string></string> | Mapping from Windows drive Y: to unix path | <none></none> |
| drive_z | < | Mapping from Windows drive Z: to unix path | <none></none> |

The following options control the fasttcf preferences.

| Preference | Туре | Description | Valid arguments | Default |
|---------------------------------|---------------------|---|--------------------|---------|
| ftcf_error_count | <integer></integer> | Maximum number of errors before a FAST- TCF script terminates | | 10 |
| ftcf_write_entity_names | <string></string> | Write entity names instead of entity IDs into FAST-TCF scripts | TRUE, FALSE | TRUE |
| ftcf_write_diadem_channel_names | <string></string> | Write DIAdem channel names instead of channel numbers into FAST-TCF scripts | TRUE, FALSE | TRUE |
| ftcf_write_user_colours | | Write all user-defined colour definitions into FAST-TCF scripts | TRUE, FALSE | FALSE |
| ftcf_write_required_models | <string></string> | Reference only the models required by the FAST-TCF script, rather than all models in the session. E.g. capturing a graph that contains only data from model M2 will write the model into the script as model 1, so it can be run in a | TRUE, FALSE | TRUE |

| | session containing 1 | |
|--|----------------------|--|
| | model. | |

The following set of options defines how various files are handled by T/HIS.

| Preference | Туре | Descriptio n | Valid arguments | Default |
|----------------------|-------------------------------|--|--|--------------------------------------|
| output_directo ry | < ctring> | - | LATEST_MODEL_RE AD, FIRST_MODEL_READ , LEGACY | LATEST_MODEL_READ |
| start_in | <string></string> | Directory to start T/HIS in | | <none></none> |
| macro_directo ry | <string></string> | Specify a directory for T/HIS to look in for MACRO definitions | | \$OA_INSTALL/this_library/mac ros |
| file_names | <string></string> | Controls default file filters. LSTC = d3thdt*, xtfile*, OASYS/ARU P = *.thf, *.xtf | OASYS, ARUP, LSTC | OASYS |
| file_timeout | <integer ></integer | Timeout period in seconds before T/HIS automatical ly closes LSDA(binou t) and THF | 0 - 300 | 10 |

| | | (d3thdt) files | | |
|----------------------|-------------------|-------------------|-----------------|--------|
| read_group_fil es | <string></string> | model | IGNORE, DELETE, | IGNORE |

The following strings and values control <u>axes, title, and legend formatting</u> for graphs

| Preference | Туре | Description | Valid arguments | Default |
|--------------|-------------------|--|---|---------|
| title_size | <string></string> | Font size for title | 8, 10, 12, 14, 18, 24, Default | Default |
| title_font | <string></string> | Font for title | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default | Default |
| title_colour | <string></string> | Colour of title (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, | |

| x_label_size x_label_font | <string></string> | Font size for X axis label Font for X axis label | PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY 8, 10, 12, 14, 18, 24, Default Helvetica_Medium, Helvetica_Bold, Courier_Medium, Times_Medium, Times_bold, Default | Default Default |
|------------------------------|-------------------|--|---|--------------------|
| x_label_colour | <string></string> | Colour of X axis label (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | FOREGROUND |
| x_axis_size | <string></string> | Font size for X axis units | 8, 10, 12, 14, 18, 24, Default | Default |
| x_axis_font | <string></string> | Font for X axis units | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default | Default |

| y_label_font y_label_colour | <string></string> | Font for Y axis label Colour of Y axis label (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, | Default FOREGROUND |
|--------------------------------|-------------------|---|---|-----------------------|
| x_axis_colour y_label_size | <string></string> | Colour of X axis units (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) Font size for Y axis label | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY 8, 10, 12, 14, 18, 24, Default | FOREGROUND Default |

| | | | LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|---------------|---------------------|--|--|------------|
| y_axis_size | <string></string> | Font size for Y axis units | 8, 10, 12, 14, 18, 24, Default | Default |
| y_axis_font | <string></string> | Font for Y axis units | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default | Default |
| y_axis_colour | <string></string> | Colour of Y axis units (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | FOREGROUND |
| y2_label_size | <string></string> | Font size for second Y axis label | 8, 10, 12, 14, 18, 24, Default | Default |
| y2_label_font | $<$ ctrin $\sigma>$ | Font for second Y axis label | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, | Default |

| | I | | | 1 |
|-----------------|--------------------|---|--|------------|
| | | | Times_Medium, | |
| | | | Times_bold, | |
| y2_label_colour | <string></string> | Colour of second Y axis label (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | Default FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, | FOREGROUND |
| y2_axis_size | <string></string> | Font size for second Y | PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY 8, 10, 12, 14, 18, | Default |
| yz_axis_size | -sumg- | axis units | 24, Default | Delault |
| y2_axis_font | <string>l</string> | Font for second Y axis units | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default | Default |
| y2_axis_colour | <string></string> | Colour of second Y axis | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, | FOREGROUND |

| | | | MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|----------------------|-------------------|---|--|------------|
| legend_size | <string></string> | Font size for curve legends | 8, 10, 12, 14, 18, 24, Default | Default |
| legend_font | <string></string> | Font for second curve legends | Helvetica_Medium, Helvetica_Bold, Courier_Medium, Courier_Bold, Times_Medium, Times_bold, Default | Default |
| legend_colour | <string></string> | Colour of curve legends (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | FOREGROUND |
| legend_display_lines | <string></string> | Turn User Lines On/Off | ON, OFF | ON |

The following strings and values control how T/HIS starts

| Preference | Туре | Description | Valid arguments | Default |
|------------------------|---------------------|---|---|---------------|
| auto_hide | <logical></logical> | Hide graph tool bar | TRUE, FALSE | FALSE |
| graphics_type | <string></string> | Graphics format to start T/HIS with | OPENGL, TTY, DEFAULT | OPENGL |
| maximise | <logical></logical> | Maximise window when T/HIS started | TRUE, FALSE | TRUE |
| image_format | <string></string> | Default image format | BMP_8_C, BMP_8_UN, PNG_8, GIF_8, BMP_24_UN, PNG_24, JPG_24, PPM_24 | PNG_24 |
| intel_hd_use_shaders | <string></string> | Control usage of hardware shaders on Intel HD graphics cards | AUTO_DETECT, FORCE_OFF, FORCE_ON | AUTO_DETECT |
| placement | <string></string> | Location for initial window on multi- screen display | LEFT, CENTRE, RIGHT, BOTTOM, TOP, LEFT_BOTTOM, LEFT_TOP, CENTRE_BOTTOM, CENTRE_TOP, RIGHT_BOTTOM, RIGHT_TOP | <none></none> |
| rhs_number_columns | <integer></integer> | Number of columns of Tools buttons | | 4 |
| white_background_image | <logical></logical> | Write images with white background | TRUE, FALSE | FALSE |
| bg_img_on | <string></string> | Turn the Background Image on or off. | ON, OFF | <none></none> |
| bg_img_path | <string></string> | Valid Background Image file path | | <none></none> |
| bg_img_scale | <string></string> | Preset Background Image scaling | WIDTH, HEIGHT, W+H | <none></none> |

| bg_img_fact | <real></real> | Scale factor for Background Image Size | | 1 |
|---------------|---------------------|--|---|---------------|
| bg_img_just | <string></string> | Background Image Justification | N, NE, E, SE, S, SW, W, NW | <none></none> |
| bg_img_pos | <string></string> | Background Image Positioning | TILED, SINGLE | SINGLE |
| window_layout | <string></string> | Multiple window | TILE_WIDE, TILE_TALL, CASCADE, 1X1, 2X2, 3X3, XY | TILE_WIDE |
| x_layout | <integer></integer> | Number used for 'X x Y' layout, number of cols | 1 - 8 | 1 |
| y_layout | <integer></integer> | Number used for 'X x Y' layout, number of rows | 1 - 8 | 1 |
| page_width | <integer></integer> | Width of the page (pixels) | | <none></none> |
| page_height | <integer></integer> | Height of the page (pixels) | | <none></none> |

The following options control graphical user interface

| Preference | Туре | Description | Valid arguments | Default |
|--------------------|---------------------|--|---------------------------------------|------------|
| gui_theme | <string></string> | | LIGHT, DARK, CLASSIC, LEGACY | LIGHT |
| gui_styling_mode | | Graphical User Interface (GUI) | NOT_USED, TIME_LIMIT, ALWAYS | TIME_LIMIT |
| gui_styling_tlimit | <integer></integer> | Graphical User Interface (GUI) menu repaint time limit to turn off decorations | 0 - 100000 | 500 |

The following strings and values control laser plotting setup

| Preference | Туре | Description | Valid arguments | Default |
|------------------|-------------------|--------------------|--------------------|---------|
| laser_paper_size | <string></string> | Default paper size | A4, A3, US | A4 |

| laser_orientation | <string></string> | I JATALIIT NAGA ORIANTATION | Portrait, Landscape | Landscape |
|---------------------|-------------------|-----------------------------|------------------------|-----------|
| laser_top_margin | <real></real> | Top margin size in mm | | 10 |
| laser_bottom_margin | <real></real> | Bottom margin size in mm | | 30 |
| laser_left_margin | <real></real> | Left margin size in mm | | 20 |
| laser_right_margin | <real></real> | Right margin size in mm | | 10 |

The following options affect the appearance and behaviour of the graphical user interface, left handed support, and the mouse

| Preference | Туре | Description | Valid arguments | Default |
|--------------------|-------------------|--|---|------------------|
| display_factor | <real></real> | Factor on display size (0.5 - 2.0, automatic if undefined) | 0.5 - 2.0 | 1.2 |
| display_brightness | <real></real> | Menu brightness (0.0-1.0) | 0.0 - 1.0 | 1.0 |
| display_saturation | <real></real> | Menu colour saturation (0.0-1.0) | 0.0 - 1.0 | 1.0 |
| button_gradation | <real></real> | Button shade gradation (0.0-1.0) | 0.0 - 1.0 | 0.0 |
| dv_sync_windows | <string></string> | Dyn view method(s) for synchronisin g windows | ICON, ICON+CAPS, ICON+NUM, ICON+CAPS+NUM | ICON+CAPS |
| dv_left_shift | <string></string> | Dyn view action for shift + Left mouse | ROTATION_XYZ, ROTATION_XY, ROTATION_Z, ROTATION_SPHERE , TRANSLATION, ZOOM_UP_+VE, ZOOM_DOWN_+VE, UNUSED | ROTATION_XY Z |

The following control settings related to curve properties

| Preference | Туре | Description | Valid arguments | Default |
|------------------------------|-------------------|---------------|---------------------------------|------------|
| curve_property_number_format | <string></string> | Number format | AUTO, SCIENTIFIC, GENERAL | SCIENTIFIC |

| curve_property_dec_places | Number of decimal <integer>places to display for</integer> | 0 - 9 | 3 |
|---------------------------|---|-------|---|
| | curves | | |

The following control settings related to quickfind

| Preference | Туре | Description | Valid arguments | Default |
|---------------------------------|-------------------|--|--|---------|
| quickfind_unmatched_text_colour | <string></string> | Text colour for unmatched characters (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
| quickfind_matched_text_colour | <string></string> | Text colour for matched characters (hex code e.g. 0XA1B2C3 or core colour name e.g. OLIVE) | FOREGROUND, WHITE, BLACK, RED, GREEN, BLUE, CYAN, MAGENTA, YELLOW, ORANGE, TURQUOISE, INDIGO, LIME, SKY, PINK, PALE_YELLOW, GOLD, OLIVE, | BLUE |

| | | | DARK_MAGENTA, MEDIUM_GREEN, MEDIUM_BLUE, HOT_PINK, LIGHT_PINK, SEA_GREEN, MAROON, DARK_GREEN, PURPLE, NAVY, DARK_GREY, MEDIUM_GREY, LIGHT_GREY | |
|-----------------------------|---------------------|--|---|-------|
| quickfind_found_list_length | - | Number of items to display in the found list | 1 - 20 | 10 |
| quickfind_recent_history | <integer></integer> | Number of recently selected items to store | 0 - 2147483646 | 10 |
| quickfind_sequential_bonus | | Modifier for two successful adjacent matches | 1 - 100 | 50 |
| quickfind_word_start_bonus | <integer></integer> | Modifier for successful match at word beginning | 1 - 100 | 10 |
| quickfind_box_size | <string></string> | Size and layout of Search box | SMALL, LARGE | SMALL |

The following control the read options.

| Preference | Туре | Description | Valid arguments | Default |
|-----------------|---------------------|---|--------------------|---------------|
| database | | | | |
| database_dir | <string></string> | Directory to look in for model database (XML) files | | <none></none> |
| database_file | <string></string> | Default model database (XML) file | | <none></none> |
| database_expand | <integer></integer> | Number of levels to automatically expand in model database tree (-1 ALL) | -1 - 2147483646 | 0 |

| equations | | | | |
|---------------------|-------------------|---|-------------------------------|--------------|
| equation_x_start | <real></real> | X axis start value for equation curves. | -1e37 - 1e37 | 0.0 |
| equation_x_interval | <real></real> | X interval between points for equation curves. | 1e-10 - 1e37 | 0.001 |
| equation_npoints | <real></real> | Number of points for equation curves. Not used if equation_x_interval is defined. | 1 - 1e7 | 0.001 |
| equation_x_end | <real></real> | X axis end value for equation curves. | -1e37 - 1e37 | 1.0 |
| ISO | | | | |
| iso_curve_labels | <string></string> | Curve label for ISO | CHANNEL_NAME, CHANNEL_CODE | CHANNEL_CODE |
| iso_list_labels | <string></string> | Default list labels in Read ISO panel | FILENAME, CHANNEL_CODE | FILENAME |

The following options define how Javascripts are processed by THIS. See <u>the JavaScript</u> <u>interface</u> for further details.

| Preference | Туре | Descriptio | Valid argumen ts | Default |
|------------------------|-------------------------------|--|------------------------|---------------------------------------|
| modules_directory | <string></string> | Directory for T/HIS to look for modules in | | <none></none> |
| script_directory | <string></string> | Directory in which T/HIS looks for scripts | | \$OA_INSTALL/this_library/scr ipts |
| javascript_memory_size | <integer ></integer | lnitial memory allocated for garbage | 1 - 4095 | 25 |

| | | collection (MB) | | |
|----------------------------------|-------------------------------|--|----------------|-------|
| javascript_update_curve_m enu | <logical ></logical | Update curve menu contents while a JavaScript is running | TRUE, FALSE | FALSE |

The following options define how T/HIS sessions are processed See <u>T/HIS Session Save</u> and <u>Retrieve</u> for further details.

| Preference | Туре | Description | Valid arguments | Default |
|--------------------------------|---------------------|---|-----------------------------------|---------------|
| save_window_positions | <logical></logical> | Save position of undocked windows between sessions | TRUE, FALSE | TRUE |
| session_auto_save | <string></string> | Save a session unconditionally on exit | OFF, ON | OFF |
| session_save_option | <string></string> | Location for automatically saving sessions | HOME, USER_DEFINED, DESKTOP | HOME |
| session_save_dir | <string></string> | User-defined location for session save | | <none></none> |
| session_embed_cur_csv_files | <string></string> | Embed the external cur/csv files into the session. | OFF, ON | OFF |
| session_embed_curve_data | <string></string> | Embed the curve xy data for all curves into the session. | OFF, ON | OFF |
| show_session_retrieve_on_start | <string></string> | A pop-up panel to retrieve a saved T/HIS session file would show up every time T/HIS is launched. | ON, OFF | OFF |

Keys can have functions assigned to them:

16.9. APPENDIX I - Windows File Associations

16.9.1. WINDOWS (PC's)

WINDOWS (PC's)

Under Windows on PC it is possible to set up file associations so that double clicking on files with the .thf , .xtf , .cur and .bdf extension opens them automatically in T/HIS.

All of these settings are optional: you should be aware that under the Windows operating system associating a filetype (via its extension) with an application is convenient, but can also be restricting and hard to undo.

To make .thf files open in T/HIS by double-clicking on them

If no application is currently associated with .thf files, a "double-click" won't work, and some non-specific, usually "windows", icon will be displayed with the file.

Right click on any .thf file, and select **properties** and then press the Change... tab next to Opens with: from the popup menu.

| Open with | X |
|---|----------------|
| Choose the program you want to use to open this file: File: sled.ptf | |
| Recommended Programs | A |
| d3plot11 - 64bit Ove Arup Ove Arup | |
| Other Programs | - ^ E |
| Adobe Reader Adobe Systems Incorporated | |
| Microsoft Office 2010 Microsoft Corporation Microsoft Corporation | |
| Microsoft Word Notepad Microsoft Corporation | |
| Notepad++ : a free (GNU) source code editor Don HO don.h@free.fr | + |
| Always use the selected program to open this kind of file | <u>B</u> rowse |
| ок (| Cancel |

- 1. This will bring up the **"Open with"** panel.
- 2. Ensure the **Always use...** box is ticked
- 3. Use the directory browsing window to find the correct T/HIS executable. You are looking for file **this11.exe** or **this11_x64.exe** .
- 4. Select the executable and click on **OK** to close the "Open With" window.

T/HIS should now open and read in the selected file and you should now find that:

- All **.thf** files on your system show the T/HIS icon.
- Double-clicking on any such file starts T/HIS and opens that file.

It is not possible to set up the filename "d3thdt" for double-clicking in this way since Windows requires filename extensions when assigning applications to files.)

To make .xtf

The procedure is exactly the same as for .thf files, and must be carried out for each of the file types that you wish to process by double-clicking:

.xtf Ansys LS-DYNA Extra Time History file

.cur T/HIS Curve file

.bdf T/HIS Bulk Data file

NoteFile types .thf and .xtf are opened in this way, but no contents are readthat:in.

File types .cur and .bdf are opened and their complete contents read in.

16.10. APPENDIX J - Typed Commands

16.10.1. Global Menu

| Global Menu | | | | |
|---|---------------------------------|--|--|--|
| PL - Plot | CL - Clear Screen | | | |
| <mark>ZM</mark> - Zoom | AU - Auto Scale Plot | | | |
| CE - Centre | PT - Point on Screen | | | |
| PF - Write Postscript file (use default) | | | | |
| PC - Write Postscript file (Colour) | | | | |
| PB - Write Postscript file (Blank/White) | | | | |
| | | | | |
| BL - Blank Curve | UB - Unblank Curve | | | |
| RM - Remove a Curve | ER - Erase all curves | | | |
| <mark>GS</mark> - Global Status | CO - Condense Curves | | | |
| <mark>Y1</mark> - 1st Y axis | <mark>Y2</mark> - Second Y axis | | | |
| DOU - Double Y axis (ON/ OFF) | | | | |
| | | | | |
| CF - Command file (read) | SF - Session file (write) | | | |
| CS - Close session file | | | | |
| | | | | |
| EX - Exit | | | | |
| | | | | |
| ! - Backspace | / - Top level menu | | | |
| Q - Abort operation | | | | |
| ; - End of command string | | | | |

16.10.2. List Commands

List Commands

LS - List all files in current directory LC - L

LC - List all files "*.cur" in current directory

LB - List all files "*.bdf" in current directory **LK** - List all files "*.key" in current directory **LI** - List all files ASCII files in current

directory

| <u>GM - Global Menu</u> | | | | | |

17. Installation Organisation

Installation organisation

Oasys LS-DYNA Environment 22.0 installation can be customised to try and avoid a number of issues that often occur in large organisations with many users.

• Large organisations generally imply large networks, and it is often the case that the performance of these networks can be intermittent or poor, therefore it is common practice to perform an installation of the software on the local disk of each machine, rather then having a single installation on a remote disk.

This avoids the pauses and glitches that can occur when running executable files over a network, but it also means that all the configuration files in, or depending upon, the top level "Admin" directory have to be copied to all machines and, more to the point, any changes or additions to such files also have to be copied to all machines.

• In larger organisations the "one person per computer" philosophy may not apply, with the consequence that users will tend to have a floating home area on a network drive and may not use the same machine every day.

This is not usually a problem on Linux where the "home" directory is tied to the login name not the machine. However on Windows platforms it means that %USERPROFILE%, which is typically on the local C drive of a machine, is not a good place to consider as "home" since it will be tied to a given computer, therefore a user who saves a file in their home directory on machine A may not be able to access it from machine B.

• In a similar vein placing large temporary files on the /tmp partition (Linux) or the C: drive (Windows) may result in local disks becoming too full, or quotas exceeded.

This section gives only a brief summary of the installation organisation, and you should refer to the separate Installation Guide if you want to find out more about the details of installation, licensing, and other related issues.

17.1. Oasys Suite 22.0 Installation Structure

Oasys Suite 22.0 Installation structure

In Oasys Suite 22.0 the option is provided to separate a top-level 'administration' directory from the 'installation' one where the executables are located.

For large installations on many machines this allows central configuration and administration files to exist in one place only, but executables to be installed locally on users' machines to give better performance. Oasys Suite 22.0 also allows the following items to be configured

- The location for user manuals and other documentation.
- The definition of a user's home directory.
- The definition of the temporary directory for scratch files.

In addition parsing of the 'oa_pref' (preferences) file will now handle environment variables, so that a generic preference can be configured to give a user-specific result, and preferences may be 'locked' so that those set at the administration level cannot be changed by users.

| Directory | Status | Directory Content and purpose | oa_pref file option |
|-------------|----------|--|---------------------|
| OA_ADMIN_xx | Optional | Top level configuration files. (xx =22 for Oasys Suite 22.0, thus OA_ADMIN_22) Admin level oa_pref file Other configuration files Timeout configuration file | |
| OA_ADMIN | Optional | Same as oa_admin_22 , provided for backwards compatibility with earlier releases. It is recommended that plain oa_admin , without the _** version suffix, is not used since otherwise there is no easy way of distinguishing between parallel installations of different releases of Oasys LS-DYNA Environment in an | |

These changes are entirely optional, and users performing a simple installation on a single machine do not need to make any changes to their existing installation practice.

| | | installation. | |
|---------------|----------|--|---|
| | | If оа_адмім_22 is not defined then this non-release specific version is checked. | |
| OA_INSTALL_xx | Optional | (xx =22 for release 22.0, thus OA_ADMIN_22 | oasys*install_dir: <pathname></pathname> |
| | | All executables Installation level oa_pref file | |
| OA_INSTALL | Optional | Same as oa_install_22 . | oasys*install_dir: <pathname></pathname> |
| | | If no "OA_ADMIN_XX" directory is used and all software is simply placed in this "install" directory, which would be typical of a single-user installation, then it is recommended that the _XX version suffix is used in order to keep parallel installations of different releases of the Oasts Ltd software separate on the machine. | |
| | | If OA_INSTALL_22 is not defined then this non-release specific version is checked | |
| OA_MANUALS | Optional | Specific directory for user manuals. If not defined then will search in: OA_ADMIN_xx/manuals (XX = major version number) OA_INSTALL/manuals | oasys*manuals_dir: <pathname></pathname> |
| OA_HOME | Optional | – Specific "home" directory for user when using Oasys LS-DYNA Environment. If not defined will use: \$номе (Linux) &USERPROFILE% (Windows) | oasys*home_dir: <pathname></pathname> |
| OA_TEMP | Optional | Specific "temporary" directory for user when using Oasys LS-DYNA Environment. If not defined will use: | oasys*temp_dir: <pathname></pathname> |
| | | <pre>P_tmpdir (Linux, typically /tmp) %темp% (Windows, typically C:\temp)</pre> | |

It will be clear from the table above that no Environment variables have to be set, and that all defaults will revert to pre-version 9.4 behaviour. In other words users wishing to keep the status quo will find behaviour and layout unchanged if they do nothing.

OA_INSTALL_XX

Previously the software used the **oa_install** (renamed from **oasys**) environment variable to locate the directory the software was installed in.

- On Windows this is no longer required as the software can work out its own installation directory. As this environment variable is no longer required it is recommended that it is removed from machines it is currently set on as in some cases where more than one version has been installed in different directories it can cause problems.
- On LINUX systems the "oasys_22" script that starts the SHELL automatically sets this Environment Variable and passes it to any application started from the SHELL. If you run applications directly from the command line and bypass the SHELL then you should set **OA_INSTALL_XX** so that the software can locate manuals and other required files.

OA_ADMIN_XX

Users wishing to separate configuration and installation directories will be able to do so by making use of the new top level **OA_ADMIN_XX** directory.

17.1.1. Installation Examples

Installation Examples

The following diagrams illustrate how the installation might be organised in various different scenarios..

a) Single user installation on one machine

There is no need to worry about separating administration and installation directories, and the default installation of all files in and below the single installation directory will suffice.

It is suggested that the <u>xx</u> version suffix of **OA_INSTALL_xx** is used in order to keep parallel installations of different releases of the Oassys Ltd software separate on the machine.

b) A few machines on a small network, each user has their own machine

The top level administration directory can be installed on a network server, possibly also locating the manuals centrally.

Each user's machine has its own 'installation' directory to give good performance, but there is no need to manage home or temporary directories centrally since each user 'owns' their machine.

If network performance is good an alternative would be to install executables on the central server, meaning that local OA_INSTALL directories are not required.

c) Large corporate network

There is no need to worry about separating administration and installation directories, and the default installation of all files in and below the single installation directory will suffice.

OA_ADMIN_xx Top level oa_pref file Úser manuals Timeouts file

Many machines, each with OA_INSTALL

17.1.2. Dynamic Configuration Using the Top Level oa_pref File

Dynamic configuration using the top level oa_pref file.

A further improvement is that all environment variables below **OA_ADMIN_xx** may either be set explicitly, or dynamically using the options in the oa_pref file at the top **OA_ADMIN_xx** level. This permits parallel installations of different versions of the software to co-exist, with only the top level administration directory names being distinct. For example:

| Oasys Suite 22.0 | Oasys Suite 22.1 | |
|---|--|--|
| Top level directory OA_ADMIN_22 | Top level directory оя_адмія_221 | |
| <pre>oa_pref file in oa_admin_22 contains: oasys*install_dir: <pathname 22.0="" for="" installation=""> oasys*manuals_dir: <pathname 22.0="" for="" manuals=""></pathname></pathname></pre> | oa_pref file in oa_admin_221 contains: oasys*install_dir: <pathname 22.1<br="" for="">installation> oasys*manuals_dir: <pathname 22.1<br="" for="">manuals></pathname></pathname> | |
| <pre>oasys*home_dir: <pathname directory="" for="" home=""> oasys*temp_dir: <pathname files="" for="" temporary=""></pathname></pathname></pre> | } would almost certainly be unchanged between major } versions, although they could be different if desired | |
| Pathnames in the oa_pref file may contain environment variables which will be | | |

resolved before being applied.

17.1.3. The Hierarchy of oa_pref File Reading

The hierarchy of oa_pref file reading

It will be clear from the above that in a large installation the "oa_pref" files have a significant role. Each piece of software reads them in the following order:

| OA_ADMIN_xx | Top level configuration |
|---------------------------|--|
| OA_INSTALL_xx | Installation level |
| OA_HOME | User's personal "home" file |
| Current working directory | File specific to the current directory (rarely used) |

The rules for reading these files are:

- If a given directory does not exist, or no file is found in that directory, then no action is taken. This is not an error.
- A more recently read definition supersedes one read earlier, therefore "local" definitions can supersede "global" ones (unless it was locked).
- If two of more of the directories in the table above are the same then that file is only read once from the first instance.

17.1.4. Locking Preference Options

Locking Preference Options

From version 9.4 onwards, preference options can be locked. If a preference option is locked in a file then that preference option will be ignored in any of the subsequent preference files that are read.

Therefore by locking a preference in a top-level file in the hierarchy above, eg in **OA_ADMIN_XX**, and then protecting that file to be read-only, an administrator can set preferences that cannot be altered by users since any definitions of that preference in their private oa_pref files will be ignored.

Preferences are locked by using a hash (#) rather than an asterisk (*) between the code name and the preference string. For example:

| *maximise: true | Normal case using " * ", means an unlocked preference |
|-----------------|--|
| #maximise: true | Locked case using " # " |

These changes may be made either by editing the file manually, or by using the preferences editor.

18. Placement of master window

Placement: where the master window is mapped on the desktop

Most CAE users will have more than one monitor on their desktop, or they may be working on a laptop with additional displays attached. Historically the Oasys LS-DYNA Environment software has always started on the main (primary) display and the existing "placement" preference has allowed a sub-area of that display to be used. However, more options are available:

- On a multi-monitor desktop it is possible to designate the monitor on which the software starts, this does not have to be the main display.
- On a single monitor desktop the original logic of partitioning the area of the single main window is still used.
- On "ultra wide" desktops, typically the case when display is made from Linux to a multi-monitor Windows desktop, an attempt is made to use the correct monitor.

Default, if no placement is defined

The default behaviour when no explicit placement preference is defined is to create the master window maximised in the main display on the desktop.

The "placement" preference

This is a standard preference, located in the oa_pref file, that can be defined for all the Oasys LS-DYNA Environment software or separately for individual programmes:

| Prefix | Application |
|--|--|
| oasys*placement: | Applies to all the software |
| <pre>primer*placement d3plot*placement etc</pre> | Applies only to PRIMER Applies only to D3PLOT <i>etc</i> |

The value of the preference is a combination, effectively a logical OR, of one or more of the following:

| Horizontal placement | LEFT CENTRE RIGHT |
|----------------------|-------------------|
| Vertical placement | TOP MIDDLE BOTTOM |

These can be combined, separating them with underscore "_" characters, for example:

oasys*placement: LEFT_TOP would locate the window in the top left monitor of a multi row and column display matrix.

How the monitor is chosen

In order to decide which monitor to use the bounding box around the monitors on the desktop, in pixel space, is divided into a 3x3 matrix. For example the two layouts below are divided as follows.

- The black rectangles are the monitors.
- The outer red rectangle is the bounding box
- The thin red lines show the sub-division into the 3x3 matrix

In each case the monitor used is the one whose centroid is closest to the centre of the designated left / centre / right and top / middle / bottom sub-area. If a vertical or horizontal placement is not given (e.g. just LEFT or just TOP) then the centre dimension of the missing axis is used.

The window will not span multiple monitors.

If there is only a single monitor on the desktop

The relevant sub-area of the monitor will be used

- Left will occupy the left hand half;
- Right will occupy the right hand half;
- Centre will use the middle half.

In the particular case of an X11 emulator on a Windows desktop with multiple displays

It will depend on the emulator, but typically they present a single virtual display to the Linux client which spans the whole desktop with no distinction between monitors. If the aspect ratio of this display is determined to be "ultra wide", that is wider than two 16:9 monitors, then it is presumed that three monitors are being used and the layout will be treated like the top image above.

Monitors with different resolutions making up a desktop

It is not unusual to have displays with different resolutions making up a desktop. For example a 15" laptop running at 3840 x 2200 and 250% scaling, with a 24" monitor running at 1920x1200 and 100% scaling next to it, will actually look something like this in pixel space:

| 3840 x 2200 laptop 240 DPI | |
|-------------------------------|--|
| 240 011 | |

1920 x 1200 monitor 96 DPI

It is *pixel* space that matters, not the physical dimensions of the display. In the example above the laptop will be running at 240 dots per inch (DPI) whereas the monitor will be running at 96 DPI, so even though the 24" monitor is physically larger it has fewer pixels than the 15" laptop. Remember that the bounding box, the red outer rectangle in the images above, is based on pixel space and not physical space.

19. Emailing Crash Dumps to Support

Emailing Crash Dumps to Support

This feature is only available on Windows platforms

Obviously we prefer our software not to crash, but if it does we want to know why, so that we can fix it in the future and – if possible – suggest workarounds for users. On Windows platforms, a crash will usually produce a small dump file which, if sent to Oasys Ltd Support, can sometimes be deconstructed to work out what went wrong.

Historically this relied on the user finding the dump file on their system, then sending it manually with a covering email. This was difficult and time-consuming, so Oasys LS-DYNA Environment software can now be configured to collect that file and create the email automatically. It must be stressed that this email is **never** sent automatically – that is always under the control of the user – and this feature can be turned off. This section describes the process in more detail and also explains how to customise the handling of crashes.

What is a dump (.dmp) file?

This is a small file (usually around 50 kB), which contains information about the "stack frame" of the software at the time of the crash. It is produced by standard Windows utilities – in fact this is the file that would normally be sent to Microsoft following a crash if their standard crash post-mortem process were used.

It contains:

- A stack trace: the hierarchical list of "what function called what" i.e. where in the software the crash occurred.
- Very limited information about variables in use at the time of the crash.

It does **not** contain:

- Any significant information about the model being processed.
- Any information about historical operations it is "instantaneous", containing only what was happening at the time of the crash.

There is absolutely no way that Oasys Ltd or anyone else could use it to reverseengineer your model data in anything other than the most general terms. For example, we might be able to deduce that you were using a spot-weld tool at the time of the crash and therefore that your model contained connections, but we could not learn anything about its size, content, geometry, material properties or any quantitative information.

If you send us these files it helps us to help you. Sometimes we can diagnose the reason for a crash and suggest ways around it, this also allows us to fix problems in future releases. This isn't always possible, they can be very opaque at times, but they are by far the best tool we have for diagnosing problems.

The default process for handling a crash in an interactive session

This is not the default behaviour for users in Japan, see "<u>Special</u> <u>configuration in some geographies</u>" below.

Following a crash, you will see this message (*this example shows PRIMER*; *the behaviour is the same for all Oasys LS-DYNA Environment products*).

| - | | | | | | | |
|---|---|--|--|-----------------|------------------------|-----------|--|
| | | Email, Save, Exit | Email, Exit | Save, Exit | Exit | Configure | |
| l | The PRIMER error trap handler has detected an illegal instruction which means that it must exit. | | | | | | |
| | The following Windows 'Mini dump' file has been written: | | | | | | |
| | C:\Users\CHRIST~1.BEL\AppData\Local\Temp\PRIMER\PRIMER-22.0 Nightly-36152-Jan-10-2025-20250113-115137-24288-6444.dmp | | | | -115137-24288-6444.dmp | | |
| l | This file only contains stack trace information showing where this process failed. It does not contain any information about your model, and can not be used to reverse-engineer your model in any way. | | | | | | |
| | You can help us to fix this error. If you select an 'Email' option PRIMER will create a pre-populated email using your normal email client with this file attached. The message body will contain some basic information about the status of PRIMER, but no details of your model(s) will be included. | | | | | | |
| | It will *not* be sent automatically. You will be able to view and edit it however you wish, it will only be sent if and when you hit 'Send'. However we hope that you do send it since this will help us to fix the issue and make PRIMER work better for you. | | | | | | |
| | The options available to you are: | | | | | | |
| ļ | Email, Save, E Email, Exit Save, Exit Exit Configure | Create email wi Save key data, Simply exit PRI | th minidump, save th minidump, then then exit PRIMER. MER. ler configuration | exit PRIMER wit | | | |

If you choose one of the **Email** options an email like the following will be created in your default email client. This example uses Microsoft Outlook but if different software is installed that will be used instead.

| T/HIS |
|-------|
|-------|

| Send To Oyna Su Cc Subject PRIMER Co | <u>apport <dyna.support@arup.com></dyna.support@arup.com></u> ash dump | General 🗸 | | | | |

| NOTE TO SENDER: Please write below any additional information that could help ==================================== | | | | | | |
| What have you been doing during this PRIMER session? How many models were open across how many windows? Which tools were you using at the time the problem occurred? anything else you think may be relevant | | | | | | |
| Your comments: (use as many lines as | you like) | | | | | |
| | | | | | | |
| Stack trace (22 entries) 21: create_email_body - 0x7FF6BD9C 20: generate_email - 0x7FF6BD9CCCE 19: cd_exception_handler - 0x7FF6BD 18: db_init_error_handler - 0x7FF6BB | DDE0 0 9C6AC0 | • | | | | |

Note that the dump file is attached automatically to the email, and it may also contain a Stack trace containing information about the stack frame.

You can add any comments you like to the email, possibly add other attachments, then send it in the normal way using **Send**. This will send it to the normal <u>dyna.support@arup.com</u> email address we use to handle support requests.

The email will never be sent automatically. If you close the email without sending it, it will remain in your drafts folder until deleted.

Configuring the crash handler

All aspects of the crash handler can be configured via preferences stored in the oa_pref file, but much the easiest way to do this is to use the interactive configuration GUI built into the software.

| | Crash handling and configuration ? | | | |
|------------------------------|---|---|--|--|
| In all | Save to oa_pref Reset all | Help | | |
| programmes other than | Action to be taken after a crash | Ex | | |
| Oasys SHELL, | | Create a minidump file, optionally email to Support for | | |
| selecting Help \rightarrow | Minidump file and exit | debugging, optionally save key data then terminate session. | | |
| Crash handler | | Trap the error, optionally save key data, try to continue | | |
| will launch the | Trap and continue | execution. No debugging information is saved. | | |
| configuration | 0 | Generate a traceback if the system supports this, terminate | | |
| panel: | O Trace and exit | execution; no data is saved. (Always used in batch mode.) | | |
| | O No option | Normal windows behaviour: job terminates, no data is save | | |
| HelpBlank | O No action | and no debugging information is generated. | | |
| User Manual Support | Preference files to update | Ex | | |
| What's New | ADMIN directory | Lock at ADMIN level | | |
| Tutorials | INSTALL directory | Lock at INSTALL level | | |
| Keyword manuals | User's HOME directory | | | |
| Online/HTML | | | | |
| Crash handler | Code(s) to configure | Ex | | |
| About | nent products | | | |
| | PRIMER D3PLC | T T/HIS REPORTER SHELL | | |
| | Minidump files | Ex | | |
| In Oasys SHELL, | Save minidump files | | | |
| this is launched | Default | | | |
| from Utilities \rightarrow | O User-def: <not defined=""></not> | | | |
| Crash Handling: | Feedback email details | Ex | | |
| | Compose emails | Test email | | |
| | | rt@arup.com | | |
| | Cc address(es): | | | |
| | | | | |
| | Email method | | | |
| | Best effort Default eliget | | | |
| | O Default client | am Files\Microsoft Office\root\Office16\OUTLOOK.EXE | | |
| | O URL mailto: | | | |
| | O Custom method: <not defi<="" td=""><td>ned></td></not> | ned> | | |
| | | | | |

Taking each section of this panel in turn:

Action to be taken after a crash

| T/HIS | | | |
|----------|--------------------------|---|-------|
| Action t | o be taken after a crash | Ex | plain |
| 0 | Minidump file and exit | Create a minidump file, optionally email to Oasys Ltd for debugging, optionally save key data then terminate session. | |
| 0 | Trap and continue | Trap the error, optionally save key data, try to continue execution. No debugging information is saved. | |
| 0 | Trace and exit | Generate a traceback if the system supports this, terminate execution; no data is saved. (Always used in batch mode.) | |
| 0 | No action | Normal windows behaviour: job terminates, no data is saved and no debugging information is generated. | 1 |
| | | | |

For interactive usage:

- The first option, "Minidump file and exit", is usually the best option. If you choose to save your data then you have a reasonable chance of recovering some of your work, and the minidump file may provide evidence for Oasys Ltd Support to debug the problem and suggest workarounds.
- "Trap and continue" is a possible alternative, especially if you don't want to save debugging information, but it may not work if the cause of the crash was mangled data and a subsequent crash may be terminal.
- "Trace and exit" and "No action" are not usually good choices for interactive use on the desktop. Tracebacks on Windows (unlike Linux) do not usually give much information.

For batch usage, where there is no interactive user:

• "Trace and exit" is usually the best choice since it will leave some evidence in the log file. If the software is run with the "-batch" command-line argument it will use this method regardless of the option set here.

The default if no explicit setting is defined is "Minidump file and exit". The next sections will show how the minidump file's configuration can be set when this option is used.

Preference files to update

| Preference files to update | Explain |
|----------------------------|-----------------------|
| ADMIN directory | Lock at ADMIN level |
| INSTALL directory | Lock at INSTALL level |
| ✓ User's HOME directory | |

Preferences can be stored in oa_pref files at three levels:

| OA_ADMIN | Administration level, optional. (Not used in this example) |
|------------|--|
| OA_INSTALL | Installation level, where the software is installed |
| HOME | The user's home directory |

If you wish to configure options for all users it is best to put them in the OA_INSTALL or OA_ADMIN levels since this will ensure uniformity. If these directories are writeprotected, users will not be able to change them, and if you choose to "lock" the preferences stored within them users will not be able to override these with locally set preferences in the HOME directory.

Unlocked preferences use a "*" between code name and preference, locked preferences use a "#". For example:

oasys*some_preference: value
oasys#something_else: value

is an unlocked preference is a locked preference

Codes to configure

温

It is possible that you will want the same crash handling behaviour for all programs. This is achieved using the "oasys" prefix – for example:

oasys*some_preference: value

You can set preferences for individual programs – for example:

primer*some_preference: value

by unticking "All Oasys LS-DYNA Environment products" and ticking only those programs you wish to configure.

Minidump files

| Minidump files | | Explain |
|----------------|---|---------|
| Save minidum | np files | |
| O Default | C:\Users\CHRIST~1.BEL\AppData\Local\Temp\ | |
| User-def: | <not defined=""></not> | |

Minidump files contain debug information about the code when it crashed. They do not contain any information about the model and cannot be used to reverse-engineer models in any way. If you send them to Oasys Ltd Support they may be able to tell what

caused the crash, but this is not guaranteed – sometimes they are very opaque. However, any information is useful when trying to debug crashes, so if you send them to us it helps us to help you.

You can choose whether or not to save them, also where to save them. The default location is the standard Windows temporary directory, typically C:\users\username\Appdata\local\temp. By default, Windows Explorer treats this as a "hidden" directory which can make it hard for users to find, so if you want to collect these files you can choose somewhere else.

If you do choose an alternative location, remember that it must be writeable by an unprivileged user. If you want to use a generic location for many different users you can use environment variables, for example %USERPROFILE%\crash_dumps defines location c:\username\crash_dumps.

| Feedback email details | S | Explain |
|------------------------|---|---------|
| Compose emails | Test email | |
| To address: | dyna.support@arup.com | |
| Cc address(es): | | |
| Email method | | |
| Best effort | | |
| O Default client | | |
| Outlook CLI | C:\Program Files\Microsoft Office\root\Office16\OUTLOOK.EXE | |
| O URL mailto: | | |
| O Custom method: | <not defined=""></not> | |

Feedback email details

Firstly you need to decide whether or not you want to compose emails automatically.

It may be corporate policy not to permit users to send emails containing sensitive information in which case if you untick "Compose emails" they will not be created and you can ignore the rest of this section. Following a crash, the user will not be shown the option to send an email.

If you do choose to send emails, you can configure the following:

• The "To:" address. This is required.

By default, this will be <u>dyna.support@arup.com</u>, but if you would rather collect emails internally, you can replace this with some other address. You can only have a single address in this data field.

• "Cc" address(es). These are optional.

If you want to send copies of the email to other addresses, enter them here. Multiple addresses should be separated by semi-colons, for example "mary.doe@wood.com; an.other@somewhere.com".

• The email sending method.

In order to give users the choice about whether or not to send an email, complete control over its contents and also the ability to add further information, Oasys LS-DYNA Environment software attempts to use the default email client on the user's system. It does not send emails (or any other data) automatically.

The majority of Windows email clients conform to Microsoft's internal protocols meaning that the default method should work, but this is not guaranteed. Therefore the software carries out the following process when using its default "Best effort" option:

- (1) It tries using the standard Microsoft protocol to run the default email client *if that fails*
- (2) It tries to use Microsoft Outlook if that is present on the system *if that fails*
- (3) It tries to use URL mailto: (the way email links are processed from web pages).

The best approach is to the use the **Test Email** button to try the currently selected method. If, after a few seconds delay, you see the test email shown below then it is working correctly and configuration is complete.

You can send the test email if you wish. If you want acknowledgement from Oasys Ltd that it has been received, please request this in the email body, otherwise it will be ignored.

This is a dummy email emulating what would happen if a code crashed.

Thank you for configuring this, sending us crash reports helps us to help you :-)

You can send this if you wish, if you would like to receive an acknowledgement that it has been received by the Oasys Ltd support team please request this below, otherwise it will be ignored.

If you see this email but it takes about one minute to appear, and you are using the default "Best effort" method, this suggests that the default email client has failed to work. The delay is because this has a time-out period of about one minute and it will have fallen back to one of the Outlook or URL mailto: methods. You can tell which method by inspecting whether or not it has the file test_attachment.txt attached: if it has then it has used Outlook, if not it has used URL mailto (the latter does not permit attachments). To avoid similar delays for users, please select the method it has actually used so that it will go directly to this.

If none of these methods work, please try to find out as much as possible about the email client installed on the machine and then contact Oasys Ltd for help.

Save this configuration

Save to oa_pref will save your selected configuration as preferences to the oa_pref files selected in the second step above.

Configuring Crash Handling manually using preferences

The GUI-based process in the previous section works by configuring and saving preferences. You can achieve the same results by setting the following preferences manually:

| Preference Purpose | Possible values (bold = default) |
|--------------------|----------------------------------|
|--------------------|----------------------------------|

| cd_compose_email | Whether or not to auto- compose and email | true or <i>false</i> |
|-------------------|--|--|
| cd_email_address | The email "To" destination | dyna.support@arup.com name@address |
| cd_cc_addresses | Optional "Cc" addresses for the email. | One or more name@address values, separated by ";" |
| cd_email_method | The mechanism used to send the email | best_effort system_default outlook_cli url_mailto |
| cd_minidump_file | Whether or not to create a minidump file, and how it is processed. | not_used saved_only emailed_only saved_and_emailed |
| cd_dump_directory | Where to write the minidump file instead of the default. | Folder to which the user has write access |

Preferences take the form <code_name> <* or #> <preference_name> : <value> where

| code_name | ls oasys for all products primer, this, d3plot, shell, reporter for individual products | |
|-----------------|--|--|
| * or # | * is an unlocked preference # is a locked preference | |
| preference_name | One of the names in the left hand column of the table above | |
| value | One of the values in the right hand column of the table above | |

Preferences are stored in oa_pref files in any combination of the following locations

| OA_ADMIN | Administration level |
|------------|---|
| OA_INSTALL | Installation level, where the software is installed |
| HOME | The user's home directory |

They are read in the order OA_ADMIN, OA_INSTALL, HOME.

A preference that is locked at one of these levels cannot be superseded by a different one at a lower level. For example locking a preference at the OA_INSTALL level (and write protecting that directory) means that a user cannot supersede it by defining it differently at the HOME level.

If, for example, you wanted to turn off and lock the composition of minidump emails for all users and all software you would define the preference

oasys#cd_compose_email: false

and save this in the OA_ADMIN and/or OA_INSTALL oa_pref files.

Special configuration in some geographies

The default configuration of crash handling depends on the geography as determined by the computer's "locale". In particular, email composition is turned off by default on computers with the Japanese "jp-JP" locale.

These defaults can be over-ridden by setting a different value; there is no restriction upon what can be set in a given locale.

20. Licences Used in Software

Licences used in software

Oasys LS-DYNA Environment uses several third party libraries and executables. The licences for them are given below

20.1. Open source

20.1.1. Apple Public Source

Apple Public Source

Copyright (c) 1999 Apple Computer, Inc. All rights reserved.

The contents of this file constitute Original Code as defined in and are subject to the Apple Public Source License Version 1.1 (the "License"). 20.1.4. FreeType

FreeType

Portions of this software are copyright The FreeType Project (<u>www.freetype.org</u>). All rights reserved.

The FreeType Project LICENSE

2006-Jan-27

Copyright 1996-2002, 2006 by David Turner, Robert Wilhelm, and Werner Lemberg

Introduction

The FreeType Project is distributed in several archive packages; some of them may contain, in addition to the FreeType font engine, various tools and contributions which rely on, or relate to, the FreeType Project.

This license applies to all files found in such packages, and which do not fall under their own explicit license. The license affects thus the FreeType font engine, the test programs, documentation and makefiles, at the very least.

This license was inspired by the BSD, Artistic, and IJG (Independent JPEG Group) licenses, which all encourage inclusion and use of free software in commercial and freeware products alike. As a consequence, its main points are that:

- o We don't promise that this software works. However, we will be interested in any kind of bug reports. (`as is' distribution)
- o You can use this software for whatever you want, in parts or full form, without having to pay us. (`royalty-free' usage)
- o You may not pretend that you wrote this software. If you use it, or only parts of it, in a program, you must acknowledge somewhere in your documentation that you have used the FreeType code. (`credits')

We specifically permit and encourage the inclusion of this software, with or without modifications, in commercial products. We disclaim all warranties covering The FreeType Project and assume no liability related to The FreeType Project.

Finally, many people asked us for a preferred form for a

credit/disclaimer to use in compliance with this license. We thus encourage you to use the following text:

.....

Portions of this software are copyright <year> The FreeType Project (www.freetype.org). All rights reserved.

Please replace <year> with the value from the FreeType version you actually use.

Legal Terms

0. Definitions

Throughout this license, the terms `package', `FreeType Project', and `FreeType archive' refer to the set of files originally distributed by the authors (David Turner, Robert Wilhelm, and Werner Lemberg) as the `FreeType Project', be they named as alpha, beta or final release.

`You' refers to the licensee, or person using the project, where `using' is a generic term including compiling the project's source code as well as linking it to form a `program' or `executable'. This program is referred to as `a program using the FreeType engine'.

This license applies to all files distributed in the original FreeType Project, including all source code, binaries and documentation, unless otherwise stated in the file in its original, unmodified form as distributed in the original archive. If you are unsure whether or not a particular file is covered by this license, you must contact us to verify this.

The FreeType Project is copyright (C) 1996-2000 by David Turner, Robert Wilhelm, and Werner Lemberg. All rights reserved except as specified below.

1. No Warranty

THE FREETYPE PROJECT IS PROVIDED `AS IS' WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT WILL ANY OF THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY DAMAGES CAUSED BY THE USE OR THE INABILITY TO USE, OF THE FREETYPE PROJECT.

2. Redistribution

_ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _

This license grants a worldwide, royalty-free, perpetual and

irrevocable right and license to use, execute, perform, compile, display, copy, create derivative works of, distribute and sublicense the FreeType Project (in both source and object code forms) and derivative works thereof for any purpose; and to authorize others to exercise some or all of the rights granted herein, subject to the following conditions:

- o Redistribution of source code must retain this license file (`FTL.TXT') unaltered; any additions, deletions or changes to the original files must be clearly indicated in accompanying documentation. The copyright notices of the unaltered, original files must be preserved in all copies of source files.
- o Redistribution in binary form must provide a disclaimer that states that the software is based in part of the work of the FreeType Team, in the distribution documentation. We also encourage you to put an URL to the FreeType web page in your documentation, though this isn't mandatory.

These conditions apply to any software derived from or based on the FreeType Project, not just the unmodified files. If you use our work, you must acknowledge us. However, no fee need be paid to us.

3. Advertising

Neither the FreeType authors and contributors nor you shall use the name of the other for commercial, advertising, or promotional purposes without specific prior written permission.

We suggest, but do not require, that you use one or more of the following phrases to refer to this software in your documentation or advertising materials: `FreeType Project', `FreeType Engine', `FreeType library', or `FreeType Distribution'.

As you have not signed this license, you are not required to accept it. However, as the FreeType Project is copyrighted material, only this license, or another one contracted with the authors, grants you the right to use, distribute, and modify it. Therefore, by using, distributing, or modifying the FreeType Project, you indicate that you understand and accept all the terms of this license.

4. Contacts

There are two mailing lists related to FreeType:

o freetype@nongnu.org

Discusses general use and applications of FreeType, as well as future and wanted additions to the library and distribution. If you are looking for support, start in this list if you

haven't found anything to help you in the documentation.

o freetype-devel@nongnu.org

Discusses bugs, as well as engine internals, design issues, specific licenses, porting, etc.

Our home page can be found at

http://www.freetype.org

--- end of FTL.TXT ---

20.1.5. FFmpeg

FFmpeg

FFmpeq is licensed under the LGPL v2.1+. The exception to this is the x264 library used by FFmpeq, for which Arup have obtained a commercial license (see here). # License Most files in FFmpeg are under the GNU Lesser General Public License version 2.1 or later (LGPL v2.1+). Read the file `COPYING.LGPLv2.1` for details. Some other files have MIT/X11/BSD-style licenses. In combination the LGPL v2.1+ applies to FFmpeg. Some optional parts of FFmpeg are licensed under the GNU General Public License version 2 or later (GPL v2+). See the file `COPYING.GPLv2` for details. None of these parts are used by default, you have to explicitly pass `-enable-gpl` to configure to activate them. In this case, FFmpeg's license changes to GPL v2+. Specifically, the GPL parts of FFmpeg are: - libpostproc - optional x86 optimization in the files - `libavcodec/x86/flac dsp gpl.asm` - `libavcodec/x86/idct mmx.c` - `libavfilter/x86/vf removegrain.asm` - the following building and testing tools - `compat/solaris/make sunver.pl` - `doc/t2h.pm` - `doc/texi2pod.pl` - `libswresample/tests/swresample.c` - `tests/checkasm/*` - `tests/tiny_ssim.c` - the following filters in libavfilter: - `signature lookup.c` - `vf blackframe.c` - `vf_boxblur.c` - `vf colormatrix.c` - `vf cover rect.c` - `vf cropdetect.c` - `vf delogo.c` - `vf eq.c` - `vf find rect.c`

sometimes

External libraries

* The files `libavcodec/jfdctfst.c`, `libavcodec/jfdctint template.c` and `libavcodec/jrevdct.c` are taken from libjpeg, see the top of the files for licensing details. Specifically note that you must credit the IJG in the documentation accompanying your program if you only distribute executables. You must also indicate any changes including additions and deletions to those three files in the documentation. * `tests/reference.pnm` is under the expat license.

FFmpeg can be combined with a number of external libraries, which

Should you, for whatever reason, prefer to use version 3 of the (L)GPL, then the configure parameter `--enable-version3` will activate this

`COPYING.GPLv3` to learn the exact legal terms that apply in this

case.

licensing option for you. Read the file `COPYING.LGPLv3` or, if you have enabled GPL

parts,

There are a handful of files under other licensing terms, namely:

- `vf kerndeint.c`
- `vf lensfun.c` (GPL version 3 or later)
- `vf mcdeint.c`

- `vf_fspp.c` - `vf histeq.c` - `vf hqdn3d.c`

- `vf mpdecimate.c`
- `vf nnedi.c`
- `vf owdenoise.c`
- `vf_perspective.c`
- `vf phase.c`

- `vf pp7.c`
- `vf pp.c`

- `vf_pullup.c`
- `vf repeatfields.c`
- `vf sab.c`
- `vf signature.c`
- `vf smartblur.c`
- `vf_spp.c`
- `vf stereo3d.c`
- `vf super2xsai.c`
- `vf tinterlace.c`
- `vf_uspp.c`
- `vf vaguedenoiser.c`
- `vsrc mptestsrc.c`

affect the licensing of binaries resulting from the combination.

Compatible libraries

The following libraries are under GPL version 2:

- avisynth
- frei0r
- libcdio
- libdavs2
- librubberband
- libvidstab
- libx264
- libx265
- libxavs
- libxavs2
- libxvid

When combining them with FFmpeg, FFmpeg needs to be licensed as GPL as well by passing `--enable-gpl` to configure.

The following libraries are under LGPL version 3: - gmp - libaribb24

- liblenefur
- liblensfun

When combining them with FFmpeg, use the configure option `--enable-version3` to upgrade FFmpeg to the LGPL v3.

The VMAF, mbedTLS, RK MPI, OpenCORE and VisualOn libraries are under the Apache License 2.0. That license is incompatible with the LGPL v2.1 and the GPL v2, but not with version 3 of those licenses. So to combine these libraries with FFmpeg, the license version needs to be upgraded by passing `--enable-version3` to configure.

The smbclient library is under the GPL v3, to combine it with FFmpeg, the options `--enable-gpl` and `--enable-version3` have to be passed to configure to upgrade FFmpeg to the GPL v3.

Incompatible libraries

There are certain libraries you can combine with FFmpeg whose licenses are not compatible with the GPL and/or the LGPL. If you wish to enable these libraries, even in circumstances that their license may be incompatible, pass `--enable-nonfree` to configure. This will cause the resulting binary to be unredistributable.

The Fraunhofer FDK AAC and OpenSSL libraries are under licenses which are incompatible with the GPLv2 and v3. To the best of our knowledge, they are compatible with the LGPL.

20.1.6. HDF5

HDF5

Copyright Notice and License Terms for HDF5 (Hierarchical Data Format 5) Software Library and Utilities

HDF5 (Hierarchical Data Format 5) Software Library and Utilities Copyright 2006 by The HDF Group.

Jpeg

The authors make NO WARRANTY or representation, either express or implied, with respect to this software, its quality, accuracy, merchantability, or fitness for a particular purpose. This software is provided "AS IS", and you, its user, assume the entire risk as to its quality and accuracy. This software is copyright (C) 1991-2012, Thomas G. Lane, Guido Vollbeding. All Rights Reserved except as specified below. Permission is hereby granted to use, copy, modify, and distribute this software (or portions thereof) for any purpose, without fee, subject to these conditions: (1) If any part of the source code for this software is distributed, then this README file must be included, with this copyright and no-warranty notice unaltered; and any additions, deletions, or changes to the original files must be clearly indicated in accompanying documentation. (2) If only executable code is distributed, then the accompanying documentation must state that "this software is based in part on the work of the Independent JPEG Group". (3) Permission for use of this software is granted only if the user accepts full responsibility for any undesirable consequences; the authors accept NO LIABILITY for damages of any kind. These conditions apply to any software derived from or based on the IJG code, not just to the unmodified library. If you use our work, you ought to acknowledge us. Permission is NOT granted for the use of any IJG author's name or company name in advertising or publicity relating to this software or products derived from it. This software may be referred to only as "the Independent JPEG Group's software".

We specifically permit and encourage the use of this software as the basis of commercial products, provided that all warranty or liability claims are assumed by the product vendor.

MOZILLA PUBLIC LICENSE Version 1.1

1. Definitions.

1.0.1. "Commercial Use" means distribution or otherwise making the Covered Code available to a third party.

1.1. "Contributor" means each entity that creates or contributes to the creation of Modifications.

1.2. "Contributor Version" means the combination of the Original Code, prior Modifications used by a Contributor, and the Modifications made by that particular Contributor.

1.3. "Covered Code" means the Original Code or Modifications or the combination of the Original Code and Modifications, in each case including portions thereof.

1.4. "Electronic Distribution Mechanism" means a mechanism generally accepted in the software development community for the electronic transfer of data.

1.5. "Executable" means Covered Code in any form other than Source Code.

1.6. "Initial Developer" means the individual or entity identified as the Initial Developer in the Source Code notice required by Exhibit A.

1.7. "Larger Work" means a work which combines Covered Code or portions thereof with code not governed by the terms of this License.

1.8. "License" means this document.

1.8.1. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently acquired, any and all of the rights conveyed herein.

1.9. "Modifications" means any addition to or deletion from the substance or structure of either the Original Code or any previous Modifications. When Covered Code is released as a series of files, a Modification is:

A. Any addition to or deletion from the contents of a file containing Original Code or previous Modifications.

B. Any new file that contains any part of the Original Code or previous Modifications.

1.10. "Original Code" means Source Code of computer software code which is described in the Source Code notice required by Exhibit A as Original Code, and which, at the time of its release under this License is not already Covered Code governed by this License.

1.10.1. "Patent Claims" means any patent claim(s), now owned or hereafter acquired, including without limitation, method, process, and apparatus claims, in any patent Licensable by grantor.

1.11. "Source Code" means the preferred form of the Covered Code for making modifications to it, including all modules it contains, plus any associated interface definition files, scripts used to control compilation and installation of an Executable, or source code differential comparisons against either the Original Code or another well known, available Covered Code of the Contributor's choice. The Source Code can be in a compressed or archival form, provided the appropriate decompression or de-archiving software is widely available for no charge.

1.12. "You" (or "Your") means an individual or a legal entity exercising rights under, and complying with all of the terms of, this License or a future version of this License issued under Section 6.1. For legal entities, "You" includes any entity which controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity.

2. Source Code License.

2.1. The Initial Developer Grant.

The Initial Developer hereby grants You a world-wide, royalty-free, non-exclusive license, subject to third party intellectual property claims:

(a) under intellectual property rights (other than patent or trademark) Licensable by Initial Developer to use, reproduce, modify, display, perform, sublicense and distribute the Original Code (or portions thereof) with or without Modifications, and/or as part of a Larger Work; and

(b) under Patents Claims infringed by the making, using or selling of Original Code, to make, have made, use, practice, sell, and offer for sale, and/or otherwise dispose of the Original Code (or portions thereof).

(c) the licenses granted in this Section 2.1(a) and (b) are effective on the date Initial Developer first distributes

Original Code under the terms of this License.

(d) Notwithstanding Section 2.1(b) above, no patent license is granted: 1) for code that You delete from the Original Code; 2) separate from the Original Code; or 3) for infringements caused by: i) the modification of the Original Code or ii) the combination of the Original Code with other software or devices.

2.2. Contributor Grant.

Subject to third party intellectual property claims, each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license

(a) under intellectual property rights (other than patent or trademark) Licensable by Contributor, to use, reproduce, modify, display, perform, sublicense and distribute the Modifications created by such Contributor (or portions thereof) either on an unmodified basis, with other Modifications, as Covered Code and/or as part of a Larger Work; and

(b) under Patent Claims infringed by the making, using, or selling of Modifications made by that Contributor either alone and/or in combination with its Contributor Version (or portions of such combination), to make, use, sell, offer for sale, have made, and/or otherwise dispose of: 1) Modifications made by that Contributor (or portions thereof); and 2) the combination of Modifications made by that Contributor with its Contributor Version (or portions of such combination).

(c) the licenses granted in Sections 2.2(a) and 2.2(b) are effective on the date Contributor first makes Commercial Use of the Covered Code.

(d) Notwithstanding Section 2.2(b) above, no patent license is granted: 1) for any code that Contributor has deleted from the Contributor Version; 2) separate from the Contributor Version;
3) for infringements caused by: i) third party modifications of Contributor Version or ii) the combination of Modifications made by that Contributor with other software (except as part of the Contributor Version) or other devices; or 4) under Patent Claims infringed by Covered Code in the absence of Modifications made by that Contributor.

3. Distribution Obligations.

3.1. Application of License.

The Modifications which You create or to which You contribute are governed by the terms of this License, including without limitation Section 2.2. The Source Code version of Covered Code may be distributed only under the terms of this License or a future version of this License released under Section 6.1, and You must include a copy of this License with every copy of the Source Code You distribute. You may not offer or impose any terms on any Source Code version that alters or restricts the applicable version of this

License or the recipients' rights hereunder. However, You may include an additional document offering the additional rights described in Section 3.5.

3.2. Availability of Source Code.

Any Modification which You create or to which You contribute must be made available in Source Code form under the terms of this License either on the same media as an Executable version or via an accepted Electronic Distribution Mechanism to anyone to whom you made an Executable version available; and if made available via Electronic Distribution Mechanism, must remain available for at least twelve (12) months after the date it initially became available, or at least six (6) months after a subsequent version of that particular Modification has been made available to such recipients. You are responsible for ensuring that the Source Code version remains available even if the Electronic Distribution Mechanism is maintained by a third party.

3.3. Description of Modifications.

You must cause all Covered Code to which You contribute to contain a file documenting the changes You made to create that Covered Code and the date of any change. You must include a prominent statement that the Modification is derived, directly or indirectly, from Original Code provided by the Initial Developer and including the name of the Initial Developer in (a) the Source Code, and (b) in any notice in an Executable version or related documentation in which You describe the origin or ownership of the Covered Code.

3.4. Intellectual Property Matters

(a) Third Party Claims.

If Contributor has knowledge that a license under a third party's intellectual property rights is required to exercise the rights granted by such Contributor under Sections 2.1 or 2.2, Contributor must include a text file with the Source Code distribution titled "LEGAL" which describes the claim and the party making the claim in sufficient detail that a recipient will know whom to contact. If Contributor obtains such knowledge after the Modification is made available as described in Section 3.2, Contributor makes available thereafter and shall take other steps (such as notifying appropriate mailing lists or newsgroups) reasonably calculated to inform those who received the Covered Code that new knowledge has been obtained.

(b) Contributor APIs.

If Contributor's Modifications include an application programming interface and Contributor has knowledge of patent licenses which are reasonably necessary to implement that API, Contributor must also include this information in the LEGAL file.

(c) Representations.

Contributor represents that, except as disclosed pursuant to Section 3.4(a) above, Contributor believes that Contributor's Modifications are Contributor's original creation(s) and/or Contributor has sufficient rights to grant the rights conveyed by

this License.

3.5. Required Notices.

You must duplicate the notice in Exhibit A in each file of the Source Code. If it is not possible to put such notice in a particular Source Code file due to its structure, then You must include such notice in a location (such as a relevant directory) where a user would be likely to look for such a notice. If You created one or more Modification(s) You may add your name as a Contributor to the notice described in Exhibit A. You must also duplicate this License in any documentation for the Source Code where You describe recipients' rights or ownership rights relating to Covered Code. You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Code, However, You may do so only on Your own behalf, and not on behalf of the Initial Developer or any Contributor. You must make it absolutely clear than any such warranty, support, indemnity or liability obligation is offered by You alone, and You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of warranty. support, indemnity or liability terms You offer.

3.6. Distribution of Executable Versions.

You may distribute Covered Code in Executable form only if the requirements of Section 3.1-3.5 have been met for that Covered Code, and if You include a notice stating that the Source Code version of the Covered Code is available under the terms of this License. including a description of how and where You have fulfilled the obligations of Section 3.2. The notice must be conspicuously included in any notice in an Executable version, related documentation or collateral in which You describe recipients' rights relating to the Covered Code. You may distribute the Executable version of Covered Code or ownership rights under a license of Your choice, which may contain terms different from this License, provided that You are in compliance with the terms of this License and that the license for the Executable version does not attempt to limit or alter the recipient's rights in the Source Code version from the rights set forth in this License. If You distribute the Executable version under a different license You must make it absolutely clear that any terms which differ from this License are offered by You alone, not by the Initial Developer or any Contributor. You hereby agree to indemnify the Initial Developer and every Contributor for any liability incurred by the Initial Developer or such Contributor as a result of any such terms You offer.

3.7. Larger Works.

You may create a Larger Work by combining Covered Code with other code not governed by the terms of this License and distribute the Larger Work as a single product. In such a case, You must make sure the requirements of this License are fulfilled for the Covered Code.

4. Inability to Comply Due to Statute or Regulation.

If it is impossible for You to comply with any of the terms of this

License with respect to some or all of the Covered Code due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be included in the LEGAL file described in Section 3.4 and must be included with all distributions of the Source Code. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it.

5. Application of this License.

This License applies to code to which the Initial Developer has attached the notice in Exhibit A and to related Covered Code.

6. Versions of the License.

6.1. New Versions.

Netscape Communications Corporation ("Netscape") may publish revised and/or new versions of the License from time to time. Each version will be given a distinguishing version number.

6.2. Effect of New Versions.

Once Covered Code has been published under a particular version of the License, You may always continue to use it under the terms of that version. You may also choose to use such Covered Code under the terms of any subsequent version of the License published by Netscape. No one other than Netscape has the right to modify the terms applicable to Covered Code created under this License.

6.3. Derivative Works.

If You create or use a modified version of this License (which you may only do in order to apply it to code which is not already Covered Code governed by this License), You must (a) rename Your license so that the phrases "Mozilla", "MOZILLAPL", "MOZPL", "Netscape", "MPL", "NPL" or any confusingly similar phrase do not appear in your license (except to note that your license differs from this License) and (b) otherwise make it clear that Your version of the license contains terms which differ from the Mozilla Public License and Netscape Public License. (Filling in the name of the Initial Developer, Original Code or Contributor in the notice described in Exhibit A shall not of themselves be deemed to be modifications of this License.)

7. DISCLAIMER OF WARRANTY.

COVERED CODE IS PROVIDED UNDER THIS LICENSE ON AN "AS IS" BASIS, WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES THAT THE COVERED CODE IS FREE OF DEFECTS, MERCHANTABLE, FIT FOR A PARTICULAR PURPOSE OR NON-INFRINGING. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE COVERED CODE

IS WITH YOU. SHOULD ANY COVERED CODE PROVE DEFECTIVE IN ANY RESPECT, YOU (NOT THE INITIAL DEVELOPER OR ANY OTHER CONTRIBUTOR) ASSUME THE COST OF ANY NECESSARY SERVICING, REPAIR OR CORRECTION. THIS DISCLAIMER OF WARRANTY CONSTITUTES AN ESSENTIAL PART OF THIS LICENSE. NO USE OF ANY COVERED CODE IS AUTHORIZED HEREUNDER EXCEPT UNDER THIS DISCLAIMER.

8. TERMINATION.

8.1. This License and the rights granted hereunder will terminate automatically if You fail to comply with terms herein and fail to cure such breach within 30 days of becoming aware of the breach. All sublicenses to the Covered Code which are properly granted shall survive any termination of this License. Provisions which, by their nature, must remain in effect beyond the termination of this License shall survive.

8.2. If You initiate litigation by asserting a patent infringement claim (excluding declatory judgment actions) against Initial Developer or a Contributor (the Initial Developer or Contributor against whom You file such action is referred to as "Participant") alleging that:

(a) such Participant's Contributor Version directly or indirectly infringes any patent, then any and all rights granted by such Participant to You under Sections 2.1 and/or 2.2 of this License shall, upon 60 days notice from Participant terminate prospectively, unless if within 60 days after receipt of notice You either: (i) agree in writing to pay Participant a mutually agreeable reasonable royalty for Your past and future use of Modifications made by such Participant, or (ii) withdraw Your litigation claim with respect to the Contributor Version against such Participant. If within 60 days of notice, a reasonable royalty and payment arrangement are not mutually agreed upon in writing by the parties or the litigation claim is not withdrawn, the rights granted by Participant to You under Sections 2.1 and/or 2.2 automatically terminate at the expiration of the 60 day notice period specified above.

(b) any software, hardware, or device, other than such Participant's Contributor Version, directly or indirectly infringes any patent, then any rights granted to You by such Participant under Sections 2.1(b) and 2.2(b) are revoked effective as of the date You first made, used, sold, distributed, or had made, Modifications made by that Participant.

8.3. If You assert a patent infringement claim against Participant alleging that such Participant's Contributor Version directly or indirectly infringes any patent where such claim is resolved (such as by license or settlement) prior to the initiation of patent infringement litigation, then the reasonable value of the licenses granted by such Participant under Sections 2.1 or 2.2 shall be taken into account in determining the amount or value of any payment or license.

8.4. In the event of termination under Sections 8.1 or 8.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or any distributor hereunder prior to termination shall survive termination.

9. LIMITATION OF LIABILITY.

UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, WHETHER TORT (INCLUDING NEGLIGENCE), CONTRACT, OR OTHERWISE, SHALL YOU, THE INITIAL DEVELOPER, ANY OTHER CONTRIBUTOR, OR ANY DISTRIBUTOR OF COVERED CODE,

OR ANY SUPPLIER OF ANY OF SUCH PARTIES, BE LIABLE TO ANY PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY CHARACTER INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF GOODWILL,

WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER

COMMERCIAL DAMAGES OR LOSSES, EVEN IF SUCH PARTY SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. THIS LIMITATION OF LIABILITY SHALL NOT APPLY TO LIABILITY FOR DEATH OR PERSONAL INJURY RESULTING FROM SUCH PARTY'S NEGLIGENCE TO THE EXTENT APPLICABLE LAW PROHIBITS SUCH LIMITATION. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THIS EXCLUSION AND LIMITATION MAY NOT APPLY TO YOU.

10. U.S. GOVERNMENT END USERS.

The Covered Code is a "commercial item," as that term is defined in 48 C.F.R. 2.101 (Oct. 1995), consisting of "commercial computer software" and "commercial computer software documentation," as such terms are used in 48 C.F.R. 12.212 (Sept. 1995). Consistent with 48 C.F.R. 12.212 and 48 C.F.R. 227.7202-1 through 227.7202-4 (June 1995), all U.S. Government End Users acquire Covered Code with only those rights set forth herein.

11. MISCELLANEOUS.

This License represents the complete agreement concerning subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent necessary to make it enforceable. This License shall be governed by California law provisions (except to the extent applicable law, if any, provides otherwise), excluding its conflict-of-law provisions. With respect to disputes in which at least one party is a citizen of, or an entity chartered or registered to do business in the United States of America, any litigation relating to this License shall be subject to the jurisdiction of the Federal Courts of the Northern District of California, with venue lying in Santa Clara County, California, with the losing party responsible for costs, including without limitation, court costs and reasonable attorneys' fees and expenses. The application of the United Nations Convention on Contracts for the International Sale of Goods is expressly excluded.

Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not apply to this License.

12. RESPONSIBILITY FOR CLAIMS.

As between Initial Developer and the Contributors, each party is responsible for claims and damages arising, directly or indirectly, out of its utilization of rights under this License and You agree to work with Initial Developer and Contributors to distribute such responsibility on an equitable basis. Nothing herein is intended or shall be deemed to constitute any admission of liability.

13. MULTIPLE-LICENSED CODE.

Initial Developer may designate portions of the Covered Code as "Multiple-Licensed". "Multiple-Licensed" means that the Initial Developer permits you to utilize portions of the Covered Code under Your choice of the NPL or the alternative licenses, if any, specified by the Initial Developer in the file described in Exhibit A.

EXHIBIT A -Mozilla Public License.

``The contents of this file are subject to the Mozilla Public License Version 1.1 (the "License"); you may not use this file except in compliance with the License. You may obtain a copy of the License at http://www.mozilla.org/MPL/

Software distributed under the License is distributed on an "AS IS" basis, WITHOUT WARRANTY OF ANY KIND, either express or implied. See the License for the specific language governing rights and limitations under the License.

20.1.15. PCRE2

PCRE2

PCRE2 LICENCE

PCRE2 is a library of functions to support regular expressions whose svntax and semantics are as close as possible to those of the Perl 5 language. Releases 10.00 and above of PCRE2 are distributed under the terms of the "BSD" licence, as specified below, with one exemption for certain binary redistributions. The documentation for PCRE2, supplied in the "doc" directory, is distributed under the same terms as the software itself. The data in the testdata directory is not copyrighted and is in the public domain. The basic library functions are written in C and are freestanding. Also included in the distribution is a just-in-time compiler that can be used to optimize pattern matching. This is an optional feature that can be omitted when the library is built. THE BASIC LIBRARY FUNCTIONS _____ Written by: Philip Hazel Email local part: ph10 Email domain: cam.ac.uk University of Cambridge Computing Service, Cambridge, England. Copyright (c) 1997-2018 University of Cambridge All rights reserved. PCRE2 JUST-IN-TIME COMPILATION SUPPORT _____ Written by: Zoltan Herczeg Email local part: hzmester Email domain: freemail.hu Copyright(c) 2010-2018 Zoltan Herczeg All rights reserved.

STACK-LESS JUST-IN-TIME COMPILER

Copyright(c) 2009-2018 Zoltan Herczeg All rights reserved.

THE "BSD" LICENCE

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

 \ast Redistributions of source code must retain the above copyright notices,

this list of conditions and the following disclaimer.

* Redistributions in binary form must reproduce the above copyright notices, this list of conditions and the following disclaimer

in the documentation and/or other materials provided with the

documentation and/or other materials provided with the distribution.

 $\,$ * Neither the name of the University of Cambridge nor the names of any

contributors may be used to endorse or promote products derived from this

software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT OWNER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER ΤN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE

POSSIBILITY OF SUCH DAMAGE.

EXEMPTION FOR BINARY LIBRARY-LIKE PACKAGES

The second condition in the BSD licence (covering binary redistributions) does not apply all the way down a chain of software. If binary package A includes PCRE2, it must respect the condition, but if package B is software that includes package A, the condition is not imposed on package B unless it uses PCRE2 independently.

End

20.1.17. POV-Ray

POV-Ray

POV-Ray is the "Persistence of Vision" Ray Tracing software package. Oasys LS-DYNA Environment can export files for this and use it to produce ray-traced images. We wish to acknowledge the efforts of the custodians of the software and thank them for making it freely available, enabling us to provide this capability.

POV-Ray is freeware that is licensed under the GNU AFFERO GENERAL PUBLIC LICENSE Version 3, 19 November 2007 which may be found here <u>http://www.povray.org/povlegal.html</u>. This grants "unlimited permission to run the unmodified program" so there are no restrictions placed on users.

However that licence places certain restrictions on software which might embed it or use its source code, also on its redistribution, therefore :

- Oasys LS-DYNA Environment does not contain POV-Ray or any part of it, rather it can run it in unmodified form as a standalone executable.
- Oasys LS-DYNA Environment software release bundle does not contain POV-Ray, users need to download and install it for themselves.

The POV-Ray home page is <u>http://www.povray.org/</u> where you can find information about the tracer itself, its licensing, download links and also online documentation.

Spidermonkey

Mozilla Public License Version 2.0 _____ 1. Definitions _____ 1.1. "Contributor" means each individual or legal entity that creates, contributes to the creation of, or owns Covered Software. 1.2. "Contributor Version" means the combination of the Contributions of others (if any) used by a Contributor and that particular Contributor's Contribution. 1.3. "Contribution" means Covered Software of a particular Contributor. 1.4. "Covered Software" means Source Code Form to which the initial Contributor has attached the notice in Exhibit A, the Executable Form of such Source Code Form, and Modifications of such Source Code Form, in each case including portions thereof. 1.5. "Incompatible With Secondary Licenses" means (a) that the initial Contributor has attached the notice described in Exhibit B to the Covered Software; or (b) that the Covered Software was made available under the terms of version 1.1 or earlier of the License, but not also under the terms of a Secondary License. 1.6. "Executable Form" means any form of the work other than Source Code Form. 1.7. "Larger Work" means a work that combines Covered Software with other material, in a separate file or files, that is not Covered Software. 1.8. "License" means this document.

1.9. "Licensable" means having the right to grant, to the maximum extent possible, whether at the time of the initial grant or subsequently, any and all of the rights conveyed by this License. 1.10. "Modifications" means any of the following: (a) any file in Source Code Form that results from an addition to, deletion from, or modification of the contents of Covered Software; or (b) any new file in Source Code Form that contains any Covered Software 1.11. "Patent Claims" of a Contributor means any patent claim(s), including without limitation, method, process, and apparatus claims, in any patent Licensable by such Contributor that would be infringed, but for the grant of the License, by the making, using, selling, offering for sale, having made, import, or transfer of either its Contributions or its Contributor Version. 1.12. "Secondary License" means either the GNU General Public License, Version 2.0, the GNU Lesser General Public License, Version 2.1, the GNU Affero General Public License, Version 3.0, or any later versions of those licenses. 1.13. "Source Code Form" means the form of the work preferred for making modifications. 1.14. "You" (or "Your") means an individual or a legal entity exercising rights under this License. For legal entities, "You" includes any entity that controls, is controlled by, or is under common control with You. For purposes of this definition, "control" means (a) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (b) ownership of more than fifty percent (50%) of the outstanding shares or beneficial ownership of such entity. 2. License Grants and Conditions

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free, non-exclusive license: (a) under intellectual property rights (other than patent or trademark) Licensable by such Contributor to use, reproduce, make available, modify, display, perform, distribute, and otherwise exploit its Contributions, either on an unmodified basis, with Modifications, or as part of a Larger Work; and (b) under Patent Claims of such Contributor to make, use, sell, offer for sale, have made, import, and otherwise transfer either its Contributions or its Contributor Version. 2.2. Effective Date The licenses granted in Section 2.1 with respect to any Contribution become effective for each Contribution on the date the Contributor first distributes such Contribution. 2.3. Limitations on Grant Scope The licenses granted in this Section 2 are the only rights granted under this License. No additional rights or licenses will be implied from the distribution or licensing of Covered Software under this License. Notwithstanding Section 2.1(b) above, no patent license is granted bv a Contributor: (a) for any code that a Contributor has removed from Covered Software; or (b) for infringements caused by: (i) Your and any other third party's modifications of Covered Software, or (ii) the combination of its Contributions with other software (except as part of its Contributor Version); or (c) under Patent Claims infringed by Covered Software in the absence of its Contributions. This License does not grant any rights in the trademarks, service

marks,

or logos of any Contributor (except as may be necessary to comply with the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to distribute the Covered Software under a subsequent version of this License (see Section 10.2) or under the terms of a Secondary License (if permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its Contributions are its original creation(s) or it has sufficient rights to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under applicable copyright doctrines of fair use, fair dealing, or other equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted in Section 2.1.

3. Responsibilities

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any Modifications that You create or to which You contribute, must be under the terms of this License. You must inform recipients that the Source Code Form of the Covered Software is governed by the terms of this License, and how they can obtain a copy of this License. You may not attempt to alter or restrict the recipients' rights in the Source Code Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

(a) such Covered Software must also be made available in Source Code Form, as described in Section 3.1, and You must inform recipients of

the Executable Form how they can obtain a copy of such Source Code Form by reasonable means in a timely manner, at a charge no more than the cost of distribution to the recipient; and (b) You may distribute such Executable Form under the terms of this License, or sublicense it under different terms, provided that the license for the Executable Form does not attempt to limit or alter the recipients' rights in the Source Code Form under this License. 3.3. Distribution of a Larger Work You may create and distribute a Larger Work under terms of Your choice, provided that You also comply with the requirements of this License for the Covered Software. If the Larger Work is a combination of Covered Software with a work governed by one or more Secondary Licenses, and the Covered Software is not Incompatible With Secondary Licenses, this License permits You to additionally distribute such Covered Software under the terms of such Secondary License(s), so that the recipient of the Larger Work may, at their option, further distribute the Covered Software under the terms of either this License or such Secondary License(s). 3.4. Notices You may not remove or alter the substance of any license notices (including copyright notices, patent notices, disclaimers of warranty, or limitations of liability) contained within the Source Code Form of the Covered Software, except that You may alter any license notices $\pm \circ$ the extent required to remedy known factual inaccuracies. 3.5. Application of Additional Terms You may choose to offer, and to charge a fee for, warranty, support, indemnity or liability obligations to one or more recipients of Covered Software. However, You may do so only on Your own behalf, and not on behalf of any Contributor. You must make it absolutely clear that anv such warranty, support, indemnity, or liability obligation is offered by You alone, and You hereby agree to indemnify every Contributor for anv liability incurred by such Contributor as a result of warranty, support,

indemnity or liability terms You offer. You may include additional disclaimers of warranty and limitations of liability specific to any jurisdiction.

4. Inability to Comply Due to Statute or Regulation

If it is impossible for You to comply with any of the terms of this License with respect to some or all of the Covered Software due to statute, judicial order, or regulation then You must: (a) comply with the terms of this License to the maximum extent possible; and (b) describe the limitations and the code they affect. Such description must be placed in a text file included with all distributions of the Covered Software under this License. Except to the extent prohibited by statute or regulation, such description must be sufficiently detailed for a recipient of ordinary skill to be able to understand it. 5. Termination _____ 5.1. The rights granted under this License will terminate automatically if You fail to comply with any of its terms. However, if You become compliant, then the rights granted under this License from a particular Contributor are reinstated (a) provisionally, unless and until such Contributor explicitly and finally terminates Your grants, and (b) on an ongoing basis, if such Contributor fails to notify You of the non-compliance by some reasonable means prior to 60 days after You have come back into compliance. Moreover, Your grants from a particular Contributor are reinstated on an ongoing basis if such Contributor notifies You of the non-compliance by some reasonable means, this is the first time You have received notice of non-compliance with this License from such Contributor, and You become compliant prior to 30 days after Your receipt of the notice. 5.2. If You initiate litigation against any entity by asserting a patent infringement claim (excluding declaratory judgment actions, counter-claims, and cross-claims) alleging that a Contributor Version directly or indirectly infringes any patent, then the rights granted to You by any and all Contributors for the Covered Software under Section 2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all end user license agreements (excluding distributors and resellers) which have been validly granted by You or Your distributors under this License prior to termination shall survive termination. ***** **** * * * 6. Disclaimer of Warranty * * _____ * Covered Software is provided under this License on an "as is" * basis, without warranty of any kind, either expressed, implied, or statutory, including, without limitation, warranties that the * * * Covered Software is free of defects, merchantable, fit for a * particular purpose or non-infringing. The entire risk as to the * * quality and performance of the Covered Software is with You. Should any Covered Software prove defective in any respect, You * (not any Contributor) assume the cost of any necessary servicing, * * repair, or correction. This disclaimer of warranty constitutes an * essential part of this License. No use of any Covered Software is * authorized under this License except under this disclaimer. **** **** * * 7. Limitation of Liability * _____

Under no circumstances and under no legal theory, whether tort \star * (including negligence), contract, or otherwise, shall any * * Contributor, or anyone who distributes Covered Software as * permitted above, be liable to You for any direct, indirect, * special, incidental, or consequential damages of any character * including, without limitation, damages for lost profits, loss of * goodwill, work stoppage, computer failure or malfunction, or any * * and all other commercial damages or losses, even if such party shall have been informed of the possibility of such damages. This * limitation of liability shall not apply to liability for death or * personal injury resulting from such party's negligence to the * * extent applicable law prohibits such limitation. Some * jurisdictions do not allow the exclusion or limitation of * incidental or consequential damages, so this exclusion and * limitation may not apply to You. ***** ****

8. Litigation

Any litigation relating to this License may be brought only in the courts of a jurisdiction where the defendant maintains its principal place of business and such litigation shall be governed by laws of that jurisdiction, without reference to its conflict-of-law provisions. Nothing in this Section shall prevent a party's ability to bring cross-claims or counter-claims.

9. Miscellaneous

This License represents the complete agreement concerning the subject matter hereof. If any provision of this License is held to be unenforceable, such provision shall be reformed only to the extent

necessary to make it enforceable. Any law or regulation which provides that the language of a contract shall be construed against the drafter shall not be used to construe this License against a Contributor. 10. Versions of the License _____ 10.1. New Versions Mozilla Foundation is the license steward. Except as provided in Section 10.3, no one other than the license steward has the right to modify or publish new versions of this License. Each version will be given a distinguishing version number. 10.2. Effect of New Versions You may distribute the Covered Software under the terms of the version of the License under which You originally received the Covered Software, or under the terms of any subsequent version published by the license steward. 10.3. Modified Versions If you create software not governed by this License, and you want to create a new license for such software, you may create and use a modified version of this License if you rename the license and remove any references to the name of the license steward (except to note that such modified license differs from this License). 10.4. Distributing Source Code Form that is Incompatible With Secondary Licenses If You choose to distribute Source Code Form that is Incompatible With Secondary Licenses under the terms of this version of the License, the notice described in Exhibit B of this License must be attached. Exhibit A - Source Code Form License Notice _____ This Source Code Form is subject to the terms of the Mozilla Public License, v. 2.0. If a copy of the MPL was not distributed with this

file, You can obtain one at http://mozilla.org/MPL/2.0/.

If it is not possible or desirable to put the notice in a particular file, then You may include the notice in a location (such as a LICENSE file in a relevant directory) where a recipient would be likely to look for such a notice.

You may add additional accurate notices of copyright ownership.

Exhibit B - "Incompatible With Secondary Licenses" Notice

This Source Code Form is "Incompatible With Secondary Licenses", as defined by the Mozilla Public License, v. 2.0.

20.1.21. SQLite

SQLite

SQLite Is Public Domain

All of the code and documentation in SQLite has been dedicated to the <u>public domain</u> by the authors. All code authors, and representatives of the companies they work for, have signed affidavits dedicating their contributions to the public domain and originals of those signed affidavits are stored in a firesafe at the main offices of <u>Hwaci</u>. All contributors are citizens of countries that allow creative works to be dedicated into the public domain. Anyone is free to copy, modify, publish, use, compile, sell, or distribute the original SQLite code, either in source code form or as a compiled binary, for any purpose, commercial or non-commercial, and by any means.

The previous paragraph applies to the deliverable code and documentation in SQLite - those parts of the SQLite library that you actually bundle and ship with a larger application. Some scripts used as part of the build process (for example the "configure" scripts generated by autoconf) might fall under other open-source licenses. Nothing from these build scripts ever reaches the final deliverable SQLite library, however, and so the licenses associated with those scripts should not be a factor in assessing your rights to copy and use the SQLite library.

All of the deliverable code in SQLite has been written from scratch. No code has been taken from other projects or from the open internet. Every line of code can be traced back to its original author, and all of those authors have public domain dedications on file. So the SQLite code base is clean and is uncontaminated with licensed code from other projects.

Open-Source, not Open-Contribution

SQLite is open-source, meaning that you can make as many copies of it as you want and do whatever you want with those copies, without limitation. But SQLite is not open-contribution. In order to keep SQLite in the public domain and ensure that the code does not become contaminated with proprietary or licensed content, the project does not accept patches from people who have not submitted an affidavit dedicating their contribution into the public domain.

All of the code in SQLite is original, having been written specifically for use by SQLite. No code has been copied from unknown sources on the internet.

Warranty of Title

SQLite is in the public domain and does not require a license. Even so, some organizations want legal proof of their right to use SQLite. Circumstances where this might occur include the following:

- Your company desires indemnity against claims of copyright infringement.
- You are using SQLite in a jurisdiction that does not recognize the public domain.

- You are using SQLite in a jurisdiction that does not recognize the right of an author to dedicate their work to the public domain.
- You want to hold a tangible legal document as evidence that you have the legal right to use and distribute SQLite.
- Your legal department tells you that you must purchase a license.

If any of the above circumstances apply to you, <u>Hwaci</u>, the company that employs all the developers of SQLite, will <u>sell you a Warranty of Title for</u> <u>SQLite</u>. A Warranty of Title is a legal document that asserts that the claimed authors of SQLite are the true authors, and that the authors have the legal right to dedicate the SQLite library into the public domain, and that Hwaci will vigorously defend against challenges to those claims. All proceeds from the sale of SQLite Warranties of Title are used to fund continuing improvement and support of SQLite.

Contributed Code

In order to keep SQLite completely free and unencumbered by copyright, the project does not accept patches. If you would like to suggest a change and you include a patch as a proof-of-concept, that would be great. However, please do not be offended if we rewrite your patch from scratch.
